7.1.2 A number of the model links that carry strategic traffic flows are outside the fully modelled area and as they are outside this area they are not calibrated or validated to observed data. As a result of this the base year flows on these links may not be fully representative of total traffic levels. However, it is considered that the forecast changes in traffic levels on these links as a result of the scheme are still valid.

7.1.3 In providing better access to northern Norwich suburbs and the proposed new development locations in the North East Growth Triangle from the proposed new junction with the A47(T) at Postwick, the routes from the east become more attractive via the A47(T) east of Norwich (see Figure I.4 in Appendix I). In 2017 there is an estimated switch of 1100 AADT from the A146 and the A149 to the A12(T)/A47(T) (sites 2 and 4 to site 1). In 2032 the corresponding figure is 2500 AADT. This represents a reduction of 4% (site 2) on the A146 between Beccles and Trowse junction with the A47(T) in 2017 and 7% in 2032, and as a result of these reductions there is a reassignment in the peak hours in 2032 that relieves the B1135/B1527/B1332 route between Dereham and Bungay to the south of the southern bypass which amounts to an AADT reduction 300 (4%) in 2032 (site 5). In addition there are reassignments of traffic north of Great Yarmouth on the A149 route from Caister on Sea resulting in reductions of 300 AADT in 2017 and 1000 AADT in 2032 (4% and 11% respectively) (site 4). The increase in traffic using the A47(T) between Great Yarmouth and Acle (the switching of 1100 AADT in 2017 and 2500 AADT in 2032) represents an increase of 4% in 2017 and 8% in 2032 (site 1). On the A47(T) east of Postwick there is an increase of 3800 AADT in 2017

and 4100 AADT in 2032, representing proportional changes of 11% in both years (site 3).

- 7.1.4 To the east of Norwich the NDR results in orbital traffic reducing on the existing routes between the A47(T) and A1151 Wroxham Road via Church Road / Broad Lane / Green Lane West through Great Plumstead and Woodbastwick Road / B1140 Low Road and Bell Lane through Salhouse. The first route via Great Plumstead experiences reductions of 4100 AADT (66%) in 2017 and 7100 AADT (72%) in 2032 (site 11), and the reductions on the second route via Salhouse are 3000 AADT (70%) in 2017 and 3900 AADT (67%) in 2032 (site 6).
- 7.1.5 To the west of Norwich the NDR results in an increase in traffic using Fakenham Road, with some trips reassigning on this route from the direction of Kings Lynn. The reassignment onto Fakenham Road amounts to an increase of 1900 AADT in 2017 and 2900 in 2032 (18% and 22%) (site 9). There is a consequential reduction on the A47(T) west of Dereham Road junction of 800 AADT in 2017 and 400 AADT in 2032 (3% and 1%), and reductions on routes to the north of Norwich, as explained below (site 8).
- 7.1.6 North of Norwich there are existing routes that experience substantial reductions in traffic with the NDR. To the north west the B1145 route between Bawdeswell / Fakenham Road and Aylsham via Reepham experiences reductions of 400 AADT (10%) in 2017 and 1200 AADT (22%) in 2032 (site 10). The route between Reepham and Hoveton on the A1151 Norwich Road via Buxton Road, Cawston Road and B1354 Coltishall Road carries significant orbital traffic movements in absence of NDR, despite its poor standard. With NDR, traffic on this route reduces by 2900 AADT (60%) in 2017 and 4500 AADT (66%) in 2032 (site 7). Another route that carries orbital traffic around northern Norwich is Spixworth Road / Crostwick Lane via Spixworth. Traffic flows reduce by 2400 AADT (35%) in 2017 and by 4900 AADT (52%) in 2032 (site 12).
- 7.1.7 A graphical representation of traffic flow changes on five selected strategic sites is shown in Figure 7-1. Clearly, the inclusion of the NDR results in a reduction of flows.

Wider Impacts to the West of Norwich

7.1.8 The model runs have been analysed to understand the impact of NDR on traffic levels on routes between the A1067 (Fakenham Road) and the A47(T) (see figure I.3 in Appendix I). The NDR runs between the A1067 west of Taverham and extends to the A47(T) at Postwick junction east of Norwich. Concern has been expressed that because the NDR does not extend to the A47(T) in the west, traffic will increase on routes between the A1067 and the A47(T).

7.1.9 To assess this, modelled traffic flows on an imaginary line running between the A1067 and the A47(T) have been investigated. The results are presented in Table 7.1.

Table 7.1: Modelled Daily Traffic Flows on Routes Between the A1067 and the A47(T)

24 hour two-way flows	2012	2017 DM	2017 DS	2032 DM	2032 DS	NDR change 2017	NDR change 2032
Low Road (A81)	4000	4600	4000	4900	4100	-13%	-16%
Costessey Lane (A89)	3300	4000	3800	4800	4900	-5%	2%
Taverham Lane (A25)	5700	5700	4700	6200	4700	-18%	-24%
Ringland Road (A31)	3600	4900	3500	8000	6300	-29%	-21%
C167 Weston Longville (A105)	1400	1700	3300	3100	5500	94%	77%
C173 Lenwade to Hockering (A106)	3000	3400	3500	3300	3600	3%	9%
Total	21000	24300	22800	30300	29100	-6%	-4%

7.1.10 The above shows that the NDR leads to a decrease in daily traffic on the above routes that connect the A1067 with the A47(T) to the west of Norwich of 6% in 2017 and 4% in 2032.

7.1.11 Traffic levels on the three key routes between Taverham and Costessey (Costessey Lane, Taverham Lane and Ringland Road) are predicted to reduce significantly, except for Costessey Lane where the predicted reduction is relatively small in 2032 and traffic levels are predicted to increase by 2% in the DS scenario.

7.1.12 Low Road provides an alternative route into the west of Norwich that avoids the A1067. Traffic levels are predicted to significantly decrease on this route with the NDR in place.

7.1.13 Further out from Norwich however, traffic levels are predicted to increase significantly on the C167 through Weston Longville and slightly on the C173 between Lenwade and Hockering with the NDR in place. Presently the flows on this route are significantly lower than any of the parallel routes compared in Table 7.1 reflecting the character of this route through Weston Longville where it is a single file lane.

7.1.14 To address existing HGV problems on routes between the A1067 and the A47(T), a route is presently being upgraded to accommodate such traffic. This route runs from Lenwade and uses the C173 in the north and the C167 Wood Lane in the south. Additional traffic management and / or signage should be used to encourage all traffic onto this improved HGV route to avoid Weston Longville and Hockering in future years; the HGV improvements thereby also being a solution to any increase in traffic on these two routes due to NDR.

Suburban traffic impacts

Table 7.2: NDR Impact on Suburban Routes and Developer Link Roads

Route / Link Road	2017 AADT change (DS – DM)	2032 AADT change (DS – DM)
Thorpe St Andrew area		
Yarmouth Road (West) (Site A65)	-3700 (-13%)	-2000 (-6%)
Route via Thunder Lane / Woodside Road / Blue Boar Lane between Thorpe St Andrew and Sprowston (Site A20)	-4300 (-33%)	-3300 (-28%)
A1042 Outer Ring Road (north east quadrant, at A1042 Mousehold Lane) (Site A7)	-4000 (-16%)	-4000 (-15%)
C283 Salhouse Road (Site A45)	-1100 (-8%)	-1600 (-10%)
A1151 Wroxham Road Site (A43)	-2900 (-15%)	-3600 (-16%)
Old Catton area		
A1042 Outer Ring Road (Chartwell Road) (Site A26)	-3700 (-13%)	-4700 (-15%)
B1150 North Walsham Road (Site A92)	-2000 (-18%)	-3600 (-27%)
St Faiths Road (Site A37)	-2600 (-17%)	-3000 (-19%)
Hellesdon area		
A140 Boundary Road / Outer Ring Road (Site A5)	-2100 (-9%)	-1500 (-6%)
A140 Cromer Road (Site A35)	-3600 (-21%)	-3300 (-18%)

Route / Link Road	2017 AADT change (DS – DM)	2032 AADT change (DS – DM)
A1067 Drayton Road (Site A32)	-1400 (-7%)	-2000 (-10%)
Reepham Road (Site A33)	1600 (16%)	700 (7%)
Middleton's Lane (between Cromer Road and Reepham Road) (site A83)	-1100 (-11%)	-1300 (-11%)
Drayton area		
School Road (north of Fakenham Road) (site A21)	-2000 (-18%)	-2400 (-19%)
Fakenham Road (through Taverham) (site A54)	-2600 (-26%)	-2600 (-23%)
Link Roads		
Beyond Green (between B1150 N Walsham Road and A1151 Wroxham Road) (site A96)	-3500 (-42%)	-6100 (-45%)
White House Farm (between A1151 Wroxham Road and Salhouse Road) (site A98)	600 (27%)	-3600 (-32%)
Salhouse Road to Plumstead Road (only in place in 2032) (site A100)	n/a	-3400 (-23%)
Brook Farm / Laurel Farm link road (site A104)	-4000 (-78%)	-8700 (-67%)

7.1.15 In the Thorpe St Andrew area (see figure I.2 in Appendix I) traffic is reduced on Yarmouth Road (West) by 3700 AADT (13%) in 2017 and by 2000 AADT (6%) in 2032, refer to Table 7.2 (negative figures indicate reductions with NDR). There is a significant reduction on the north-south suburban route Thunder Lane / Woodside Road / Blue Boar Lane between Thorpe St Andrew and Sprowston of 4300 AADT (33%) in 2017 and 3300 AADT (28%) in 2032. There are significant reductions in traffic on the A1042 Outer Ring Road around the north east quadrant with traffic flows on the A1042 Mousehold Lane reducing by 4000 AADT (16%) in 2017 and 4000 AADT (15%) in 2032. On the radial routes into the city through city's north eastern suburbs in Spowston and Thorpe St Andrew there is a small reduction in forecast traffic on C874 Plumstead Road but larger reductions on C283 Salhouse Road and A1151 Wroxham Road. The Salhouse Road reduction is 1100 AADT (8%) in 2017 and 1600 AADT (10%) in 2032. On Wroxham Road the traffic reduces by 2900 AADT (15%) in 2017 and 3600 AADT (16%) in 2032.

- 7.1.16 In Old Catton the traffic reduces on the A1042 Outer Ring Road (Chartwell Road) by 3700 AADT (13%) in 2017 and 4700 AADT (15%) in 2032. The traffic flows also reduce across the radial routes on B1150 North Walsham Road, C246 Spixworth Road and C251 St Faiths Road. The main reductions are on North Walsham Road of 2000 AADT (18%) in 2017 and 3600 AADT (27%) in 2032, and on St Faiths Road of 2600 AADT (17%) in 2017 and 3000 AADT (19%) in 2032.
- 7.1.17 In Hellesdon (see figure I.1 in Appendix I) the traffic reduces on the A140 Boundary Road Outer Ring Road by 2100 AADT (9%) in 2017 and 1500 AADT (6%) in 2032. On the radial routes traffic is reduced on A140 Cromer Road and A1067 Drayton Road. On the A140 Cromer Road traffic reduces by 3600 AADT (21%) in 2017 and 3300 AADT (18%) in 2032, and on A1067 Drayton Road traffic reduces by 1400 AADT (7%) in 2017 and 2000 AADT (10%) in 2032. However the traffic on Reepham Road increases by 1600 AADT (16%) in 2017 and 700 AADT (7%) in 2032, although on Middleton's Lane between Cromer Road and Reepham Road traffic reduces by 1100 AADT (11%) in 2017 and 1300 AADT (11%) in 2032 (site A83). In Drayton the traffic reduces on the School Road north of A1067 Fakenham Road by 2000 AADT (18%) in 2017 and 2400 AADT (19%) in 2032 (site A21) and on Fakenham Road through Taverham traffic reduces by 2600 AADT (26%) in 2017 and 2600 AADT (23%) in 2032 (site A54).
- 7.1.18 With the implementation of the JCS planned development a number of developer link roads are assumed to be provided as part of the developments. These are designed to act either as urban high streets to serve walking and cycling movement as well as traffic access for the development or as local development distributor roads. In absence of NDR these link roads carry very high traffic flows that is incompatible with their intended purposes, but these traffic flows are relieved substantially by the NDR as shown in Table 7.2.

City centre traffic impacts

- 7.1.19 Traffic impacts in the city centre occur due to a combination of impacts resulting from the NDR and complementary traffic management measures in the city centre that would be introduced should the NDR scheme proceed. The traffic management measures effect restrictions to general traffic crossing the city centre and thus displace traffic movements to the Inner Ring Road.
- 7.1.20 These changes are captured at several locations along the inner ring road and radial routes into the city centre as shown in Figure I.5 in Appendix I.

- Carrow Road (site 13) increased by 200 AADT (1%) in 2017 and increased by 2200 AADT (8%) in 2032;
- A147 Chapelfield Road (site 14) increased by 200 AADT (1%) in 2017 and 1100 AADT (4%) in 2032;
- A147 Grapes Hill Road (site 15) reduced by 400 AADT (1%) in 2017 and increased by 3000 AADT (9%) in 2032;
- A147 St Crispins Road (west) (site 16) decreased by 400 AADT (1%) in 2017 and 2200 AADT (6%) in 2032; and
- A147 St Crispins Road (east) (site 17) stays the same in 2017 and increased by 800 AADT (3%) in 2032.

Figure 7-1: Comparison of Traffic Flows on Inappropriate Routes

7.2 Traffic Queues

7.2.1 The network queues estimated by SATURN have been examined and presented in Table 7.3. These are produced in the detailed model area where traffic queues are simulated by the model. These comprise transient queuing such as produced by traffic signal cycles and overcapacity queuing. The total queues are shown in Figure 7-2 and Figure 7-3 for the base, DM and DS scenarios for the AM and PM peaks respectively. In the AM peak the queues increase from a base of 2831 PCU.hrs to 3372 PCU.hrs in 2017 DM and 4265 PCU.hrs in 2032 DM. These levels are reduced with the scheme by 13% in 2017 to 2948 PCU.hrs and by 8% in 2032 to 3908 PCU.hrs. Changes in the PM peak are from a base of 2353 PCU.hrs to 3116 PCU.hrs in 2017 DM and 4201 PCU.hrs in 2032 DM. These levels are reduced with the scheme by 7% in 2017 to 2889 PCU.hrs and by 5% in 2032 to 3993 PCU.hrs. It should be noted that the queues are representative of the whole of the city network (the detailed model area) so in this context the Scheme would have a significant effect, especially in the AM peak.

Table 7.3: Queue estimated by SATURN (PCU hrs)

Scenario	Transient queues (PCU hrs)				Over-capacity queues (PCU hrs)				Total queues (PCU hrs)			
	AM	IP	PM	OP	AM	IP	PM	OP	AM	IP	PM	OP
2012 Base	2,165	1,248	2,062	267	666	35	290	0	2,831	1,283	2,353	267
2017 Do Minimum	2,466	1,394	2,463	286	906	58	653	0	3,372	1,451	3,116	286
2017 Do Something	2,336	1,339	2,350	282	612	47	539	0	2,948	1,386	2,889	282
2032 Do Minimum	2,910	1,739	2,904	328	1,355	170	1,296	0	4,265	1,909	4,201	328
2032 Do Something	2,743	1,664	2,691	321	1,165	167	1,301	0	3,908	1,832	3,993	321

Figure 7-2: Overall Queue Comparison - AM peak

Figure 7-3: Overall Queue Comparison - PM peak

7.3 Effects on People

7.3.1 The Effects on People are evaluated in Table 7.4 by calculating the number of dwellings within 50 metres of roads with a Volume to Capacity ratio of over 90%. This uses existing address point data, so the analysis does not account for proposed new dwellings. A graph representing this data is shown in Figure 7-4.

Table 7.4: Number of Dwellings within 50 metres of roads

	2012	2017		2032	
	Base	Do Minimum	Do Something	Do Minimum	Do Something
AM	3922	5676	4456 (-21%)	6824	4989 (-27%)
PM	2973	4432	4123 (-7%)	5587	5163 (-8%)

Figure 7-4: Effects on People

7.4 City Centre through Traffic

7.4.1 City centre through traffic has been calculated in Table 7.5 by establishing 3 cordons. These cordons are:

- Inner Ring Road Inner – just inside the Inner Ring Road;
- Inner Ring Road Outer – just outside the Inner Ring Road; and
- Outer Ring Road Outer – just outside the Outer Ring Road.

7.4.2 Using these we can show the amount of traffic using the city centre, the inner ring road, and the outer ring road for through trips. One of the aims of the NDR is to decrease the amount of traffic and congestion that in part is due to travel through and across the city. In addition, the complementary city centre traffic management measures will substantially reduce through traffic in the city centre.

Table 7.5: City Centre through Traffic (AADT)

	2012	2017		2032	
	Base	Do Minimum	Do Something	Do Minimum	Do Something
Inner Ring Road Inner Cordon	9477	8159	6787 (-17%)	9236	4726 (-49%)
Inner Ring Road Outer Cordon	77825	82152	78369 (-5%)	88368	80352 (-9%)
Outer Ring Road Outer Cordon	68117	73691	63421 (-14%)	79151	66780 (-16%)

7.4.3 A graphical representation of this is shown in Figure 7-5 to Figure 7-7 which illustrate the reduction of through trips in the Do Something Scenario. Tables showing this information by time period are contained in Appendix J.

7.4.4 With the proposed city centre traffic management measures in the Do Something scenario through traffic in the city centre is reduced from the Base level and almost halved in 2032.

7.4.5 On the Inner Ring Road cross city traffic that uses the Inner Ring Road reduces with the Scheme by 3783 AADT (5%) in 2017 and by 8016 AADT (9%) in 2032 to levels only just higher than those in the base year.

7.4.6 On the Outer Ring Road, cross city traffic is reduced with the scheme by 10270 (14%) in 2017 and by 12371 (16%) in 2032 to levels below those in the base year.

Figure 7-5: Through Trips crossing Inner Ring Road Inner Cordon

Figure 7-6: Through Trips crossing Inner Ring Road Outer Cordon

Figure 7-7: Through Trips crossing Outer Ring Road Outer Cordon

7.5 Highway Journey Times

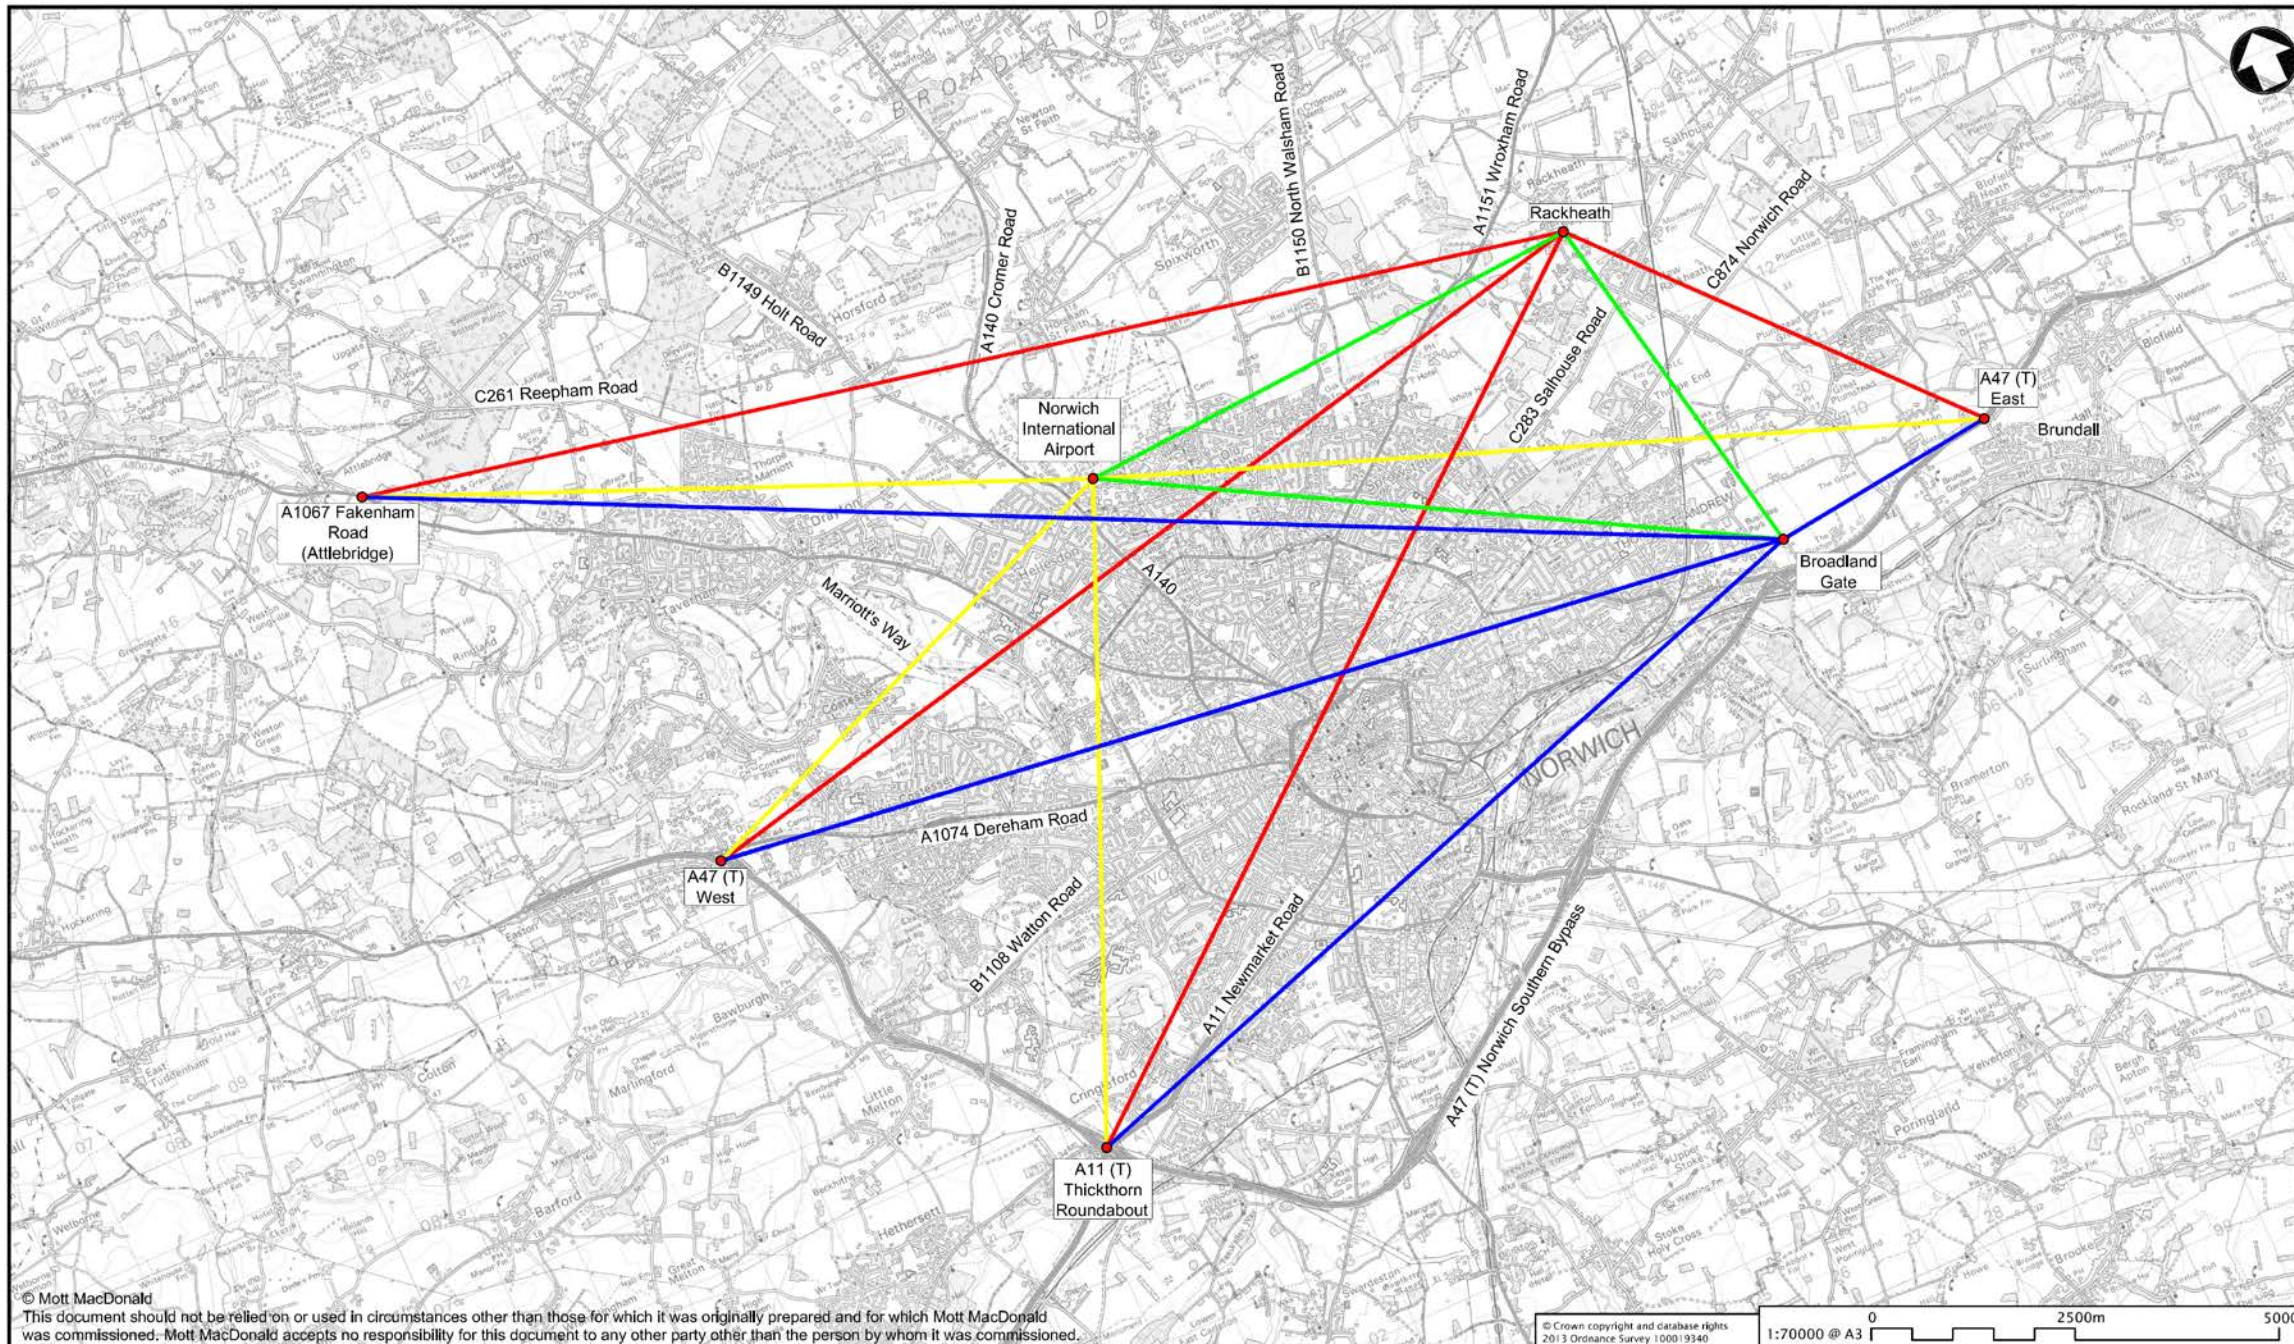

7.5.1 Highway journey times between four locations on strategic routes and three proposed development locations have been compared between scenarios. The locations are shown in Figure 7-8 and stated below:

- A47(T) West;
- A11(T) (Thickthorn Roundabout);
- A47(T) East (Brundall);
- A1067 Fakenham Road (Attlebridge);
- Norwich International Airport;
- Rackheath; and
- Broadland Gate

7.5.2 Figure 7-9 and Figure 7-10 show a comparison of average journey times for the AM peak and PM peak respectively, these are arithmetic means of the journey time for both directions. These Figures show the journey times for the base year and for Do Minimum and Do Something scenarios for the forecast years. The data for these Figures is presented in Table 7.6 and Table 7.7, as well as the percentage changes for the Do Something compared with the Do Minimum scenario.

7.5.3 The Figures and Tables show that with the Scheme there would be substantial reductions in journey times between the trunk road network and the Airport and Rackheath, with journey times from the A47(T) East to the Airport reducing by over eight minutes in 2017 and over ten minutes in 2032, or by over one third. In addition the journey times for orbital movements between Fakenham Road, Airport, Rackheath and Broadland Gate reduce by between 30% and 50% in 2017 and by between 29% and 52% in 2032. This data demonstrates that the Scheme would substantially improve access times between the strategic highway network and the planned development locations in the JCS plan and would provide a significant improvement for orbital movements to the north of the City between the proposed major development locations.

Figure 7-9: AM Peak Highway Average Journey Times

Figure 7-10: PM Peak Highway Average Journey Times

7.6 Journey Times on Public Transport Routes

7.6.1 For the 2017 and 2032 AM and the PM peaks, journey times on five public transport routes carrying high patronage levels into the city have been examined and compared between scenarios. These do not account for stopping times for bus services, but serve to show the changes in running times. The five routes are:

- Fakenham Rd/ Drayton High Rd to Fakenham Rd/Fir Covert Rd Junction;
- Cromer Road to Holt Rd/ Cromer Road Junction;
- Wroxham Road to Wroxham Road/ Green Lane W Junction;
- Plumstead Road to Plumstead Road/ Broad Lane Junction; and
- Yarmouth Road to Postwick NW Roundabout.

7.6.2 Figure K.1 in Appendix K shows the five routes and Figure 7-11 to Figure 7-14 show the graphical representation of journey times for the Do-Minimum and the Do-Something scenarios. Calculated journey time savings are set out in Table 7.8 and Table 7.9 for inbound and outbound directions respectively. In these tables, the journey time variability for each route is shown using the formula in paragraph 3.3.2 in WebTAG Unit 3.5.7.

7.6.3 In 2017 AM peak journey times into the city centre reduce with the Scheme by between 5% and 14%, with a journey time reliability improvement of around half of one minute. In the 2017 PM peak the journey times out of the city centre reduce with the Scheme by between 1 % and 13%, with an average journey time reliability improvement of around one quarter of a minute. Journey time changes in 2032 are more affected by the complementary city centre measures. In 2032 AM peak journey times into the city centre change with the scheme by between a 1% increase and an 11% reduction, with the average journey time reliability improvement of 18 seconds. In the 2032 PM peak the journey times for routes out of the city reduce by between 3% and 24%, with an average journey time reliability improvement of around half of one minute.

8 Abbreviations

AADT	Average Annual Daily Traffic
ATC	Automatic Traffic Count
DfT	Department for Transport
DIADEM	Dynamic Integrated Assignment and Demand Modelling - software released by the Department for Transport
DM	Do Minimum
DMRB	Design Manual for Roads and Bridges – a Highways Agency publication setting out guidance and good practice for design and appraisal of road schemes
DS	Do Something
COBA	DfT’s Cost-Benefit Analysis tool
EB	East Bound or Employer’s Business
GAP	Minimum gap (in seconds) accepted by a vehicle which gives way at priority junctions or traffic signals. Also a measure of Wardrop equilibrium assignment convergence
GAPR	As GAP above in relation to junctions but for entry onto roundabouts
GEH	Statistical tool to measure closeness of model to observed flows
GIS	Geographic Information System - designed to capture, store, manipulate, analyse, manage, and present all types of geographical data
GPS	Global Positioning System
HA	Highways Agency
HB	Home-based
HBEB	Home-based Employers Business
HBO	Home-based Other
HBW	Home-based Work
HGV	Heavy Goods Vehicle
JT	Journey Time

LGV	Light Goods Vehicle
LMVR	Local Model Validation Report
MCC	Manual Classified Count (for a link)
MCTC	Manual Classified Turning Count
ME	Matrix Estimation
NATS	Norwich Area Transportation Strategy
NB	North Bound
NCC	Norfolk County Council
NDC	Nationwide Data Collection (company specialising in traffic surveys)
NDR	Norwich Northern Distributor Road
NHB	Non-home-based
NHBEB	Non-home based Employer's Business
NHBO	Non-home –based Other
NTEM	National Trip End Model
NTS	National Travel Survey
OD	Origin Destination
OGV	Other Goods Vehicle
OGV1	A sub-category of OGV. Includes all rigid vehicles over 3.5 tonnes gross vehicle weight with two or three axles
OGV2	A sub-category of OGV. Includes all rigid vehicles with four or more axles and all articulated vehicles
OP	Off-peak
PA	Production-Attraction
PCU	Passenger Car Unit
PPK	Pence per Kilometre
PPM	Pence per Minute

RSI	Road Side Interview
SATURN	Simulation – Assignment model of Traffic on Urban Road Networks software
SB	South Bound
SRN	Strategic Road Network
TRADS	Traffic flow Data System – the Highways Agency’s database of traffic count data
TRICS	Trip Rate Information Computer System
VISUM	Transport modelling software used (in this case) for public transport modelling
VOC	Vehicle Operating Cost
VOT	Value of Time
WB	West Bound
WebTAG	Web-based Transport Analysis Guidance produced by the Department for Transport

1 Key Summary

- 1.1.1 Funding approval for the Norwich Northern Distributor Road (NDR) was sought in 2011 through the Department for Transport's (DfT) Development Pool process. A business case was developed and submitted in accordance with the guidance in the Treasury Green Book. Ministerial decisions were made in December 2011 to award funding.
- 1.1.2 The NDR is a project of national significance which requires a Development Consent Order (DCO) under the Planning Act 2008. This report was prepared as part of the submission.
- 1.1.3 The Value for Money (VfM) and Scheme Affordability for the NDR has been re-assessed for the submission based on outputs from an updated transport model using economic parameters published by the DfT in October 2012.
- 1.1.4 The economic appraisal results show that the NDR is likely to deliver present value of benefits (including TUBA transport user benefits and COBA accident benefits) of £773m over a 60 year appraisal period in 2010 prices discounted to 2010. This compares with present value costs of £186m.
- 1.1.5 Additional benefits in relation to wider economic impacts (WEBs) and journey time reliability (JTR) amount to a further £216m in 2010 prices discounted to 2010 which improve the value for money assessment of the Scheme. The table below shows a summary of the economic appraisal results for the NDR.

	Scenario including Accidents	Scenario also including WEBs and JTR
Present Value of Benefits (PVB)	773,317	989,063
Present Value of Costs (PVC)	185,542	185,542
Net Present Value (NPV)	587,775	803,521
Benefit to Cost Ratio (BCR)	4.168	5.331

Notes: Both costs and benefits are in £'000, in 2010 prices discounted to 2010 and for a 60 year appraisal period

- 1.1.6 The scheme delivers a benefit-to-cost ratio (BCR) of 4.17 (inclusive of accident benefits) and a BCR of 5.33 when WEBs and JTR are included. Both of these represent very high value for money (BCR above 4) according to DfT's VfM criteria.

2 Introduction

2.1 Background

- 2.1.1 Mott MacDonald (MM) has been appointed by Norfolk County Council (NCC) to assist with the development and appraisal of the Norwich Northern Distributor Road, known as the NDR or referred to as the Scheme.
- 2.1.2 The Scheme would be a dual carriageway all-purpose strategic distributor road, to be classified as the A1270 Principal Road, which would link the A1067 Fakenham Road near Attlebridge, to the A47(T) Trunk Road at Postwick. This will be over a length of approximately 20.4km.
- 2.1.3 The NDR is a project of national significance which requires a Development Consent Order (DCO) under the Planning Act 2008 and this formal planning process began in early 2013. It is currently anticipated that the process will be completed in time for the NDR scheme to start construction in 2015 and to be opened in 2017.
- 2.1.4 This document is one of a number that support the DCO, each of which has its own unique document number, and should therefore be read in conjunction with the other documentation. The proposed layout of the NDR is shown in the General Arrangement Plans contained in document number 2.6, whilst the full needs case for the NDR is explained in the Statement of Reasons (document 4.1) and the Environmental Statement (document 6.1).
- 2.1.5 Funding approval for the NDR was sought in 2011 through the Department for Transport's (DfT) Development Pool process. A business case was developed and submitted in accordance with the guidance in the Treasury Green Book. Ministerial decisions were made in December 2011 to award funding.
- 2.1.6 For DCO submission the transport model used in 2011 was updated using fresh data collected in 2012 to comply with current DfT guidance.
- 2.1.7 The economic appraisal approach adopted in this work follows existing WebTAG guidance in unit 3.5. The variable demand model (VDM) forecasts, which make allowance for traffic generation, redistribution and mode choice effects arising from introduction of the scheme, have been prepared for the NDR proposed opening year of 2017 and the design year of 2032. It has been assumed in the appraisal that the benefits of the scheme do not change for each year beyond 2032 although traffic will continue to grow.

2.2 Purpose and Layout of Report

2.2.1 This report presents the economic appraisal for the NDR and focuses on the monetised impacts of the scheme. The report sets out to provide:

- An assessment of economic benefits for consumer and business users from the NDR scheme based on the VDM forecasts and the likely expenditure profile during the assessment period.
- An assessment of the scheme Value for Money (VfM) based on the VDM model outputs and the latest available scheme costs. The Guidance on Value for Money describes the criteria used to determine the VfM of various types of schemes.
- Examination of the stability and distribution of the economic assessment results so as to demonstrate that the economic appraisal is robust and reliable as required by WebTAG 3.10.4.

2.2.2 This report describes the methodology used to produce the economic appraisal using the TUBA version 1.9.1 computer program. This undertakes a matrix-based appraisal taking demand and cost matrices (time, distance and charges) from the transport model as inputs. The report describes how transport model issues highlighted by TUBA have been dealt with.

2.2.3 The report also discusses the calculation of accidents benefits, wider economic benefits and journey time reliability benefits. These comply with relevant WebTAG guidance in units 3.4.1, 3.5.14 and 3.5.7 respectively.

2.2.4 This report contains the following sections after the current introductory section:

- Section 3 – discusses the economic appraisal process followed and the assumptions that have been made;
- Section 4 – describes the derivation of scheme costs for inclusion in the economic appraisal;
- Section 5 - presents the results of the economic appraisal and discusses the levels of user benefits that are reported for the scheme;

- Section 6 – demonstrates that the economic results are robust, reliable and stable as required by WebTAG;
- Section 7 – presents results from accident benefit analysis;
- Section 8 – discusses wider economic impacts of the scheme calculated using WITA software;
- Section 9 – presents the journey time reliability assessment of the NDR scheme; and
- Section 10 – presents conclusions from the economic appraisal.

2.2.5 Supporting information is included in a number of appendices in Section 11:

- Appendix A – describes the calculation of annualisation factors adopted for the appraisal;
- Appendix B – describes in detail the TUBA setup; and
- Appendix C – documents the analysis of TUBA and COBA warnings

2.2.6 Sections 12 and 13 contain Abbreviations and Glossary.

3 Economic Appraisal

3.1 Overview

- 3.1.1 The transport economic appraisal has been undertaken using the TUBA (Transport Users Benefit Appraisal) program Version 1.9.1 which carries out an economic appraisal in accordance with published DfT guidance. TUBA implements elements of the Sugden method as described in Unit 3.5.3 of WebTAG and undertakes matrix-based appraisal taking trip, time, distance and toll/charge matrices from the transport model as inputs. Based on these trip and cost matrices from the traffic model, TUBA calculates user benefits discounted to the present value year (2010) and produces results for various degrees of disaggregation and summarises the outputs.
- 3.1.2 Assumptions for the economic appraisal including economic parameters and annualisation factors that form inputs to the TUBA economic appraisal process are discussed in Appendices A, B and C. The key assumptions that have been made in the appraisal are as follows:
- The NDR scheme will be opened in 2017 and is appraised over a 60 year period from the year of opening. User benefits of the scheme after the design year of 2032 are assumed not to grow and are subject to the normal discounting to 2010 present value year and changes to values of time (VOTs) and other economic parameters.
 - The economic benefits of the NDR scheme are accrued over all days of the year (including weekends, bank holidays and overnight) although the transport model does not specifically model weekends and bank holidays. How this is done is discussed in Appendix A.
 - The scheme will be developed and funded by the public sector and investment costs are subject to optimism bias of 15%.
 - The economic appraisal has been carried out for a scenario that assumes the implementation of the Joint Core Strategy (JCS) plan for growth. The land use and development assumptions are consistent in the scenarios with and without the scheme intervention, termed the Do Something and Do Minimum scenarios.

- Changes in journey times and any economic benefits that are calculated are based on differences between the Do Minimum and the Do Something scenarios.

3.1.3 The main economic analysis is based on matrices from VDM assignments which makes allowance for the effects of suppressed and generated trips, destination choice, mode-choice and trip frequency. The impacts of the various demand modelling responses is considered in detail in section 6 of the Forecasting Report (Document Reference Number 5.6).

3.2 Modelling Framework

3.2.1 The Norwich Area Transportation Strategy (NATS) transport modelling framework used to assess the NDR consists of three main elements:

- Highway Traffic Model - This is a SATURN model with 413 zones with a network covering the greater Norwich area. It has a detailed simulation area covering the Norwich city urban area. The model has been validated to a 2012 base year in accordance with WebTAG unit 3.19.
- Public Transport Model - This is a VISUM public transport model covering bus and rail modes which has been developed using the guidance in WebTAG unit 3.11. The model covers the same area as the highway model plus the key rail routes into Norwich and has been calibrated to the same base year of 2012.
- Demand Model - DIADEM was used for demand modelling. The demand model is an incremental model, and is set up in Production-Attraction format as required by WebTAG unit 3.10.

3.2.2 The overall modelling framework and the individual elements of the framework have been developed to be consistent with the guidance set out in WebTAG.

3.2.3 The highway and public transport assignment models have been developed and validated for three time periods:

- AM Peak Hour (0800-0900hrs)
- Average Inter-Peak Hour (1000-1600hrs)
- PM Peak Hour (1700-1800hrs)

- 3.2.4 An Off-Peak model representing an average hour for the period 1900 to 0700hrs, has also been developed for the purposes of demand modelling, where costs are required for all times of the day. It should be noted that the off peak model is not a fully validated model. In terms of demand the overall levels of demand have been derived from observed counts, however there has been no flow validation at an individual link level. In terms of network performance, as the network has been calibrated for the other time periods the representation of network costs should be appropriate.
- 3.2.5 The NATS transport model is described in the Highway Local Model Validation Report (LMVR) of December 2013 (Report Reference Number 5.9) and in the Public Transport Local Model Validation Report, dated December 2013 (Report Reference Number 5.10). The traffic forecasts and demand modelling that form the basis of this economic appraisal are presented in the NDR Forecasting Report dated December 2013 (Report Reference Number 5.6).

3.3 Do Minimum Assumptions

- 3.3.1 A Do Minimum (DM) scenario is required as a reference upon which to assess the economic effects of the proposed scheme intervention. As such it includes schemes and measures that will be implemented between 2012 (the model base year) and 2017 to the existing transport system classified as 'near certain' or 'more than likely' in accordance with TAG Unit 3.15.5. Thus, the DM includes:
- Network changes - junction improvements, pedestrian improvements and traffic management and safety schemes within Norwich.
 - Public transport changes - it is assumed that the public transport network remains as it is in the base year. Assumptions have been made in terms of how bus and rail fares change in the future. Overall, it should be noted that there are no major changes to the public transport network in the Do Minimum.
 - Future housing and business developments
 - Reference traffic growth based on DfT's data contained in TEMPRO using NTEM dataset 6.2 and RTF 2013.
- 3.3.2 A full description of the Do Minimum including location plans of Do Minimum transport schemes is given in the Forecasting Report.

3.4 Do Something Network

3.4.1 The Do Something (DS) scenario represents a scenario with the NDR dual carriageway from the A1067 to the north west of Norwich to the A47(T) east of Norwich at Postwick junction, and associated complementary traffic management measures. More specifically the DS includes:

- The preferred route option for the NDR consisting of a dual carriageway all-purpose strategic distributor road, which would link the A1067 Fakenham Road, near Attlebridge to the junction with the A47 (T) at Postwick. The total length of the NDR is approximately 20.4km.
- Upgrade of the A47(T) Postwick Trunk Road junction and access improvements to Postwick Park and Ride site.
- City Centre changes - complementary traffic management measures proposed for Norwich city centre, with the aim of discouraging through car trips and reducing the dominance of traffic.
- Traffic management measures at three locations to address local transport issues that arise with NDR.
- Public transport – there are no changes proposed between the DM and DS.

3.4.2 These are the measures that, together, are assessed in this economic appraisal. The impact of the NDR is, of course, by far the dominant factor. These measures represent the DS scenario.

3.4.3 A full description of the DS scenario including location plans of DS schemes is given in the Forecasting Report.

3.5 Delays during Construction and Maintenance

3.5.1 Delays during construction have not been calculated as the scheme is off line and therefore its construction would not have a major impact on the operation of the existing highway network. At locations where the scheme ties in to the existing highway network, construction sequences will be planned to minimise disruption to the existing network.

3.5.2 Delays during maintenance have not been assessed as the scheme provides more capacity in the network, and it is considered that the delays would be small.

3.6 NDR Scheme Costs

3.6.1 Base costs for construction, land, preparation, supervision, road maintenance and operation, including an allowance for risk were provided by Norfolk County Council (NCC) together with spend profiles. These costs have been modified for economic appraisal in line with WebTAG guidance, as described later in Chapter 4.

3.7 NDR Scheme Analysis of Monetised Costs and Benefits

3.7.1 The analysis of monetised costs and benefits compares the monetised costs of the scheme against the benefits of the scheme over a 60 year appraisal period. This takes into account the following costs and benefits:

- Construction costs
- Maintenance costs
- Operating costs
- Supervision costs
- Time savings
- Vehicle operating cost savings
- Private sector provider benefits
- Greenhouse gases benefits
- User charges (e.g. parking charges)
- Accidents

3.7.2 A number of metrics are then calculated to demonstrate the value of the scheme. These are the:

- Net Present Value (NPV) – the net set of all benefits and costs
- The Benefit to Cost Ratio (BCR) – The ratio of the Present Value of Benefits (PVB) to the Present Value of Costs (PVC).

3.8 Value for Money Criteria

3.8.1 The DfT Value for Money appraisal includes benefits and costs that can be counted in monetary terms. Under the DfT guidance, a project is generally considered to be:

- Poor VfM if BCR is less than 1
- Low VfM if BCR is between 1 and 1.5
- Medium VfM if BCR is between 1.5 and 2
- High VfM if BCR is between 2 and 4
- Very High VfM if BCR is greater than 4

3.8.2 The Value for Money Assessment includes the transport user appraisal, accident benefits and wider impacts of the scheme that include wider economic benefits and journey time reliability benefits.

3.8.3 We have also assumed in this appraisal that user benefits do not change beyond 2032 due to continued traffic growth beyond the design year – all changes in benefits only relate to discounting, value of time changes and other economic parameter changes. A less conservative approach that allowed for some growth in user benefits (in line with growth between the opening year and design year, for example) would significantly improve the BCR and VfM assessment.

4 Scheme Costs for Economic Appraisal

4.1 Scheme Costs

4.1.1 Total scheme costs sub divided by construction, land, preparation and supervision during construction were provided by the Norfolk County Council (NCC). These consisted of base costs and an allowance for risk calculated from a Quantitative Risk Assessment (QRA). All costs were presented in 2013 Quarter 1 prices.

4.1.2 Preparation costs that have already been incurred are considered to be sunk costs and therefore do not form part of the appraisal.

4.1.3 Land costs from years 2007/08 and 2012/13 are considered to be recoverable and therefore have been included in the economic appraisal. Land costs include an allowance for potential Part 1 claims.

4.1.4 A summary of scheme costs is provided in Table 4.1. For input to the economic appraisal these costs need to be adjusted to:

- Convert from financial year to calendar year
- Take into account construction inflation
- Reflect Optimism Bias

4.1.5 These processes are discussed in further detail below.

4.2 Conversion from Financial Year to Calendar Year

4.2.1 Information provided by NCC is by financial year whereas TUBA requires input by calendar year. Costs have been converted to calendar year by assuming that costs are distributed evenly throughout the year, for example 2015 costs consist of 25% of 2014/2015 costs and 75% of 2015/2016 costs.

4.2.2 The resulting costs in calendar years are shown in Table 4.2.

4.3 Adjustment for Construction Inflation

4.3.1 Construction inflation has been assessed at 2% per annum for the years 2013 to 2018. The use of 2% has been agreed with the County Council's appointed contractor Birse Civils and is considered appropriate for the following reasons:

- Construction inflation has probably peaked;
- Due to overall market conditions Birse Civils are finding it easier to negotiate with their supply chain to obtain discounts;
- Ability to use the buying power of a large organisation to obtain best value supply chain orders will also reduce our exposure to increased costs (Birse Civils is part of Balfour Beatty);
- There are number of inflation related risk allowances already included within the budget.

4.3.2 Building Cost Information Service (BCIS) and other relevant construction inflation indices show forecast construction inflation to be at a lower level than forecast background inflation from RPI over the 2013 to 2017 period. RPI forecasts for above period can be found in Table M3: Medium Term Forecasts for CPI and RPI, HM Treasury Document, Forecasts for the UK economy: a comparison of independent forecasts, August 2013.

4.3.3 As forecast construction inflation is less than the forecast of RPI, scheme costs for input to TUBA need to be adjusted by a constant price adjustment factor. The derivation of the constant price adjustment factor is shown in Table 4.3.

4.3.4 The constant price adjustment factor is applied to Construction costs, (including risk). They are not applied to land, preparation and supervision costs. The resultant scheme costs after the application of the constant price adjustment factor are included in Table 4.4 and Table 4.5.

4.4 Application of Optimism Bias

4.4.1 For the Best and Final Funding Bid submission in September 2011 an Optimism Bias of 20% was employed. For this submission a lower Optimism Bias of 15% has been adopted to reflect the further development that has been completed since September 2011. This is considered to be justified as the level of uncertainty has reduced as a result of the following:

- Detailed design of Postwick A47(T) Junction Improvement has been completed and a corresponding provisional target costing has been received from Birse Civils and this has been reviewed.

- Planning Permission for Postwick A47(T) Junction Improvement has been reconfirmed and the Orders have been the subject of a Public Inquiry in July 2013, though the outcome is still awaited.
- Design development for the remainder of the NDR scheme has since been progressed to a more advanced stage and Birse Civils have revised the budget costing accordingly. This has followed further public consultation in the summer 2013.
- Previous higher value risk items in relation to ground conditions, environmental aspects and utilities have all reduced significantly as a result of the ongoing Early Contractor Involvement (ECI) process and further surveys and investigations.

4.4.2 In addition the scheme is at order publication stage hence an optimism bias of 15% is recommended by Table 9 of WebTAG 3.5.9.

4.4.3 Optimism Bias has not been applied to land costs up to 2013 as these costs have already been expended. Final costs for inclusion in TUBA are presented in Table 4.6.

4.4.4 Central government funding for the scheme is £86.5m while the rest is funded by local government.

4.5 Maintenance Costs

4.5.1 Annual Maintenance Costs were reviewed in detail by the NCC for the DCO submission and assumed a constant profile over the 60 years appraisal period. Road maintenance costs have been assumed to increase in line with retail price inflation and therefore no construction price adjustment factors have been applied. Optimism bias has been applied at 15%, the same rate as applied to construction costs, and is considered to be appropriate following the detailed review of costs that was undertaken. All prices are in 2013 Quarter 1 prices. The assumed maintenance costs are shown in Table 4.7.

4.6 Operating Costs

4.6.1 Operating costs associated with the scheme have been split into:

- Landscaping costs
- Street lighting costs
- Structures Maintenance costs

4.6.2 Annual Operating Costs were provided by the NCC and assumed a constant profile over the 60 years appraisal period. WebTAG 3.5.9 states that there is currently insufficient evidence available to recommend any specific optimism bias uplifts for operating costs. In the absence of such guidance NCC's forecasts reflect the best possible estimate of operating costs. Therefore optimism bias has not been applied to operating costs. All costs have been provided in 2013 Quarter 1 prices. Table 4.8 shows the profile of operating costs received from the Norfolk County Council.

5 Economic Appraisal Results

5.1 Overview

5.1.1 The economy objective identified within WebTAG is concerned with improving the economic efficiency of transport and the efficiency of economic activities, with the key aim of supporting sustainable economic activity and returning good value for money. It considers the following three sub-objectives:

- To improve transport economic efficiency for business users and transport providers;
- To improve transport economic efficiency for consumer users;
- To get good value for money in relation to impacts on public accounts;

5.2 Transport Economic Efficiency (TEE)

5.2.1 The results of the assessment of user benefits and user charges are shown in the TEE table of TUBA output file which is presented in Table 5.1. All values quoted are in 2010 prices, discounted to 2010. The TEE table shows that the NDR scheme achieves total transport economic efficiency benefits of about £700m in the 60 year assessment period.

5.2.2 The results of the Transport Economic Efficiency assessment, show significant efficiency benefits for all trip purposes. Business trips, constitute the highest proportion of the reported user benefits.

Table 5.1: Transport Economic Efficiency (TEE)

Item	Benefit (£000s)
Consumer - Commuting user benefits	
Travel Time	61,783
Vehicle operating costs	-13,532
User charges	2,912
During Construction & Maintenance	0
NET CONSUMER - COMMUTING BENEFITS	51,164

NET BUSINESS IMPACT	267,797
TOTAL	
Present Value of Transport Economic Efficiency Benefits (TEE)	699,584

Notes: All monetary values are expressed in 2010 prices discounted to 2010

5.3 Public Accounts

5.3.1 Table 5.2 below provides the public accounts summary in 2010 prices discounted to 2010. This shows that the local authority revenues reduce,

which occurs as a result of changes in car parking and P&R revenues. The Scheme results in an increase in road travel and hence there is an increase in indirect tax revenues to central Government. As mentioned before part of the investment costs of the scheme is funded by the central Government and the rest is funded by the NCC.

Table 5.2: Summary of Public Accounts

Item	Cost (£000s)
Local Government Funding	
Revenue	28,834
Operating Costs	17,806
Investment Costs	62,333
Developer Contributions	0
Grant/Subsidy Payments	0

Central Government Funding: Transport	
Revenue	0
Operating costs	0
Investment costs	76,568
Developer Contributions	0
Grant/Subsidy Payments	0
NET IMPACT	76,568
Central Government Funding: Non-Transport	
Indirect Tax Revenues	-55,270
TOTALS	
Broad Transport Budget	185,542
Wider Public Finances	-55,270

Notes: All monetary values are expressed in 2010 prices discounted to 2010.

5.4 Analysis of Monetised Costs and Benefits

5.4.1 Table 5.3 presents the analysis of monetised costs and benefits.

Table 5.3: Analysis of Monetised Costs and Benefits

Item	Accidents included (£000)
Accidents (not assessed by TUBA)*	41,219
Greenhouse Gases**	-22,756
Economic Efficiency: Consumer Users (Commuting)	51,164
Economic Efficiency: Consumer Users (Other)	380,623
Economic Efficiency: Business Users and Providers	267,797
Wider Public Finances (Indirect Taxation Revenues)	55,270
Present Value of Benefits (PVB)	773,317
<hr/>	
Broad Transport Budget Present Value of Costs (PVC)	185,542
<hr/>	
OVERALL IMPACTS	
Net Present Value (NPV)	587,775
Benefit to Cost Ratio (BCR)	4.168

Notes: All monetary values are expressed in 2010 prices discounted to 2010

* The lower conservative accident benefit is included based upon the use of local accident data, as explained in section 7.

**Greenhouse gas impacts were calculated using TUBA1.9.2 since there was a bug in TUBA 1.9.1

5.4.2 The results show that the Present Value of Benefits (PVB) is estimated to be £773m (inclusive of accident benefits), outweighing the £186m Present Value of Costs (PVC).

5.4.3 The Benefit Cost Ratio (BCR) of the scheme is 4.17 including accidents. Under the DfT's value for money criteria, this represents a Very High value for money category.

5.5 Inclusion of Wider Benefits

5.5.1 The BCR is improved further to 5.33 once journey time reliability benefits (£28m) and wider economic benefits (£187m) are included in the appraisal as can be seen from Table 5.4 below. More details on wider economic impacts and journey time reliability can be found in Sections 8 and 9 respectively. These additional benefits amount to £216m (2010 prices discounted to 2010). The inclusion of these benefits increases the BCR to a higher level within the Very High value for money category.

Table 5.4 Summary of Economic Appraisal including Wider Benefits

Item	Scenario including Accidents	Scenario also including WEBS and JTR
Present Value of Benefits (PVB)	773,317	989,063

6 Analysis of User Benefits and Robustness of the Economic Appraisal

6.1 Total User Benefits by Time Period

6.1.1 Table 6.1 shows total user benefits by time period. This shows that the NDR scheme has a large impact on all time periods. The NDR will provide significant benefits to traffic movements in the inter peak as well as peak periods. The ratio of benefits per hour is about half in the inter peak compared with the AM peak and in the PM peak (2 hours) the benefits are little lower than the AM peak. Therefore the profile of the benefits matches expectations for a scheme such as NDR. The detailed annualisation is discussed in Appendix A.

Table 6.1: Total User Benefit by Time Period

Time Period	Annualisation	Total User Benefit (£m)
Weekday AM	246	77.8
Weekday PM	481	122.8
Weekday Inter Peak	2,298	333.5
Weekday Off Peak	3,056	80.6
Weekend (all hours)	3,667	204.9

Notes: All monetary values are expressed in 2010 prices discounted to 2010

6.1.2 Weekend benefits are derived from outputs from both the off peak and inter peak models. The allocation of weekend hours to the inter peak and off peak modelled time periods is presented in Appendix A.

6.2 Geographical Sectorisation of User Benefits

6.2.1 In order to confirm that the distribution/location of user benefits for the NDR is sensible and that the economic user benefits of the scheme are reliable and robust, a sector-to-sector analysis of user time benefits has been carried out. In order to do this Norwich and the surrounding areas covered by the transport model were split into 15 geographical sectors as shown in Figure 6.1 below.

6.2.2 Sectors 3, 4, 6, 8 and 11 are in the vicinity of the scheme and would naturally be expected to see significant beneficial impacts resulting from the scheme. In addition to these sectors that are close to the scheme, longer distance movements, would also have significant beneficial impacts on sectors 4, 991, 992, 994 and to a lesser extent sector 993.

- 6.2.3 Table 6.2 below shows the full breakdown of benefits by sector-to-sector movement. This confirms that trips from the key sectors identified above account for the vast proportion of benefits of the NDR scheme. Trips within these key areas account for about 85% of the benefits of the scheme. The other 15% (shaded in grey) is spread fairly evenly over the rest of the sector-sector movements.
- 6.2.4 The centre of Norwich city is subject to traffic management and control measures which are reflected in the totals of time benefits associated with movements from Sector 1.
- 6.2.5 There are no significant user benefits reported for movements that are well away from the scheme. This, together with the set of observations above, would appear to confirm that any impacts of model noise on reported user benefits is minimal and that the economic results presented are both robust and reliable.

Figure 6.1: Sectors for Analysis of Economic Benefits

Table 6.2: Sector-to-sector Proportion (%) of Total Time Benefits

6.3 User Benefits by WebTAG Time and Distance Bands

6.3.1 It is important to demonstrate that the concentrations of user benefits are of significant magnitude, that the savings are sensibly distributed over time and distance bands. In line with current WebTAG requirements we have examined time and distance bands within which user benefits fall.

Table 6.3: Net User Benefits by Time Saving Bands (£000)

Time saving bands	0-2mins	2-5mins	>5mins	Total
All user benefits (£000s)	215,113	241,028	363,398	819,539
Proportion of benefits	26%	29%	44%	100%

Notes: All monetary values are expressed in 2010 prices discounted to 2010

Table 6.4: Net User Benefits by Distance Bands (£000)

Distance Bands	Up to 5 kms	5 to 10 kms	10 to 15 kms	15 to 20 kms	20 to 50 kms	50 to 100 kms	>100 kms	Total
All user benefits	46,137	120,176	100,650	65,018	298,899	149,311	39,354	819,545
Proportion	6%	15%	12%	8%	36%	18%	5%	100%

Notes: All monetary values are expressed in 2010 prices discounted to 2010

6.3.2 73% of benefits are due to time savings of more than 2 minutes, and approximately 44% are longer than 5 minutes. The allocation of user benefits to distance bands, shows that longer trips into or around the city account for the majority of the scheme's generated benefits, reflecting its function of providing ease of access to the A47(T) trunk road, providing alternative route for cross city trips and providing benefit to other longer journeys into the city.

6.3.3 Table 6.2 to Table 6.4 confirm further that the economic benefits reported in the appraisal are robust and represent realistic impacts of the NDR scheme together with the city centre traffic management measures.

6.4 Reliability and Stability of the Economic Appraisal Results

6.4.1 WebTAG requires that the economic results are robust and stable based on stability ratios. The impact of transport model convergence noise should be shown to be minimal. In order to do this the demand/supply model convergence (%GAP) is compared against the proportion of user benefits relative to total costs in the appraisal as calculated in TUBA. A ratio of 10 between the two values is recommended in WebTAG.

6.4.2 Table 6.5 shows the total user benefits as a proportion of total do-minimum user costs by mode for the Norwich transport model.

Table 6.5: Total User Benefits as a Proportion of Total User Costs

Mode	2017	2032
Road	0.52%	0.56%
Bus	0.00%	0.00%

6.4.3 Table 6.6 shows the level of convergence of the demand and assignment models.

Table 6.6: Demand and Assignment Model Convergence (% GAP)

	2017		2032	
	Demand model (Target = 0.2%)	Assignment model (Target = 0.1%)	Demand model (Target = 0.2%)	Assignment model (Target= 0.1%)
Do Minimum	0.06	N/A	0.1	-
AM	-	0.036	-	0.0018
IP	-	0.0014	-	0.0014
PM	-	0.0043	-	0.003
OP	-	0	-	0
Do Something	0.1	-	0.08	-
AM	-	0.0037	-	0.0033
IP	-	0.0007	-	0.001
PM	-	0.0041	-	0.004
OP	-		-	0

6.4.4 Convergence (%GAP) statistics of the demand-supply model shown in Table 6.6 fall well below the acceptable value of 0.20% from WebTAG (values smaller than the target values means that the model is better converged). User benefits as a percentage of total costs are around 0.5% for both 2017 and 2032 for the Norwich transport model. The resultant stability ratios are close to 5 for 2017 (0.52/0.1) and close to 6 for 2032 (0.56/0.1). These stability ratios would suggest that the economic results are robust and do not suffer from convergence noise influences. Although these ratios are lower than the value of 10 recommended in WebTAG, taken together with our earlier observations regarding sector location of benefits and time and distance band concentration of benefits, it is clear that the economic benefits reported are robust and not subject to model noise in any significant way. The ratio of 10 is also very difficult to achieve with a large scale model, and thus it is very important that the model is well converged which has been successfully achieved for the NATS transport model.

6.5 Warnings in the TUBA Appraisal

- 6.5.1 Warnings that were produced by TUBA 1.9.1 during the appraisal were used to improve the network and transport model in general. This is described in Appendix C.
- 6.5.2 All warning messages are consistent with the impacts of the NDR scheme and other traffic control measures that have been introduced in other parts of the Norwich model.

7 Accident Benefits

7.1.1 Accident benefits were calculated using COBA software (Version 11 Release 15) which is consistent with the most up to date economic parameters in WebTAG 3.5.6. Accident benefits have been calculated for the whole of the modelled highway network.

7.2 Data Sources

7.2.1 Data was extracted from the NATS highway model for the model years of 2017 and 2032 for input into the COBA assessment. This data included network structure and forecast traffic flows. The SATURN program SATCOBA was used to convert the DM SATURN highway model data to the required COBA input data files. In the DS, network restructuring was applied to the network as defined for the DM to make sure the common links/nodes between DM and DS SATURN networks correspond with the same COBA links/nodes.

7.2.2 Two NDR COBA assessments were undertaken:

- Applying locally derived accident rates. Norfolk County Council provided accident data for the years between 2008 to 2012 inclusive covering the area of detailed modelling. The observed accidents were allocated to the nearest modelled links/junctions within 10 metres of the accident by GIS tool. This data was used by COBA to calculate observed link and junction accident rates. Outside the area of detail modelling, and for the NDR links, default COBA accident rates were applied.
- Applying COBA default accident rates to the whole of the modelled highway network. Observed data can only be applied to existing links and junctions. Any new links or junctions added in the Do Minimum or Do Something scheme must take on default rates derived from national data. A review of the accident data received from NCC reveals that 51% of all current links in the area of detailed modelling had no accidents recorded on them over the five-year period, and hence over the entire 60-year appraisal period will be assumed to be free of accidents. On this basis the relative propensity for accidents on NDR (default data) compared against the rest of the detailed modelled area (observed data) may be distorted. To counter this, an appraisal has been undertaken using COBA default accident rates to the whole of the modelled highway network in both the Do Minimum and Do Something. The

default accident rates are those presented in Section 2 of DMRB Volume 13, Section 2.

7.3 Traffic growth rates

- 7.3.1 COBA is most suitable for fixed demand modelling where the travel demand remains the same for the Do Minimum and Do Something scenarios. Therefore, a slightly different process was adopted to accommodate NDR variable demand model. This deals with, for example, the reflected 'different' traffic growth rates for Do Minimum and Do Something (with impact on vehicle-kilometres) between the assessment years of 2017 and 2032.
- 7.3.2 The COBA assessment had to be divided into two separate data files for the Do Minimum and Do Something. The compound annual growth in vehicle-kilometres between the two forecast years 2017 and 2032 is used as the traffic growth rates for the period between these years.
- 7.3.3 No further traffic growth is assumed post-2032. The Do Minimum annual traffic growth rate is 1.20% for light vehicle and 1.15% for HGV; and the Do Something annual traffic growth rate is 1.28% for light vehicle and 1.19% for HGV. As the HGV demand matrix is fixed for the Do Minimum and Do Something scenarios, the higher growth rate in Do Something indicates that the HGVs will travel further as a result of the scheme.

7.4 Network Structure and Link Flows

- 7.4.1 Link numbers are allocated to the SATURN A-B node references so that A-B and B-A has the same link number with Park and Ride links and zone connector links excluded from the assessment. Links are allocated link types and are given appropriate accident type in the normal way. In the assessment with local accident rates, observed accident rates are calculated from the accident numbers received which are applied to the existing links and junctions within the area of detailed modelling, and future year scheme links in Do Minimum and Do Something scenarios are applied with default accident rates.
- 7.4.2 Link traffic flows are coded in the data files as 2-way AADT flows for both assessment years of 2017 and 2032. The conversion from model period (AM, Inter-Peak, PM and Off-Peak) hourly October flows (which is the validation month of the transport model) to AADT uses suitable, calculated factors.
- 7.4.3 Links that are common to both the Do Minimum and Do Something scenarios are given the same link numbers so that link attributes and observed data can

be accurately transferred from the DM to DS data files. New links are given the unused link number available. Link attributes are allocated on a case by case basis for new links, the NDR scheme is given accident type 11 (modern dual two lane road with 1 metre Hard Strips) and link class 2 (rural all-purpose dual two lane carriageway).

7.5 Junction Assessment

- 7.5.1 In the assessment with local accident data, junctions and links are assessed separately. However, this assessment can only be performed on junctions where observed data is available. This means that at any new junctions that form part of the Do Minimum and Do Something schemes, accidents at junctions will not be taken into account.
- 7.5.2 Attributing default junction accident rates in these locations is not possible due to the manner in which junctions are represented in the SATURN model as a series of nodes. To overcome this, the default data in DMRB Volume 13 for *combined* link and junction accident rates was used for all new links in the Do Minimum and Do Something.
- 7.5.3 In the assessment with default accident data, the accident rates and cost attribute all accidents to links.

7.6 Results Summary

- 7.6.1 Table 7.1 summarises the results of the COBA accident assessment with local accident rates. This shows that the NDR scheme reduces the numbers of accidents in the Norwich area.
- 7.6.2 The reduction in accidents represents £41.2m of monetary benefits in 2010 prices and discounted to 2010.

Table 7.1: Accident Assessment with Local Accident Rates

		60 Year Appraisal Period
		Do Minimum
Number of Personal Injury Accidents		70,984
Casualties	Fatal	1,890
	Serious	12,597
	Slight	91,490
Accident Costs (£000's in 2010 prices discounted to 2010)		5,999,332
		Do Something
Number of Personal Injury Accidents		69,944
Casualties	Fatal	1,898
	Serious	12,488
	Slight	90,226
Accident Costs (£m in 2010 prices discounted to 2010)		5,958,113
		Accident Benefits
Number of Personal Injury Accidents savings		1,041
Casualties	Fatal	-7
	Serious	109
	Slight	1,263
Accident Savings (£000s in 2010 prices discounted to 2010)		41,219

7.6.3 Table 7.2 summarises the results of the COBA accident assessment with default COBA accident rates applied to the whole network. This shows that the NDR scheme reduces both the numbers of accidents in the Norwich area and the severity of those accidents.

7.6.4 The reduction in accidents represents £205.7m of monetary benefits in 2010 prices and discounted to 2010.

Table 7.2: Accident Assessment with COBA Default Accident Rates

		60 Year Appraisal Period
		Do Minimum
Number of Personal Injury Accidents		109,530
Casualties	Fatal	2,309
	Serious	17,300
	Slight	145,423
Accident Costs (£000's in 2010 prices discounted to 2010)		8,418,232
		Do Something
Number of Personal Injury Accidents		106,006
Casualties	Fatal	2,288
	Serious	16,866
	Slight	140,986
Accident Costs (£m in 2010 prices discounted to 2010)		8,212,557
		Accident Benefits
Number of Personal Injury Accidents savings		3,524
Casualties	Fatal	21
	Serious	434
	Slight	4,437
Accident Savings (£000s in 2010 prices discounted to 2010)		205,675

7.6.5 The different assessments yield quite different results in terms of:

- The level of benefit reported. When COBA default rates are used, the overall benefits are £205.7m and significantly greater than local rates case, which reports benefits of £41.2m.
- The impact on casualties. Whilst both assessments lead to an overall reduction in casualties, it can be seen that the application of local rates in the assessment leads to an increase of seven fatalities, whilst using default rates leads to a decrease of 21.

7.6.6 A limitation of the COBA approach when observed data is used is that all new links and junctions take on default accident rates and severity splits. A review of the accident data received from NCC reveals that 51% of all current links in the area of detailed modelling had no accidents recorded on them over the five-year period, and hence over the entire 60-year appraisal period will be assumed to be free of accidents. It is likely that assessment using locally observed data has under-estimated the level of benefit since the representation of accidents on NDR will be unrealistically high compared to the rest of the network.

- 7.6.7 When default rates are used throughout, the assumption is made that all links in the model will have accidents on them over the appraisal period, which might create a rather pessimistic view of the Do Minimum case (especially given the above comment on the number of links where zero accidents have been observed in-situ), and, hence, an over-estimation of the benefits that a new, high standard road can provide when traffic transfers to it.
- 7.6.8 As such, it is reasonable to consider the results presented above as either end of a range of possible outcomes. For the calculation of scheme benefits, the lower value of accident savings were taken forward as this represents a conservative estimate of the benefits. The appraisal also indicates that there will be fewer accidents and casualties overall as a result of the scheme.

8 Wider Economic Impacts

8.1.1 The NDR is forecast to generate wider economics benefits additional to journey time and accident savings reported in previous sections, and is also expected to generate significant job creation and labour movement benefits. The estimation of these wider economics benefits is the subject of DfT's WebTAG unit 3.5.14 'The Wider Impacts Sub-Objective'. This chapter summarises the wider impacts appraisal method adopted and the results that have been obtained for the NDR model.

8.1.2 The guidance sets out wider economic impacts that can be estimated and prescribes how they should be calculated. The wider economic benefits include:

- Agglomeration impacts. These are the impacts of a scheme on concentration of economic activity over an area or region and reflects the accessibility of firms and workers to each other. Transport improvements will lead to increased accessibility and thus a higher level of agglomerated activity and thus improved productivity for firms and workers.
- Increased or decreased output in imperfectly competitive markets. In most cases, markets are not 'perfectly competitive' and this can lead to lower production and higher prices than would exist in the case of a competitive market, normally to the detriment of consumers and the economy as a whole. A reduction in transport costs allows for an increase in production or output in the goods or service markets that use transport.
- Labour market impacts from more/less people working. Transport costs are likely to affect the overall costs and benefits to an individual from working. A change in transport costs is therefore likely to affect the incentives of individuals to work and hence the overall level of labour supplied in the economy.
- Labour market impacts from moves to more/less productive jobs. Transport can affect the incentives for firms and workers to locate and work in different locations which is likely to have implications for productivity, as workers are often more or less productive in different locations.

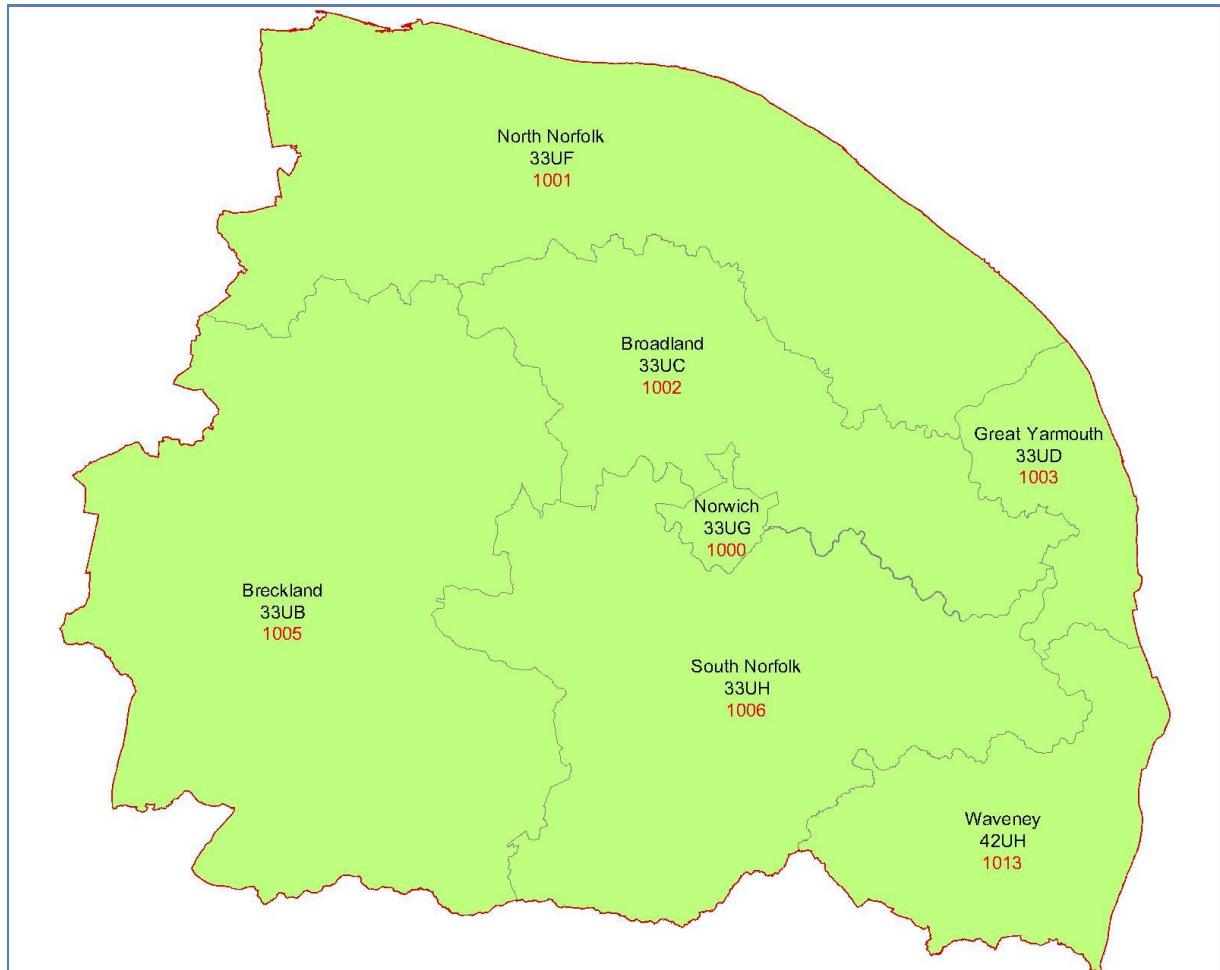

8.1.3 WebTAG methodology seeks to capture only that part of the above impacts that is not already included in the conventional user benefit calculations for

transport schemes as presented in the main economic appraisal report. The formulae and detailed description of the processes can be found in WebTAG 3.5.14.

8.2 Approach Adopted for NDR Wider Impacts Appraisal

- 8.2.1 Figure 8.1 below shows how the Norwich area was sectored for wider benefits appraisal using Wider Impacts in Transport Appraisal (WITAv1.1i-4 Be) software. The local authority districts in the figure correspond to the area from which wider economic benefits were extracted. All local authority zones more distant from the detailed model area are excluded from wider impact benefit appraisal.
- 8.2.2 Economics and employment data for each WITA analysis zone come from the DfT local authority district economics and employment files (data set v2.4, July 2012). Economic data includes GDP per worker by four employment sectors (manufacturing, construction, consumer services and producer services), average wage per worker and index of labour productivity. Employment data contains employment data for four employment sectors described above and for two forecast years 2017 and 2032. The generalised cost of travel between WITA zones comes from transport model data extracted from the main economic appraisal (i.e. TUBA files) – a combination of time, distance and charges (DM and DS scenarios and for the two forecast years 2017 and 2032). Other inputs include the TUBA economics file, several zone correspondence files, global data and a commuting production-attraction data file. More information on WITA can be found in Wider Impacts in Transport Appraisal, User Manual for Version 1.1 beta (Mott MacDonald, 2009).

Figure 8.1: Wider Impacts Analysis Zones and Local Authority Areas

8.3 Wider Economic Benefits Results

8.3.1 Summarised below are wider economic benefits calculated using the DfT's WITA software (version 1.1). Table 8.1 shows that agglomeration benefits make up the bulk of the £187m total wider benefit impacts.

8.3.2 Increased output in imperfect competitive markets is calculated as a proportion of the total business user benefits of the main economic appraisal.

Table 8.1: Summary Wider Economic Benefits of NDR

	Year 2017 (£)	Year 2032 (£)	Full Appraisal Period (£)
Agglomeration – manufacturing	376,864	218,217	12,099,287
Agglomeration – construction	308,611	190,741	10,433,028
Agglomeration - consumer services	946,115	724,016	38,054,835
Agglomeration - producer services	2,413,810	1,577,908	85,351,823
Agglomeration – Total	4,045,400	2,710,882	145,938,973
Labour supply impact	44,195	71,134	2,634,209
Increased output in imperfectly competitive market			38,775,300
The move to more/less productive jobs			Not assessed
Total	4,089,595	2,782,016	187,348,482

Notes: All entries are in £ in 2010 prices discounted to 2010

8.3.3 The estimated benefits of £187m for wider economic impacts feed into the overall VfM consideration.

9 Journey Time Reliability Benefits

- 9.1.1 This Section provides an estimate of journey time reliability benefits for the NDR. 'Reliable journeys' is one of the sub-objectives within the 'Economy' section of scheme appraisal; and the estimate provided in this Section is aimed at addressing this sub-objective for the NDR scheme. The term 'reliability' is often used interchangeably with 'travel time variability' or 'journey time variability'. The definition of journey time variability is provided in WebTAG Unit 3.5.7 - it represents unpredictable variations in journey times, i.e. it excludes predictable variations such as those associated with different times of day, days of the week, or times of the year.
- 9.1.2 WebTAG 3.5.7 recommends the use of the standard deviation (SD) of travel time as the measure of reliability. The standard deviation is a measure of how travel times are distributed around the average, with increasing standard deviation associated with increasing variability. In the appraisal, a monetary value is applied to the standard deviation of travel time. Reliability ratios are used to relate the value of one minute of standard deviation to one minute of average travel time (where the latter is defined by the values of time given in WebTAG Unit 3.5.6 Values of Time and Operating Costs).

9.2 Assumptions

- 9.2.1 WebTAG 3.5.7 methodologies that are used for estimating variability benefits are dependent on the dominating road types in the area where a particular scheme lies. The NDR scheme lies in an area dominated by the city of Norwich which the scheme is designed to positively impact upon. On that basis, the urban road variability methodology described in WebTAG 3.5.7 (section 3.3) is the most appropriate for calculating reliability benefits for the NDR scheme.
- 9.2.2 The NDR reliability assessment uses trip, time and distance matrices originally extracted from the Norwich transport model for purposes of economic appraisal. Time and distance matrices are trip-weighted average matrices across used routes, and do not always represent one selected route. As the methodology for urban variability appraisal assumes no or small distance changes between each OD-pair as a result of the scheme, an average of the Do Minimum and Do Something journey distances have been used in the calculations here.

- 9.2.3 A reliability ratio of 0.8 has been used for cars as recommended in WebTAG 3.5.7, meaning that one minute of standard deviation has the same value as 0.8 minutes of average travel time. A reliability ratio of 1.2 has been used for OGVs and LGVs in the reliability calculations.
- 9.2.4 In line with appraisal tools and published DfT guidance, the reliability benefits for the NDR have been calculated for a period of 60 years, discounted to 2010 and reported in 2010 values.
- 9.2.5 Highway reliability is estimated for the AM, PM and IP time periods only, because OP journey times are usually close to free-flow journey times and there is no significant impact on reliability. Sector to sector journey time reliability results were extracted and those movements within Norwich or benefit from going through Norwich are included in the benefit calculations. This is because urban journey time reliability calculations are applicable for urban areas where free flow speed is less than 30mph.

9.3 Method Adopted for Calculation of Reliability Benefits

- 9.3.1 Because of the size of input matrix files involved in the NDR, a simple software tool has been developed to calculate journey time reliability benefits which, in principle, may be used for assessments of any scheme dominated by urban roads. The NDR reliability benefits are calculated for each OD-movement, time period, user class and model year.
- 9.3.2 The core of the calculations use trip matrices, time matrices, distance matrices, VOTs by purpose, reliability ratios and discount rates as the inputs. The calculations proceed as follows:
- 9.3.3 For each of the OD-pair, 2 modelled years, 3 time periods and 7 appraisal user classes in the NDR traffic model, the program
- Calculates changes in standard deviation between Do Minimum and Do Something using the urban road variability equation given in WebTAG 3.5.7 (Paragraph 3.3.2);
 - Calculates variability benefits by applying VOTs (2010 values by purpose), reliability ratios (by vehicle type) and trips as discussed in WebTAG 3.5.7. The results are at 2010 level and 2010 prices.
 - Generates values for each year in the appraisal period by applying interpolation between the two modelled years, and extrapolation beyond the

last modelled year and also applying VOT growth. These values are in corresponding future year level and 2010 prices.

- Discount all values to 2010 prices and annualise to obtain yearly benefits for each year in the model period and for each OD-pair, time period and user class.
- Aggregate values to produce overall variability benefits for a 60 year period and prepare sectorised benefits.

9.3.4 The NDR reliability benefits are annualised using the same annualisation factors that have been applied in the economic appraisal and reported in 2010 prices discounted to 2010.

9.4 Journey Time Reliability Benefits

9.4.1 WebTAG 3.5.7 indicates that reliability benefits should not be included in estimating the Net Present Value (NPV) and the Benefit to Cost Ratio (BCR) because the methodology is still subject to further research. However, reliability benefits may be taken into account in the assessment of the overall value for money.

9.4.2 Table 9.1 below shows reliability benefits of around £28m (in 2010 prices discounted to 2010) for the 60 year appraisal period . This is equivalent to around 4% of the time benefits generated by the scheme.

Table 9.1: NDR Reliability Benefits

Model Year	Reliability Benefits (£000s)
Full (60yrs) Appraisal	28,398

Notes: Benefits are in 2010 prices and discounted to 2010

9.4.3 Table 9.2 shows the distribution of these benefits over the whole traffic model area. This shows that, although the journey time reliability benefits are concentrated on cross city movements, overall, all areas covered by the transport model do experience some journey time reliability improvements from the NDR scheme.

Table 9.2: Proportion of Sector to Sector Journey Time Reliability Benefits

Origin Sector	Destination Sector

10 Conclusion

10.1.1 An economic appraisal for the proposed NDR with proposed complementary measures has been undertaken. The NATS transport model provides the required transport inputs for the appraisal. The variable demand model (VDM) forecasts, which make allowance for traffic generation, redistribution and mode choice effects arising from introduction of the scheme, have been prepared for the NDR proposed opening year of 2017 and the design year of 2032.

10.1.2 The costs of the proposed NDR (including preparation, operation, maintenance, land and construction costs) are shared between local authority and central government. The economic appraisal complies with guidance in WebTAG. It has been assumed in the appraisal that the benefits of the scheme do not change for each year beyond 2032 although traffic will continue to grow which suggests that the PVB and the NPV presented in the table below will be conservative.

10.1.3 Table 10.1 shows a summary of the economic appraisal results:

Table 10.1: Summary of Economic Appraisal (£000's)

	Scenario including Accidents	Scenario also including WEBS and JTR
Present Value of Benefits (PVB)	773,317	989,063
Present Value of Costs (PVC)	185,542	185,542
Net Present Value (NPV)	587,775	803,521
Benefit to Cost Ratio (BCR)	4.168	5.331

Notes: All monetary values expressed in 2010 prices discounted to 2010

10.1.4 The BCR of 4.17 represents Very High value for money under the DfT's VfM criteria. The PVB includes accident benefits but does not include wider economic benefits or journey time reliability benefits. When these are included the BCR increases to 5.33.

10.1.5 It has been demonstrated in this report that the economic benefits calculated are robust and reliable. This has been done by:

- Demonstrating high stability ratios
- Providing sector-to-sector benefits that look realistic, logical and convincing

- Showing plausible breakdown of user benefits by WebTAG time and distance bands
- Providing a sensible breakdown of benefits by time period.

11 Appendices

11.1 Appendix A – Annualisation Factors

11.1.1 Different annualisation factors have been used in the economic appraisal for different time periods. These annualisation factors have been calculated based on one year counts for a selected number of sites in the Norwich area. Days and time periods that are not specifically part of the transport model (e.g. weekends and bank holidays) have been 'fitted' into the modelled time periods as described later in this section.

11.1.2 **Selection of Count Sites:** The following two-way Automatic Traffic Count (ATC) sites were selected from within the urban area of Norwich for the purpose of producing annualisation factors.

- Site 318 – A1151 Rackheath
- Site 337 – A1074 Dereham Road
- Site 345 – B1332 Poringland
- Site 352 – A1074 Dereham Road
- Site 361 – A140 Sweet Briar Road
- Site 363 – A140 Ipswich Road
- Site 367 – Reepham Road
- Site 386 – B1150 Crostwick
- Site 412 – A1067 Attlebridge
- Site 413 – A147 Koblenz Avenue
- Site 419 – C283 Salhouse Road
- Site 426 – B1113 Keswick

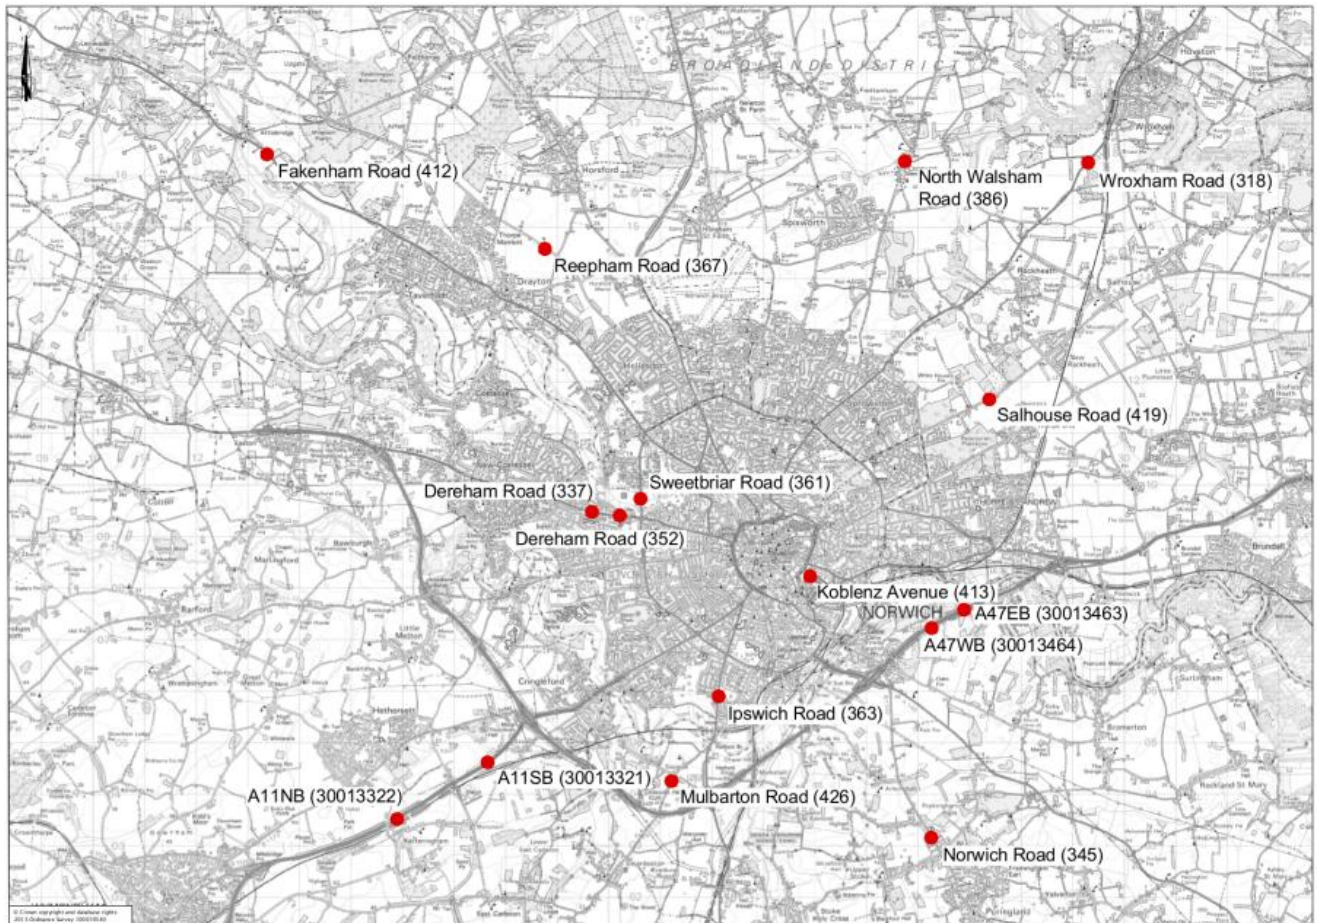

11.1.3 In addition to above ATC sites, the following TRADS sites were also used in deriving annualisation factors.

- Site 30013463 – A47(T) eastbound between A146 and A1042

- Site 30013464 – A47(T) westbound between A146 and A1042
- Site 30013321 – A11 southbound between A47(T) and B1135
- Site 30013322 – A11 northbound between A47(T) and B1135

11.1.4 Figure 11.1 shows the location of ATC and TRADS sites.

Figure 11.1: Map showing Count Sites Used for Production of Annualisation Factors

11.1.5 **Calculation of Average Flows - For Each Site:** Each of the selected sites contains almost an entire full year of 2012 hourly traffic flow data. As is commonly the case with traffic data from ATCs/TRADS, there were small amounts of missing data. For each site, any day that has any missing data has been excluded entirely from the analysis. The following data was calculated for each site:

- October average traffic flows were found for each hour of the day for weekdays, Saturdays and Sundays.
- Whole year 2012 average flows were found for each hour of the day for weekdays, Saturdays, Sundays and Bank Holidays.

11.1.6 Calculation of Average Flows - For all Sites Combined: To form overall average flows for all the sites combined, a straight average traffic flow was taken for every hour in the day for the 2012 October and 2012 whole year datasets. For sites with counts in two directions, each direction has effectively been treated as an individual site for the averaging process. Figure 11.2 shows the average October weekday profile calculated from the count sites and also displays the inter-peak average flow.

Figure 11.2: October Weekday Profile for Count Sites

11.1.7 Designation of Weekday Hours: The data suggests that following can be applied in the derivation of weekday annualisation factors:

- AM period (0800-0900) benefits have been derived from the AM peak hour model (0800-0900)
- PM period (1600-1800) benefits have been derived from the PM peak hour model (1700-1800)

- Inter Peak period (0700-0800, 0900-1600, 1800-1900) benefits have been derived from the inter peak model (average hour 1000-1600)
- Off Peak period benefits have been derived from the off peak model (average hour 1900-0700)

11.1.8 Designation of Saturday, Sunday and Bank Holiday Hours as Inter-peak or Off-peak: As there is no weekend assignment model, it was necessary to designate weekend hours as either weekend inter-peak or weekend off-peak in order to produce a full annualisation. 2012 October weekday average flows for the inter-peak average hour and the off-peak average hour were calculated and compared with October average Saturday and Sunday hourly traffic flows, see Figure 11.3 below. It was found that the October inter-peak average hour was 573vehicles/hour and the October off-peak average hour was 137vehicles/hour. The designation of Saturday and Sunday hours as inter-peak or as off-peak is shown in Table 11.1. Saturday and Sunday 19:00-07:00 hours are designated as off-peak. All Bank Holiday hourly flows were designated as weekend off-peak.

Figure 11.3: October Saturday and Sunday Profile for Count Sites

Table 11.1: Designation of Saturday and Sunday 07:00 - 19:00 Hours

Hour	07:00	08:00	09:00	10:00	11:00	12:00	13:00	14:00	15:00	16:00	17:00	18:00
Flow - Sat	219	377	511	598	634	650	624	596	577	582	552	452
Flow - Sun	111	173	360	504	573	618	579	549	550	540	423	337
Designation - Sat	OP	OP	OP	IP	IP	IP	IP	IP	IP	IP	IP	OP
Designation - Sun	OP	OP	OP	OP	IP	IP	IP	IP	IP	OP	OP	OP

Notes: IP – interpeak, OP – off peak

11.1.9 Calculation of Annualisation Factors: The annualisation factors were calculated by dividing the total flow in 2012 by the average October 2012 hourly flow for each time period. The annualisation factors are shown below in Table 11.2.

Table 11.2: Annualisation Factors

Time Period	Annualisation
AM	246
IP	2,298
PM	481
OP	3,056
Weekend IP	693
Weekend OP	2,974

11.1.10 Journey Purpose Splits for Weekend Time Periods: The composition of non-freight car/ personal LGV was adjusted for the weekend inter-peak and off-peak time periods so that each journey purpose represented the following proportion of total non-freight demand:

- Commute: 8.5%
- Employers Business: 3.2%
- Other 88.3%

11.1.11 In a similar way the weekend inter-peak and off-peak demand was adjusted for public transport so that each purpose represented the following proportion of total public transport demand: The journey purpose proportions were obtained from WebTAG 3.5.6 Table 7: Proportion of Trips Made in Work and Non-Work Time.

- Commute: 6.4%
- Employers Business: 1.5%
- Other 92.1%

11.1.12 Weekend Adjustment for Freight: Annualisation factors derived from total ATC/TRADS traffic flows, as described above, do not provide an accurate representation of freight demand, particularly due to differences between traffic composition in weekend hours and during weekday inter-peak and off-peak average hours. The 2012 ATC/TRADS used to derive annualisation factors were not classified. Classified data was available for the ATC sites for 2012 October. Using the classified traffic data, freight weekend demand adjustment factors were calculated by comparing the proportion of traffic that is freight during the average weekday inter-peak and off-peak with the designated inter-peak and off-peak weekend periods. Table 11.3 shows the calculated freight weekend demand adjustment factors. The freight demand adjustment factors are affected through the matrix factoring process in the TUBA setup.

Table 11.3: Freight Weekend Demand Adjustment Factors

Time Period	LGV	OGV
Weekend IP	0.42	0.23
Weekend OP	1.05	0.73

11.1.13 Factors to Disaggregate Light Vehicles to Car and LGV Personnel: For assignment purposes car and LGV personnel are included into a single user class for commuting and other purposes. However for the purpose of economics it was necessary to disaggregate these so that appropriate economic parameters can be applied. This was done using purpose proportions given in WebTAG 3.5.6, COBA Volume 13 Section 1 (Table 1/1) and NTM road traffic forecasts for east of England for base year of 2012. These proportions are given below in Table 11.4. Same factors were used for home based and non-home based other purposes.

Table 11.4: Car and LGV Personnel Proportions for Different Time Periods

Purpose	Vehicle type	Proportion			
		AM	IP	PM	OP
Commuting	Car	0.9901	0.9611	0.9888	0.9874
	LGV personnel	0.0099	0.0389	0.0112	0.0126
Other	Car	0.9556	0.9763	0.9652	0.9687
	LGV personnel	0.0444	0.0237	0.0348	0.0313

11.2 Appendix B – TUBA Setup

11.2.1 Demand: The DIADEM variable demand model provides TUBA with input demand matrices for highway and public transport modes. Highway demand is provided as Passenger Car Units (PCUs) and the public transport demand

is provided as passengers. Table 11.5 and Table 11.6 show the input demand segmentation.

Table 11.5: Highway Demand Segmentation

User Class	Vehicle Type	Purpose
1	Car/LGV	Home Based Commute
2	Car	Home Based Employers Business
3	Car/LGV	Home Based Other
4	Car/LGV	Non-Home Based Other
5	Car	Non-Home Based Employers Business
6	LGV	Employers Business
7	OGV	Employers Business

Table 11.6: Public Transport Demand Segmentation

User Class	Purpose
1	Home Based Commute
2	Home Based Employers Business
3	Home Based Other
4	Non-Home Based Other
5	Non-Home Based Employers Business

11.2.2 **Skims:** The DIADEM demand model, in combination with the highway and public transport assignment models produces skims of time, distance and cost as shown in Table 11.7 and Table 11.8 below.

Table 11.7: Summary of Highway Skims

Highway Skim	Assignment Unit	TUBA Unit
Vehicle Trips	PCUs/Hour	Vehicles/Hour
Distance	Metres	Kilometres
Time	Seconds	Hours
Car Parking (Local Authority)	Pence	Pence
Car Parking (Private)	Pence	Pence

Table 11.8: Summary of Public Transport Skims

Highway Skim	Assignment Unit	TUBA Unit
Passenger Trips	Passengers/Hour	Passengers/Hour
Time	Seconds	Hours
Fare	Pounds	Pence

11.2.3 **Adjustment to Economics File for Purpose:** The latest TUBA 1.9.1 standard economics file, based on October 2012 WebTAG 3.5.6 values, was used with an adaptation for purposes. Purposes were adjusted to enable separate TUBA analysis for each assignment user class. Table 11.9 shows the new purpose table in the economics file. All of the tables have been

adjusted to include the new purposes shown in the table. The adjustment to the purpose definitions necessitated further changes to the following tables: The changes to the tables listed above, involved only the reformatting of the tables and no adjustment to the default Business, Commute and Other values was made.

- Value of Time
- Value of Time Growth
- Default Person Factors
- Default Person Factors Change

Table 11.9: Revised Purposes

Purpose No.	Purpose Type	Purpose Description
1	B	HB-EB
2	C	HB-Commute
3	O	HB-Other
4	B	NHB-Business
5	O	NHB-Other

11.2.4 Current, Modelled and Appraisal Years: TUBA requires a minimum of two years to be modelled and interpolates/extrapolates benefits for other years over the 60 year appraisal period. For each modelled year, demand and skim matrices for do-minimum and do-something scenarios were input to TUBA. The following years have been included in the scheme file:

- Current Year – 2013
- Modelled Years – 2017, 2032
- Appraisal Period – 2017 – 2076 (60 years)

11.2.5 User Classes: In order to split each TUBA Purpose as defined in the economics file into each possible TUBA Vehicle Type, the following user class structure, as shown in Table 11.10 was devised.

Table 11.10: TUBA User Classes

TUBA User Class	TUBA Vehicle Type	TUBA Purpose	TUBA Person Type
1	Car (1)	Home Based Commute (2)	All* (0)
2	LGV (personal) (2)	Home Based Commute (2)	All* (0)
3	Car (1)	Home Based Employers Business (1)	All* (0)
4	Car (1)	Home Based Other (3)	All* (0)
5	LGV (personal) (2)	Home Based Other (3)	All* (0)
6	Car (1)	Non-Home Based Employers Business (4)	All* (0)
7	Car (1)	Non-Home Based Other (5)	All* (0)
8	LGV (personal) (2)	Non-Home Based Other (5)	All* (0)
9	LGV (freight) (3)	Non-Home Based Employers Business (4)	All* (0)
10	OGV1 (4)	Non-Home Based Employers Business (4)	All* (0)
11	OGV2 (5)	Non-Home Based Employers Business (4)	All* (0)
12	Public Transport (6)	Home Based Commute (2)	Passenger (2)
13	Public Transport (6)	Home Based Employers Business (1)	Passenger (2)
14	Public Transport (6)	Home Based Other (3)	Passenger (2)
15	Public Transport (6)	Non-Home Based Employers Business (4)	Passenger (2)
16	Public Transport (6)	Non-Home Based Other (5)	Passenger (2)

Notes: *All TUBA person type split by TUBA into drivers and passengers using default proportions from the economics file

11.2.6 Demand Factors: The combined car/ personal LGV user classes as supplied by the DIADEM demand model were split into the separated car and personal LGV user class as used in TUBA using factors derived in Appendix A. The following factors, shown in Table 11.11, were used to convert the OGV (all) user class in PCUs supplied by the DIADEM demand model to the OGV1 and OGV2 user classes in vehicles as used by TUBA.

Table 11.11: Vehicular Conversion of OGV User Class

Factor	OGV1	OGV2
PCU to vehicle factor	0.448	0.448
OGV1/ OGV2 Split	53%	47%
OGV (all) PCU to Vehicle Factor	0.237	0.211

Notes: OGV1 and OGV2 splits are from NTM 2013 data set for an average year between 2017 & 2032

11.2.7 Skim Factors: Table 11.12 and Table 11.13 show the unit conversion factors used in TUBA.

Table 11.12: Unit Conversion of Highway Skims

Highway Skim	Assignment Unit	TUBA Unit	Unit Conversion Factor
Distance	Metres	Km	0.001
Time	Seconds	Hours	0.00028
Car Parking (Local Authority)*	Pence	Pence	1
Car Parking (Private)*	Pence	Pence	1

Notes: *Charges are in base price values

Table 11.13: Unit Conversion of Public Transport Skims

Highway Skim	Assignment Unit	TUBA Unit	Unit Conversion Factor
Time	Seconds	Hours	0.00028
Fare*	Pounds	Pence	100

Notes: *Fares are in base price values

11.2.8 Split Public/ Private Parking Charges: Parking charges have been split as 80% private sector, 20% public sector. Parking charges are in price base year (2010) values.

11.2.9 Sectorisation of User Benefits: A sector file was referenced in the scheme file in order to facilitate detailed analysis of the TUBA outputs at 15-sector level shown in Figure 6.1. The sector system has been used to confirm that user benefits accrue in areas of the network that are impacted by the NDR scheme.

11.3 Appendix C – TUBA and COBA Warnings

11.3.1 Summary of TUBA Warnings: Table 11.14 below provides a summary of the warnings produced by TUBA.

Table 11.14: Summary of TUBA Warnings

Warning Type	Number of warnings (Serious Warnings)
Ratio of DM to DS Journey Time too Low	58062 (3070)
Ratio of DM to DS Journey Time too High	124609 (1095)
Ratio of DM to DS Distance too Low	208541 (8876)
Ratio of DM to DS Distance too High	49205 (49205)
DM Speed too Low	190728
DS Speed too Low	194705

11.3.2 Investigation of Serious TUBA Warnings

- *Ratio of DM to DS Journey Time too Low:* These warnings occur where there is a significant rise in journey time from Do Minimum to Do Something scenarios. The majority of the serious warnings relate to travel involving a trip

end in Sector 1, which are as expected due to the city centre traffic management measures which discourage traffic movement in the city centre.

- *Ratio of DM to DS Journey Time too High:* These warnings occur where there is a significant decrease in journey time from Do Minimum to Do Something scenarios. A large proportion of these serious warnings have a trip end in sectors 10, 4, 8 and 6 which are at either end of the proposed highway scheme and therefore significant decreases in journey time would be expected for these movements. The majority of other serious warnings are for trips having both trip ends in Sector 1. It is considered that these warnings occur because of local reassignment issues concerning the city centre measures in Sector 1.
- *Ratio of DM to DS Distance too Low:* These warnings occur where there is a significant rise in trip distance from Do Minimum to Do Something scenarios. The majority of the serious warnings have a trip end in Sector 1 and it is considered that these warnings are caused by local reassignment issues concerning the city centre measures in Sector 1. Also in the modelling of Park and Ride, for the bus leg of the journey the bus journey time is included in the time skims but there is no distance included in the distance skims.
- *Ratio of DM to DS Distance too High:* These warnings occur where there is a significant decrease in journey distance from Do Minimum to Do Something scenarios. All of the serious warnings have a trip end in Sector 1 and it is considered that these warnings are caused by local assignment issues associated with the city centre improvements. Also in the modelling of Park and Ride, for the bus leg of the journey the bus journey time is included in the time skims but there is no distance included in the distance skims.
- *DM Speed too Low & DS Speed too Low:* These warnings occur where speeds are low. The vast majority of these warnings have a trip end in Sector 1. Investigation of these warnings has found that they relate to travel on Park and Ride and are acceptable. In the modelling of Park and Ride, for the bus leg of the journey the bus journey time is included in the time skims but there is no distance included in the distance skims.

11.3.3 **COBA Warning Messages:** The COBA results file contained instances of the following warning messages. An explanation of the warning is given in the sub-bullet point.

- *Additional header or delimiter (9999) lines have been inserted by the program:* Additional header information is inserted by the COBA program to ensure the successful running of the model
- *Some link lengths were greater than 10 km (classes 1-6 and 9-12) or 3 km (classes 7-8):* These long links relate to the external links at the periphery of the model.
- *Link overcapacity was detected:* Refers to a level of link flow that is beyond COBA defaults for a given link type. These have been checked and are acceptable.
- *There was link or node overcapacity in the do-minimum/do-something scheme:* As above.
- *Respecifications or reclassifications caused overcapacity junctions or roads to become undercapacity:* These have been checked and are acceptable. Explicit link flows are given for each forecast years, 2017 and 2032, rather than applying forecast growth rates.
- *Entry link flows have been changed:* As above.
- *Accident rates were given which exceeded the warning limit:* This warning message only appear when an assessment is carried out with local accident data. Accident rates for some links in the period 2008 – 2012 exceed COBA defaults for a given link type. These have been checked and are acceptable.

12 Abbreviations

AADT	Annual Average Daily Traffic
ARCADY	Assessment of Roundabout Capacity and Delay software
AST	Appraisal Summary Table
ATC	Automatic Traffic Count
B1/B2/B8	Development categories: business (including office) / general industrial / storage and distribution
BAFB	The Best And Final funding Bid submitted by Norfolk County Council to the Department for Transport in 2011 for the combined Postwick and NDR schemes
BCIS	Building Cost Information Service
BCR	Benefit Cost Ratio
BGBP	Broadland Gate Business Park development
COBA	Cost Benefit Appraisal – software released by the Department of Transport that has been used to undertake an accident appraisal
DfT	Department for Transport
DIADEM	Dynamic Integrated Assignment and Demand Modelling - software released by the Department for Transport
GDP	Gross Domestic Product
GEH	A comparison statistic named after GE Havers
GNDP	Greater Norwich Development Partnership
GPS	Global Positioning System
GVA	Gross Value Added
HA	Highways Agency
HB	Home Based (trips)
HBEB	Home Based Employers' Business (trips)
HBO	Home Based Other (trips)
HBW	Home Based Work (commuter trips)
HGV	Heavy Goods Vehicle
IP	Inter-peak
JCS	Joint Core Strategy
JTR	Journey Time Reliability
LGV	Light Goods Vehicle
LINSIG	Traffic signal analysis software
LMVR	Local Model Validation Report
MCC	Manual Classified Count (for a link)
MCTC	Manual Classified Turning Counts
NATS	Norwich Area Transportation Strategy
NCC	Norfolk County Council

NDR	Norwich Northern Distributor Road
NHB	Non-Home Based (trips)
NPV	Net Present Value – given by subtracting the Present Value Costs (PVC) from Present Value Benefits (PVB)
NTEM	National Trip End Model – a database containing trip-end, journey mileage, car ownership and population/workforce planning data
NTM	National Transport Model
OD	Origin Destination
OE	Other Externalities
OGV	Other Goods Vehicle (sometimes called HGV)
PA	Production Attraction
PCU	Passenger Car Unit
PDL	Previously Developed Land
PG	Planning Gain
PIA	Personal Injury Accident
PPK	Pence Per Kilometre
PPM	Pence Per Minute
PT	Public Transport
PVB	Present Value Benefits – the stream of benefits over the appraisal period (60 years) that are converted to 2010 prices and discounted to 2010 to give a ‘present value’
PVC	Present Value Costs – the costs of the scheme over the construction period as well as maintenance and operational costs that are converted to 2010 prices and discounted to 2010 to give a ‘present value’
PYV	Present Year Validation
P&R	Park and Ride
QRA	Quantified Risk Assessment
RFC	Ratio of Flow to Capacity
RPI	Retail Price Index
RSI	Road Side Interview
RTF	Road Transport Forecasts
SATME2	Matrix estimation module of the SATURN software
SATURN	Simulation – Assignment model of Traffic on Urban Road Networks software
TA	Transport Assessment
TEC	Transport Externality Cost
TRADS	Traffic flow Data System – the Highways Agency’s database of traffic count data
TRICS	National Trip Generation database
TEMPRO	Trip End Model presentation Program is software released by the Department for Transport to allow detailed analysis of NTEM data
TUBA	Transport User Benefit Appraisal – software released by the Department for Transport that is used to assess transport user benefits of transport schemes

VDM	Variable Demand Modelling
VfM	Value for Money
VISUM	Transport modelling software used (in this case) for public transport modelling
VOC	Vehicle Operating Costs
VOT	Value Of Time
WEBS	Wider Economic Benefits
WebTAG	Web-based Transport Appraisal Guidance produced by the Department for Transport
WITA	Wider Impacts in Transport Appraisal

13 Glossary

Assignment	A process of loading a trip matrix onto routes through a network that accounts for travel costs on the network in identifying the optimum route choice for every trip
Buffer network	The external part of a highway network in which travel is represented by speed/ flow relationships or cruise speeds
Calibration	A process of adjusting the model input data or model parameters to improve the model and its validation
Convergence	An equilibrium between model outputs, in assignment between the flows and travel costs and in demand models between the demand and the costs from the supply model
Cost matrix	A table of travel costs for journeys that may include travel time, operating costs and charges such as tolls or fares
Cruise speeds	Average travel speed along a network link
Demand model	See variable demand model
Demand segment	Travel demand is divided into a number of segments for the purposes of applying different demand modelling procedures. The division is usually by trip purpose and whether the trips are home-based or non-home-based
DMRB	Design Manual for Roads and Bridges – a Highways Agency publication setting out guidance and good practice for design and appraisal of road schemes
Dependent development	Housing or commercial development that can only proceed with the implementation of a transport intervention
Discounting	Discounting is a technique used to compare costs and benefits that occur in different time periods. It is based on the principle known as time preference that people prefer goods and services now rather than later. This preference for goods and services now rather than later applies to both individuals and society. By applying a discount rate, streams of costs and benefits are reduced to their present values.
Do Minimum	The forecast scenario without the proposed transport scheme, but that includes committed transport network improvements and developments
Do Something	The Do Minimum network but with the proposed transport scheme and developments added
Generalised cost	A combination of time and money costs (operating costs and charges) that are expressed in time or money units which are used to represent the total travel costs for a journey within the assignment or demand models
Journey purpose	Trips are divided into different travel purposes, usually work (or commute), employers' business and other. These trip purposes have different generalised costs applied and different demand model responses
Matrix estimation	A process used to adjust an initial or 'prior' matrix so that the resulting assignment of the adjusted matrix matches count data as closely as possible
Network	A mathematical representation of a transport network in a supply-side assignment model, either a highway network which represents vehicle travel, or a public transport network that represents bus and rail services
Speed / flow relationships	Relationship between traffic speed and traffic flow on a network link

Reference trip matrix	A forecast reference matrix based on applying growth from national (or other) datasets, but before the application of adjustments due to the impact of how travel costs will change with growth in travel
User classes	Trips are aggregated into several user classes for the purposes of assignment. These usually represent different types of vehicle (e.g. car, HGV) and different trip purposes
Trip matrix	A table representing travel in a model area between land areas or zones
Validation	A process of comparing the model data with independent data
Variable demand modelling	A model that forecasts changes in travel behaviour such as trip frequency, choice of mode, time of travel and trip distribution
Zone	An area of land or development which is used in a transport model to aggregate individual households or commercial premises into a manageable number of units that can be used to represent journey patterns in the study area. Usually the zone size will be relatively small in the study area, but progressively larger further away from it.

This document is issued for the party which commissioned it and for specific purposes connected with the above-captioned project only. It should not be relied upon by any other party or used for any other purpose.

We accept no responsibility for the consequences of this document being relied upon by any other party, or being used for any other purpose, or containing any error or omission which is due to an error or omission in data supplied to us by other parties

This document is submitted in relation to the application for a Development Consent Order by Norfolk County Council to the Secretary of State, under the Planning Act 2008.

The application is for the Norfolk County Council (Norwich Northern Distributor Road (A1067 to A47(T))) Order, to grant development consent for the construction of a new highway running west to east, to south, between the A1067 Fakenham Road and the A47 Trunk Road at Postwick, including improvements to the existing highway network to the north and north east of Norwich.

This document comprises part of the application documents and relates to Regulation 5(2)(q) of the Infrastructure Planning (Applications: Prescribed Forms and Procedure) Regulations 2009.

1 Key Summary

1.1 Summary

1.1.1 Data collected in support of the NATS Transport Model is required to ensure that the model is up to date and able to comprehensively and accurately reflect the travel behaviour currently being observed in the vicinity of the proposed Norwich Northern Distributor Road Scheme and the greater Norwich area.

1.1.2 This report provides a description of the traffic surveys undertaken in 2012 and presents a summary of the data collected. It also summarises other data sources that have been used in the modelling work.

1.1.3 The following surveys were undertaken:

- Automatic traffic counts were undertaken at 59 sites over a two-week period between 19 October and 26 November 2012.
- 12-hour manual classified counts were undertaken at 63 sites over a four-day period between 22 October and 26 October 2012.
- Road side interview data was collected at 30 sites over a two-week period between 5 November and 20 November 2012. This was accompanied by MCC and ATC data.
- Journey time data was sourced from TrafficMaster.
- Additional count data where required was obtained from the Highways Agency TRADS database.
- Inbound and outbound vehicle movements from the six Park and Ride sites.
- Supplementary turning count data was sourced for the following junctions:
 - Thickthorn and Postwick Park and Ride sites
 - Reepham Road/Middleton's Lane Roundabout
 - Holt Road Roundabout
 - Junctions to the north of Norwich located at Old Catton and Sprowston

PAGE NOT USED

2 Introduction

2.1 Background

- 2.1.1 Mott MacDonald (MM) has been appointed by Norfolk County Council (NCC) to assist with the development and appraisal of the Norwich Northern Distributor Road (NDR), known as the NDR or referred to as the Scheme.
- 2.1.2 The Scheme would be a dual carriageway all-purpose strategic distributor road, to be classified as the A1270 Principal Road, which would link the A1067 Fakenham Road, near Attlebridge, to the A47 Trunk Road (T) at Postwick. This will be over a length of approximately 20.4km.
- 2.1.3 The NDR is a project of national significance which requires a Development Consent Order (DCO) under the Planning Act 2008 and this formal planning process began in early 2013. It is currently anticipated that the process will be completed in time for the NDR scheme to start construction in 2015 and to be opened in 2017.
- 2.1.4 This document is one of a number that support the DCO, each of which has its own unique document number, and should therefore be read in conjunction with the other documentation. The proposed layout of the NDR is shown in the General Arrangement Plans contained in document number 2.6, whilst the full needs case for the NDR is explained in the Statement of Reason (document 4.1) and the Environmental Statement (document 6.1).
- 2.1.5 To assist with the assessment of the NDR and NATS a multi-modal transport model has been developed. The model has been developed over many years, but the latest version had relied on data collected in 2002 and 2006. For the purpose of progressing the Scheme development surveys were commissioned in 2012 to enable the transport model to be updated. This document reports on those surveys.

2.2 Report contents

- 2.2.1 Following this introduction, the Report of Surveys is divided into the following sections:
- Section 3 provides an overview of the 2012 surveys and the survey programme;
 - Section 4 describes the surveys undertaken to expand the 2006 roadside interviews;

- Section 5 presents the new roadside interviews;
- Section 6 describes the traffic counts undertaken to provide model calibration and validation data.
- Section 7 provides the process for obtaining the journey time data from TrafficMaster;
- Section 8 summarises the other sources of count data collated for the model development
- Section 9 contains information relating to the handling, checking and manipulation of the data prior to being used in the model development.

3 Overview of Surveys

3.1 Purpose and Scope of Data

- 3.1.1 The transport model comprises of separate highway and public transport assignment models developed in SATURN and VISUM software respectively, with variable demand responses catered for with the Department for Transport's DIADEM software.
- 3.1.2 This report contains details of the surveys undertaken for the highway model. Details of additional surveys for the public transport model are contained within the Public Transport Local Model Validation Report (document 5.10).
- 3.1.3 Data collected are required to ensure that the highway assignment model is able to comprehensively and accurately reflect the travel behaviour currently being observed in the vicinity of the proposed scheme and the greater Norwich area and thus form a robust basis for the testing of future (with and without NDR) scenarios.
- 3.1.4 The data has been used in the calibration and validation of the highway assignment model, covering three time periods:
- The morning (AM) peak hour, representing traffic conditions between 08:00 and 09:00;
 - An average inter-peak (IP) hour, representing the average hour between 10:00 and 16:00; and
 - The evening (PM) peak hour between 17:00 and 18:00.
- 3.1.5 Consequently the data was required to cover these three model periods.
- 3.1.6 The survey programme was designed to capture the following data:
- New Roadside interviews (RSI) to replace interview data previously collected in 2002.
 - Traffic counts to expand the new RSI
 - Traffic counts to expand RSI data previously collected in 2006 and considered sufficiently contemporary to be re-used in the current model.
 - Traffic counts, including turning counts, to provide matrix calibration and model validation data.
- 3.1.7 Where traffic counts were undertaken these were carried out in accordance with WebTAG Unit 3.19, in relation to the specific requirement to undertake

a minimum of a two-week automatic traffic count in conjunction with a single day manual classified count.

3.2 Commissioning Surveys

3.2.1 Mott MacDonald was requested by Norfolk County Council (NCC) to appoint a contractor through a procurement process to undertake traffic data collection in the Norwich area in October 2012. Nationwide Data Collection (NDC) was awarded the contract for the survey work following the tender period.

3.2.2 The three different survey types are summarised below.

3.3 Automatic Traffic Counts

3.3.1 Automatic Traffic Counts (ATC) record the hourly volume of traffic by direction. The data is collected to provide longer term flow levels, typically over at least two weeks, in order to avoid daily fluctuations in traffic and provide a longer term average.

3.3.2 The ATC data is used to provide both calibration data for the matrix estimation procedure and also to provide validation checks against modelled traffic flows. These validation checks are carried out independently of the sites used for calibration.

3.3.3 The ATC data is also used to derive factors to convert modelled time period flows into 12-hour Annual Average Weekday Traffic (AAWT), 18-hour AAWT, 6-hour night time AAWT and 24-hour Annual Average Daily Traffic (AADT) flows used in the economic and environmental appraisals.

3.3.4 WebTAG Unit 3.19 states that ATCs are accurate to +/- 5% for the measurement of total vehicle movements. Whilst ATC data is often split into vehicle classes, vehicle splits obtained from the data are not considered to be reliable.

3.4 Manual Classified Counts

3.4.1 Manual Classified Counts (MCCs) - of both link and turning volumes - record the directional volume of traffic by vehicle type. MCC counts are typically undertaken over a single 12-hour period, between 07:00 and 19:00 hours. The MCC data is used to split the longer term ATC volume data into vehicle categories, thus overcoming the daily fluctuations that can be expected in traffic volumes and the inability of ATC collection to record vehicle type with sufficient accuracy.

3.4.2 According to WebTAG Unit 3.19, the accuracy of MCCs for total vehicles is +/- 10%; for cars and taxis: $\pm 10\%$; light goods vehicles: $\pm 24\%$; other goods vehicles: $\pm 28\%$; and all goods vehicles: $\pm 18\%$.

3.4.3 For the purpose of the NDR surveys, MCCs were classified into the following vehicle types:

- Cars
- Taxi
- Light goods vehicle (LGV)
- Other goods vehicle (OGV1)
- Other goods vehicle (OGV2)
- Bus
- Motorcycles
- Bicycles

3.5 Roadside Interviews

3.5.1 Road Side Interviews are used to obtain the origin and destination of the driver along with information relating to the vehicle type, vehicle occupancy and the trip purpose (both the origin and destination end of the trip). Depending on the constraints of the interview site, the surveys may be undertaken by face to face interviews or through the distribution of questionnaires for completion by the driver at a later point in time (with a pre-paid envelope to encourage return).

3.6 Survey Programme

3.6.1 In accordance with the Design Manual for Roads and Bridges (DMRB) guidance, surveys were programmed to be carried out during neutral months, outside of school holidays and other local abnormal traffic periods.

3.6.2 The surveys were carried out as shown below in Table 3.1

Table 3.1: Survey programme

Survey Type	Date from	Date to	Timescales
Automatic traffic counts	19/10/12	26/11/12	Over a minimum two week period, 24 hour
Manual classified counts	22/10/12	26/10/12	Single day between 07:00 to 19:00
Road side interviews	5/11/12	20/11/12	07:00 to 19:00

3.7 Additional data sources

3.7.1 Additional count data were also obtained from other sources and surveys conducted by NCC and did not form part of the survey commission. This included the following:

- Highways Agency TRADS data;
- 2012 turning count data at:
 - Thickthorn Park and Ride site;
 - Postwick Park and Ride site;
 - Holt Road roundabout;
 - Reepham Road/Middleton Lane roundabout;
 - Junctions in the north of Norwich in the Old Catton and Sprowston carried out for the Beyond Green development Transport Appraisal;
- 2006 ATC count data to inform missing gaps in cordon data.
- Journey time data was sourced from TrafficMaster.

3.7.2 These additional data sources are described in more detail in Section 8.

4 Data for Re-Expansion of 2006 RSI Records

4.1 Overview

4.1.1 ATC and MCC surveys were undertaken at the site of the 2006 Road Side Interviews for the purpose of re-expanding the interview records collected in 2006.

4.2 Location

4.2.1 The location of the sites that were subject to a RSI in 2006 is shown in Figure 4.1. Surveys formed an inner and outer cordon around Norwich City centre, along with two screenlines to capture movements to the north-west of the city.

Figure 4.1: Location of 2006 RSI sites

Source: Extracted from Mott MacDonald Norwich Traffic Survey Brief, dated October 2012

4.2.2 The Highway Agency's (HA) monitors traffic on (nearly) every link of the trunk road network which is stored in an on-line database called TRADS, so this data was used where available. Table 4.1 provides a more detailed

description of the locations and indicates whether the commissioned ATC data or TRADS data was used.

Table 4.1: Existing ATC Data (2006)

2006 Site Reference	Site Description	Site Type	Data Type	Source

5 2012 RSI Data

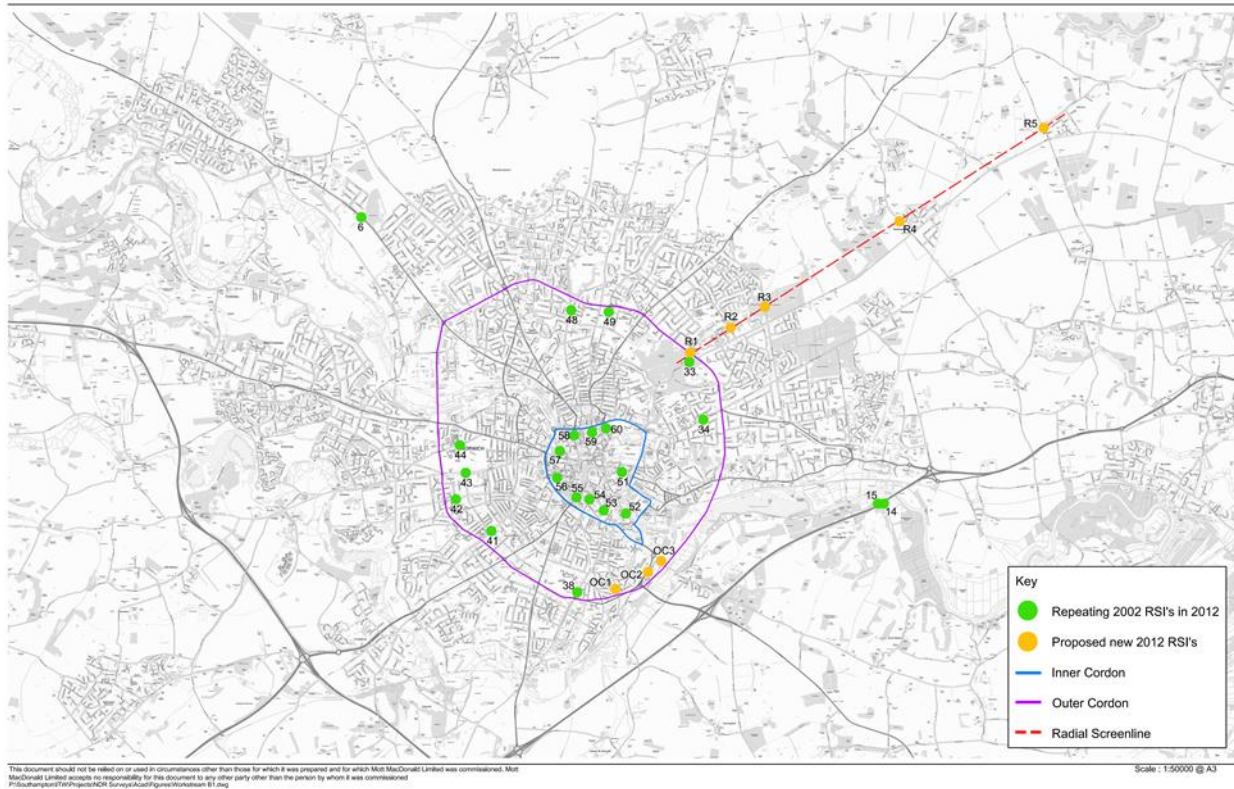

5.1 Overview

5.1.1 Roadside Interviews were undertaken to replace data previously collected in 2002 and to provide origin-destination data for trips crossing an additional radial screenline to the north-east of Norwich city centre. In total, 35 sites were surveyed through a combination of face-to-face interviews and postcard surveys.

5.2 Location

5.2.1 The location of the sites is shown in Figure 5.1.

Figure 5.1: 2012 RSI survey locations

5.3 Methodology

5.3.1 Prior to the commencement of the RSI surveys site visits were undertaken to confirm that the site was positioned in a safe location that did not compromise road user's safety; and that the location would provide an

accurate sample of traffic movements. The surveys located on the A47 required the approval of the Highways Agency and their agents.

- 5.3.2 The layout of the survey sites were designed in accordance with Chapter 8 of the Traffic Signs Manual, and the planning and management of survey sites was in conformity with the Design Manual for Roads and Bridges, Volume 5, Section 1, Part 4 (TA 11/09).
- 5.3.3 Data collection was undertaken at each site for a duration of 12 hours between 07:00 and 19:00. These were undertaken on weekdays, excluding Fridays and outside of school holidays. A 12-hour MCC was undertaken on the day of the survey, with longer term data provided by means of an ATC, or a TRADS site.
- 5.3.4 Postcard surveys were distributed where face-to-face interviews were not possible due to the busy nature of the route or other constraints. Postcard surveys were distributed to vehicle drivers with respondents required to manually complete and return the surveys within two weeks of the survey date. The postcard survey questions were identical to those in the face-to-face interviews. Examples of both the questionnaire form and postcard survey are included within Appendix A. A table detailing the chosen survey method for each site is included in Appendix B. RSI Summary.
- 5.3.5 Interview sample rates were monitored at regular intervals of fifteen minutes to ensure a good representation of vehicle types. The following vehicle classification was included within the interview sample:
- Car
 - LGV/Van
 - OGV 1
 - OGV 2
 - Minibus
- 5.3.6 For the two cordons around the city centre, the interviews were carried out in the outbound direction. On the new radial screenline, interviews were carried out in both directions.
- 5.3.7 Table 5.1 summaries the location and method of data collection. Whilst some sites were entirely face-to-face interviews, and others entirely postcard, it can be seen that both methods of survey collection were employed at some sites. In such cases, it was found that stopping and interviewing drivers was only possible during discreet periods of the day to avoid significant disruption to road users.

Table 5.1: 2012 RSI data collection

Site Reference	Site Locations	Survey Method	Survey Direction
Outer Cordon			
38	Hall Road North of A146 Roundabout	Both	Outbound
41	Unthank Road (Between Christchurch Rd & Mile End Rd)	Both	Outbound
42	The Avenue (Between Christchurch Rd and Colman Rd)	Both	Outbound
43	B1108 Earlham Road (Between Christ \ Church Road & Coleman Road)	Face-to-face	Outbound
44	Bowthorpe Road (Between Dereham Road & Farrow Road)	Both	Outbound
48	Catton Grove Road (Between Woodcock Rd & Mile Cross Lane)	Postcard	Outbound

5.3.8 The total number of interview records collected is summarised in Table 5.2. Over 30,000 interviews were collected, representing just over 18% of all traffic passing the census points.

Table 5.2: Summary interview records

Method	Number of Interview Records
Face to Face	17,674
Postcards	12,815

Method	Number of Interview Records
Total	30,489
Total Traffic (vehicles)	165,814
Overall Sample Rate	18.4%

5.3.9 A summary of the survey sample rates achieved for each site are shown below in Table 5.3. A full interview summary showing the number of interviews and postcards returned at each site is provided in Appendix B.

5.3.10 With the exception of the sites highlighted in grey, all interview sites had a sample rate (measured as the number of interviews as a percentage of the vehicle count) over 10%; over two-thirds of the sites had a sample rate greater than 20%.

5.3.11 Figure 5.2 shows the sample rate achieved with the desired rate as set out in DMRB Volume 5, Section 1 Part 4 TA 11/09. With the exception of the five sites highlighted, all sites had a sample rate over the required amount (shown by the points on or above the TA 11/09 line).

Figure 5.2: Comparison of achieved sample rate against TA 11/09 guidance

5.3.12 At Site 55 the operation of the survey site was affected by bus stops in close proximity along the road, and buses swinging in and out of the stops frequently struck the traffic management in the early part of the survey. As a result it was necessary to shorten the interview bay, which meant it was not possible to run a full contingent of staff distributing postcards.

5.3.13 The two sites on the A47 Norwich Southern Bypass (Sites 14 and 15) caused significant disruption and major queuing. As a result of Police and County Council requests the sites were abandoned at 09:30 and all traffic management removed from the carriageway. The classified counts continued for the entire period.

5.3.14 Sites R1 Northbound and Southbound operated as postcard distribution sites at adjacent traffic signals on the A1042. This was the only way to operate the sites due to insufficient room to accommodate traffic management for an interview bay. The on-site survey supervisor reported a

very short red phase at the signals, which severely limited the number of postcards that could be issued.

6 Counts for Calibration and Validation

6.1 Overview

6.1.1 ATC and accompanying MCC were carried out on a cordon and screenlines to provide data points for the model calibration and validation.

6.2 Location

6.2.1 The location of these counts is shown in Figure 6.1 with a more detailed site description and period over which the data collected shown in Table 6.1. In one instance (Site V16 on the A47) TRADS data has been used.

Figure 6.1: Location of additional validation sites

7 Journey Times

7.1 Overview

7.1.1 Journey time data was collected along key routes pertinent to the proposed scheme. The data recorded the journey time between pre-designated timing points along each route throughout the day. Journey time data were required as part of the assignment model validation and calibration appraisal to ensure any scheme benefits from journey time savings is accurately forecast. Comparison of observed and modelled journey times provides a measure of the appropriateness of the speed-flow relationship in a capacity restrained network, as well as junction delay calculations at fully simulated junctions.

7.2 Methodology

- 7.2.1 Data generated from the movements of GPS-equipped 'probe' vehicles are mapped to a representation of the road network (provided by the Department for Transport) in order to estimate average vehicle journey times across England. Traffic Master collate this data for the whole of England and provide it to the DfT annually, who pass the data on to local authorities.
- 7.2.2 Extraction of journey times from the data provided to Norfolk County Council was undertaken by Mott MacDonald using their in-house "Strat-e-gis" software. The data provided each year is for a 12 month period starting in September. Whilst the traffic model represents traffic demand for October 2012, TrafficMaster data sets were only available for September 2011 to August 2012.
- 7.2.3 Data for March 2012 was used as it represented the closest month to October 2012 in terms of overall traffic demand – as shown in Figure 7.1.

Figure 7.1: Comparison of traffic data with October 2012

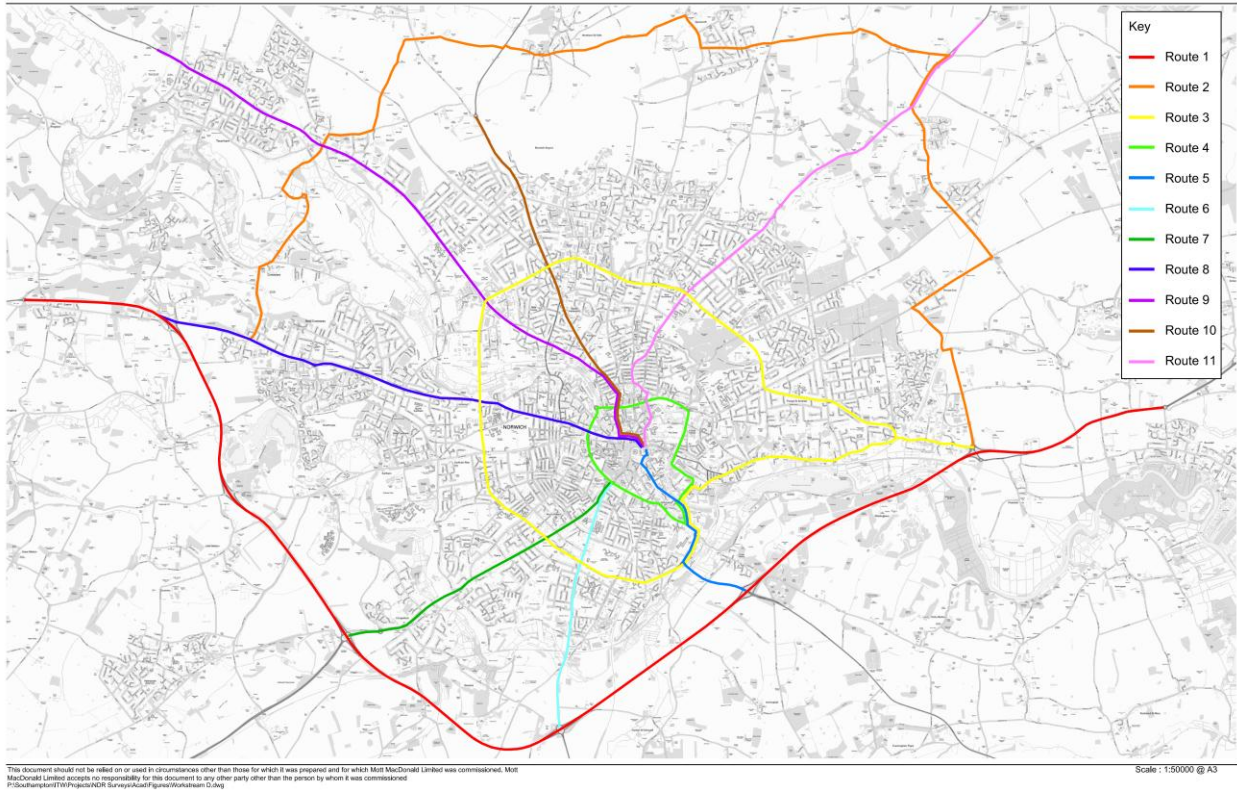

7.2.4 Specific journey time routes were selected for use in validating the SATURN model, with each route split into sections between junctions in the SATURN model. Data was extracted for all school term-time weekdays in March 2012, covering the modelled periods:

- AM peak 08:00-09:00
- Inter-peak averaged over 10:00-16:00
- PM peak 17:00-18:00

7.2.5 The journey time routes assessed are shown below in Figure 7.2 below.

Figure 7.2: Journey time routes

7.3 Data Output

7.3.1 The journey time results were provided for each section, including data on section lengths, together with cumulative results, from which time/distance graphs were produced. TrafficMaster data are provided at a disaggregated level, with a separate link between every junction and main access on each road, with all public roads included. Therefore, each section for the journey time analysis consisted of several TrafficMaster links.

7.3.2 The data on section lengths were compared to the SATURN link lengths, to ensure that there was consistency between the two sets of data.

PAGE NOT USED

8 Other Sources of Data

8.1 TRADS

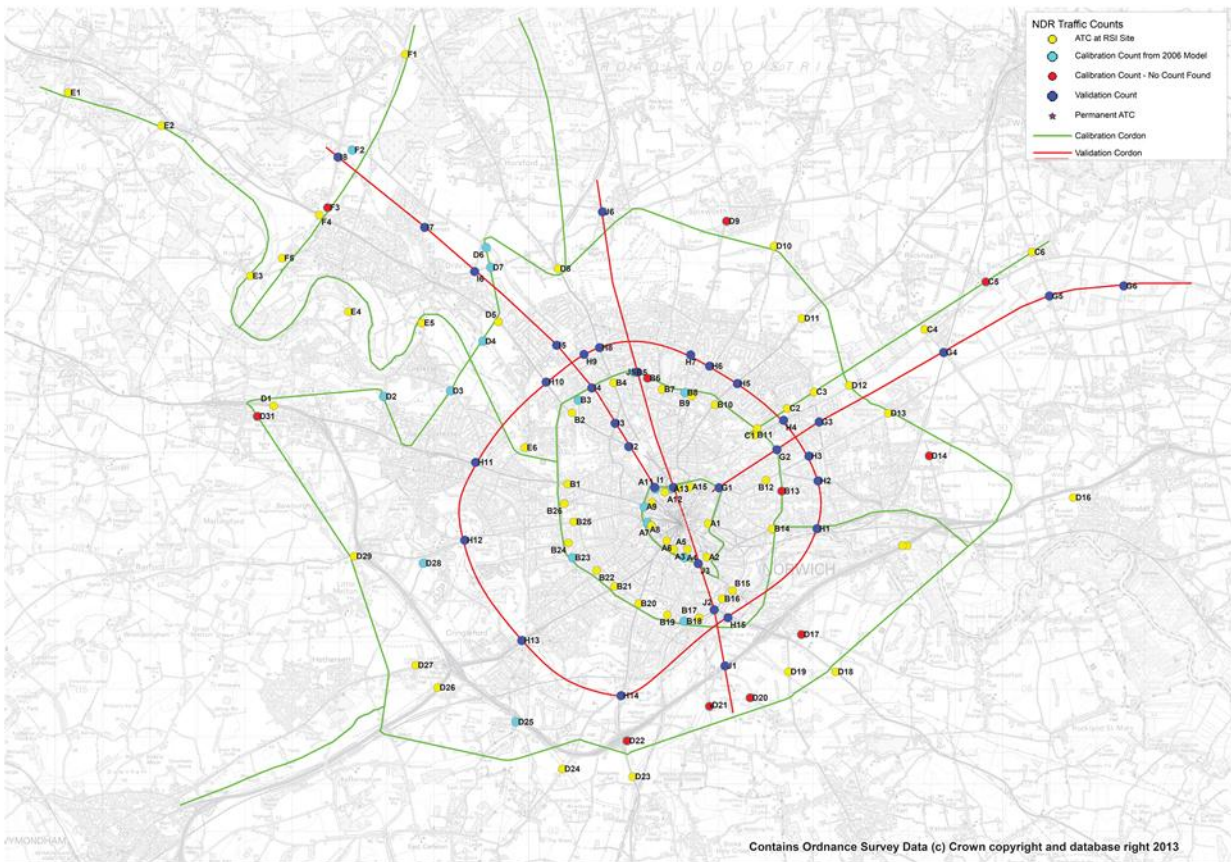

8.1.1 ATC data on the trunk road network was obtained from the Highways Agency’s Traffic Flow Data System (TRADS) at the following locations:

- A47 West of A1074;
- A47 Postwick Junction west of Cucumber Lane;
- A11 Southwest of A47; and
- A47 East of Stoke Road.

8.2 2006 Counts

8.2.1 The locations of the 2006 ATC sites which have been used to infill gaps in the cordons are shown as the light blue markers within Figure 8.1 below.

Figure 8.1: NDR traffic counts

8.2.2 The factors used to convert 2006 count data to 2012 values are detailed in Table 8.1 and Table 8.2 below. These factors were calculated from ATC data collected from 10 locations where data was available for both years.

8.2.3 Table 8.1 shows the factor required to convert from 2006 peak periods to equivalent peak periods in 2012. In this case the peak periods are defined as:

- AM peak period: 07:00-10:00
- IP period: 10:00-16:00
- PM peak period: 16:00-19:00

Table 8.1: 2006 to 2012 yearly growth factors peak periods

Direction	AM	IP	PM
Inbound	0.98	1.04	1.06
Outbound	1.08	1.03	0.99

8.2.4 Table 8.2 shows the factor required to convert from peak hours to the peak periods. These factors are used to allow the transport model flows to be aggregated to daily traffic flows and for the purpose of aggregation associated with the demand modelling processes.

Table 8.2: Time period factors (peak hour to the peak period).

Direction	AM	IP	PM
Inbound	2.56	6.00	2.81
Outbound	2.62	6.00	2.67

8.3 Park and Ride

8.3.1 In and outbound vehicle flows to the following Park and Ride sites was provided by Norfolk County Council:

- Airport;
- Sprowton;
- Postwick;
- Costessey;
- Hartford; and
- Thickthorn.

8.4 Turning Counts

8.4.1 Turning count data was obtained for the roundabout junction on the A47 at the Thickthorn Park and Ride site in April 2012.

8.4.2 ATC and turning count data was obtained in 2012 for the roundabout junction on the A47 at the Postwick Park and Ride site.

8.5 Other Locations

8.5.1 Turning count data was obtained for the Beyond Green development scheme in Old Catton and Sprowston in North Norwich in February 2012. This took the form of 22 turning count sites at junctions within Old Catton and Sprowston. In total 21 sites were used for validation and model calibration purposes.

8.5.2 Manual classified turning counts (MCTCs) were undertaken at the Reepham Road/Middleton Lane roundabout. This was undertaken for a period of 12 hours on 22nd October 2012 using video cameras with the classification reported in line with the MCC surveys.

8.5.3 Traffic counts for the A140 Cromer Road and A1149 Holt Road were derived from turning count proportions from a 2006 turning count survey of the Holt Road Roundabout.

9.3.4 On receipt of the data a series of manual checks were carried out by the survey contractor, NDC, and Mott MacDonald to ensure its accuracy.

9.4 ATC Data Checking

9.4.1 All ATC data was checked to ensure its accuracy and reliability. Checks included:

- Tidality - ATC flows were plotted by time and direction, and judged as to whether the inbound/outbound flows were as expected (for example, Inbound; AM peak flows, Outbound; PM peak flows).
- Anomalies - any recorded spikes or troughs in the data that did not follow the overall trend of the site, were removed from the dataset.
- Vehicle Class - flows by vehicle classification were examined to confirm they appeared sensible in terms of the relative proportions.

9.4.2 Anomalous results were relatively rare, but when observed these instances were removed from the dataset.

9.4.3 At sites where ATC and MCC counts had been undertaken on the same site, on the same day, an analysis of the data was carried out to confirm that both counts had recorded similar volumes of traffic. A sample of the MCC videos was also undertaken to ensure the vehicle classification split had been accurately recorded.

9.5 RSI Data Checking

9.5.1 The Contractor NDC was to undertake and provide evidence of a series of checks on the collected data. This included:

- Evidence of RSI interview sample rates;
- Accuracy of transcription between enumerator records and electronic spreadsheets;
- Evidence that the compilation of raw RSI interview records was carried out correctly;
- Logic checks to ensure that origins and destinations were representative for the survey site;
- Accuracy of classification of vehicle types;
- Checks to ensure that traffic counts are representative of the characteristics of the survey site (i.e. checks of direction, tidality, hourly profiles); and
- Checks to identify any data anomalies.

9.5.2 In addition, Mott MacDonald carried out an independent review of the new RSI data. Data checks included general sense checking and origin/destination checking.

9.5.3 The following checks have been performed in regards to general sense checking:

- Time period - all data received was checked to ensure that records were correctly referenced to a valid time. The RSIs were carried out between the hours of 07:00 and 19:00, and were referenced to 15 minute intervals.
- Vehicle - data was checked to ensure that no more than five vehicle types were represented and that vehicle occupancy was appropriate. Car occupancy should not be greater than 7, LGV, OGV1 and OGV2 not greater than 3 and Bus no greater than 14.
- Postcode & purpose - all data was checked for the presence of records with the same origin/destination postcode or journey purpose. For example, 'home-home' and 'work-work' journey purposes were deemed to be erroneous and removed from the data set.
- Journey purpose - data was organised into charts representing the proportion of trips by origin and destination purposes. This was reviewed in relation to the site location in order to convey any systematic problems with the data.
- Vehicle distribution - data was organised to show the distribution of vehicle classification obtained. Again, this was reviewed in relation to the site location order to ensure sensibility and express any recognisable problems with the data.
- ATC cross-check - manual vehicle counts from RSI sites were compared with the Automatic Traffic Count data for the same site,

where available on the same day. The percentage difference between these two measures was calculated in order to ensure a good level of accuracy was achieved in the manual counts, and so we could calculate an accurate sample rate.

9.5.4 MapInfo GIS software was used to plot origin and destination postcodes, with a straight line (i.e. crow fly route) drawn between the two points in order to visually represent the recorded trip. This process enabled potentially invalid journeys to be highlighted; in particular that the journey records were in the appropriate direction (i.e. the origin and destination appeared on the correct side of the RSI location) and that the recorded trip was likely to have passed through the RSI. Figure 9.4 shows an example of a GIS origin/direction check for RSI Site 43, with illogical trips highlighted with a red line

Figure 9.4: Typical RSI Origin-Destination Check

Source: Contains Ordnance Survey Data (c) Crown copyright and database right 2013

9.5.5 In the case shown in Figure 9.4 4 illogical journeys were highlighted from 1,053 records. On completion of this process it was determined that illogical trips did not represent a significant number of trips within the dataset, and therefore were not removed from the dataset.

9.6 Data Manipulation

9.6.1 The average hourly weekday traffic flows from ATC data have been calculated for each direction of travel. The corresponding MCC was then used to split the ATC into vehicle categories.

9.7 Data Output

9.7.1 The data output from all surveys is available upon request.

10 Glossary of Abbreviations

AADT	Annual Average Daily Traffic
AAWT	Annual Average Weekday Traffic
ATC	Automatic Traffic Count
DfT	Department for Transport
DIADEM	Dynamic Integrated Assignment and Demand Modelling - software released by the Department for Transport
DMRB	Design Manual for Roads and Bridges – a Highways Agency publication setting out guidance and good practice for design and appraisal of road schemes
EB	East Bound
GIS	Geographic Information System - designed to capture, store, manipulate, analyse, manage, and present all types of geographical data
GPS	Global Positioning System
HA	Highways Agency
HGV	Heavy Goods Vehicle
LGV	Light Goods Vehicle
MCC	Manual Classified Count (for a link)
MCTC	Manual Classified Turning Counts
NATS	Norwich Area Transportation Strategy
NB	North Bound
NCC	Norfolk County Council
NDC	Nationwide Data Collection (company specialising in traffic surveys)
NDR	Norwich Northern Distributor Road

OD	Origin Destination
OGV1	A sub-category of OGV. Includes all rigid vehicles over 3.5 tonnes gross vehicle weight with two or three axles
OGV2	A sub-category of OGV. Includes all rigid vehicles with four or more axles and all articulated vehicles
RSI	Road Side Interview
SATURN	Simulation – Assignment model of Traffic on Urban Road Networks software
SB	South Bound
TRADS	Traffic flow Data System – the Highways Agency’s database of traffic count data
TrafficMaster	The company that collates movements of vehicles equipped with GPS equipped ‘probe vehicles’
VISUM	Transport modelling software used (in this case) for public transport modelling
WB	West Bound
WebTAG	Web-based Transport Appraisal Guidance produced by the Department for Transport

NORWICH TRAFFIC SURVEYS

This survey will provide vital information to enable us to consider measures to relieve traffic problems in the area. Please answer the following questions concerning the journey you were making when handed this card. Please return it using the FREEPOST envelope provided. Thank you for your assistance.

All completed questionnaires will be entered into a prize draw. Three questionnaires will be drawn, each for a prize of £100 in Marks & Spencers vouchers. If you wish to enter the prize draw please complete Question 7.

Site Number (Office use only)			
Time of Issue (Office use only)	Q1 - What type of vehicle were you driving?	Q2 - Would you please tell us the exact address you had JUST come from, i.e. before being stopped? Include the postcode if possible.	Q3 - And your reason for being there?
07:00	1 - Car / Taxi / Minibus	HOUSE No. / FIRM /	1 - Home
07:30	2 - Light Goods Vehicle	CAR PARK	2 - Temporary Residence
08:00	Van, under 3.5 tonnes	STREET	3 - Normal Place of Work
08:30	3 - HGV type 1	TOWN	4 - Employers Business
09:00	2 axle twin rear tyres or three axle rigid	COUNTY	5 - Education (including pickup / drop off)
09:30	4 - HGV type 2	POSTCODE	6 - Shopping
10:00	Rigid vehicles with 4 or more axles and all articulated vehicles		7 - Personal Business (e.g. Bank, Dentist etc)
10:30	5 - Bus or Coach		8 - Visit Friends or Family
11:00			9 - Recreation and Leisure
11:30			10 - Other (please specify)
12:00			
12:30			
13:00			
13:30			
14:00	Q4 - How many people were in the vehicle, including the driver?	Q5 - Would you please tell us the exact address were going to NEXT? Include the postcode if possible	Q6 - And your reason for going there?
14:30		HOUSE No. / FIRM /	1 - Home
15:00		CAR PARK	2 - Temporary Residence
15:30		STREET	3 - Normal Place of Work
16:00		TOWN	4 - Employers Business
16:30		COUNTY	5 - Education (including pickup / drop off)
17:00		POSTCODE	6 - Shopping
17:30			7 - Personal Business (e.g. Bank, Dentist etc)
18:00			8 - Visit Friends or Family
18:30			9 - Recreation and Leisure
			10 - Other (please specify)
G7 - PRIZE DRAW		Winners will be notified by telephone. To enter the prize draw complete the following details:	
Name.....		Tel.....	

We should emphasise that although drivers are required to obey the instructions of the traffic officer, participation in this survey is purely voluntary. All information is collected on a strictly confidential basis. Address information is required to enable allocation of an accurate geographical location when details of the journeys are analysed. Once this has been done the addresses and survey questionnaires will be destroyed. For further information please telephone Ian Parkes 01 603 223288. Finally we would like to apologise for any inconvenience caused by this survey and thank you for your co-operation.

MM filing reference: 233906/DP/01/233906DP01-DOC-006

This document is submitted in relation to the application for a Development Consent Order by Norfolk County Council to the Secretary of State, under the Planning Act 2008.

The application is for the Norfolk County Council (Norwich Northern Distributor Road (A1067 to A47(T))) Order, to grant development consent for the construction of a new highway running west to east, to south, between the A1067 Fakenham Road and the A47 Trunk Road at Postwick, including improvements to the existing highway network to the north and north east of Norwich.

This document comprises part of the application documents and relates to Regulation 5(2)(q) of the Infrastructure Planning (Applications: Prescribed Forms and Procedure) Regulations 2009.

1 Key Summary

- 1.1.1 Mott MacDonald has been appointed by Norfolk County Council (NCC) to develop and update the existing Norwich Area Transportation Strategy (NATS) transport model of Norwich for the purposes of supporting the promotion of the Norwich Northern Distributor Road (NDR).
- 1.1.2 Highway models have been developed in SATURN to represent the AM peak hour (08:00-09:00), an average hour in the inter-peak (10:00 – 16:00) and the PM peak hour (17:00 – 18:00).
- 1.1.3 The development of the highway model relies on some of the information collected for the previous version of the model, however this is limited to the origin-destination information from the 2006 roadside interview surveys (RSI). Other data, including new RSIs and traffic counts was obtained through a new data collection exercise that was undertaken in the autumn of 2012. Full details of the data collection exercise to collate this information are included in the Report of Surveys (document 5.8).
- 1.1.4 For the 2012 rebase of the NDR model eleven journey time routes have been defined to cover the principal radial and ring routes in the urban area as well as extending into the rural fringe. Observed journey time data has been sourced from Traffic Master subject to checks on the integrity of the dataset in each case.
- 1.1.5 Trip matrices have been prepared in line with advice given in WebTAG (Unit 3.10.2) and DMRB (Volume 12) based on both observed and synthetic data. Details of checks undertaken at key stages in the development of the matrices to ensure that the provenance of the matrices is maintained are presented in this report. Checks include analysis of the observed and synthetic matrices prior to merging and, subsequent to merging, comparisons with counts before applying matrix estimation. Analyses of the effects of matrix estimation are also documented.
- 1.1.6 The model convergence has been monitored and meets the criteria in WebTAG (Unit 3.19) in all time periods.
- 1.1.7 The model achieves a good level of traffic flow calibration with results indicating a close match to observations on the calibration screenlines and for individual link counts, with the WebTAG (Unit 3.19) criteria for GEH and flow proximity being met in all time periods for both all vehicles and cars.

- 1.1.8 Traffic flow validation has been undertaken against independent count data and assessment of the validation process shows that the model also achieves a good level of flow validation in each of the modelled time periods, meeting many of the validation criteria and is close to meeting the criteria in WebTAG (Unit 3.19) in other cases.
- 1.1.9 The journey time validation is considered to be reasonably good with the model recreating journey times that are representative on key routes in the modelled area. The discrepancy with observed journey times in the AM and PM peak hours is considered to be acceptable on the basis that the majority of links over which journey times have been compared are generally consistent with observations and that where overall journey time routes do fall outside the acceptability guidelines this is generally as a result of short sections, or single junctions, where delay has not been fully represented in the model.
- 1.1.10 It is considered that the base year highway assignment models developed for the 2012 NATS transport model demonstrate a good representation of traffic behaviour in the study area and form a robust basis from which future year forecasts for the NDR scheme can be developed.

2 Introduction

2.1 Background

- 2.1.1 Mott MacDonald has been appointed by Norfolk County Council (NCC) to assist with the development and appraisal of the Norwich Northern Distributor Road, known as the NDR or referred to as the Scheme.
- 2.1.2 The Scheme would be a dual carriageway all-purposes strategic distributor road, to be classified as the A1270 Principal Road, which would link the A1067 Fakenham Road near Attlebridge, to the A47 Trunk Road (T) at Postwick. This will be over a length of approximately 20.4km.
- 2.1.3 The NDR is a project of national significance which requires a Development Consent Order (DCO) under the Planning Act 2008 and this formal planning process began in 2013. It is currently anticipated that the process will be completed in time for the NDR scheme to start construction in 2015 and to be opened in 2017.
- 2.1.4 This document is one of a number that support the DCO, each of which has its own unique document number, and should therefore be read in conjunction with the other documentation. The proposed layout of the NDR is shown in the General Arrangement Plans contained in document number 2.6, whilst the full needs case for the NDR is explained in the Statement of Reason (document 4.1) and the Environmental Statement (document 6.1).
- 2.1.5 This document has been prepared to describe the updating of the existing (NATS) transport model of Norwich for the purposes of supporting the appraisal of the NDR. The development of the traffic model has been undertaken in line with current Department for Transport (DfT) guidance, and particularly with that contained in WebTAG (Unit 3.19), such that the model is suitable for the preparation of the DCO submission.
- 2.1.6 Figure 2.1 below shows the preferred route for the NDR scheme.

Figure 2.1: Preferred Route of the NDR Scheme

2.2 Overall Modelling System

2.2.1 The existing modelling system consists of three main elements:

- A highway assignment model developed in SATURN
- A public transport assignment model developed in VISUM
- A variable demand model using the DIADEM software.

2.2.2 Key changes from previous versions of the Norwich SATURN model include:

- Rebasing the Norwich model to 2012 through the collection of new survey data including new road side interviews (RSI) at locations previously surveyed in 2002 and at locations along a new radial screenline;
- Changes to the arrangement of calibration and validation screenlines;
- New tracker/satnav journey time data collected from Traffic Master; and
- New signal data for key junctions incorporated into model.

2.3 Purpose of Report

2.3.1 The purpose of this report is to document the development of the revised 2012 highway model including:

- The key characteristics of the model;
- The data used to develop the model;
- The process used to develop highway demand; and
- The calibration and validation of the model.

2.3.2 This report constitutes the local model validation report for the highway (SATURN) model and describes the development of the model in detail and presents the validation of model outputs against observed traffic flows and journey times. Other reports of relevance to the modelling work include:

- Report of Surveys¹;
- Local Model Validation Report - Public Transport Model² ; and
- Traffic Forecasting Report³.

2.4 Structure of Report

2.4.1 Following the introductory chapter, this report is structured as follows:

- Chapter 3 provides an outline description of the model development and structure;
- Chapter 4 presents the development of the highway network;
- Chapter 5 describes the development of the observed and synthetic demand matrices;
- Chapter 6 covers the work involved in calibrating the network and matrices, through matrix estimation;
- Chapter 7 describes the local model validation, in terms of both traffic flows and journey times. Comparisons are in each case based upon the validation criteria in WebTAG Unit 3.19.
- Chapter 8 sets out conclusions

³ DCO Document 5.6 - Norwich Northern Distributor Road, Traffic Forecasting Report

PAGE NOT USED

3 Data Used in Model Development

3.1 Overview

- 3.1.1 To develop the base year model, information is required on travel demand and network performance.
- Travel demand refers to travel patterns i.e. where people are travelling to and from and the volumes of traffic between each origin and destination.
 - Network performance relates to how the network is operating, for example travel times or junction delays.
- 3.1.2 The base year model should reflect observed travel patterns, including origin-destination movements and volumes of traffic making these movements. It should also represent network characteristics and performance including routing, traffic volumes at specific locations and journey times between key locations. To obtain this information a data collection exercise has been undertaken. The key elements of this exercise are:
- Origin destination data
 - Traffic count data
 - Journey time data
- 3.1.3 The development of the highway model relies on some of the information collected for the previous version of the model, however this is limited to the origin-destination information from the 2006 roadside interviews. Other data, including new RSIs and traffic counts was obtained through a new data collection exercise that was undertaken in the autumn of 2012. Full details of the data collection exercise to collate this information are included in the Report of Surveys (document 5.8).
- 3.1.4 A summary of the data used to develop the current model is outlined in the following section.

3.2 Summary of existing traffic data

- 3.2.1 The data used to develop the previous NATS traffic model consisted of the following:
- Roadside Interview Surveys (62 sites)
 - Manual Classified Counts (MCC) (56 turning counts, 106 link counts)
 - Automatic Traffic Counts (ATC) (106 sites)
 - Journey Time Surveys (9 bi-directional routes)

- 3.2.2 Traffic data used in the NATS model were primarily taken from surveys undertaken in 2002 and 2006 with a small number of additional traffic counts being undertaken in 2010.
- 3.2.3 Existing traffic data that were retained from the previous modelling work for use in the 2012 rebasing of the Norwich model consisted of RSI origin-destination data from surveys undertaken in 2006. Data from earlier RSI surveys was discarded along with the associated count data.
- 3.2.4 The locations of the 2006 RSI sites from which origin-destination data were retained are indicated in Figure 3.1 below.

Figure 3.1: Location of 2006 RSI Sites

3.3 Data for SATURN Model Update

- 3.3.1 The previous Norwich Area Transportation Strategy (NATS) model is based on a large amount of trip interview data from surveys undertaken in 2002 (26 sites) as well as 2006 data (36 sites). Due to the prohibitive cost of updating all the RSI sites an approach has been adopted that replaces the ten year old 2002 interview data but reuses that from 2006, albeit with the 2006 OD data being expanded to 2012 traffic counts.
- 3.3.2 An exercise to gather this interview data was undertaken in the autumn of 2012 along with the collection of contemporaneous traffic counts at a number of locations in addition to the RSI sites for the purposes of calibration and validation of the traffic model.

3.4 New Roadside Interview Surveys

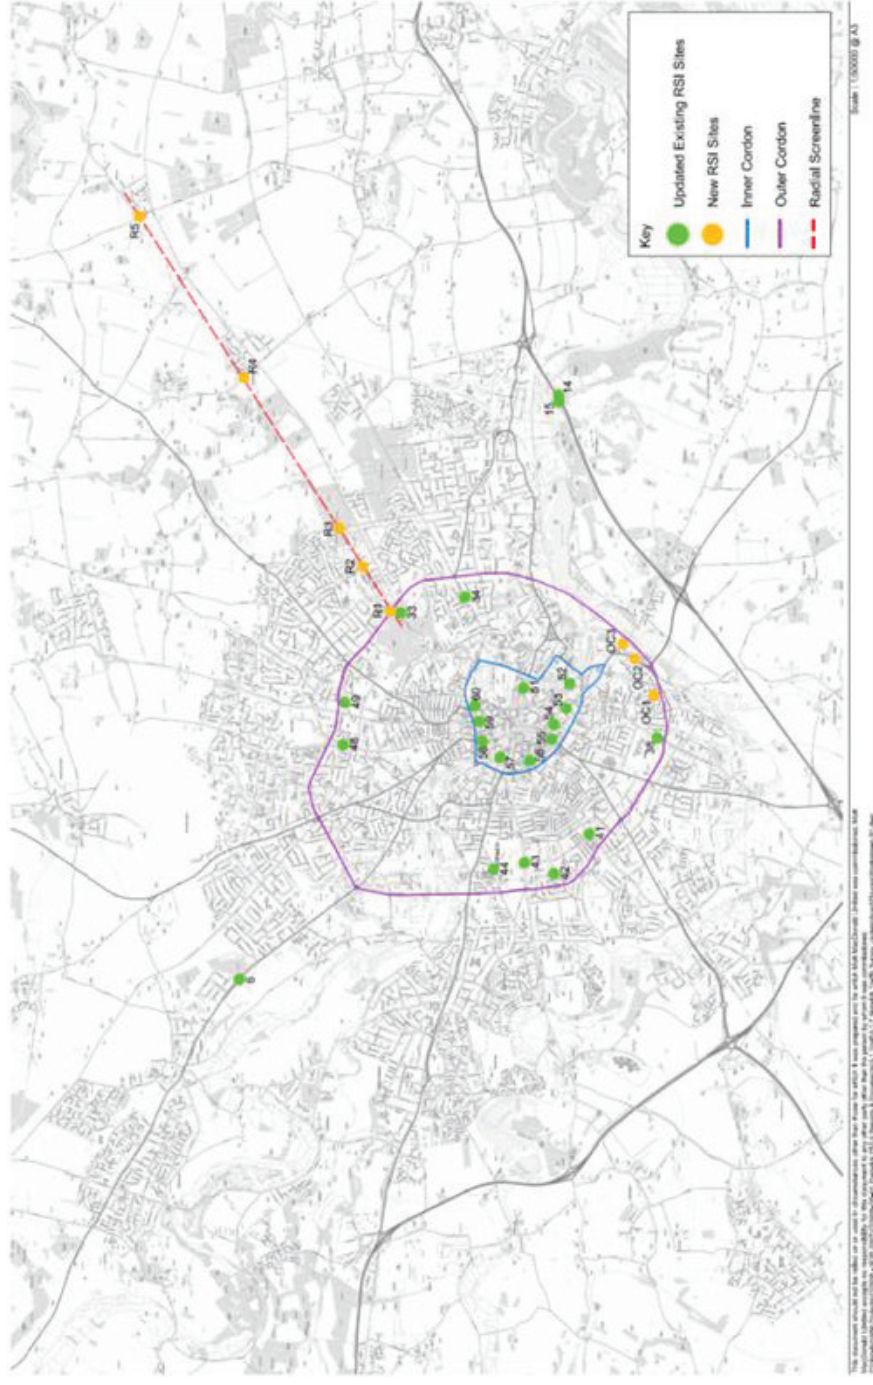

- 3.4.1 A key issue that arose during the last model build and update was that the existing RSI screenlines were comprehensive in intercepting radial trips, but poorer at intercepting orbital trips. This is important for NDR so the data collection has been enhanced with a new radial screenline (dashed on Figure 3.2) with five new sites that pick up orbital movements in the north-east quadrant.
- 3.4.2 In addition to the new radial screenline the existing cordons have been enhanced as follows:
- The 2002 sites 12 and 13 on Longwater Lane have been omitted from the new data collection exercise as they repeat the data captured by the River screenline.
 - The southern part of the outer cordon has been modified so that a more watertight cordon can be formed. The modification consists of the exclusion of existing sites 1 and 20 (A47 west of A1074 and A146 Barrett Road respectively) and the inclusion of three new RSI sites (shown as OC1 to OC3 in Figure 3.2).
- 3.4.3 The result of the above changes is that 30 new RSI surveys were undertaken in October/November 2012 (avoiding the school holiday period in the week commencing 29th October). Of these, 22 are at sites previously surveyed in 2002; 5 new sites form the radial screenline to the north east and 3 new sites are included to the southern part of the outer cordon. The new sites are shown in orange in Figure 3.2.
- 3.4.4 A summary list of the 2012 RSI surveys is provided in Table 3.1.

Table 3.1: List of RSI sites for 2012 update

Figure 3.2: RSI sites for 2012 update

3.5 New Traffic Count Data

3.5.1 Traffic count data has been collected for all the RSI sites (both the newly surveyed sites and the 2006 sites) to allow all the RSI data to be expanded to a common October 2012 base. The 2006 RSI sites where new ATCs (29 in total) have been undertaken are shown in Figure 3.1 and summarised in Table 3.2. ATC counts have been undertaken at 59 RSI sites in total with counts being undertaken for both directions over a two-week period, including the day of the RSI survey for the 2012 RSI sites.

Table 3.2: The 2006 RSI sites where ATC surveys have been undertaken in 2012

NW8	C461 Taverham Lane Taverham at bridge
NW10	C162 Costessey Lane Costessey at bridge

3.5.2 Further to the above requirement for count data to expand the RSI data, two-week ATC data has also been collected for the purposes of model validation. It is acknowledged that the previous model build resulted in a limited selection of sites that could be organised onto screenlines for the purposes of validation. In light of this, the arrangement of validation screenlines and cordons has been revised significantly with the introduction of several new screenlines. The resulting arrangement of validation screenlines is shown in Figure 3.3.

3.5.3 The validation screenlines required ATC data to be collected at 35 sites with sites on the SRN being covered by the HA TRADS data. For each of the sites count data was collected for both directions. A summary of the ATC sites for validation is provided in Table 3.3 below.

Table 3.3: Validation count locations

Site Reference	Site Location
V1	Yarmouth Road Between Bishops Close and South Avenue
V2	St Williams Way Between Thunder Lane and Thor Loke

V28	A147 St Crispins Road Between Pitt Street and Barker Street
V29	A1057 Drayton Road Between Junction Road and Stone Road
V30	A1024 Mile Cross Road Between Half Mile Road and Woodward Road
V31	A140 Boundary Road Between Overbury Road and City View Road
V32	Middleton's Lane Between Westgate and Kinsale Avenue
V33	Hall Lane Between George Drive and Carter Road
V34	School Road Between Reepham Road and Badgers Brook Road
V35	Fir Covert Road Between Fakenham Road and Reepham Road

3.5.4 Manual classified counts (MCC) were undertaken in conjunction with the ATCs to allow classification by vehicle type of all the ATC data. MCCs have been undertaken using video cameras at 94 sites (59 RSI sites and 35 validation sites) over a 12 hour period from 0700 to 1900.

3.5.5 A single manual classified turning count (MCTC) has been undertaken as part of the 2012 data collection exercise. The survey is located at the roundabout junction of Middletons Lane and Reepham Road (see Figure 3.3)

3.5.6 This MCTC was done to add to the other turning counts referenced below to help improve calibration.

3.6 Other traffic count data

3.6.1 In addition to the data collected specifically for the purposes of rebasing the Norwich model a number of other traffic counts were also ultimately used in the calibration of the peak hour models. These data consisted of the following:

- Turning counts at the A11/A47 Thickthorn Junction;
- Turning counts at the A47 Postwick Junction;
- Various count data from the Beyond Green planning application;
- ATC data on Middle Road; and
- Turning counts at the A140 Cromer Road/Holt Road Roundabout.

3.6.2 The locations of these additional calibration counts are illustrated in Figure 3.4. It should be noted that in some cases data was only available for the peak periods and therefore these additional sites were not generally used in the development of the inter-peak model.

Figure 3.3: Validation count locations for 2012 update

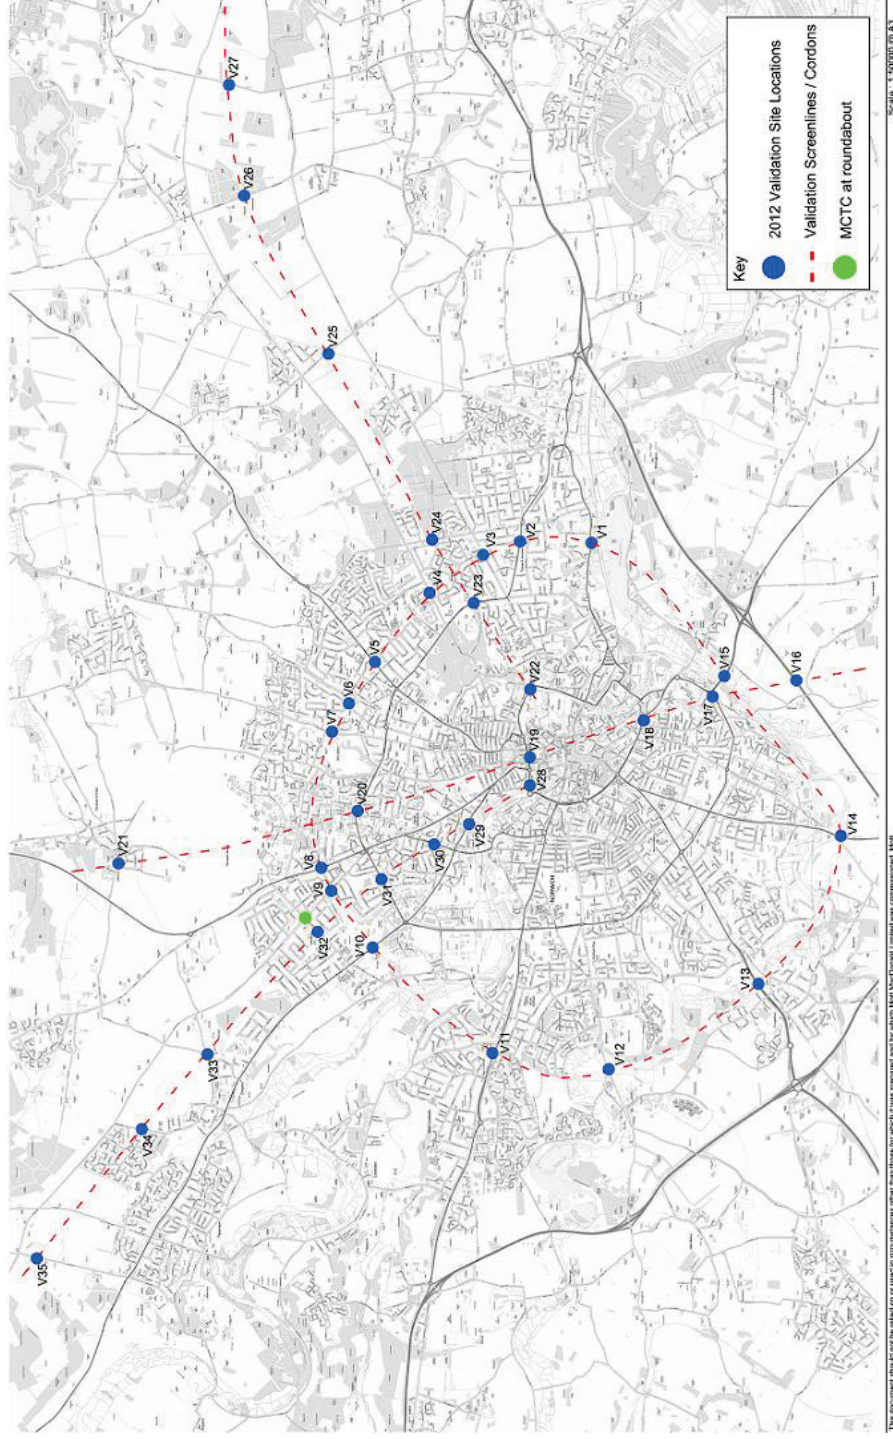

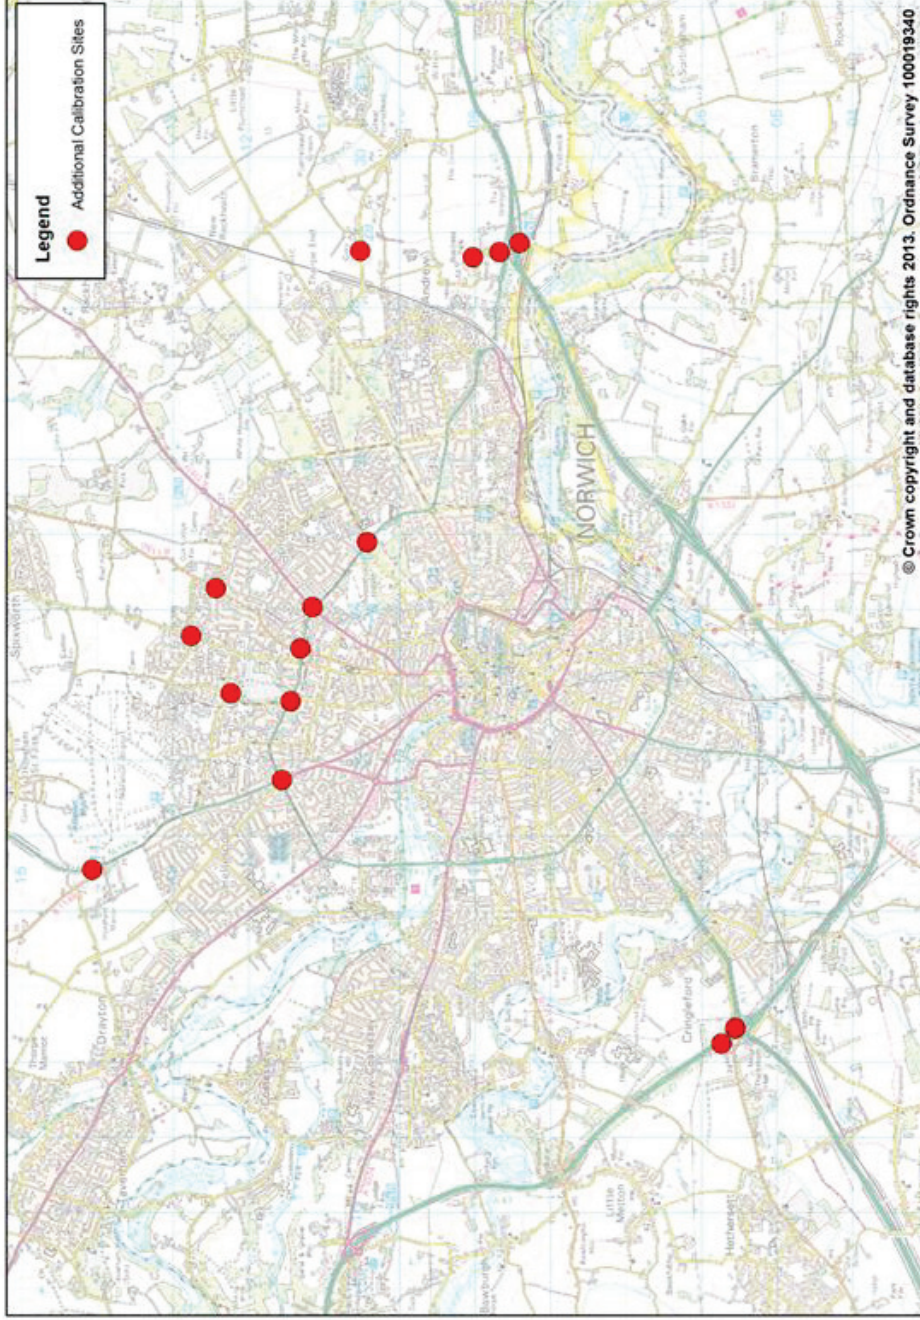

Figure 3.4: Additional calibration count sites

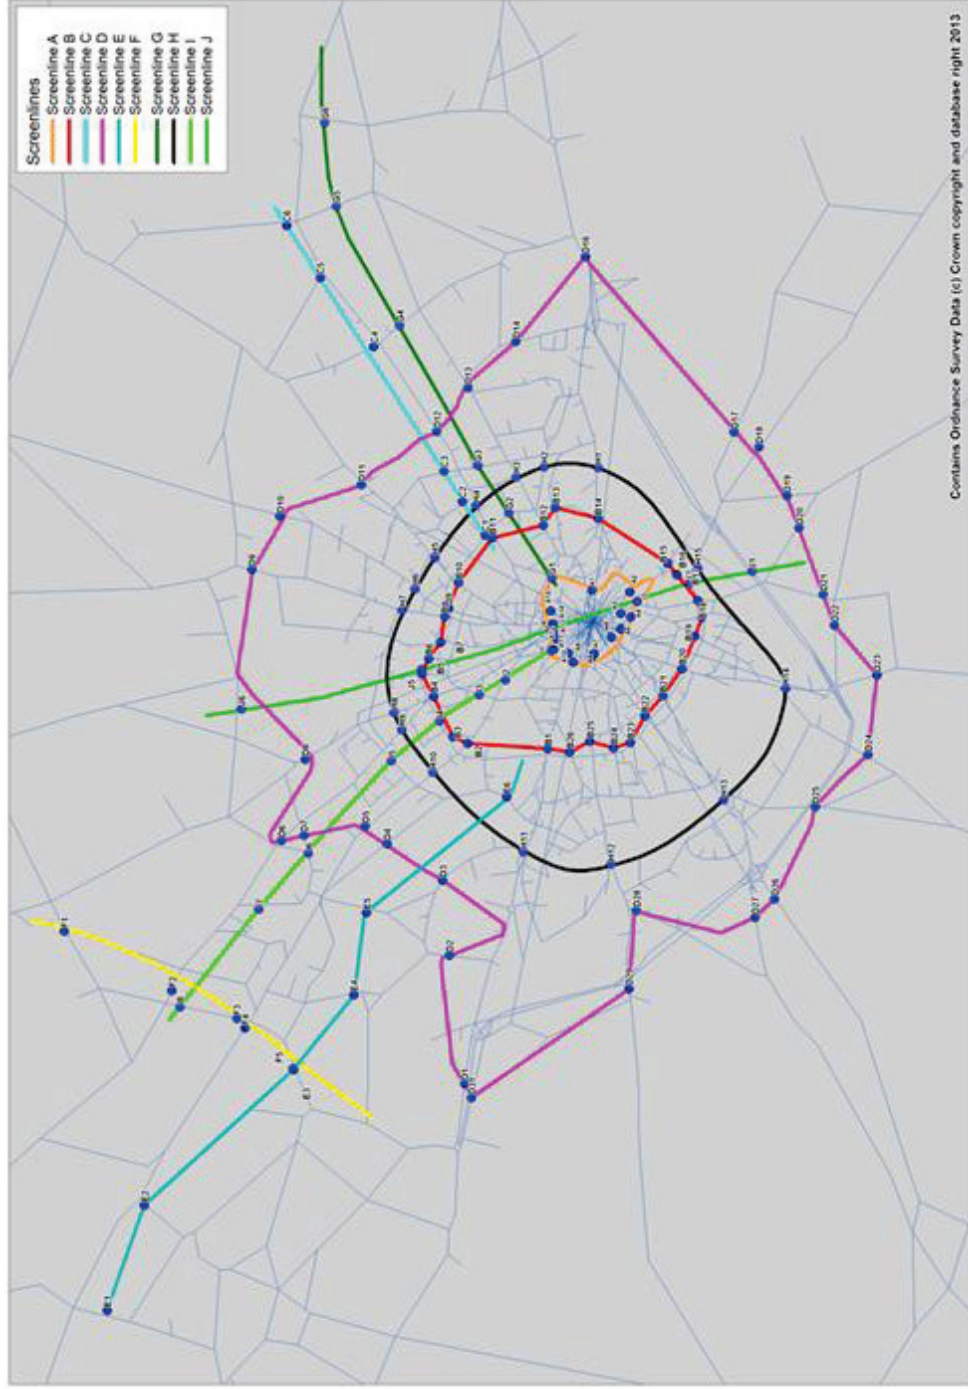

3.7 Normalisation of Counts

- 3.7.1 The main traffic counts used in the modelling were those collected in the autumn 2012 surveys. As these surveys were undertaken in the months of October and November it was appropriate to check that there was no significant variation in traffic flows between the two months that could skew the data. Examination of long term ATC data indicated that the variability in flows between October and November was minimal and therefore no adjustment was considered to be needed to normalise the November data to be consistent with that from October.
- 3.7.2 Other counts that were used in the traffic modelling (as indicated in 3.6) were undertaken over a range of different years/months. In order to use these counts in the modelling work it was necessary to apply adjustments to normalise the data to October 2012. Adjustments were generally based on long term ATC counts as appropriate.
- 3.7.3 For a number turning counts from the Beyond Green dataset, particularly those on the outer ring road, the sites were coincident with recently collected ATC data. At these sites the turning proportions were retained with volumes being controlled to the new October/November 2012 ATC counts.

3.8 Application of Traffic Counts

- 3.8.1 The traffic count dataset has been used for a number of purposes including:
- As control counts for expansion of interview data
 - For matrix calibration
 - Assignment validation
- 3.8.2 Figure 3.5 shows the locations of traffic counts used in the development of the highway model and their arrangement into screenlines/cordons as described in the sections below.

Figure 3.5: Location and Arrangement of Traffic Counts used in Model Development

3.9 Calibration screenlines

3.9.1 The following calibration screenlines have been used for the new NDR model. In all cases, the screenlines are bi-directional. The calibration screenlines are indicated in Figure 3.5.

- Inner Ring Road (RSI) Cordon (Screenline A) - a cordon around Norwich city centre just inside the inner ring road intersecting 15 radial routes and the 6 park and ride routes.
- Outer Ring Road (RSI) Cordon (Screenline B) - a cordon just inside the outer ring road, intersecting 23 radial routes and the 6 park and ride routes.
- North East (RSI) Screenline (Screenline C) - a radial screenline consisting of five points, oriented southwest/northeast and running parallel to Salhouse Road (to the north) from A1042 Mousehold Lane in the west to the B1140 Bell Lane in the east.
- Outer (RSI) Cordon (Screenline D) - a cordon around the outskirts of Norwich intersecting 23 radial routes. The cordon extends beyond the A47 to the south; west of the A47/A1074 Longwater Interchange; north of Norwich Airport and beyond A47/A1042 Postwick Junction to the east.
- River (RSI) Screenline (Screenline E) - a screenline consisting of 17 points running northwest/southeast through the centre of Norwich following the River Wensum from Weston Hall Road in the west to the A47 crossing of the River Yare in the east.
- North West (RSI) Screenline (Screenline F) - a screenline consisting of 4 points running southwest/northeast just east of Taverham to the north west of Norwich.

3.10 Validation screenlines

3.10.1 The following validation screenlines were proposed for the new NDR model. In all cases the screenlines are bi-directional. The proposed validation screenlines are indicated in Figure 3.5.

- North East radial Screenline (Screenline G) - a screenline running radially from the inner ring road at A147 Barrack Street (west of Gurney Road) out of town parallel, and to the south of Salhouse Road. The screenline consists of 6 points ending at Primrose Corner.
- Intermediate Cordon (Screenline H) - a cordon of Norwich lying between the Outer Ring Road (RSI) cordon and the Outer calibration

cordon. The cordon intersects 15 radial routes. (Sites H8 to H11 were used in calibration)

- North West Radial Screenline (Screenline I) – a screenline running radially from the inner ring road at A147 St Crispins Road (west of Pitt Street) out of town parallel, and to the north of A1067 Fakenham Road. The screenline consists of 8 points ending at Fir Covert Road.
- North/South Screenline (Screenline J) - a north/south screenline running through Norwich city centre. The screenline consist of 6 points and runs from the A47 (west of the A146 Trowse Interchange) in the south, through to Church Street, Horsham St Faith. (Screenline J was used in calibration)

3.10.2 The intention was that all four of these screenlines be retained for validation purposes, although during the course of validation (and indeed at the scoping stage) it was recognised that it would be necessary to use some of these data in the calibration.

3.10.3 For the final model validation the north/south screenline (screenline J) was used in the calibration dataset along with the northwest portion of the intermediate cordon (screenline H, points H8, H9, H10 and H11).

3.11 Journey Times

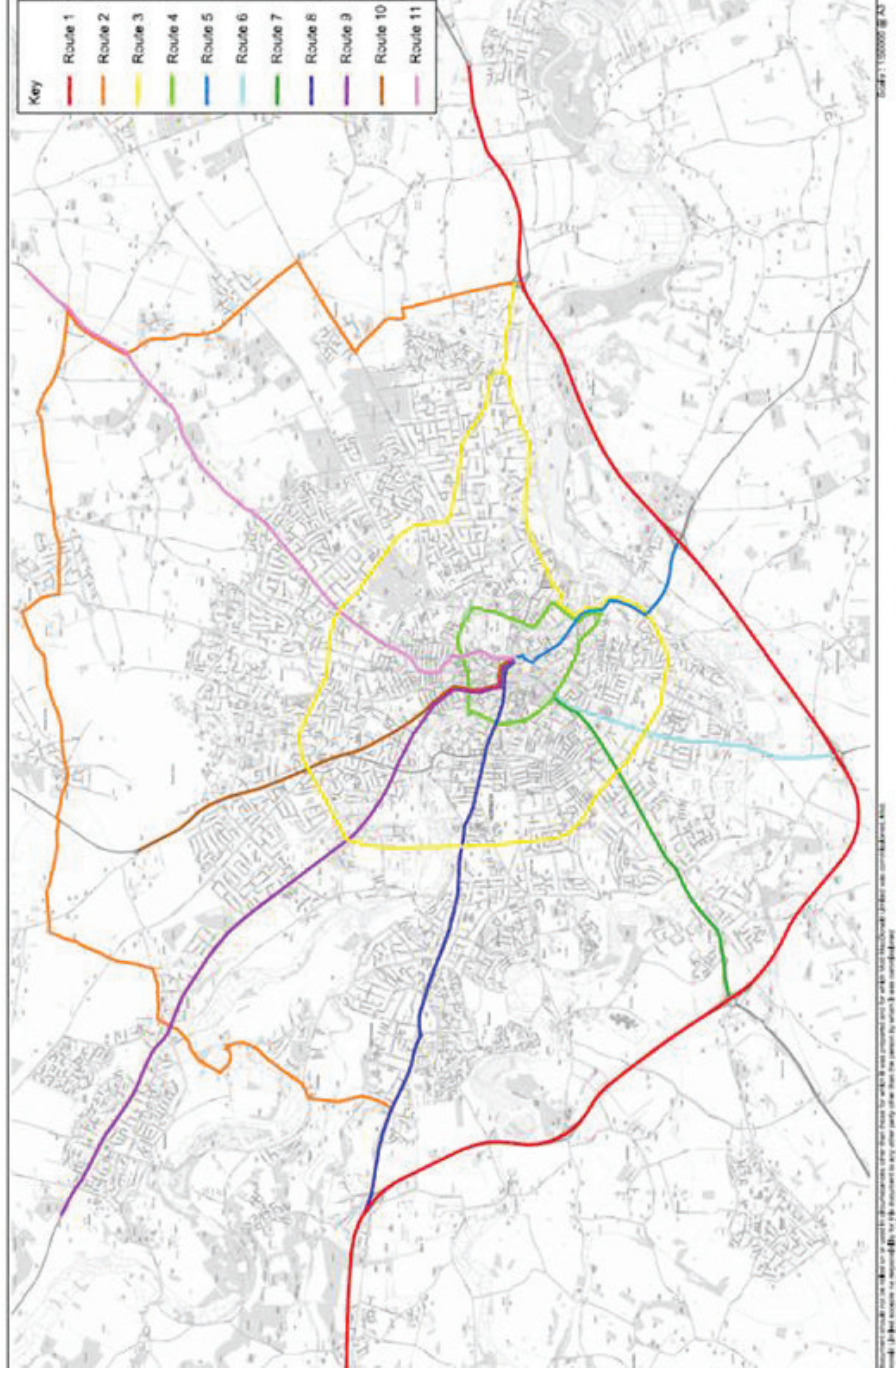

3.11.1 For the 2012 rebase of the NDR model a new arrangement of 11 journey time routes was adopted compared to the 9 routes used in the previous modelling work. Journey time data was sourced from Traffic Master subject to checks on the integrity of the dataset in each case. It is considered that the arrangement of routes and the use of Traffic Master data provides reliable journey time data for key areas of the network.

3.11.2 The arrangement of journey time routes for the 2012 rebase is illustrated in Figure 3.6 with a summary of routes provided in Table 3.4 below.

Table 3.4: Summary of journey times

Journey Time Route	Site Location
Route 1 (Red)	A47 Norwich Bypass
Route 2 (Orange)	Norwich northern orbital route
Route 3 (Yellow)	Outer ring road circular (via Postwick)
Route 4 (Light Green)	Inner ring road circular
Route 5 (Light Blue)	A47/A146 Trowse Interchange to city centre
Route 6 (Cyan)	A140 Ipswich Road
Route 7 (Dark Green)	A11 Newmarket Road
Route 8 (Dark Blue)	A47/A1074 Longwater Interchange to city centre (Dereham Road)
Route 9 (Purple)	A1067 Fakenham Road
Route 10 (Brown)	A140 Holt Road/Cromer Road/Aylsham Road
Route 11 (Pink)	A1151 Wroxham Road

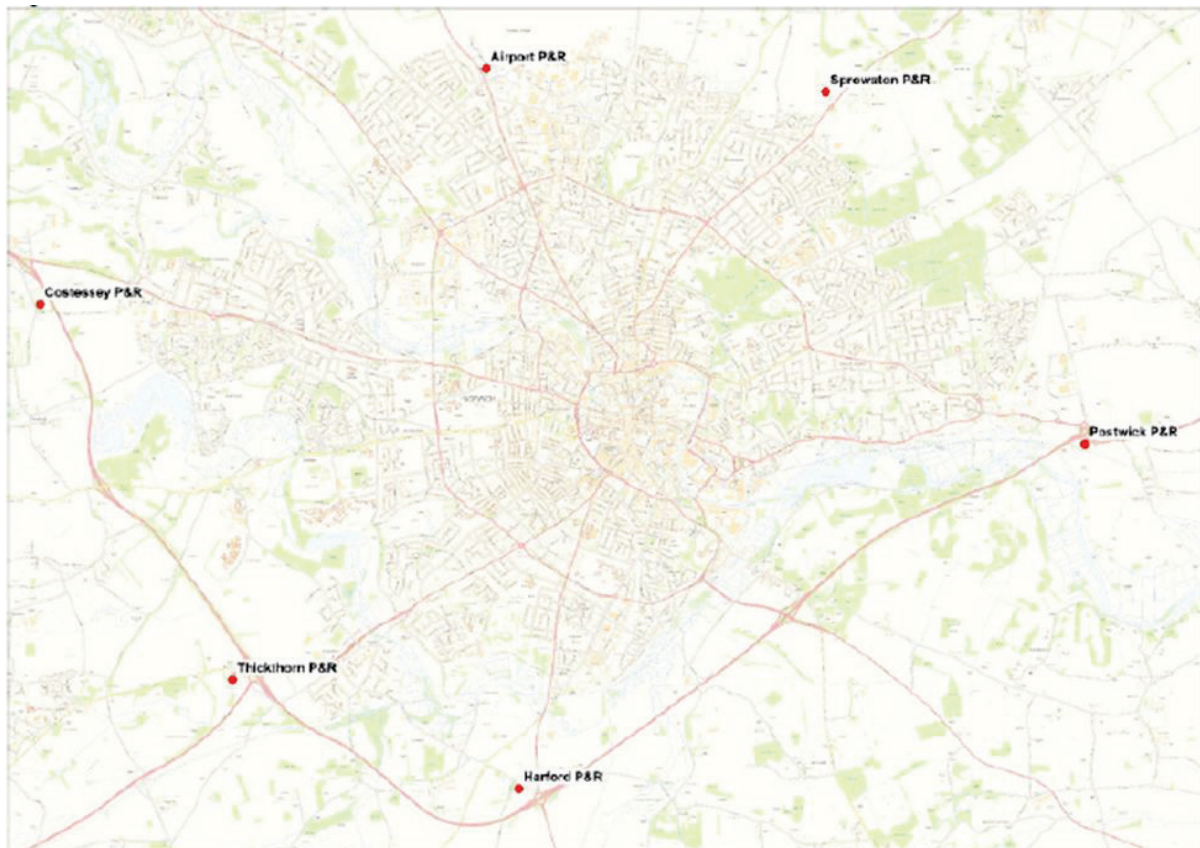

Figure 3.6: Journey time routes

3.12 Park and Ride

3.12.1 There are six Park and Ride sites serving Norwich City Centre. The location of these sites is shown in Figure 3.7. As part of the data collection exercise parking accumulation data were obtained for each of the Park and Ride sites from which flow profiles throughout the day could be derived.

Figure 3.7: Park and Ride sites

4 Network Development

4.1 Summary Approach

4.1.1 The 2006 NATS model that was recalibrated in 2011 for the appraisal of the Postwick scheme was considered to be the most appropriate starting point for the rebase to 2012. It was anticipated that this network would be largely representative already, although some enhancements to the network were considered during the rebasing exercise as well as the coding of schemes built since 2006.

4.1.2 In developing the existing NATS model a number of checks and enhancements to the model coding and structure have been implemented. Significant changes to the previous model include:

- Redefining the area of detailed modelling such that all areas of simulation coding fall within the fully modelled area;
- Roundabout coding has been changed generally within the model such that the use of roundabout nodes (Type 2 or 5) has been limited to roundabouts less than 28m in diameter (i.e. mini-roundabouts). Elsewhere roundabouts have been coded as a series of priority nodes;
- A review of junction coding has been undertaken across the simulated area and priority and signalised nodes have been systematically recoded based on generic parameters for various common junction arrangements (see section 4.7)
- The external area has been recoded with fixed speeds;
- Network topology has been validated through the use of GIS to reliably establish connectivity and link lengths.

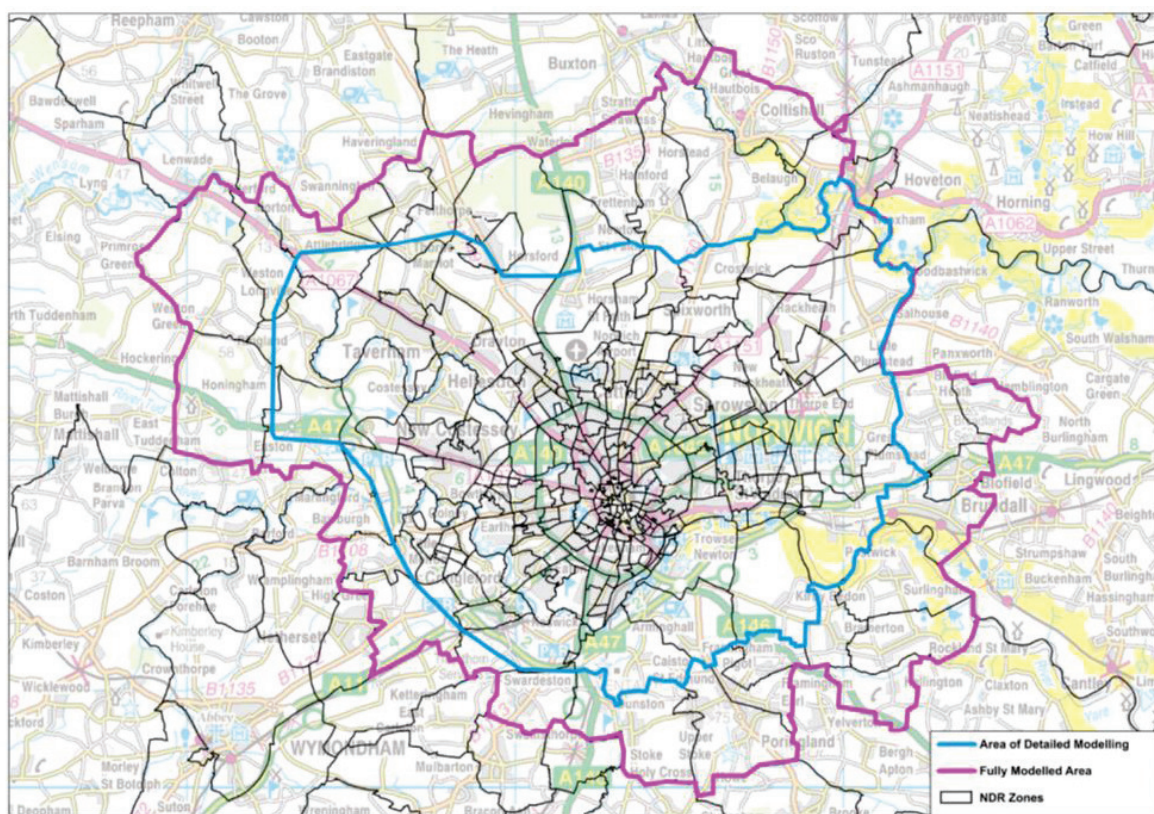

4.2 Geographical Extent of Model and Network Hierarchy

4.2.1 Two main areas have been defined within the model in line with WebTAG guidance. The areas are as follows (and are illustrated in Figure 4.1)

- Fully Modelled Area– this is the area over which proposed interventions have influence, subdivided into:
 - *Area of Detailed Modelling* – the area in which significant impacts of interventions are certain. Modelling in this area is characterised by representation of all trip movements, small zones and, detailed network representation with

- junction modelling (including flow metering and blocking back).
- *Rest of Fully Modelled Area* – this is the area over which the impacts of interventions are considered to be quite likely, but relatively weak in magnitude. This area is characterised by representation of all trip movements, somewhat larger zones and less network detail than the area of detailed modelling with speed/flow modelling.
 - *External Area* – the impacts of interventions can be assumed to be negligible here. In terms of detail it would be expected that the network represents a large proportion of the rest of Great Britain, with only a partial representation of demand – i.e. external to external movements through the FMA; large zones; skeletal network and fixed speed modelling

Figure 4.1: Modelled Areas

© Crown copyright and database rights 2013. Ordnance Survey 100019340

4.2.2 The definition of modelled areas as shown in Figure 4.1 has been significantly revised from the previous version of the Norwich SATURN model such that

the fully modelled area is now explicitly defined in accordance with WebTAG (unit 3.19) guidance.

4.3 Key Model Parameters

4.3.1 *Modelling software* - the highway model has been developed using the SATURN software. Version 11.1.09 has been adopted.

4.3.2 *Modelling base year* - the model represents an average weekday in October for a base year of 2012.

4.3.3 *Modelled time periods* - SATURN models have been developed for the AM and PM peak hours and for an average hour in the inter-peak. Based on an analysis of long-term ATC data, the modelled hours are as follows:

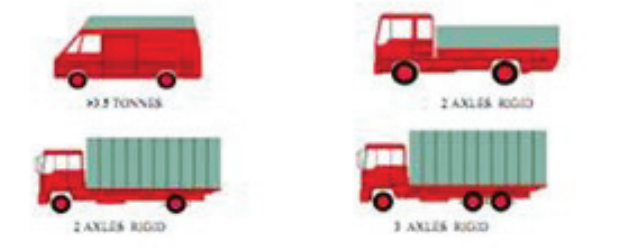

- AM Peak hour (08:00 – 09:00)
- Average Inter Peak Hour (10:00 – 16:00)
- PM Peak hour (17:00 – 18:00)

4.3.4 For the purposes of forecasting at a 24-hour level an off-peak model covering the period from 19:00 to 07:00 has been derived from the inter-peak model, although this off-peak model has not been validated. Details of the off-peak model are discussed in the NDR Forecasting Report.

4.4 Assignment User Classes

4.4.1 For the purposes of the NDR SATURN modelling work, the vehicle classes and definitions from the COBA manual were adopted, as shown in Figure 4.2 below.

Figure 4.2: Vehicle classification

<p>CAR</p>	 <p>SALOON ESTATE</p> <p>PEOPLE CARRIER CAR TOWING CARAVAN/TRAILER</p>
<p>LIGHT GOODS VEHICLE (LGV)</p>	 <p>VAN ≤ 3 TONNES PICKUP</p>
<p>OTHER GOODS VEHICLES (OGV 1)</p>	 <p>≤ 3 TONNES 2 AXLES RIGID</p> <p>2 AXLES RIGID 3 AXLES RIGID</p>
<p>OTHER GOODS VEHICLES (OGV 2)</p>	 <p>4 OR MORE AXLES RIGID 3 AXLES ARTIC</p> <p>4 OR MORE AXLES ARTIC OTHER GOODS VEHICLE WITH TRAILER</p>
<p>BUSES & COACHES (PSV)</p>	 <p>DOUBLE DECK BUS SINGLE DECK BUS OR COACH</p>

Source: Figure 8.1 COBA Vehicle Categories, DMRB Volume 13 Section 1

4.4.2 Modelled vehicle classes were further split by purpose and by Home-based (HB) and Non-Home-based (NHB) trips to allow for variations in the perceived costs of travel between different journey purposes. Segments for light vehicles included commuting, employer's business and other trips. Light goods vehicles (LGV) on employer's business were modelled as a separate user class with ordinary goods vehicles (OGV1 and OGV2) forming the final user class.

4.4.3 A summary of the SATURN user classes adopted for the base model validation is provided in Table 4.1 below.

Table 4.1: SATURN user classes

SATURN User Class	Vehicle Type	Description
1	Car and LGV (personal)	HB Work (Commuting)
2	Car and LGV (personal)	HB Employer's Business
3	Car and LGV (personal)	HB Other
4	Car and LGV (personal)	NHB Employer's Business
5	Car and LGV (personal)	NHB Other
6	LGV	LGV Employer's business
7	HGV	OGV1 and OGV2

4.4.4 In the SATURN assignments vehicles were represented in passenger car units (PCUs) based on the factors provided in Table 4.2 below.

Table 4.2: Passenger car unit (PCU) factors

Vehicle Type	PCU factor (PCUs/vehicle)
Car/LGV	1
HGV	2.3
Bus	2

4.5 Buffer Network Coding

4.5.1 Outside of the area of detailed modelling the network representation in the model is less detailed and is often referred to as buffer network (as opposed to simulation network). In the buffer area the representation of the road network in the traffic model is link based with the network described in terms of its link characteristics.

4.5.2 The buffer coding for the rebased 2012 model has been revised significantly from the previous version of the NATS model with links outside the fully modelled area now generally being coded with fixed speeds. Inside the fully modelled area the buffer network is coded with speed-flow curves as detailed below.

4.5.3 In addition, link lengths in the buffer area and throughout the model have been updated in the new model based on distances derived from GIS.

4.6 Speed flow curves

4.6.1 Speed flow curves are used to relate the average modelled speed along a particular type of link with the number of vehicles. The application of speed flow curves was limited to an area surrounding the detailed model area where flows were to be reasonably represented, as indicated in Figure 4.3. The speed flow relationships were based on those presented in COBA 10.

4.6.2 In SATURN the speed flow relationship is defined by the free flow speed (S0, km/hr), speed at capacity (S2, km/hr), capacity (C, PCU/hr) and the shape of the relationship, which is determined by the power function (N). In SATURN these are attributed by link type through use of a capacity index.

4.6.3 The speed flow curves used in the highway model are shown in Table 4.3 below.

Table 4.3: SATURN Speed Flow Curves

Capacity Index	Link type description	S0 (kph)	S2 (kph)	C (PCU/hr)	No
10	S7.3 Rural (A Rd)	87	45	1640	2.2
11	S7.0 Rural (B Rd)	78	45	1380	2.1
12	S6.5 Rural (C Rd)	67	45	1010	1.8
13	Suburban Single 40mph	61	25	1270	2.3
14	'Small Town 30mph	40	30	880	2.5
15	'Winding Rural Single	50	40	800	2.0
20	D2 Rural (Dual A Rd)	110	45	4360	5.0
21	D2 Suburban Slit Dev	78	35	3460	3.3
22	D2 Suburban Typ Dev	71	35	2540	2.0

Figure 4.3: Extent of Speed Flow Curves

4.7 Simulation Network Coding

- 4.7.1 In the simulation area the assumption is that the effect of junctions is the key determinant on route choice. As such, within this area junction nodes are coded in detail to include the junction type, number of approach lanes, priority/conflicts, signal timings, saturation flows etc. As a result of this approach the delay at junctions by individual turning movements can be modelled as well as junction interaction, e.g. the effect of blocking back of traffic and flow metering.
- 4.7.2 With a large number of junctions in a model it is impractical to calculate a unique saturation flow for each individual movement at each junction. Instead, a series of typical values can be applied during the model build and during the calibration of the model those junctions where the generic approach gives rise to problems can be investigated and values adjusted within acceptable ranges.

Priority Junctions

4.7.3 Standard saturation flows for movements at priority junctions were developed for the rebased highway model, which took into account the approach width, turning radii and visibility on each arm of a junction, with the saturation flow for each individual movement being calculated separately. These have been calculated based on information included in TRRL Report SR 810 and TRRL Report LR 942.

4.7.4 Table 4.4 details the saturation flows that were adopted for major arm unopposed movements at priority junctions in the simulation network. Minor arm and major arm opposed movement saturation flows are shown in Table 4.5.

Table 4.4 Saturation flows (PCU/hr) on priority junction major arm unopposed movements

Nearside/Offside	Approach Width	Entry Width	Downhill/Uphill	Gradient	Turning Proportion	Turning Radius	Movement	Left Turn	Straight	Right Turn
								Sat Flow		
N	3.5	3.5	0	0	1	20	←	1828		
N	3.5	3.5	0	0	1	40	←	1894		
N	3.5	3.5	0	0	0.5	20	↖	1894	1894	
N	3.5	3.5	0	0	0.5	40	↖	1929	1929	
N	3.5	3.5	0	0	0.5	20	↔	1894		1894
N	3.5	3.5	0	0	0.5	40	↔	1929		1929
N	3.5	3.5	0	0	0.333	20	↕	1917	1917	1917
N	3.5	3.5	0	0	0.333	40	↕	1941	1941	1941
N	3.5	3.5	0	0	0	0.1	↑		1965	
O	3.5	3.5	0	0	0	0.1	↑		2105	
O	3.5	3.5	0	0	0.5	20	↗		2029	2029
O	3.5	3.5	0	0	0.5	40	↗		2066	2066
O	3.5	3.5	0	0	1	20	→			1958
O	3.5	3.5	0	0	1	40	→			2029

4.7.5 Two saturation flows for each movement were calculated, based upon turning radius. The turning radius adopted for each movement was determined from reference to aerial photography, available mapping and junction plans.

Table 4.5: Saturation flows (PCU/hr) on priority junction minor arm and major arm opposed movements

Minor Arm			Major Arm Opposed
Left	Ahead	Right	Right
721	721	574	721

4.7.6 The global GAP parameter that defines the minimum gap accepted by a vehicle that gives way at priority junctions (or traffic signals) was set as 2 seconds. The value of GAP at various individual junctions was subsequently overridden during the model calibration process to better represent observed behaviour as described in section 6.4

Signalised Junctions

4.7.7 The saturation flows in Table 4.6 were adopted at signalised junctions. The values displayed are per movement per full lane. Short flared approaches were coded with saturation flows of less than 800 PCU/hr, usually 600 PCU/hr.

Table 4.6: Signalised Junctions Saturation Flows (PCU/hr)

Left flare	Left	Ahead & Left	Ahead	Ahead & Right	Right	Right flare
<800	1800	1900	1950	1900	1850	<800

4.7.8 These values of saturation flow are based on TRRL Report RR67 and assume standard values for lane width, entry width, turning proportion and turning radii to establish a generic set of junction parameters that it was felt represent saturation flows at the average signalised junction. The effect of gradient on saturation flows was ignored.

4.7.9 Signalised junctions either run on fixed timings, or are Vehicle Activated, MOVA controlled or SCOOT controlled. In the case of fixed timings, the SATURN coding is relatively straightforward, with staging, intergreens and stage timings coded as indicated from the available data. Where variable or vehicle actuated signal plans are in operation an equivalent fixed time plan has been calculated based on operational data obtained from Norfolk County Council.

Roundabout Coding

- 4.7.10 The approach taken for signalised and non-signalised roundabouts was different. In the case of signalised roundabouts, relevant signal time data were obtained in the same way as for signalised junctions and, in general, signalised roundabouts were coded as a series of separate nodes.
- 4.7.11 Non-signalised roundabouts, if greater than 28m in diameter, were coded as a series of priority junctions. This allowed for lane gains/drops on the circulating carriageway to be more accurately represented, and was considered to be preferable when modelling non-circular roundabouts – since different link lengths can be modelled between different approaches on the circulating carriageway.
- 4.7.12 Roundabouts with a diameter of less than 28m were modelled as single nodes. Table 4.7 shows the saturation flows adopted at all non-signalised roundabouts, whether coded as a ‘Type 2’ single node roundabout or an ‘exploded’ priority node roundabout. These saturation flows were used on incoming links only, as required at Type 2 roundabouts. Circulating saturation flows on ‘exploded’ roundabouts were coded as per major arm priority links. Saturation flows were calculated based on formulas included in TRRL Report SR 810 and TRRL Report LR 942.

Table 4.7: Saturation flows at Type 2 and Type 5 roundabouts

Approach Width – V (metres)	Average Effective Flare Length – I (Metres)	Entry Width – E (metres)			
		3.5 (1)	7.0 (2)	10.5 (3)	14.0 (4)
3.5 (1)	10	1060	1561	1715	1790
	20	1060	1740	2061	2248
	30	1060	1833	2275	2561
	40	1060	1889	2420	2790
7.0 (2)	10		2121	2621	2776
	20		2121	2801	3121
	30		2121	2893	3335
	40		2121	2950	3481
10.5 (3)	10			3182	3682
	20			3182	3861
	30			3182	3954
	40			3182	4010
14.0 (4)	10				4242
	20				4242
	30				4242
	40				4242

4.7.13 The global GAPR parameter that defines the minimum gap accepted by a vehicle that gives way at a roundabout entry was set as 2 seconds.

Pedestrian crossing

4.7.14 The coding of pedestrian crossings in the model was reviewed during the rebasing and a large number of the previously coded on-demand crossings were removed. Crossings that remained in the model are those where data indicated that there was substantial demand by pedestrians and that activation of the crossing had a significant impact on traffic.

Banned turns

4.7.15 Banned turns were coded using a banned turns file. As the model is validated for each vehicle type, banned turns are unique to a particular vehicle type, e.g. OGVs.

Height and weight restrictions

4.7.16 Height and weight restrictions are included in the model using turn or link based restrictions. Height and weight restrictions were taken as applying to OGVs only.

Bus routes

4.7.17 Bus route and frequency is required particularly in the simulation area in order that the model will recognise the contribution made by buses to total traffic flows on links and at junctions.

4.7.18 Bus routes were coded as end-to-end journeys, this allows for bus turning flows to be taken into account within junction calculations, thus contributing to delays. Details of bus services and frequencies were obtained from the public transport model.

Zones

4.7.19 The zoning system from the existing 2006 model has largely been retained for the 2012 rebase with the only changes being the segregation of known future development sites. The zoning system consists of 413 zones in total. A summary of the number of zones by location is shown below in Table 4.8.

4.7.20 Plans showing the zone system are included in Appendix A.

Table 4.8: Details of zone system

Location	Number of zones
Within Norwich	280
Norfolk	118
External	15
TOTAL	413

4.8 Representation of Park and Ride

4.8.1 There are six Park and Ride sites serving Norwich city centre. The location of these sites is shown in Figure 3.7 and these sites have been included in the model. Park and Ride users will have been intercepted at the Road Side Interview (RSI) cordons as part of the RSI data collection process for the

highway model. Therefore Park and Ride trips are represented in the car matrices.

- 4.8.2 Patronage of Park and Ride is determined in the traffic assignment process. Taking trips going into the city centre as an example, in the traffic model vehicles have the choice of driving all of the way to the city centre and parking in the city centre or driving to the Park and Ride site and catching a bus to the city centre.
- 4.8.3 For a particular origin and destination the choice between using Park and Ride or driving all of the way is determined by the generalised costs of travel between competing routes. These costs are made up of a combination of time, distance and toll/charge.
- 4.8.4 For those vehicles driving all of the way to the city centre:
- Time refers to the drive time to their destination, access time to the car, and access and egress time from parking place to final destination.
 - Distance refers to the driving distance to the city centre
 - Toll/charge refers to the car parking charge in the city centre.
- 4.8.5 For those persons using Park and Ride:
- Time refers to the access time to car at origin, drive time to the Park and Ride site, access and waiting time for the Park and Ride bus, bus journey time and egress time from bus stop to final destination.
 - Distance refers to the distance from the origin to the Park and Ride site (excluding distance from Park and Ride site to the city centre)
- 4.8.6 City centre parking charges were calculated by journey purpose reflecting the different lengths of stay and vehicle occupancies. These were average values across the city centre. A summary of the charges applied in the modelling is included in Table 4.9 below. For commuting the charge is based on all-day parking in a long stay car-park whereas the charge for employer's business and other trip purposes assumes a 4 hour stay in a short-stay car-park.

Table 4.9: Parking Charges (2010 prices)

Journey Purpose	Charge
Commuting	£4.15
Employer's Business/Other	£5.90

Source: MM Calculation: NET-021 44444 Car Park Charges

4.8.7 Charges were applied in two stages with half the value being applied to the inbound trip and half to the outbound trip. In the AM peak charges were only applied to inbound trips and in the PM peak only the outbound trips were charged. In the inter-peak model half the charge was applied to both inbound and outbound trips.

4.8.8 Park and Ride charges have been obtained from NCC. These have been adjusted by purpose to allow for season ticket use by commuters and also to take into account factors such as variations in vehicle occupancy and differences between peak and off-peak fares. A summary of charges applied by journey purpose and modelled period is included in Table 4.10. The application of park and ride charges in the modelling was similar to that described above for parking charges with both inbound and outbound legs attracting an equal portion of the charge.

Table 4.10: Park and Ride Charges (2010 prices)

Journey Purpose	Charge
Commuting (AM/IP/PM)	£2.22
Employer's Business/Other (AM/PM)	£3.16
Employer's Business/Other (IP)	£2.72

Source: MM Calculation: NET-023 44444 Park and Ride

4.8.9 In the assignment process only cars (all journey purposes) are allowed to use Park and Ride. LGVs (employers business) and OGVs are banned.

4.8.10 The restrictions to use of the Park and Ride site by time period are shown in Table 4.11.

Table 4.11: Park and Ride restrictions by Time Period

Time Period	Towards City Centre	From City Centre
AM Peak	Allowed	Banned
Inter Peak	Allowed	Allowed
PM Peak	Banned	Allowed

4.9 Assignment Algorithm

4.9.1 The route choice during a highway assignment is determined by the generalised travel cost incurred on each route. Generalised cost for a particular route between an Origin(O) and Destination (D) is a function of the travel time for a route and the distance travelled on the route plus any fares/tolls for the particular route, as shown in the equation below.

Generalised Cost = $VOT \times \text{Time} + VOC \times \text{Distance} + \text{Tolls}$, where:

- VOT = values of time (pence per minute; PPM)
- VOC = vehicle operating cost (pence per km; PPK)

4.9.2 Tolls in the assignment process include car parking charges in the city centre and Park and Ride charges.

4.9.3 In general, for private trips including cars and goods vehicles, time is the most significant part of the equation, with distance less significant. This relative weighting of time and distance varies depending on the trip purposes e.g. commuter trips will be more time critical whereas leisure trips are more sensitive to distance.

4.9.4 The assignment utilises the Wardrop Equilibrium assignment algorithm which seeks to arrange traffic on congested networks such that the cost of travel on all routes used between each O-D pair is equal to the minimum cost of travel and all unused routes have equal or greater cost.

4.10 Generalised Cost Parameters

4.10.1 SATURN requires values of time and distance for generalised cost to be used by the assignment. The PPM and PPK values used in the assignment were calculated by using Values of Time and Operating Costs from WebTAG (Unit 3.5.6 – February 2013). The OGV (or HGV) values of time in WebTAG represent the driver's value of time; these have been modified by a factor of 2 to also take into account the operators' value of time (in accordance with WebTAG Unit 3.19). The values used in the SATURN model are summarised in Table 4.12 below.

Table 4.12: PPM and PPK values (pence)

Vehicle Class	Purpose	AM		IP		PM	
		PPM	PPK	PPM	PPK	PPM	PPK
Car/LGV	Home Based Work	12.39	7.51	12.29	7.51	12.10	7.51
Car	Home Based Employer's Business	53.83	13.74	52.61	13.74	51.85	13.74
Car/LGV	Home Based Other	15.84	7.51	16.47	7.51	16.92	7.51
Car	Non-Home Based Employer's Business	53.83	13.74	52.61	13.74	51.85	13.74
Car/LGV	Non-Home Based Other	15.84	7.51	16.47	7.51	16.92	7.51
LGV	Non-Home Based Employer's Business	20.66	15.95	20.66	15.95	20.66	15.95
HGV	Employer's Business	35.85	45.63	35.85	45.63	35.85	45.63

Source: MM Calculation NET-123 - 88888 Generalised Costs 7UC

5 Development of Demand

5.1 Overview

- 5.1.1 This section deals with the development of the base year travel demand. For home-based purposes 24-hour production-attraction (PA) matrices are required, with non-home based purposes, including freight being covered by origin-destination (OD) matrices. For assignment, peak hour origin/destination matrices must then be derived, requiring the development of time period factors to be applied to the PA matrices.
- 5.1.2 The highway matrices have been built from a combination of observed and synthetic data.

5.2 Synthetic Matrix Development

- 5.2.1 The synthetic trip matrices for the rebased 2012 model have been based to a large degree on those synthetic matrices developed for the 2006 NATS model. For private vehicles only the previous 2006 tripends have been retained, but for goods vehicles the previous matrices have been used as a basis from which to prepare 2012 trip matrices.

5.3 Synthetic Private Vehicle Matrices

- 5.3.1 For private vehicles the 2006 synthetic tripends derived with CTripend and described in the previous LMVR have been taken from the previous model development and factored by purpose using NTEM 6.2 to give 2012 tripends.
- 5.3.2 Trip distribution models have been developed using the following function:

$$T_{ij} = O_i \frac{B_j \exp(\beta c_{ij})}{\sum_j B_j \exp(\beta c_{ij})}$$

Where

- O_i are the production trip end totals,
 - B_j are the attraction trip end totals
 - C_{ij} is the cost matrix.
- 5.3.3 For each purpose a singly constrained distribution model has been calibrated to represent the average trip length from the National Travel Surveys. The only available local observed data on highway trip length was that collected

from the roadside interview surveys. However, those surveys were originally designed to capture specific movements and would potentially miss out on some shorter trips; therefore they are not considered representative of average trip lengths in the study area. In the absence of any other data the synthetic matrices were calibrated to trip length data from the National Travel Survey. The average trip lengths used for the calibration are shown in Table 5.1 below.

Table 5.1: Target Average Trip Length by purpose

Trip Purpose	Average Trip Length (km)
HB Work	15.8
HB Employers Business (EB)	31.7
HB Education	6.7
HB Shopping	9.2
HB Personal Business (PB)	10.8
HB Recreation / Social	13.7
HB Visiting friends & relatives (for HB trips only)	16.4
HB Holiday / Day trip	44.9
NHB Work	15.8
NHB Employers Business (EB)	31.7
NHB Education	6.7
NHB Shopping	9.2
NHB Personal Business (PB)	10.8
NHB Recreation / Social	13.7
NHB Holiday / Day trip	44.9

Source: MM Calculation SYN-007 NTS Average Trip Length By Purpose

5.4 Synthetic Goods Vehicle Matrices

5.4.1 During previous work on the NATS model a set of goods vehicle matrices for a 2006 base year was developed. For LGVs these matrices were based on an analysis of planning and socio-economic data in addition to observed LGV data from RSI surveys. In conjunction with this, a set of OGV matrices was previously derived from the 2005 DfT's NUTS4 OGV matrix.

5.5 Development of 2012 Goods Vehicle Matrices

5.5.1 The 2006 matrices were used as a starting point from which to develop 2012 matrices. In this regard the 2006 LGV and OGV matrices have been factored

in-line with observations of growth of LGV and OGV traffic (from DfT Road Traffic Statistics – Tables TRA8901a and TRA2501) to give 2012 synthetic goods vehicle matrices. The factors applied are shown in Table 5.2 below.

Table 5.2: 2006 to 2012 Goods Vehicle Growth Factors

	From 2006 to 2012
LGV	+1.9%
OGV	-6.2%

Source: Calculation ref: SYN-009 - Freight Factors 2006 to 2012

5.6 Comparison of Trip Length Distributions

- 5.6.1 A comparison has been carried out between the trip length distribution from the synthetic matrices, compared to the trip length distribution from the observed data set. This is for those OD movements that are fully observed from the OD surveys. The purpose of this comparison is to demonstrate that the synthetically derived trip matrices are reasonably consistent with those derived from observations. Details of these analyses are presented in Appendix C.
- 5.6.2 The charts in Appendix C show a reasonable match between the observed and synthetic matrices for the fully modelled movements, although they also fairly consistently show that the synthetic matrices have proportionally more trips than the observed matrices in the shorter distance bands. This is not wholly unexpected as the RSI surveys will tend to underestimate short distance trips and therefore the distributions of the matrices are considered to be sufficient as an initial input to the calibration of the assignment models.

5.7 Synthetic Matrix Assignment

- 5.7.1 An initial set of 12 hour (average hour) OD matrices was prepared and assigned to the SATURN highway model with a view to comparing the flows resulting from the synthetic matrices with the aggregate screenline and cordon counts. The synthetic matrices were subsequently factored at the sector level to improve consistency with observed screenline counts. The results from an assignment of the finalised synthetic matrices are presented in Appendix D.
- 5.7.2 Table D.1 shows a comparison of link flows across the calibration/validation screenlines and cordons following an assignment of the 12-hour synthetic matrix. Modelled results are presented by direction and by vehicle type and compared against observed 12-hour count data. Differences are colour

coded to indicate discrepancies between the model and the counts of greater than +/-10%.

- 5.7.3 From the results it can be noted that the assignment of the synthetic matrices generally shows a good fit against aggregate screenline counts with most modelled screenlines being within 10% of the counts for all vehicles combined and also for cars only. The radial calibration screenline to the east (screenline C) compares less well against the counts but this RSI screenline should be well represented in the observed build and is therefore not a particular concern. On the northwest screenline (screenline F) in the synthetic matrix assignment the modelled flow is higher than the count in the eastbound direction. The proximity of large model zones in this area could be a factor in this discrepancy, although the screenline is also represented in the observed build so again is less of a concern.

5.8 Observed Matrix Build

- 5.8.1 Observed Road Side Interview (RSI) data from 2006 and 2012 has been used to build an observed demand matrix. RSI sites included in the observed matrix build form three cordons and two screenlines around Norwich. The location of these screenlines together with individual sites on each screenline is shown in Figure 3.1 and Figure 3.2
- 5.8.2 These interviews have largely been conducted in the outbound direction. In order to fully represent trip patterns, interview data has been transposed using the following rules where a return direction interview site does not exist.
- Average trip duration by overall purpose has been estimated (as indicated in Table 5.3.
 - From Home trips have been assumed to have an associated To Home trip later in the day
 - To Home trips have been assumed to have an associated From Home trip earlier in the day
 - Commute From Home trips have had the full trip duration added to the interview time if they occur before 12noon, after that they have had half the trip duration added to account for part time working
 - Commute To Home trips have had the full trip duration subtracted from the interview time if they occur after 3pm, before that they have had half the trip duration subtracted to account for part time working
 - Employer's Business/Other From Home trips have had the average trip duration added to the interview time, and the To Home trips have had the average trip duration subtracted

- Non Home Based trips have had the average trip duration added to the interview time - the assumption being that they will have to go somewhere after the NHB trip

Table 5.3: Return Times

	Trip Duration	Half Trip Duration
Commute	09:00	04:00
Business	03:00	
Other	02:30	

Expansion

- 5.8.3 RSI records were expanded to MCC counts carried out in 2012 and then factored to ATCs.
- 5.8.4 In addition to the expansion factors used to uplift the number of interviews to match the passing counts by vehicle type two sets of additional factors were also applied to the RSI data set during the data expansion process. These were a postcard response bias factor to compensate for issues associated with self-completion postcards and a corridor factor to compensate for those links within the cordons and screenlines where it was not possible to undertake roadside interview surveys.
- 5.8.5 The return rate of postcard forms can vary significantly between travel purposes and user classes. In order to reduce the adverse impact of response bias for the Norwich model, postcard data was adjusted using correction factors that are based on responses from a selected number of sites. When the 2006 and 2012 surveys were conducted, a number of sites were surveyed using both face-to-face interviews and postcards. Some of these were conducted on the same day and during the same time period as each other. These sites provide a source of data for checking and accounting for bias. The correction factors deal with purpose bias only. As survey data is expanded by vehicle type, any bias by vehicle type was automatically corrected in that process.
- 5.8.6 Tests indicated that the sample size for this factor was not sufficient if factors were calculated for each site. Therefore, a global adjustment factor has been produced by time period and survey year. A summary table of the factors derived to account for response bias is included in Appendix E Table E.1.

5.8.7 It was not possible to undertake RSIs on a number of roads crossing the survey cordons for a variety of reasons including safety, physical layout or low flows. In these instances classified counts were available and corridor correction factors were applied to adjacent sites where it was considered that the travel patterns would be representative. A summary of sites where corridor correction factors were applied is shown in Appendix E Table E.2

5.9 Creation of Fully Observed Matrices

5.9.1 The first step in the process was to create 12-hour matrices by purpose for fully observed movements. Observed trips may have been captured by the same cordon more than once or crossed more than one cordon. The ERICA program has been used to combine datasets from multiple cordons. This is essentially a database application that builds trip matrices from origin-destination (OD) data. ERICA allows the merging of data from multiple screenlines where a particular OD movement could be observed at more than one screenline or cordon, in accordance with DfT methodologies, using variance weighted averages.

5.9.2 The matrices are built in ERICA origin-destination format and converted to production-attraction format at a later stage.

5.10 ERICA Set Up

5.10.1 ERICA requires each RSI site to be allocated to a cordon. The ERICA cordon segments are shown in Appendix F Table F.1.

5.10.2 ERICA also requires a set up file to identify those movements that are fully observed and identify which screenline or cordon particular sector to sector movements should be taken from. Fully observed sectors for the matrix build are shown in Table 5.4 for the A and B matrices. The sectors are shown in Figure 5.1. Trips for those sector to sector movements that are not fully observed are derived from the synthetic matrices.

5.10.3 A trip can be picked up from more than one cordon if it crosses multiple cordons. Where particular ODs are observed by more than one cordon/screenline a separate matrix can be built for each set of observations. To account for this, more than one matrix can be built within ERICA. In the case of the Norwich model, two matrices (A and B) are built. The A and B matrix represent two separate observations of the same movement. The A and B matrices are then merged using variance weighting.

Figure 5.1: Sectors

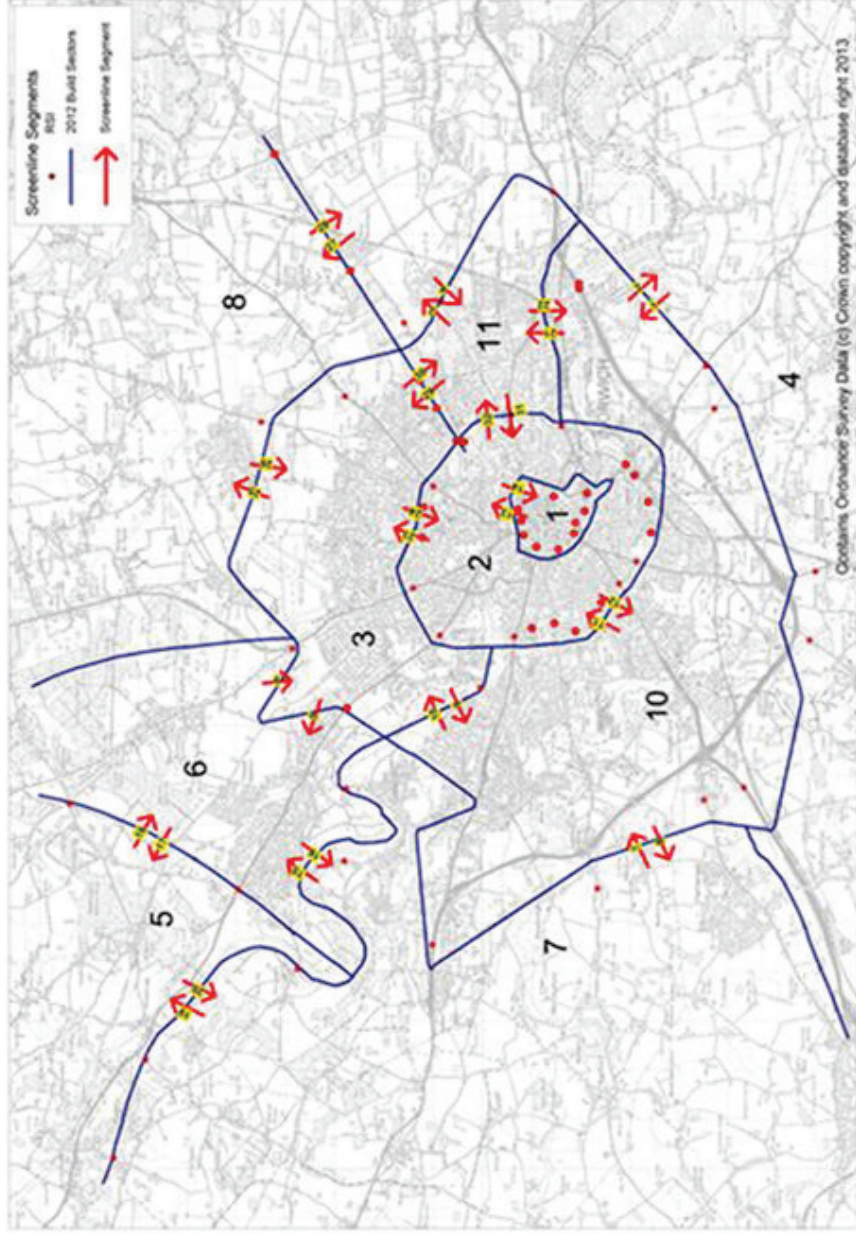

Table 5.4: Fully observed sector to sector movements

OD	1	2	3	4	5	6	7	8	9	10	11	99
1	0	1	1	1	1	1	1	1	1	1	1	1
2	1	0	1	1	1	1	1	1	1	1	1	1
3	1	1	0	1	1	1	1	1	1	1	1	1
4	1	1	1	0	1	1	0	1	0	1	1	0
5	1	1	1	1	0	1	1	0	0	1	1	0
6	1	1	1	1	1	0	1	0	1	1	1	0
7	1	1	1	0	1	1	0	1	0	1	1	0
8	1	1	1	1	0	0	1	0	1	1	1	0
9	1	1	1	0	0	1	0	1	0	1	1	0
10	1	1	1	1	1	1	1	1	1	0	1	1
11	1	1	1	1	1	1	1	1	1	1	0	1
99	1	1	1	0	0	0	0	0	0	1	1	0

1 = Movements that are fully observed

5.10.4 The demand segments specified for the matrix build are shown in Table 5.5

Table 5.5: Demand Segments

Demand Segment	PA/OD	Vehicle Type	Description	Direction
1	PA	Car/LGV	Home Based Work	To Home
2	PA	Car/LGV	Home Based Work	From Home
3	PA	Car	Home Based Employer's Business	To Home
4	PA	Car	Home Based Employer's Business	From Home
5	PA	Car/LGV	Home Based Other	To Home
6	PA	Car/LGV	Home Based Other	From Home
7	OD	Car	Non-Home Based Employer's Business	NHB
8	OD	Car/LGV	Non-Home Based Other	NHB
9	OD	LGV	Non-Home Based Employer's Business	NHB
10	OD	HGV	Employer's Business	Any

5.11 Home-Based Purposes Matrix Build

5.11.1 The home-based elements of the demand matrix are initially built as 12-hour origin destination matrices using the ERICA program. These are network wide, fully observed, matrices. Each 12-hour matrix is factored to 24 hours using a factor calculated by purpose as shown in Table 5.6 below. The factors used have been derived from NTS data that has been locally adjusted using a factor calculated from a sample of ATC data.

5.11.2 From the RSI data both from home and to home trips will have been observed and matrices will initially be built for both of these purposes. To form a true PA matrix the 'to home' trip matrices were transposed to create a second estimate of 'from home' trips. The 'from home' and the transposed 'to home' matrices are merged by taking an average of 'to home' and 'from home' trips. This provides a true PA format 24-hour matrix, one for Home Based Work, one for Home Based Employer's Business and one for Home Based Other.

Table 5.6: 12-24-hour Factors

Purpose	Factor
HB Work - To Home	1.151
HB Work - From Home	1.102
HB EB - To Home	1.247
HB EB - From Home	1.068
HB Other - To Home	1.356
HB Other - From Home	1.210

5.12 Non Home-Based Origin-Destination Matrix

5.12.1 The non-home based purposes (freight is included in this process) are built in 12 hour origin destination format. These are built in ERICA using the processes described in Section 5.10.

5.13 OGV Matrices

5.13.1 In the observed build ordinary goods vehicles (OGV1 and OGV2) were identified separately and ultimately converted to PCUs using factors of 1.9 for OGV1 and 2.9 for OGV2 prior to being combined in a single OGV user class. Subsequently a PCU factor of 2.3 has been used for OGV in the modelling work.

5.14 Creation of Time Period Matrices

5.14.1 The matrices for the various trip purposes were prepared in different ways with home-based purpose matrices ultimately being constructed as 24-hour PA and the other non-home based purposes being peak period OD matrices.

5.14.2 For assignment the matrices were required to represent the peak hour for AM and PM and an average hour for the inter-peak period. To achieve this 24-hour PA matrices were first converted to period matrices and then all the period matrices (including the NHB OD elements) were subsequently factored to represent the relevant peak hour.

5.14.3 The 24-hour PA matrices were converted to AM, IP, PM and OP period matrices using a series of factors derived from traffic count data, the RSI surveys and from NTS as indicated in Table 5.7 below.

Table 5.7: PA to OD conversion factors

Time Period	HBW		HBEB		HBO	
	from Home	to Home	from Home	to Home	from Home	to Home
AM	0.800	0.024	0.408	0.020	0.276	0.055
IP	0.092	0.151	0.491	0.436	0.442	0.435
PM	0.015	0.694	0.037	0.346	0.108	0.248
OP	0.093	0.131	0.064	0.198	0.174	0.262

Source: MM Calculation PA_ODFactors_MX19.xls

5.14.4 For each time period the resulting “from Home” period matrices were then added to the transpose of the “to Home” matrices to form equivalent OD period matrices for the home-based purposes.

5.14.5 Subsequently the period matrices were factored to hourly matrices using values derived from observed traffic count data. The factors applied are presented in Table 5.8.

Table 5.8: Time period to hourly factors

	AM	IP	PM
Car	0.398	0.167	0.392
LGV	0.339	0.167	0.359
OGV	0.315	0.167	0.325

5.15 Observed Matrix Assignment (12-hour)

5.15.1 By combining the individual time period matrices a set of 12-hour observed matrices were produced. The 12-hour observed matrices were assigned to the SATURN network as a check of their suitability for use in the calibration of the base model and also to ensure that there were no problems with the build. The results of these 12-hour (average hour) assignments are presented in Appendix I.

5.15.2 N.B. the observed matrices only contain fully observed trips and therefore screenlines that are crossed by a substantial number of partially observed movements are shown as under-represented in this comparison.

5.16 Merge of Observed and Synthetic Matrices

5.16.1 The 24-hour observed home based matrices are merged with the synthetic 24-hour home based matrices. Where a sector to sector movement is classed as not fully observed and hence not included in the ERICA matrix build, the synthetic trip is taken. Where a sector to sector movement is fully observed and hence included in the matrix build, 90% of the observed cell value is added to 10% of the synthetic cell value. Fully observed movements were identified in Table 5.4.

5.16.2 Matrices for non-home based purposes (including freight) were merged at the 12-hour level using a similar methodology to that adopted for home-based purposes. Following the merge the 12-hour non-home based matrices are subsequently factored back to time period matrices using the factors in Table 5.9.

Table 5.9: 12-hour to period factors for non-home based purposes

Purpose	AM	IP	PM
NHBEB	0.119	0.597	0.284
NHBO	0.093	0.567	0.34
LGV	0.288	0.477	0.234
OGV	0.289	0.565	0.146

5.17 Merged Matrix Assignment (12-hour)

5.17.1 The results from an assignment of the merged 12-hour matrices are provided in Appendix J where Table J.1 shows a comparison of link flows across the calibration/validation screenlines and cordons following an assignment of the 12-hour merged matrix. Modelled results are presented by direction and by

vehicle type and compared against observed 12-hour count data. Differences are colour coded to indicate discrepancies between the model and the counts of greater than +/-10%.

5.17.2 From the results of the merged assignment it can be seen that the majority of screenlines and cordons are modelled within 10% of the aggregate screenline counts particularly for all vehicles combined. For cars the same trends are noted, but are more pronounced than the all vehicle comparison to the detriment of the comparison against screenline counts.

5.17.3 The results of the merged assignment at the 12-hour (average hour) level were considered to be reasonable, although it was recognised that some improvement to the fit against counts would be beneficial to the development of the peak hour models. On the basis of the results of the merged assignment it was therefore considered appropriate to adjust the merged matrices through a process of matrix estimation at the 12-hour level

6 Model Calibration

6.1 General

6.1.1 During calibration various elements of the model were adjusted in order to achieve a good fit between the model and various observations of traffic flow and journey time. As well as changes made to the network, adjustments were also made to the trip matrices through matrix estimation at both the 12-hour level and then subsequently at the peak hour assignment level.

6.1.2 As is typical of similar transport models, the calibration of this updated NATS highway assignment model was undertaken in an iterative manner, with improvements being implemented in such a way that several assignments were undertaken prior to reaching a state in which the model was deemed to be adequately calibrated and validated. As such the results presented below are based on the final assignments – where indicators of goodness of fit have been improved to a point where further effort to adjust the model was not deemed to be worthwhile in the context of preparing a base model suitable for forecasting the effects of the NDR scheme.

6.2 Traffic Flow Calibration Criteria

6.2.1 WebTAG (Unit 3.19) validation criteria for traffic flows have been used as the guideline for assessing the results of the calibrated model. Table 6.1 below shows the model validation criteria according to WebTAG.

6.2.2 According to the guideline, the model validation is measured by assessing the goodness of fit between the assigned hourly flow and the corresponding independent observed data.

Table 6.1: WebTAG Validation Criteria

Criteria and Measures	Acceptability Guidelines
Assigned Hourly flows compared with observed flows	
1. Individual flows within 15% for flows 700-2700 vph	>85% of cases
2. Individual flows within 100 vph for flows < 700 vph	
3. Individual flows within 400 vph for flows > 2700 vph	
4. Total screenline flows (normally > 5 links) to be within 5%	All (or nearly all) screenlines
5. GEH statistic	
i. Individual flows: GEH < 5	> 85% of cases
ii. Screenline (+) totals: GEH < 4	All (or nearly all) screenlines
Modelled journey times compared with observed times	
6. Times within 15% (or 1 minute, if higher)	> 85% of routes

Source: WebTAG Unit 3.19 Tables 1, 2 and 3

6.2.3 The goodness of fit was assessed by estimating the GEH value at the individual calibration points. The GEH formula is as follows:

$$GEH = \sqrt{\frac{(M - O)^2}{(M + O)/2}}$$

Where:

- M = modelled flow (vehicles per hour);
- O = observed flow (vehicles per hour)

6.2.4 These criteria have been used for testing the model against data used in model building, as part of the calibration process, as well as testing the model against independent data as part of the validation process (described separately in Chapter 7)

6.3 Traffic Count Dataset for Matrix Calibration

6.3.1 As noted in sections 3.9 and 3.10, seven cordons and screenlines were adopted for the matrix calibration process. These cordons and screenlines were all used in the matrix build process. The following screenlines were used:

- Inner Ring Road Cordon (A) – just inside the Inner Ring Road
- Outer Ring Road Cordon (B) – Just inside the Outer Ring Road
- North East Screenline (C) – radial screenline to north east of Norwich
- Outer cordon (D) – Around the outskirts of Norwich
- River Screenline (E) – along the River Wensum
- North West Screenline (F) – to the north west of Norwich
- North/South Screenline (J) – bisecting Norwich town centre

6.3.2 In addition to the above screenlines, 4 sites on the intermediate validation cordon (H) were also used in the model calibration (sites H8, H9, H10 and H11).

6.3.3 The screenlines and cordons are illustrated in Figure 3.5. In addition to these, a series of counts not on screenlines or cordons which intercepted trips in between screenlines and cordons were used for calibration, the locations of these are shown in Figure 3.4.

6.4 Network Calibration

6.4.1 During the period of model calibration various elements of the network were reviewed following comparisons of model data against observations of traffic counts and journey times. In addition, ongoing checking of the model network coding also revealed improvements that could be made to the representation of the highway beyond the confines of the generic approach adopted for the initial coding as described in Section 4.7.

6.4.2 Network calibration was driven by aiming to achieve a good fit between the modelled and observed journey times and link flows. Modifications made to the network included changes to zone centroid loading points, signal timings, priority junction/roundabout parameters and complex coded junctions.

6.4.3 *Zone-centroid loading points* - in the initial network coding an approach was adopted whereby each model zone was coded with a single zone centroid connector. This approach was preferred as multiple connectors can lead to model instability, particularly when running matrix estimation. However, a consequence of this approach was that in a number of cases the zone access

point had insufficient capacity to accommodate traffic demand and trips were effectively trapped on zone connectors, unable to access the network and leading to unrealistic delays.

- 6.4.4 To alleviate this issue some problem connectors were coded with additional capacity to reflect the fact that the single modelled access was acting as a proxy for several entries onto the network in actuality. In other cases, and where deemed appropriate, additional connectors were coded to achieve a capacity increase. This latter approach was generally only applied to larger model zones, where it was unrealistic to expect traffic to load at a single point without causing downstream problems on the network itself.
- 6.4.5 *Signal Timings* - The signal timings used in the original coding were provided by NCC and in many cases were provided as a series of operating parameters rather than fixed plan timings. As a result during the calibration it was necessary to review many of the signalised junctions (generally within the confines of the operational parameters) to ensure that junction operation within the model matched as well as possible with observations, both in terms of delay and throughput of traffic.
- 6.4.6 *Priority Junction/Roundabout Parameters* - The generic approach to the coding of priority junctions and roundabouts enabled a level of consistency to be achieved across the simulated network. However, at some of the major priority junctions/roundabouts within the model the generic approach to coding did not provide a particularly good representation of how these junctions operated. This was particularly the case for the congested roundabouts such as those on the inner and outer ring roads
- 6.4.7 *Complex Junction Coding* - Several complex junctions consisting of many links and nodes are included in the NATS model and during the course of the model calibration it was necessary to ensure that these behaved in a manner consistent with observations. To achieve this it was occasionally necessary to increase the complexity of junction coding to allow individual lanes to be coded separately or to allow flared approaches to be represented more accurately. This was achieved through the introduction of additional nodes and links and in general enabled traffic streams with different behaviours to be separated.

6.5 Matrix Estimation from counts (12-hour level)

- 6.5.1 Following the initial assignment of the 12-hour merged matrices described in section 5.17. it was considered appropriate to attempt to improve the fit of the modelled flows against observations prior to splitting the matrices into three

separate hourly time periods (AM, IP and PM) and calibrating at the hourly level.

6.5.2 Matrix estimation (ME) was undertaken within SATURN using the SATPIJA and SATME2 modules and was based on counts by vehicle type (car, LGV, HGV) aggregated across screenlines by direction (the two town centre cordons A and B were omitted from the counts due to concerns that routing could influence the flows across these two cordons over the 12-hour period). To ensure a reasonable level of convergence for the matrix estimation process it was established through testing that nine iterative loops of SATURN, SATPIJA and SATME2 were required. The results from testing are illustrated in Figure 6.1 below, which shows a plot of the proportion of ij pairs where trips change by less than 5% as a result of matrix estimation, between consecutive loops of the matrix estimation process.

Figure 6.1: Convergence of ME process – Proportion of ij pairs where trips change by less than 5% by ME loop

6.5.3 Following a satisfactory result from the 12-hour matrix estimation process the output 12-hour matrices were used along with the 12-hour prior matrices to adjust the hourly prior assignment matrices on a pro-rata basis. Following this

the calibration of the AM, inter-peak and PM models was undertaken. However, in the course of calibrating the three hourly models various elements of the network were modified and as such it was considered appropriate to revisit the 12-hour matrix estimation process iteratively throughout the various stages of model calibration.

- 6.5.4 The results from the final run of matrix estimation at the 12-hour level are presented in Appendix K
- 6.5.5 Table K.1 shows a comparison of link flows across the calibration/validation screenlines and cordons following the application of matrix estimation at the 12-hour level. Modelled results are presented by direction and by vehicle type and compared against observed 12-hour count data. Differences are colour coded to indicate discrepancies between the model and the counts of greater than +/-10%.
- 6.5.6 From the results in Table K.1 it can be noted that the comparison against aggregate screenline counts shows that at the 12-hour level the model matches the observations reasonably well. Compared to the results of the merged matrices (shown in Appendix J) it can be seen that matrix estimation has had a positive impact on the fit of the model, particularly for cars.
- 6.5.7 Screenline F to the northwest is an exception to this general trend although the difficulties at this location are considered to be a consequence of the coarse zoning adjacent to this screenline that makes it difficult to model trips across it accurately.

6.6 Analysis of the effects of matrix estimation

- 6.6.1 To understand the changes that matrix estimation had made to the prior matrix and to ensure that the effects were reasonable, it was necessary to undertake various analyses. These included regression analyses of both cell values and tripends, comparisons of trip length distributions and comparisons of sector to sector movements.
- 6.6.2 Table 6.2 below summarises the tests undertaken to understand the difference between the prior and post matrix estimation matrices. It was agreed during the scoping of the model that these targets were challenging and would not be considered as strict pass and fail criteria.

Table 6.2: Tests of Significance of Matrix Estimation Changes

Measure	Benchmark Criteria
Matrix zonal cell values	Slope within 0.98 and 1.02 Intercept near zero R2 in excess of 0.95
Matrix zonal trip ends	Slope within 0.99 and 1.01 Intercept near zero R2 in excess of 0.98
Trip length distributions	Means within 5% Standard deviations within 5%
Sector to sector level matrices	Differences within 5%

Source: WebTAG Unit 3.19 Highway Assignment Modelling

6.6.3 Linear regression analysis of the post and prior ME matrices have been undertaken within SATURN based on the following expression: $y=A+Bx$

6.6.4 The results of these analyses are presented as the intercept and slope coefficients 'A' and 'B' along with the R² coefficient of determination.

6.6.5 Table 6.3 below shows a comparison at the cellular level with Table 6.4 and Table 6.5 showing comparisons for origins and destinations respectively. Data cells in the tables have been colour coded to indicate compliance with the targets defined in Table 5.2 and as can be seen the effects of matrix estimation at the 12-hour level are generally all within the prescribed limits except for LGVs where the slope exceeds the target for both origin and destination tripends.

- 6.6.6 Plots showing comparisons of the trip length distribution pre and post matrix estimation at the 12-hour level are presented in Appendix L.
- 6.6.7 From the plots it is evident that whilst matrix estimation at the 12-hour level has had some effect on the trip length distributions, none of the changes noted represent a significant impact for any of the modelled user classes.
- 6.6.8 Analyses of sector to sector movements before and after matrix estimation are presented in Appendix M. The results of the analysis generally show relatively modest changes in movements between sectors with changes being varied in nature and no particular trends standing out. As a result of this it was considered that the effects of matrix estimation had not had a detrimental effect on the matrices.

6.7 Matrix Estimation from counts (Peak Hour level)

- 6.7.1 Following the initial successful application of matrix estimation at the 12-hour level in which screenline flows were generally found to be either close to, or within 15% of the observations, the post estimation 12-hour matrices were considered to form a reasonable platform from which to develop the peak hour matrices for detailed model calibration and validation.

6.7.2 Having split the 12-hour matrices into assignment matrices for the AM peak hour, the PM peak hour and an average hour in the inter-peak (as described in Section 5.14, the process adopted for matrix estimation from counts was similar to that used for the 12-hour matrix estimation, although counts were applied individually rather than being grouped into screenlines as this was found to give a better result. As with the 12-hour matrix estimation approach described above the output matrices were taken from the ninth iterative loop of the SATURN, SATPIJA, SATME2 process.

Analysis of the effects of matrix estimation

6.7.3 As with matrix estimation at the 12-hour level, linear regression analysis has been undertaken following matrix estimation at the peak hour level to allow the pre and post matrix estimation matrices to be compared and any large changes to be understood.

6.7.4 The results of these analyses are presented in Table 6.6 to Table 6.14 below, which indicate the intercept and slope coefficients 'A' and 'B' along with the R² coefficient of determination. Tables are presented for the AM Peak, the inter-peak and the PM peak, with data cells in the tables being colour coded to indicate compliance with the notional targets defined in Table 6.2.

6.7.5 It can be seen from the tables above that the parameters from the regression analyses mostly fall within the prescribed limits for each of the three time periods. Where values exceed the WebTAG guidelines they generally do so only by a small margin and changes made to the matrices by the matrix estimation process are not considered to give cause for concern in the context of the calibration of the model.

Trip Length Distribution

6.7.6 Plots showing comparisons of the trip length distribution pre and post matrix estimation at the peak hour level are presented in Appendix N.

6.7.7 In general the plots indicate that whilst matrix estimation at the peak hour level has had some impact on the trip length distribution, the impact of this is relatively slight in all the modelled time periods with most variations being minor in nature.

Sector Analysis

6.7.8 Analyses of sector to sector movements before and after matrix estimation are presented in Appendix O (sectors are as per those used for the 12-hour analysis and are as indicated in Appendix M. Naturally, at the individual user class level the changes resulting from matrix estimation have caused a number of changes at the 12 sector level that are significantly greater than the 5% guide given in Table 6.2 above. However, this could be in part a consequence of the relatively fine sector system used for the comparison. On the whole it is considered that the results of the analysis generally show relatively modest changes in movements between sectors with changes being varied in nature and no particular trends standing out. As a result of this it is considered that the effects of matrix estimation have not had a detrimental effect on the matrices.

6.8 Conclusions

6.8.1 A robust approach to estimating the matrices has been followed, taking into account the impact of changes at both the 12-hour and the peak hour level. The results from the analysis of the estimated matrices indicate that the degree of change from the prior matrices are, for the most part within, or close to the challenging targets set out in WebTAG guidance.

PAGE NOT USED

7 Model Validation

7.1 General

- 7.1.1 Following the model calibration described in Chapter 6 the results from the final peak hour assignments are presented below. Comparisons by peak hour for model flows and journey times against observations are presented along with key statistics from the assignments to demonstrate the robustness of the results.
- 7.1.2 The majority of the model results are presented in the appendices with flow comparisons for calibration and validation screenlines summarised in Appendix R (with detailed results in Appendix S) and journey time charts in Appendix T.

7.2 Assignment Model Convergence and Stability

- 7.2.1 An assignment model can be monitored using a variety of indicators to assess the degree to which the assignment process has converged;
- Global stability indicators, based on comparison between successive iterations of network-wide values of total journey time, total journey distance, total or average travel costs or average speeds.
 - Disaggregate stability indicators, based on absolute changes in values of individual link flows, costs or times, origin-destination costs of a combination of these.
 - Proximity indicators, reflecting how close the current flow and cost pattern is to the assignment objective.
- 7.2.2 In general, iterative methods for reaching equilibrium will not converge absolutely. Rather, it is necessary to demonstrate that the model has achieved convergence to an acceptable level to be able to produce stable, consistent and robust model results. Care needs to be exercised to distinguish between convergence and stability. Stability can be achieved without there being convergence to a solution.
- 7.2.3 It was decided that the criteria from WebTAG (Unit 3.19) should be used for this study although in practice stricter criteria were applied to the assignments such that the convergence exceeded the requirements of WebTAG. In particular, the measurement of proximity using the Gap statistic, which is required to be below 0.1% since the model is to be used with variable demand modelling (via the use of DIADEM) and possibly economic appraisal.

7.2.4 Other indicators of model stability included the following:

- Percentage flow (changing less than 1%) for more than 98% of links.
- Relative Average Absolute Difference (RAAD) in link flows less than 1%
- Average Absolute Difference (AAD) in link flows less than 1 vehicle per hour

7.2.5 A summary of the convergence achieved for the three peak hour models is provided in Appendix P which shows the models are very well converged.

7.3 Route Analysis

7.3.1 To provide confidence that the highway model is assigning trips along appropriate routes a series of select link analyses were undertaken in SATURN. The results of these analyses are presented in Appendix Q and are generally as expected with traffic routeing in a logical manner.

7.3.2 Directional plots are shown for the AM and PM peaks for the following sites:

- A47 east of Postwick Junction
- A47 west of Longwater Interchange
- A11 west of Thickthorn Junction

7.4 Flow Comparisons

7.4.1 The results from the model flow calibration and validation are presented in summary form below for 'all vehicles' and 'cars' with a summary by screenline provided in Appendix R. A detailed breakdown of each screenline is provided in Appendix S where comparisons for individual counts are presented by screenline for each of the three time periods.

Calibration Screenlines

7.4.2 The calibration and validation used the guidelines set out in WebTAG (Unit 3.19), which were previously summarised in Table 6.1.

7.4.3 Table 7.1 shows the results for all vehicles combined across the calibration screenlines with Table 7.2 giving the equivalent comparison just for cars.

Table 7.1: Summary of screenline flow calibration results (All Vehicles)

Criteria	Cases	AM	IP	PM	Target
Total screenline within 5% of observed	15 (16 IP)	13	11	13	All or nearly all screenlines
Total screenline flow GEH<4	15 (16 IP)	12	16	13	All or nearly all screenlines
Individual link flows (proximity)	171	91%	98%	94%	>85% of cases
Individual link flows GEH<5	171	86%	94%	90%	>85% of cases

Table 7.2: Summary of screenline flow calibration results (Cars)

Criteria	Cases	AM	IP	PM	Target
Total screenline within 5% of observed	15 (16 IP)	14	13	14	All or nearly all screenlines
Total screenline flow GEH<4	15 (16 IP)	14	16	14	All or nearly all screenlines
Individual link flows (proximity)	171	93%	98%	96%	>85% of cases
Individual link flows GEH<5	171	87%	95%	92%	>85% of cases

Source: MM Calculation CAL-462 - Link Flow Summary - Peak_Hour_ME_060813

7.4.4 For the purposes of summarising the level of calibration across the screenlines, a total of 15 screenlines are defined in the AM and PM Peak hours (seven screenlines in two directions and the Park & Ride screenline in a single direction) and 16 screenlines for the Inter Peak (eight screenlines in two directions).

7.4.5 With reference to the full calibration and validation results presented in Appendix S nearly all of the calibration screenlines achieve a GEH value of less than 4 in each of the three modelled periods.

7.4.6 In the AM Peak, 12 of the 15 screenlines (both directions considered separately) calibrate with GEH values of less than 4, while this figure increases to 13 of the 15 screenlines in the PM Peak. All 16 screenlines calibrate with GEH values of less than 4 in the Inter Peak.

7.4.7 Importantly, the most critical screenlines in the context of the NDR scheme (Outer Cordon (D) and North/South (J)) both calibrate well in each modelled period.

7.4.8 It is also worth noting that along the screenlines that do not achieve an overall GEH of less than 4, the vast majority of individual count sites satisfy the calibration criteria. For example, whilst the inbound Outer Ring Road

screenline does not achieve a GEH of less than 4 in the AM Peak, of the 24 individual count sites that constitute the screenline only three of these fail to achieve the relevant calibration criteria.

7.4.9 This is also reflected in the calibration results at the individual link level where it can be seen that more than 85% of links achieve the link-based calibration criteria of a GEH value of less than 5 in each modelled period.

Validation Screenlines

7.4.10 Similarly to the calibration flow comparisons above the tables below show the equivalent statistics for the validation screenlines. Whilst there is a degree of overlap, these screenlines have not been used in the model calibration and therefore provide an independent set of data against which the model flows can be validated. As the data used for validation has not been used in model building the comparison between observations and the model is naturally not as close as for the calibration screenlines detailed above.

7.4.11 Table 7.3 presents a summary of the validation results for all vehicles with the comparison for cars shown in Table 7.4.

Table 7.3: Summary of screenline flow validation (All Vehicles)

Criteria	Cases	AM	IP	PM	Target
Total screenline within 5% of observed	6	4	4	5	All or nearly all screenlines
Total screenline flow GEH<4	6	4	5	5	All or nearly all screenlines
Individual link flows (proximity)	58	84%	84%	84%	>85% of cases
Individual link flows GEH<5	58	81%	78%	86%	>85% of cases

Table 7.4: Summary of screenline flow validation (Cars)

Criteria	Cases	AM	IP	PM	Target
Total screenline within 5% of observed	6	5	4	5	All or nearly all screenlines
Total screenline flow GEH<4	6	5	5	5	All or nearly all screenlines
Individual link flows (proximity)	58	86%	84%	84%	>85% of cases
Individual link flows GEH<5	58	86%	81%	86%	>85% of cases

Source: MM Calculation CAL-462 - Link Flow Summary - Peak_Hour_ME_060813

7.4.12 For the purposes of summarising the model validation on the screenline basis, a total of 6 validation screenlines are defined (three screenlines in both directions).

7.4.13 Four of the six screenlines validate in the AM Peak, while five of the six validate in both the Inter Peak and PM Peak models.

7.4.14 Two of the three screenlines (the North East and the Outer Cordon screenlines) validate in both directions in each of the three modelled periods.

7.4.15 The North West validation screenline (Screenline I) does not achieve the screenline validation criteria in either direction in the AM Peak or in the northeast direction in the Inter Peak and PM Peak. However, on an individual count site basis the screenline can be seen to validate well. For example, only one site has a GEH of more than 5 in the northeast direction in the AM Peak and no sites have a GEH of more than 5 in the opposite direction. Similarly, only one individual site has a GEH value of more than 5 in the PM Peak in the northeast direction.

7.5 Journey Time Validation

7.5.1 In addition to the validation of link flows the model is also validated against observed journey times along a series of set routes. The routes used are described in section 3.11 and shown graphically in Figure 3.6. The tables below summarise the results of the journey time validation whilst detailed plots of each of the journey routes for each of the time periods are presented in Appendix T.

7.5.2 A summary of the journey time validation for all time periods is shown in Table 7.5 with detailed summaries of the AM peak, inter peak and PM peak models provided below.

Table 7.5: Journey Time Validation Summary

Time Period	Number of Routes	Number Achieving Validation Criteria	Percentage Achieving Validation Criteria
AM Peak	22	17	77%
Inter Peak	22	22	100%
PM Peak	22	17	77%

- 7.5.3 Table 7.6 below provides a summary of the AM peak journey time validation with detailed plots of the journey time profiles being provided in section Appendix T.
- 7.5.4 From Table 7.6 it can be seen that 17 of the 22 journey routes in the AM peak hour satisfy the WebTAG criteria of being within 15% of the observed time. Routes that fall outside the criteria include Route 4 anti-clockwise; Route 6 (northbound); Route 7 (southbound); Route 8 (eastbound) and Route 10 (southbound). In all cases the modelled journey time is faster than the observations, although in the case of Routes 7 and 8 the modelled time is only just outside the 15% criterion.
- 7.5.5 On closer inspection of the route profiles (in Appendix T) it can be noted that the routes highlighted above, whilst being fast over their entire length, are generally too fast over quite short sections and that the vast majority of the routes by length track the observations quite closely.
- 7.5.6 For Route 4 clockwise (Inner Ring Road) the first 2km section leading up to the junction with the A11 St Stephens is too fast in the model, but the remainder of the route can be seen in Figure T.7 to track the observations at a constant offset, indicating that the remainder of the route matches closely with the observations.
- 7.5.7 Similarly, Route 6 northbound (Ipswich Road) can be seen in Figure T.12 to be too fast in the model up to the Outer Ring Road but after this point the rest of the route into town mirrors observations well.
- 7.5.8 Route 7 southbound covers the A11 route out of Norwich. The profile for this route is indicated in Figure T.13 where it can be noted that the section that is too fast in the model is from the Outer Ring Road to the start of the dual carriageway section (a length of approximately 1.5km). The rest of the route can be seen to match the observations well.
- 7.5.9 The profile for Route 8 eastbound (Dereham Road) is shown in Figure T.16 and indicates that the model is too fast overall on this route. However, on inspection of the journey time profile it can be seen that the route generally

follows the observations closely except for a short section at around 3.5km. This point represents the signalised junction of Dereham Road and Norwich Road where the model is under-representing eastbound delay in the AM peak.

7.5.10 Route 10 southbound (A140 Cromer Road) is shown in Figure T.20. The graph shows that the modelled times deviate from observations after approximately 2.5km. This portion of the curve represents the southbound approach to the Boundary Junction with the Outer Ring Road. Delays on this approach are lower than observations but elsewhere this route tracks the journey time profile reasonably well.

Table 7.6: AM Peak Journey Time Validation Summary

AM Peak		% routes meeting DMRB criteria (AM) 77%				
Route	Name	Direction	Journey Time (minutes)			% Difference
			Observed	Modelled	Difference	
AM Peak

7.5.11 Table 7.7 below shows the journey time validation summary for the inter-peak period. As can be seen from the table and from the charts in Appendix T, the journey times reproduced by the inter-peak model are a good match to the observations.

Table 7.7: Inter-Peak Journey Time Validation Summary

Inter-Peak		% routes meeting DMRB criteria (IP)				100%
Route	Name	Direction	Journey Time (minutes)		Difference	% Difference
			Observed	Modelled		
Inter-Peak						
Route 1	A47 Brundall Roundabout to A47 Easton Roundabout	WB	14.22	13.49	-0.73	-5%

Peak_Hour_ME_060813_Journey_Time_Validation_AvgLinkTime_IP

7.5.12 From Table 7.8 it can be seen that 17 of the 22 journey routes in the PM peak hour satisfy the WebTAG criteria of being within 15% of the observed time. Routes that fall outside the criteria include Routes 3 and Route 4 in both directions and Route 10 northbound. Of these routes both Route 3 and 4 clockwise, only narrowly fall outside the 15% target.

7.5.13 From the graphs in Appendix T it can be seen that Route 3 clockwise (Outer Ring Road) and both directions of Route 4 (Inner Ring Road) show similar trends with modelled journey times being marginally too fast throughout the

route. This is attributable to the model slightly underrepresenting the observed delays at the roundabout junctions on the Inner and Outer Ring Roads.

7.5.14 Route 3 anti-clockwise, whilst still being too fast overall is affected to a greater extent by delays at the A140 Cromer Road (Boundary Junction) shown around 8km into the route on Figure T.50 where the observed delays are not fully represented in the model.

Peak_Hour_ME_060813_Journey_Time_Validation_AvgLinkTime_PM

7.6 Summary

- 7.6.1 The new 2012 NATS model accurately reproduces flows across key screenlines and at locations in respect of the assessment of the NDR scheme.
- 7.6.2 The link flow calibration indicates that flows across the calibration screenlines meet WebTAG criteria in terms of total flow across the screenline and individual link flows. In terms of validation, the model only marginally fails to meet the full WebTAG flow criteria.
- 7.6.3 The journey time validation indicates that modelled speeds are representative on key routes in the modelled area. The discrepancy with observed journey times in the AM and PM peak hours is considered to be acceptable on the basis that the majority of links over which journey times have been compared are reasonably consistent with observations and that where overall journey time routes do fall outside the prescribed limits this is generally as a result of short sections, or single junctions, where delay has not been fully represented in the model
- 7.6.4 On the basis of the results set out in this chapter, it can be concluded that the model forms a reasonable basis for forecasting the impact of the NDR scheme

8 Conclusions

- 8.1.1 Mott MacDonald has been appointed by Norfolk County Council (NCC) to develop and update the existing (NATS) transport model of Norwich for the purposes of supporting the promotion of the Norwich Northern Distributor Road (NDR).
- 8.1.2 Models have been developed to represent the AM peak hour (08:00-09:00), an average hour in the inter-peak (10:00 – 16:00) and the PM peak hour (17:00 – 18:00).
- 8.1.3 Trip matrices have been prepared in line with current guidance based on both observed and synthetic data. Details of checks undertaken at key stages in the development of the matrices are presented in the report to ensure that provenance of the matrices is maintained. Checks include analysis of the observed and synthetic matrices prior to merging and, subsequent to merging, comparisons with counts before applying matrix estimation. Analyses of the effects of matrix estimation are also documented.
- 8.1.4 The model convergence meets WebTAG criteria in all time periods.
- 8.1.5 The model achieves a good level of flow calibration with results indicating a close match to observations on the calibration screenlines and for individual link counts, with the WebTAG criteria for GEH and flow proximity being met in all time periods for both all vehicles and cars.
- 8.1.6 Flow validation has been undertaken against independent data and assessment of the validation process shows that the model also achieves a good level of flow validation in each of the modelled time periods, meeting many of the validation criteria and is close to meeting the WebTAG criteria in other cases.
- 8.1.7 The journey time validation is considered to be reasonably good with the model recreating journey times that are representative on key routes in the modelled area. The discrepancy with observed journey times in the AM and PM peak hours is considered to be acceptable on the basis that the majority of links over which journey times have been compared are generally consistent with observations and that where overall journey time routes do fall outside the acceptability guidelines this is generally as a result of short sections, or single junctions, where delay has not been fully represented in the model.

- 8.1.8 In conclusion, it is considered that the base year highway assignment models developed for the 2012 NATS transport model demonstrate a good representation of traffic behaviour in the study area and form a robust basis from which future year forecasts for the NDR scheme can be developed.

9 Glossary of Abbreviations

ATC	Automatic Traffic Count
DfT	Department for Transport
DIADEM	Dynamic Integrated Assignment and Demand Modelling - software released by the Department for Transport
DMRB	Design Manual for Roads and Bridges – a Highways Agency publication setting out guidance and good practice for design and appraisal of road schemes
COBA	Dft’s Cost-Benefit Analysis tool
EB	East Bound or Employer’s Business
ERICA	The Department for Transport’s Matrix builder software
GAP	Minimum gap (in seconds) accepted by a vehicle which gives way at priority junctions or traffic signals. Also a measure of Wardrop equilibrium assignment convergence
GAPR	As GAP above in relation to junctions but for entry onto roundabouts
GEH	Statistical tool to measure closeness of model to observed flows
GIS	Geographic Information System - designed to capture, store, manipulate, analyse, manage, and present all types of geographical data
GPS	Global Positioning System
HA	Highways Agency
HB	Home-based
HBEB	Home-based Employers Business
HBO	Home-based Other
HBW	Home-based Work
HGV	Heavy Goods Vehicle
LGV	Light Goods Vehicle

LINVAL	DfT Link flow validation program referenced in the ERICA Manual
LMVR	Local Model Validation Report
MATVAL	DfT matrix building program referenced in the ERICA Manual
MCC	Manual Classified Count (for a link)
MCTC	Manual Classified Turning Count
ME	Matrix Estimation
MOVA	Microprocessor Optimised Vehicle Actuation
NATS	Norwich Area Transportation Strategy
NB	North Bound
NCC	Norfolk County Council
NDC	Nationwide Data Collection (company specialising in traffic surveys)
NDR	Norwich Northern Distributor Road
NHB	Non-home-based
NHBEB	Non-home based Employer's Business
NHBO	Non-home –based Other
NTEM	National Trip End Model
NTS	National Travel Survey
OD	Origin Destination
OGV	Other Goods Vehicle
OGV1	A sub-category of OGV. Includes all rigid vehicles over 3.5 tonnes gross vehicle weight with two or three axles
OGV2	A sub-category of OGV. Includes all rigid vehicles with four or more axles and all articulated vehicles
OP	Off-peak
PA	Production-attraction

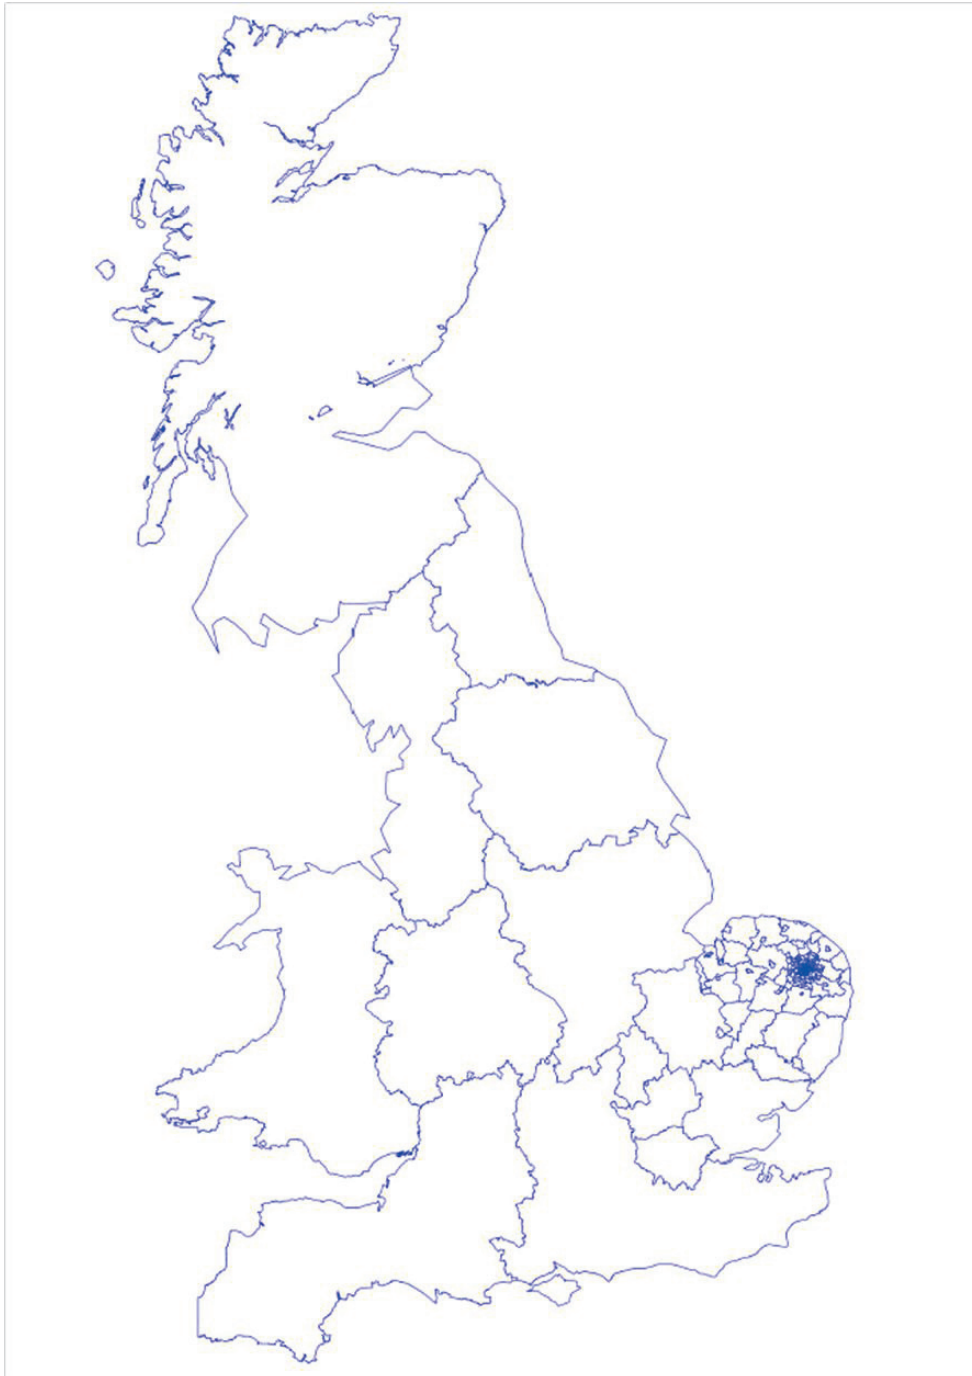

PCU	Passenger Car Unit
RSI	Road Side Interview
SATPIJA	Part of the SATURN suite of programs used to determine the proportion of trips for each ij movement on a particular link
SATME2	Part of the SATURN suite of programs used for matrix estimation (Matrix Estimation from Maximum Entropy)
SATURN	Simulation – Assignment model of Traffic on Urban Road Networks software
SB	South Bound
SCOOT	Split Cycle Offset Optimisation Technique
SRN	Strategic Road Network
TAM	Traffic Appraisal Manual
TRADS	Traffic flow Data System – the Highways Agency’s database of traffic count data
TRRL	Transport and Road Research Laboratory
VISUM	Transport modelling software used (in this case) for public transport modelling
WB	West Bound
WebTAG	Web-based Transport Analysis Guidance produced by the Department for Transport

1 Key Summary

1.1.1 The primary aim of the public transport model is to provide:

- Accurate representation of public transport usage in both base and forecast years;
- Changes in costs and demand for public transport to feed into the demand model to assess levels of modal transfer.

1.1.2 The model has been developed from surveys that have been carried out over a number of years, most recently surveys of bus patronage were carried out in 2013. The model represents bus and rail services and patronage in Norwich for a base year of 2012.

1.1.3 The model represents the AM peak hour (08:00-09:00), an average inter-peak hour (10:00-16:00) and the PM peak hour (17:00-18:00) which are consistent with the highway assignment model.

1.1.4 The model has been very successfully calibrated, but in doing this it was not possible to independently validate the assigned flows as all the available on-board count information was used for calibration. This was judged to be the best use of the available data.

1.1.5 Given the role of the model in the appraisal of the Norwich Northern Distributor Road (NDR), it is considered that the public transport model provides a good representation of base year supply and demand as part of the transport model forecasting system.

2 Introduction

- 2.1.1 Mott MacDonald (MM) has been appointed by Norfolk County Council (NCC) to assist with the development and appraisal of the Norwich Northern Distributor Road, known as the NDR or referred to as the Scheme.
- 2.1.2 The Scheme would be a dual carriageway all-purpose strategic distributor road, to be classified as the A1270 Principal Road, which would link the A1067 Fakenham Road near Attlebridge, to the A47 Trunk Road (T) at Postwick. This will be over a length of approximately 20.4km.
- 2.1.3 The NDR is a project of national significance which requires a Development Consent Order (DCO) under the Planning Act 2008 and this formal planning process began in early 2013. It is currently anticipated that the process will be completed in time for the NDR scheme to start construction in 2015 and to be opened in 2017.
- 2.1.4 This document is one of a number that support the DCO, each of which has its own unique document number, and should therefore be read in conjunction with the other documentation. The proposed layout of the NDR is shown in the General Arrangement Plans contained in document number 2.6, whilst the full needs case for the NDR is explained in the Statement of Reasons (document 4.1) and the Environmental Statement (document 6.1).
- 2.1.5 Norfolk County Council (NCC) submitted a Major Scheme Business Case (MSBC) for the Norwich Northern Distributor Road (NDR) to the Department for Transport (DfT) in July 2008. Programme Entry for the scheme was granted in January 2010.
- 2.1.6 In October 2010 as part of the Government's Comprehensive Spending Review, the DfT reviewed the funding of all major local transport schemes. The outcome of this review was that the NDR was included in a Development Pool of schemes. Despite these schemes offering good value for money the DfT invited scheme promoters to undertake some further analysis and submit improved funding bids. These revised funding bids were submitted in September 2011. Ministerial decisions were made in December 2011 to award funding for NDR.
- 2.1.7 For that purpose Mott MacDonald updated an existing 2006 VISUM Public Transport Model for the September 2011 submission. The aim of the updating was to produce a VISUM model which could provide inputs into the demand model which was in production-attraction format so that the overall modelling

approach complied with the WebTAG guidance. This resulted in the re-building of the base year matrices using origin and destination interview data collected in 2009 for bus and rail services in Norwich. At the same time further enhancements were introduced into the modelling including the development of a more refined zoning system, and the revision of the public transport services. The base year of 2006 was retained during the September 2011 updating.

2.1.8 This report was prepared as part of the DCO submission. For this the public transport model was updated to a 2012 base which complied with the current DfT guidance.

2.1.9 The required 2012 modelling system consisted of three main elements:

- A highway assignment model developed in SATURN software
- A public transport model developed in VISUM software
- A demand model using the DIADEM software

2.1.10 This report details the updating of the VISUM Public Transport (PT) model to 2012, the revision of the public transport services along with their timetables and presents the model calibration achieved following the guidelines contained in WebTAG.

2.1.11 The structure of the report is as follows:

- Chapter 3 details public transport data collection
- Chapter 4 explains supply and assignment model development
- Chapter 5 contains information on matrix calibration using matrix estimation
- Chapter 6 reports model validation results
- Chapter 7 provides conclusions on the 2012 base PT model and
- Appendices contain information on bus surveys and fares
- A glossary and bibliography are included at the end

3 Public Transport Data Collection

3.1 Background

3.1.1 The transport model components were to be brought up to date by rebasing the model to 2012. Whilst the highway surveys were conducted during the autumn of 2012, public transport data was collected in May 2013. It was considered that there would be very little difference between patronage in autumn 2012 and spring 2013, especially for bus data. This was supported by NTEM v6.2 public transport forecasts for Norfolk which are very similar for 2012 and 2013. Any differences would be statistically insignificant and would not have any effect on the forecasts for NDR.

3.1.2 The public transport data collection in 2013 comprised the following:

- Bus monitoring counts
- The updating of the bus services running in or around Norwich
- The collection of the timetables of the bus services identified above
- Checking and confirming that rail services remain similar

3.1.3 The gathered information formed the necessary dataset that enabled the model to be calibrated so that the updated 2012 model represented the bus and rail network operation as closely as possible. No further rail patronage information was collected for 2012 PT model rebasing. This was done on the basis that the NDR would have very little impact on rail travel or be affected by that mode as the rail network serves only a limited number of radial routes in the Norwich area.

3.2 Bus Monitoring Counts

3.2.1 Counts of bus passengers were undertaken on an annual basis on a cordon of sites around Norwich until 2008 by the Public Transport Unit (PTU) of NCC. These were one day counts of buses and bus occupancy counts undertaken on on-board buses. However, due to budget constraints the bus monitoring counts were stopped in 2008.

3.2.2 To support the 2012 PT model update and the model calibration exercise a series of on-board bus counts were commissioned and undertaken in May 2013. These replicated the historic sites that were previously surveyed up to

2008 by NCC, and they covered bus stops on a cordon inside the A140/A1042 outer ring road. Several stands at Castle Meadow which are not on above cordon were also surveyed. They are shown in Figure 3.1 below and include the following locations:

- Thorpe Road
- Bracondale
- Long John Hill
- Newmarket Road
- Hall Road
- Constitution Hill
- Plumstead Road
- Bowthorpe Road
- The Avenues
- Earlham Road
- Dereham Road
- Drayton Road
- Aylsham Road
- Catton Grove Road
- Sprowston Road
- Ipswich Road
- Unthank Road
- Castle Meadow – Stands B, E, P, R and W

3.2.3 Each bus stop was surveyed in the AM peak, interpeak and PM peak periods as follows for a total of 9 hours:

- AM Peak 07:30 – 09:30
- Interpeak 10:00 – 12:00 and 13:00 – 15:00
- PM Peak 15:30 – 18:30

3.2.4 Surveys were completed within a single week. Each site was surveyed for one weekday within this week except Castle Meadow stands B, E, P, R and W which were surveyed for the whole week. The counts at Castle Meadow provided day to day variability of bus patronage which was required for the subsequent matrix estimation, and the location of Castle Meadow was chosen because it was noted that many of the bus services included in the updated 2012 model stopped at that location. Survey dates are given below in Table 3.1.

Table 3.1: Survey Dates

Count site(s)	Date
Thorpe Road, Bracondale, Plumstead Road, Castle Meadow	13 th May 2013
Long John Hill, Newmarket Road, Hall Road, The Avenue, Ipswich Road, Castle Meadow	14 th May 2013
Bowthorpe Road, Earlham Road, Dereham Road, Unthank Road, Castle Meadow	15 th May 2013
Constitution Hill, Catton Grove, Sprowston Road, Castle Meadow	16 th May 2013
Drayton Road, Aylsham Road, Castle Meadow	17 th May 2013

Notes: For each site both inbound and outbound surveys were carried out on the same day.

3.2.5 Patronage counts were undertaken by enumerators boarding the bus services at the survey bus stops. This was done for both directions of travel on each scheduled bus, but excluding Park & Ride buses as these were dealt with separately within the highway assignment model. The following information was gathered for each bus:

- Time of arrival
- Bus service number
- Bus operator
- Bus type
- Number of passenger boarding and alighting
- Number of on-board through-stop passengers (excluding alighting and boarding passengers)

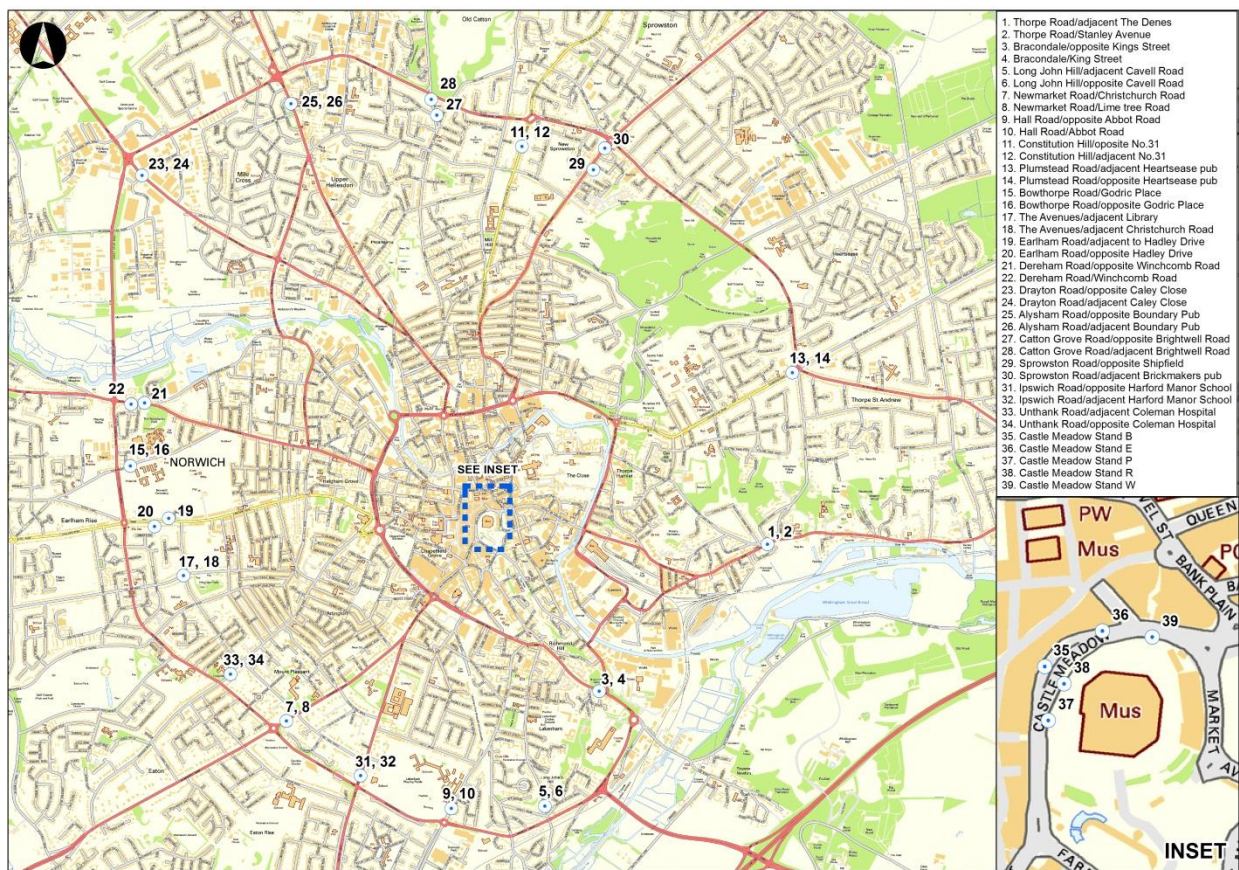

3.2.6 Any buses not stopping (or those that the enumerators were unable to board) were also recorded on the survey sheets with the time, service number, bus type and operator, along with a comment stating that the bus did not stop. The numbers of passengers on board were estimated taking into account the bus type (i.e. double decker, single decker, coach, small bus and bendy bus) and their maximum seating capacities along with the rough enumerator's estimates on the bus. The following maximum capacities were assumed (see Table 3.2).

Table 3.2: Assumed maximum seating capacity

Bus Type	Maximum Seating Capacity
Double Deck	67
Single Deck	42
Coach	47
Small Bus	33

3.2.7 Details of the surveyed bus stop locations and services that pass through these bus stops are included in Appendix A, which also contains summary survey data of the bus on-board through passenger counts.

Figure 3.1: Bus Monitoring Count Locations

3.3 Bus and Rail Service and Timetable Information Collection

3.3.1 There have been significant changes to bus routes and timetables since 2006, and the updated PT model uses February 2013 service and timetables provided by the NCC (<http://www.travelineeastanglia.org.uk>). Bus timetables also provided up to date information on bus stops. The February 2013 data set was examined for changes from autumn 2012 and other than minor changes in service timings, the timetable used is also considered to represent the 2012 base.

3.3.2 The modelled rail services were compared with the latest timetables and were shown to be very similar, with only minor changes in service timings. Therefore the model is representative of the rail service in the 2012 base.

3.4 Bus and Rail Fares

3.4.1 Bus and rail fares by distance stages for 2006 were available from the 2006 PT model. Real growth in bus and rail fares between 2006 and 2012 was obtained from Railways: fares statistics, "*Standard Note: SN/SG/6384, House of Commons Library, 2013*".

3.4.2 Values of time were obtained from WebTAG 3.5.6 October 2012.

3.4.3 More details on the use of real growth in PT fares and value of time can be found in Section 4.

4 Supply and Assignment Development

4.1 Overview of the Model

4.1.1 Supply and assignment model development is similar to what was reported in the 2011 Public Transport Local Model Validation Report (Norfolk County Council, 2011). There are no changes to modelling time periods or the extent of the model.

4.1.2 The public transport model has been developed to represent the following time periods which are consistent with the highway assignment model.

- AM peak hour - 8:00 am to 9:00 am
- Average interpeak hour - 10:00 am to 4:00 pm
- PM peak hour - 5:00 pm to 6:00 pm

4.1.3 The public transport model represents a base year of 2012. The network structure, rail and bus service patterns and demand are all representative of this year. The demand in the model reflects an average 2012 October weekday.

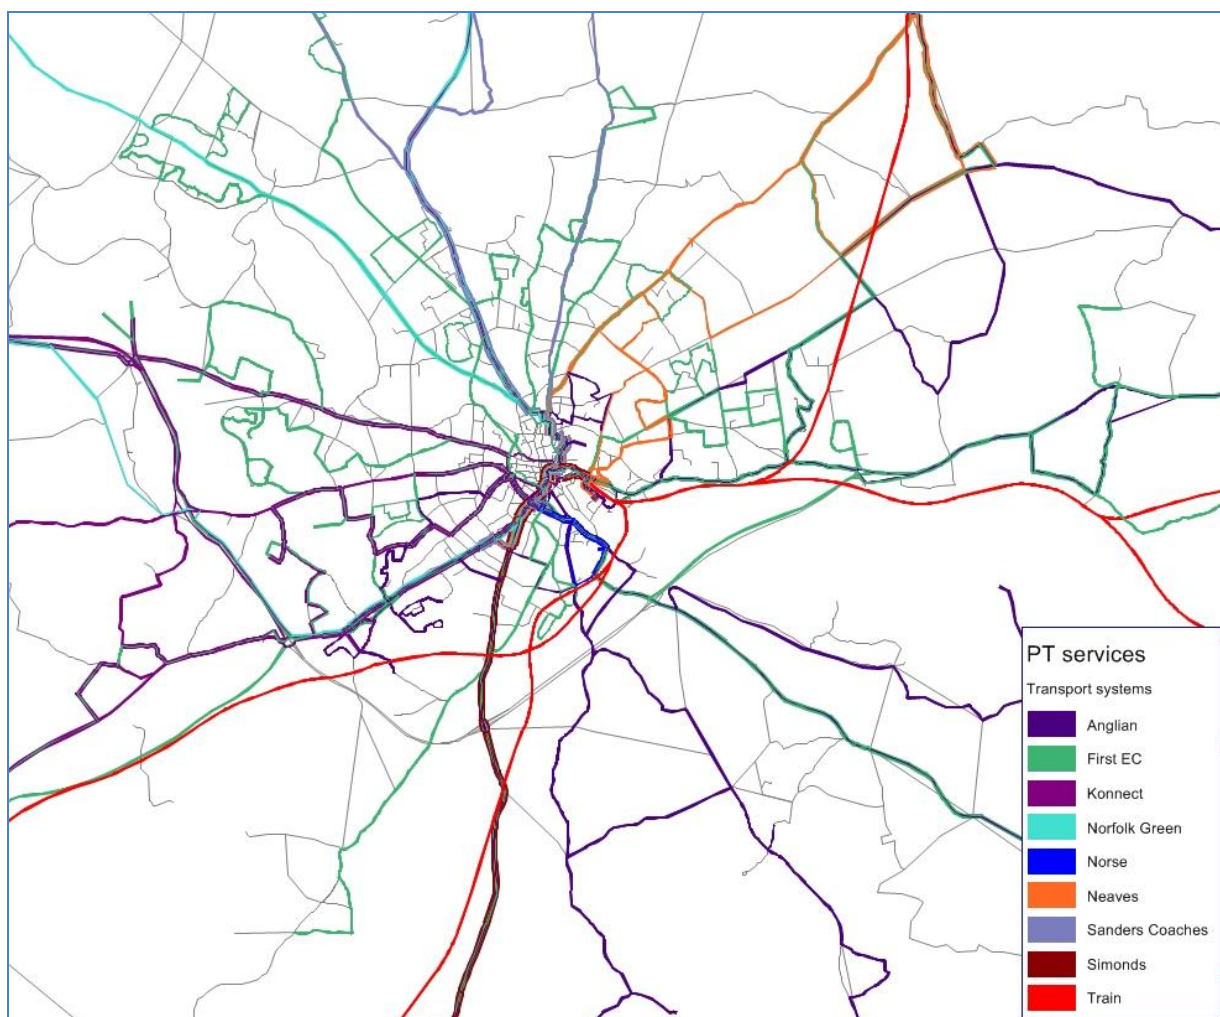

4.1.4 Information on bus service provision in terms of services operating, routing, frequency, stopping patterns, and journey times were obtained from the service providers/NCC via the information published on-line (<http://www.travelineeastanglia.org.uk>). A review of the services included in the model was undertaken, and where required these were added/amended as appropriate. The following main bus operators were identified and included in the updated 2012 model:

- EC/First
- Anglian
- Konnect
- Norfolk Green
- Norse
- Neaves
- Sanders Coaches
- Simonds

4.1.5 All timetables relating to the above individual services for each operator were coded into the model between 07:00 and 19:00.

4.1.6 The above changes ensured that bus service network and timetables were representative of the 2012 base service conditions. The rail network was already representative of the base service pattern. Figure 4.1 shows the extent of the public transport network.

Figure 4.1: Extent of the Bus and Rail Network in the Detailed Model Area

4.1.7 The zoning system in the public transport model is consistent with the zoning system used in the highway assignment model. The zoning system has been updated from the zoning system in the 2006 model to include several additional zones mainly representing developments in appropriate detail. The

updated 2012 VISUM PT model contains 413 zones in total. More details on zones can be found in Highway Local Model Validation Report (Mott MacDonald, 2013).

4.2 Assignment Details

4.2.1 The assignment model uses a timetable- (or schedule) based assignment process. This allows fares to be included in the assignment procedure. The Generalised Journey Time (GJT in minutes) of the assignment algorithm, which informs the path search mechanism for the most attractive path for each OD pair, takes the following form:

$$\text{GJT} = (\text{IVT}) + 2*(\text{AT}) + 2*(\text{ET}) + 2*(\text{WT}) + 2*(\text{OWT}) + 2*(\text{TWT}) + \text{TF} + \text{Fare}$$

4.2.2 Where

- IVT - in-vehicle time
- AT and ET - access and egress time
- WT - walking time
- OWT and TWT - origin and transfer waiting time
- TF = 7.5 - Transfer penalty (minutes) per number of transfers

4.2.3 As the GJT calculation includes fares, appropriate values of time and fare coefficients were required. Model operates in units of generalised time hence the fare coefficient is the time equivalent (in minutes) of a £1 fare. Values of time were calculated from WebTAG Unit 3.5.6 October 2012 and appropriate fare coefficients calculated. Value of times (VOT) in 2010 prices and fare coefficients can be found in Table 4.1 below for the assignment user classes that were retained from the previous 2006 model, i.e. Commuting, Employers' Business and Other.

Table 4.1: Value of time and corresponding fare coefficient by user class

User class	Perceived value of time (£/hr 2010 prices)		2012 fare coefficient (min/£)
	2010	2012	
Employers' business	21.69	21.70	2.77
Commuting	6.46	6.46	9.29
Other	5.71	5.71	10.51

Source: WebTAG unit 3.5.6 October 2012

4.2.4 Real growth in bus and rail fares between 2006 and 2012 were first calculated using data collected from Railways: fares statistics, "*Standard Note: SN/SG/6384, House of Commons Library, 2013*", and can be found in Table 4.2 below. 2006 distance based fares were then uplifted to 2012 level by applying real growth in fare. Since above fares are still in 2002 prices these were then uplifted to 2010 prices by applying growth in the retail price index between 2002 and 2010 which is 26.9% (RPI from Table A3, SN/SG/6384, House of Commons Library 2013). Distance based PT fares for the First and Anglian bus operators and rail are given in Appendix B, noting that the same First fares were also used for the remaining bus operators given the lack of available 2012 information.

Table 4.2: Real Growth in PT Fares between 2006 and 2012

Year	PT fare index	
	Bus fare	Rail fare
2006	126	131
2012	144	150
Real growth 2006 to 2012	14.3%	14.5%

Source: Table A4, SN/SG/6384, House of Commons Library 2013, 1987=100

5 Model Calibration

5.1 Overview

- 5.1.1 No new PT matrix building exercise was carried out for the 2012 PT model update. However, instead of relying on the validated 2006 PT matrices, the 2012 Present Year Validation (PYV) PT matrices (bus + rail) developed for the Postwick Hub Study were used as "prior" matrices for the 2012 matrix estimation (ME) process which was used for the model updating.
- 5.1.2 As mentioned in Section 3 on-board bus counts carried out at 17 count locations were used in the matrix estimation process. The Castle Meadow bus stops which were surveyed for the whole week provided the day-to-day variability or a tolerance for the counts used within the ME process.
- 5.1.3 No rail counts were undertaken in 2012, and therefore the PT matrix calibration excluded rail.

5.2 Matrix Calibration using Matrix Estimation (ME)

- 5.2.1 The Matrix Estimation (ME) was carried out using VISUM's matrix correction tool TFlowFuzzy. All demand segment matrices were adjusted using the matrix estimation process.
- 5.2.2 On-board through bus passenger counts for the AM and PM peak hours were directly available from the surveys. On-board through bus passenger counts for the average interpeak hour were derived from the 10:00 - 15:00 and 15:30 - 16:00 data where the latter period was uplifted so that data for the whole hour from 15:00 - 16:00 could be derived.
- 5.2.3 The ME process used the 2012 Postwick PYV PT matrices as prior matrices, and these were adjusted by TFlowFuzzy to match the May 2013 observed on-board bus through counts. The goodness of fit of the matrix estimation was assessed by comparing the modelled passenger flows against the corresponding observed figures for each modelled time peak hour in the AM, PM and average Inter-peak. WebTAG 3.11.2 indicates that modelled flows should be within 25% of the counts except where observed flows are particularly low (less than 150) for individual links. Moreover it requires at least 85% of the links to have GEH less than 5. As before GEH value of 5 is considered as appropriate maximum limit since this can be applied to any observed flow. All flow comparisons were undertaken at the hourly level.

5.2.4 Table 5.1 provides a summary of the number of individual sites achieving the GEH calibration criteria, and Table 5.2 to Table 5.4 provide detailed comparisons of observed and modelled flows for bus for individual time periods. These indicate that as a result of the matrix calibration process the modelled passenger flows show an excellent match with the observations in all peak hours with GEH statistics well below the recommended value of 5.

Table 5.1: Site Calibration - Summary

Peak	No of Sites	Inbound		Outbound	
		No GEH <5	% GEH <5	No GEH <5	% GEH <5
AM 08:00-09:00*	16	16	100	16	100
Average IP 10:00-16:00	17	17	100	17	100
PM 17:00-18:00	17	17	100	17	100

Notes: *Observed passenger counts were not available for one of the sites in the AM peak due to an incident

5.3 Impacts of the ME process

- 5.3.1 The impacts of matrix estimation on the structure of the matrix were investigated by looking at sectoral changes (see Figure 5.1) in the matrix and changes in the trip length distributions. The sector system used here is consistent with the sector system used in highway model validation checks.
- 5.3.2 Sectoral changes to the matrix in each time period are presented in Table 5.5 to Table 5.10. These include absolute change and GEH. The overall change in demand from the ME process is a reduction in the 2012 modelled demand of 18% in the AM peak hour, 0% in the inter peak hour and 14% in the PM peak hour.
- 5.3.3 The comparisons indicate that in the peak hour time periods the impact of matrix estimation is to decrease the size of the matrix and thus the prior matrices had overestimated PT demand in the peak hours. The key impact is to modify trips between a few sector movements and this is consistent in the time periods. Overall, those movements most impacted upon by matrix estimation are not key movements in respect to the proposed NDR.

5.3.4 Changes in trip length distribution as a result of matrix estimation are shown in Figure 5.2 to Figure 5.10 by purpose and time period. The comparisons indicate that the 2012 matrix estimation process resulted in small increases in both short and long distance trips and a small reduction in medium distance trips, and this is consistent across all journey purposes and time periods.

6 Model Validation

6.1 Introduction

6.1.1 WebTAG Unit 3.11.2 outlines the validation criteria for public transport assignment models. The guideline suggests that there are three checks required:

- Validation of trip matrix
- Network and services validation; and
- Assignment validation

6.2 Validation of Trip Matrix

6.2.1 NCC no longer collates public transport patronage information. It was therefore not possible to carry out trip matrix validation on PT patronage at peak hour or 24 hour level. In addition, Electronic Ticket Machine (ETM) data was not available. Whilst manual counts had been carried out for updating the model it was considered that using all of these in the calibration was a better use of the data and would produce a better model than reserving some of the data for validation. Given the primary focus of the NDR appraisal is on using traffic data from the highway model, this approach was considered to be acceptable. In addition, the results from the demand modelling show a small level of mode switch with the modelling framework, so that any uncertainty in the PT model forecasts would have an insignificant effect on NDR forecasts.

6.3 Network and Service Validation

6.3.1 A number of checks have been carried out on the network and representation of services:

- The routing for each service included in the model has been checked against routing included in the timetables by plotting each service.
- A comparison between observed and modelled journey time for each service was undertaken.

6.3.2 These checks indicated that modelled service routeings and journey times were in line with observed timetable information.

6.3.3 Network and service validation also involved in looking at level of patronage on each of the service. Patronage graphs in Figure 6.1 to Figure 6.3 indicate an accurate representation of service patterns.

6.4 Assignment Validation

6.4.1 A series of sense checks were carried out on the assignment to ensure that model was working appropriately. All of these checks indicated that the assignment routines were working as expected. These included:

- A check of assignment statistics to ensure trips from all origins and destinations were assigned in all peaks.
- A visual check of routeing to ensure that sensible assignment routes were used.
- A check to ensure that majority of demand was assigned to a public transport service i.e. there were very small amount of walk only movements in all peaks. Table 6.1 below indicate that walk only trips is a very small proportion of total trips in each peak.
- A check to see that all services had demand assigned to them.

Table 6.1: Percentage of walk only PT trips

	AM	IP	PM
Total with trips with a ride	6,672	4,870	5,270
Trips without ride (walk only trips)	160	96	103
% of walk only trips	2.4%	2.0%	2.0%

Figure 6.1: Patronage plots for AM peak

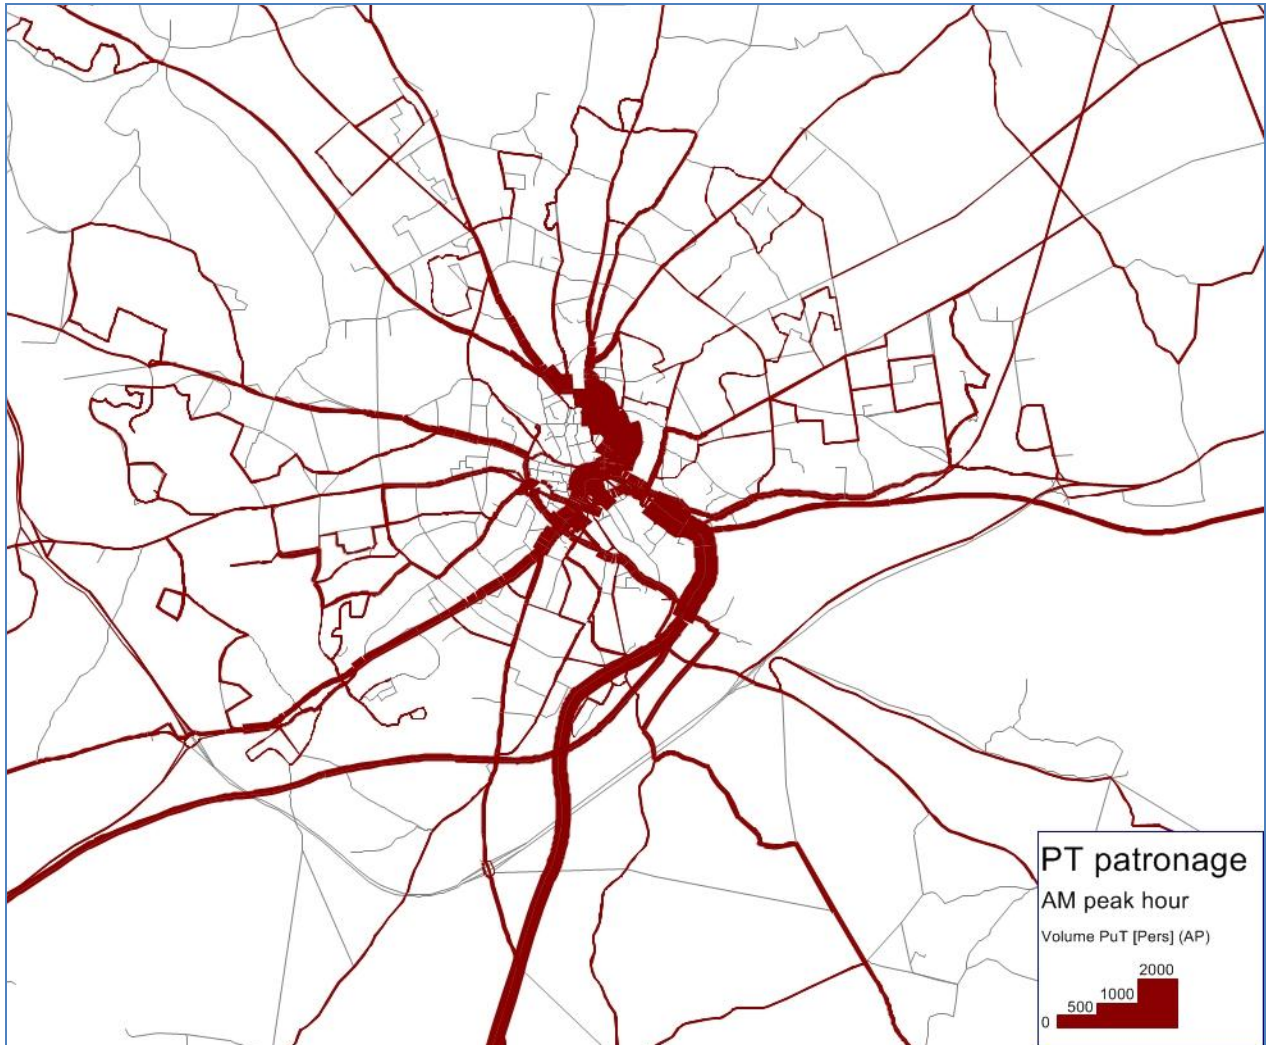

Figure 6.2: Patronage plots for interpeak

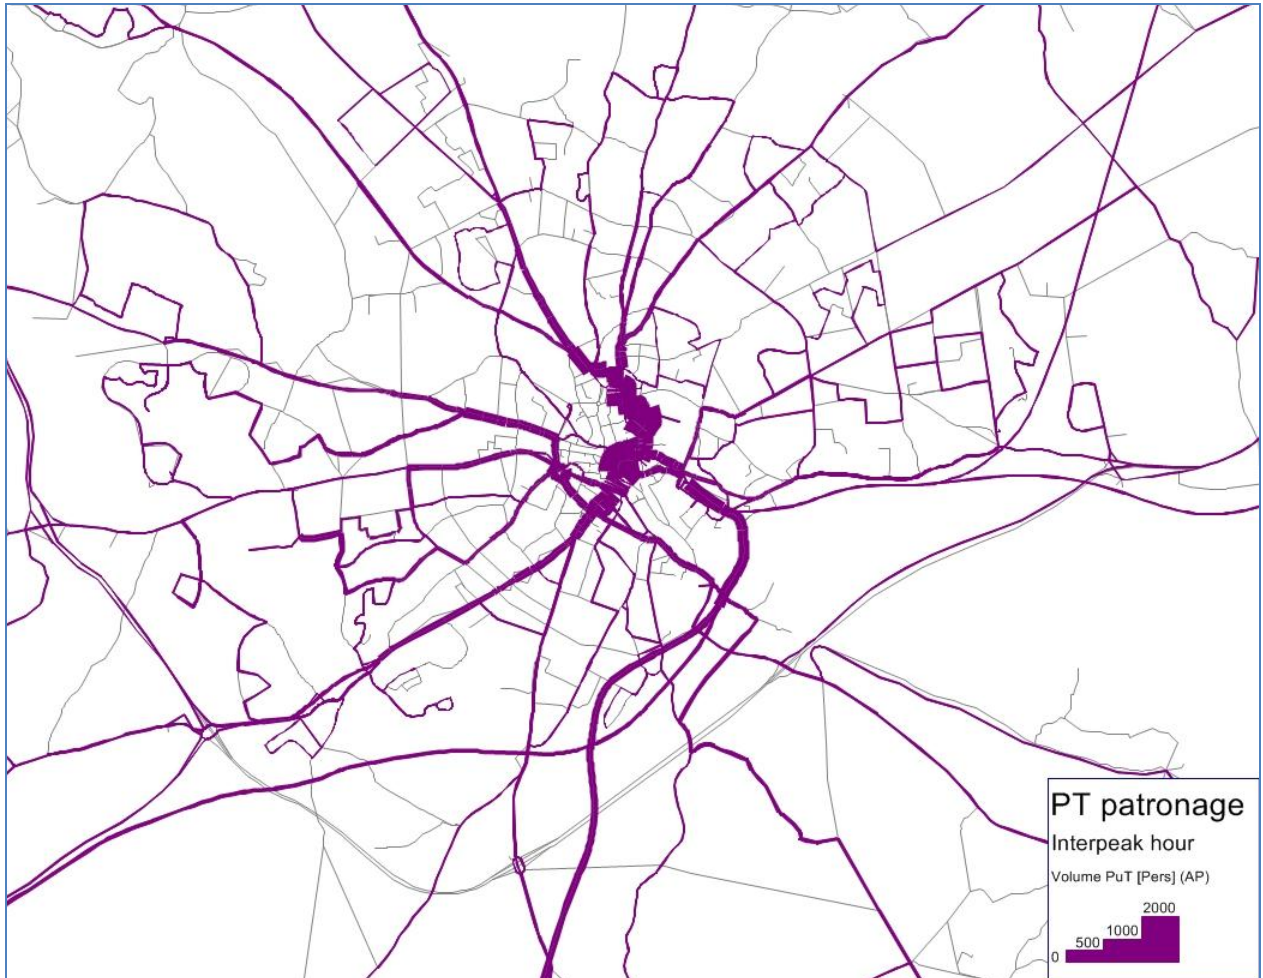

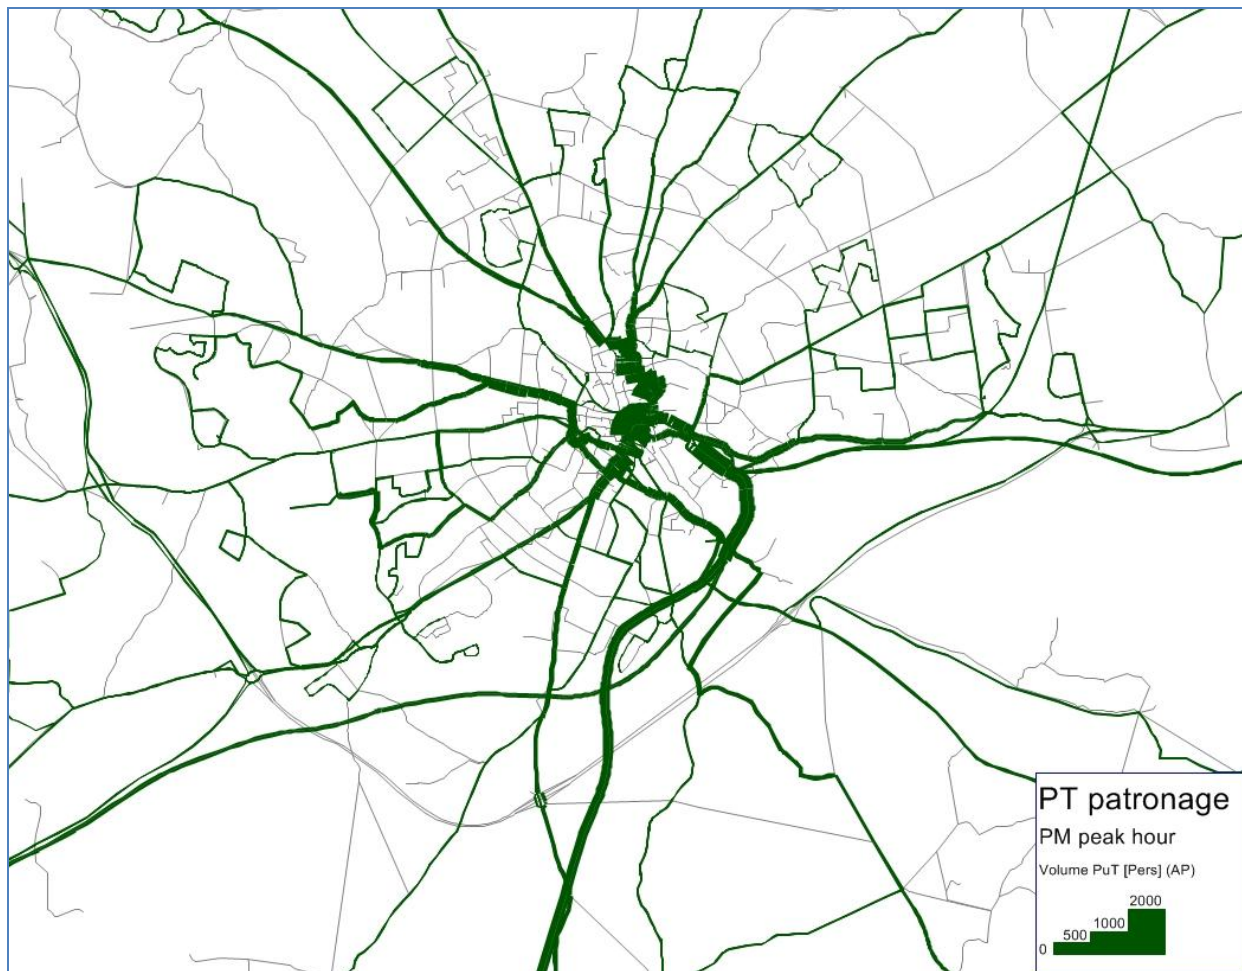

Figure 6.3: Patronage plots for PM peak

6.5 PT flow validation

6.5.1 No independent PT flow validation was undertaken during the development of the 2012 public transport model. The 2012 bus dataset captured all bus trips into Norwich from outside of the urban area and a significant proportion of trips from the suburbs into the city centre and cross city trips. However this was used for the 2012 matrix calibration, as it was considered that the benefits of using this data in calibration to provide a better representation of public transport movements was more important than using it in independent validation. For the purposes of the assessment of the NDR Scheme this is considered acceptable as the public transport modelling has very little influence on the highway traffic forecasts.

8 Glossary

Assignment	A process of loading a trip matrix onto routes through a network that accounts for travel costs on the network in identifying the optimum route choice for every trip
Calibration	A process of adjusting the model input data or model parameters to improve the model and its validation
Convergence	An equilibrium between model outputs, in assignment between the flows and travel costs and in demand models between the demand and the costs from the supply model
Cost matrix	A table of travel costs for journeys that may include travel time, operating costs and charges such as tolls or fares
Cruise speeds	Average travel speed along a network link
Demand model	See variable demand model
Demand segment	Travel demand is divided into a number of segments for the purposes of applying different demand modelling procedures. The division is usually by trip purpose and whether the trips are home-based or non-home-based
Generalised cost	A combination of time and money costs (operating costs and charges) that are expressed in time or money units which are used to represent the total travel costs for a journey within the assignment or demand models
Journey purpose	Trips are divided into different travel purposes, usually work (or commute), employers' business and other. These trip purposes have different generalised costs applied and different demand model responses
Matrix estimation	A process used to adjust an initial or 'prior' matrix so that the resulting assignment of the adjusted matrix matches count data as closely as possible
Network	A mathematical representation of a transport network in a supply-side assignment model, either a highway network which represents vehicle travel, or a public transport network that represents bus and rail services
Reference trip matrix	A forecast reference matrix based on applying growth from national (or other) datasets, but before the application of adjustments due to the impact of how travel costs will change with growth in travel
User classes	Trips are aggregated into several user classes for the purposes of assignment. These usually represent different types of vehicle (e.g. car, HGV) and different trip purposes
Trip matrix	A table representing travel in a model area between land areas or zones
Validation	A process of comparing the model data with independent data
Variable demand modelling	A model that forecasts changes in travel behaviour such as trip frequency, choice of mode, time of travel and trip distribution
Zone	An area of land or development which is used in a transport model to aggregate individual households or commercial premises into a manageable number of units that can be used to represent journey patterns in the study area. Usually the zone size will be relatively small in the study area, but progressively larger further away from it.

1 Key Summary

- 1.1.1 Funding approval for the Norwich Northern Distributor Road (NDR) was sought in 2011 through the Department for Transport's (DfT) Development Pool process. A business case was developed and submitted in accordance with the guidance in the Treasury Green Book. Ministerial decisions were made in December 2011 to award funding.
- 1.1.2 The NDR is a project of national significance which requires a Development Consent Order (DCO) under the Planning Act 2008. The submission was made in January 2014. Since that time there have been some further developments that are considered in this report. These include:
- Revised WebTAG guidance was made definitive at the end of January 2014 after the Scheme submission; and
 - The Joint Core Strategy (JCS) that was reviewed and approved at Examination in 2013 has been formally adopted by the Greater Norwich Development Partnership (GNDP) authorities; and
 - The Postwick Scheme orders have been approved by the Secretaries of State and Ministerial approval of funding was confirmed in April 2014.
- 1.1.3 The Transport Assessment for the Scheme is set out in submission document ref. 5.5. This included an operational assessment of the Scheme design with traffic forecasts based on the full implementation of JCS, as set out in the Traffic Forecasting Report document ref. 5.6. The forecasts were based on the transport model described in the Highway and Public Transport Local Model Validation Reports (document refs. 5.9 and 5.10). The transport assessment concluded that the Scheme design is considered to be the best possible balance between relieving the existing network whilst ensuring acceptable conditions on this new part of the network.
- 1.1.4 The Economic Appraisal Report (document ref. 5.7) shows that the Scheme would deliver very high value for money (VfM), the Benefit Cost Ratio (BCR) value exceeding 4, according to DfT's VfM criteria. In addition the Land Use and Economic Development Report (document ref. 10.3) sets out the substantial benefits of jobs, GVA and infrastructure investment that the Scheme would help to bring to the City.

1.1.5 This report contains a number of sensitivity test results to address the changes since the submission and to further examine the robustness or sensitivity of the results. The tests include:

- Showing the effect on the economic appraisal of new WebTAG values of time and growth;
- Sensitivity testing upper and lower bound ranges for values of time;
- Testing low and high growth;
- An alternative network scenario with Postwick included in the Do Minimum network;
- An alternative growth scenario with only JCS developments that would be unlocked by Postwick and an economic appraisal using a dependent development approach. This has been tested with and without the developer link roads.

1.1.6 The series of sensitivity tests has been undertaken primarily to test the robustness of the economic appraisal of the Scheme to changes in parameters, forecast assumptions and methodology. The traffic flow forecasts of the Scheme in these test scenarios have also been reviewed and where appropriate operational performance has been assessed.

1.1.7 The sensitivity test results indicate that BCR ranges from 3.68 – 5.36 (inclusive of accident benefits) and 4.75 – 6.86 when WEBs and JTR are included as can be seen from summary table below. Both of these represent high/very high value for money for all sensitivity tests (BCR above 3 / 4) according to DfT's VfM criteria.

Scenario	BCR (including accidents)	BCR (also including WEBs and JTR)
DCO submission	4.17	5.33
<i>Sensitivity tests</i>		
New WebTAG parameters	4.26	5.42
New WebTAG – non work VOT reduced by 25%	3.68	4.75
New WebTAG – non work VOT increased by 25%	4.85	6.07
New WebTAG – work VOT reduced by 25%	4.02	5.13
New WebTAG – work VOT increased by 25%	4.51	5.69
Low growth	3.76	4.75

Scenario	BCR (including accidents)	BCR (also including WEBs and JTR)
High growth	4.55	5.73
Postwick in DM	5.29	6.77
Dependent development_link roads included*	4.76	5.99
Dependent development_link roads excluded*	4.73	5.99

Notes: *This dependent development BCR excludes very high additional GVA benefits of £422.4m and development benefits (includes planning gain and transport external costs) of £1,146m

1.1.8 It is therefore concluded that the transport benefits reported in the submission are robust and that the Scheme would deliver high or very high value for money.

1.1.9 In addition to the transport benefits the testing using the dependent development methodology shows that the completion of the NDR would deliver very high development benefits amounting to £1,146m. In addition the business development dependent on completion of the NDR could realise £422m of GVA benefits, though these should not simply be added to development benefits.

2 Introduction

2.1 Background

- 2.1.1 Mott MacDonald (MM) has been appointed by Norfolk County Council (NCC) to assist with the development and appraisal of the Norwich Northern Distributor Road, known as the NDR or referred to as the Scheme.
- 2.1.2 The Scheme would be a dual carriageway all-purpose strategic distributor road, to be classified as the A1270 Principal Road, which would link the A1067 Fakenham Road near Attlebridge, to the A47(T) Trunk Road at Postwick. This will be over a length of approximately 20.4km.
- 2.1.3 The NDR is a project of national significance which requires a Development Consent Order (DCO) under the Planning Act 2008 and this formal planning process began in early 2013. It is currently anticipated that the process will be completed in time for the Scheme to start construction in 2015 and to be opened in 2017.
- 2.1.4 This document is one of a number that support the DCO, each of which has its own unique document reference number, and should therefore be read in conjunction with the other documentation. The proposed layout of the NDR is shown in the General Arrangement Plans contained in document ref. 2.6, whilst the full needs case for the NDR is explained in the Statement of Reasons (document ref. 4.1) and the Environmental Statement (document ref. 6.1).
- 2.1.5 Funding approval for the NDR was sought in 2011 through the Department for Transport's (DfT) Development Pool process. A business case was developed and submitted in accordance with the guidance in the Treasury Green Book. Ministerial decisions were made in December 2011 to award funding.
- 2.1.6 The NDR DCO submission was submitted on 8th January 2014 and has been accepted for examination by the planning inspectorate on 4th February 2014.

2.2 Purpose and Layout of Report

- 2.2.1 This report presents the results of sensitivity testing that would provide additional information for the examination. These tests address changes since the submission that include:

- Revised WebTAG guidance was made definitive at the end of January 2014 after the Scheme submission; and
- The Joint Core Strategy (JCS) that was reviewed and approved at Examination in 2013 has been formally adopted by the GNDP authorities; and
- The Postwick Scheme orders have been approved by the Secretaries of State and Ministerial approval of funding was confirmed in April 2014.

2.2.2 The report sets out to provide, where appropriate:

- A review of the flow and operational assessment of the Scheme under sensitivity tests where appropriate.
- An assessment of safety benefits of the scheme under the sensitivity test
- An assessment of economic benefits for consumer and business users from several sensitivity tests based on the variable demand model (VDM) forecasts and the likely expenditure profile during the assessment period where appropriate.
- An assessment of the scheme Value for Money (VfM) under these sensitivity tests based on the corresponding VDM model outputs and the latest available scheme costs where appropriate. The Guidance on Value for Money describes the criteria used to determine the VfM of various types of schemes.

2.2.3 The methodology used to produce the safety and economic appraisal is described in detail in DCO submission document ref. 5.7. This methodology was mainly retained for these sensitivity tests. More information is given where a different methodological approach has been applied.

2.2.4 This report contains the following sections after the current introductory section:

- Section 3 – describes details of the sensitivity tests;
- Section 4 – contains scheme costs excluding Postwick costs and will be used in scenarios where Postwick is included in the Do Minimum.;
- Sections 5 to 8 – present the results of the flow, operational, safety and economic appraisal for each sensitivity test separately;
- Section 9 – presents conclusions from the sensitivity test appraisals.

2.2.5 Supporting information is included in Appendix A in Section 10.

2.2.6 Sections 11 and 12 contain Abbreviations and Glossary.

3 Description of Sensitivity Tests

3.1 Overview

- 3.1.1 In order to test the impact of the changes described in the previous section and to provide additional information on further WebTAG requirements, several sensitivity tests were carried out. More details on these tests can be found in later sections.
- 3.1.2 The economic appraisal complies with the latest guidance in WebTAG. It has been assumed in the appraisal that the benefits of the scheme do not change for each year beyond 2032 although traffic will continue to grow which suggests that the PVB and the NPV presented for the scheme and each sensitivity test will be conservative.
- 3.1.3 For each sensitivity test economic and safety appraisals have been carried out. As with the DCO submission, the economic appraisal calculates TUBA benefits, wider economic benefits (using WITA) and journey time reliability benefits. Safety appraisal was based on COBA. In addition to the above benefits, dependent development benefits such as Transport External Costs (TEC), Planning Gain (PG) and Gross Value Added (GVA) benefits are calculated for dependent development scenarios (see below for more information on this sensitivity test).
- 3.1.4 The costs of the scheme are shared between local authority and central government.
- 3.1.5 In addition a review of traffic flow impacts and the operational assessment of the Scheme have been carried out where necessary.

3.2 New WebTAG Guidance Sensitivity Test

- 3.2.1 The DCO submission transport modelling and appraisal has been developed in accordance with then definitive WebTAG guidance (last updated in August 2012). However revised WebTAG guidance became definitive at the end of January 2014 after the Scheme DCO submission. This included a number of changes that were published in Draft Units in October 2013. The new WebTAG guidance has been reorganized and was released on a new website. It describes the new guidance as being 'retrenched' which it is understood means it is simplified. Sometimes the new guidance is referred to as WebTAG2.

- 3.2.2 The main changes that need to be addressed with the new WebTAG guidance are due to changes in parameter values and additional sensitivity testing of ranges for the values. Changes in values include new Values of Time (VOT) and growth rates for working and non-working trip purposes. Car business VOTs have been reduced by about 20%. Non-business VOTs have increased by about 5% and now increase in line with GDP per capita (previous assumption was they increased by 0.8 of the GDP per capita increase). In addition, due to the findings of the latest research on these values, there is a requirement to test changes in base values by +/-25%.
- 3.2.3 There are also changes to fuel costs, CO2 emissions factors and CO2 values which would have a relatively small impact but are taken into account in the sensitivity test analysis.
- 3.2.4 These new parameter values that became definitive in WebTAG2 were used to produce a revised economic appraisal.
- 3.2.5 In addition, to comply with WebTAG2 guidance on new VOT parameters, tests were undertaken with variations of +/-25% for either the working or non-working base VOTs.
- 3.2.6 The new guidance includes a unit on proportionate updating of appraisal. This requires agreement of the sponsoring authority, which in this case requires DfT and NCC agreement. Following discussions it was agreed that base model calibration and validation is checked with new WebTAG parameters. Also 2032DS forecasts will be re-run with new parameters and forecast assignments are compared against the DCO.
- 3.2.7 These tests, assumptions and appraisal required are summarised in Table 3.1 below.

Table 3.1: Summary of Requirements – New WebTAG Guidance

Scenario	Modelling required	Appraisal required	Additional requirements
Existing DCO scheme with WebTAG2 revised parameters for economic appraisal	No	Economic and safety appraisal with revised parameters	None
DCO Scheme with +/- 25% to base VOTs (four tests)	No	Economic appraisal with revised base VOTs	None
Base validation check with new WebTAG2 parameters	Revised VOT parameters used in base model re-assignment	Comparison of assignment validation with DCO	As agreed with DfT
Forecasts with new WebTAG2 parameters	Revised growth in VOT used in re-forecast using DIADEM for 2032DS	Compare resulting forecast assignment with DCO submission	As agreed with DfT

3.3 Low and High Growth Scenario Sensitivity Tests

3.3.1 The current DCO submission is based on central growth forecasts and there is a WebTAG requirement to assess the uncertainty in growth by carrying out low and high growth forecasts. Table 3.2 summarises the key assumptions and appraisal required.

Table 3.2: Summary of Requirements – Low and High Growth

Scenario	Modelling required	Appraisal required	Additional requirements
Existing DCO scheme with low growth	Revised forecast reference growth demand matrices for 2017 and 2032. Run through demand model for 2017 and 2032 DM and DS.	Economic appraisal. Safety appraisal. Traffic forecast changes with DCO	None
Existing DCO scheme with high growth	Revised forecast reference growth demand matrices for 2017 and 2032. Run through demand model for 2017 and 2032 DM and DS.	Economic appraisal. Safety appraisal. Traffic forecast changes with DCO	None

3.4 Postwick Scheme in the Do Minimum Sensitivity Test

3.4.1 The DCO submission appraisal included the proposed improvement at Postwick as part of the NDR Scheme. The Postwick Hub Scheme was subject to an Public Inquiry in mid-2013 and the Orders have since been approved by the Secretaries of State in January 2014, coincident with the DCO submission, and full approval was granted in April 2014. This sensitivity test therefore assesses the economic benefits of the remainder of the NDR Scheme in isolation from the Postwick improvements. It also looks at the operational performance of Postwick junctions in 2032. Table 3.3 summarises key assumptions and appraisal required.

Table 3.3: Summary of Requirements – Postwick Scheme in the DM

Scenario	Modelling required	Appraisal carried out	Additional requirements
DCO scheme with the Postwick improvement included within the Do Minimum.	Recoding of the DM network to include the Postwick Scheme. Running recoded DM network and DCO reference matrices through demand model for 2017 and 2032.	Economic and safety appraisal. Traffic forecast changes with DCO Operational assessment of Postwick junctions	Revised costs required for scheme to exclude Postwick Improvement costs.

3.5 Dependent Development Sensitivity Tests

3.5.1 The DCO submission appraisal was based on full spatial allocation of JCS development for both with and without the scheme scenarios. This means that

the performance of the Scheme is assessed with the full JCS development allocation which is expected to represent the maximum Scheme impact. However, in the without Scheme scenario it could be argued that the full spatial allocation could not be achieved although growth is still required to be controlled to similar growth across the GNDP area (known as controlled to NTEM or TEMPRO). An approach to dealing with this is set out in WebTAG2 A2-3 by dealing with the development that can be unlocked by the Scheme as dependent development. In the context of the approval that has been confirmed for the Postwick scheme then the development that can be considered as dependent is that development that would be unlocked by NDR in addition to that unlocked by Postwick. These sensitivity tests therefore assume that certain developments are dependent only on the NDR scheme (i.e. over and above those unlocked by Postwick). Table 3.4 summarises key assumptions and the appraisals required.

Table 3.4: Summary of Requirements – Dependent Development Scenario

Scenario	Modelling required	Appraisal required	Additional requirements
Existing DCO scheme with dependent development growth scenario.	Develop dependent development matrices for 2032 (there are no NDR dependent developments in 2017). Run DM (with Postwick included in DM) and DS networks with dependent development matrices through demand model for 2032.	Economic appraisal using a fixed reference demand, and appraisal using a dependent development approach. Safety appraisal. Calculation of Planning Gain, Transport External Costs and GVA. Traffic forecast changes with DCO Operational assessment of NDR and Postwick junctions	Revised costs required for scheme to exclude Postwick Improvement costs.
Scenario as above but with developer link roads removed* from 2017 DM (with Postwick included) and DS networks	Run 2017 DM and DS networks with DCO 2017 reference matrices (there are no NDR dependent developments in 2017)	Economic appraisal using a fixed reference demand, and appraisal using a dependent development approach. Safety appraisal. Calculation of Transport External Costs	Revised costs required for scheme to exclude Postwick Improvement costs. Planning Gain and GVA from above 2032 assignments from above

Notes *In the scenario where the dependent development is not implemented then the corresponding developer link roads would not exist. Therefore the tests have been carried out with and without the developer link roads.

3.5.2 In accordance with dependent development guidance set out in WebTAG A2-3, the economic appraisal was carried out in two parts, as follows:

- Assessment of the NDR transport scheme in isolation.
- Assessment of the development benefits associated with dependent developments.

- 3.5.3 The former is calculated with reference traffic levels that exclude the development that is dependent upon the completion of the NDR.
- 3.5.4 Benefits of land use development assuming the implementation of the transport intervention are equal to the Planning Gain (PG) arising from the development less the Transport Externality Cost (TEC) and Other Externalities (OE). Here the TEC is produced by the extra congestion for existing transport users, whilst the OE refers to the loss or gain in amenity value of the land compared to its existing use.
- 3.5.5 The TEC can be positive when the land use development imposes costs on existing users in the absence of a transport scheme improvement, but with an improvement in place it is likely to be negative, especially when the trips are constrained to NTEM. This occurs as the TECs with the specified land use development and the transport improvement are lower than with wider distributed development implied by NTEM without the dependent development. Put another way, with the implementation of the NDR Scheme the transport externalities are lower with the spatially allocated NDR dependent developments than with a wider distribution of developments. This outcome is consistent with the WebTAG A2-3 guidance.
- 3.5.6 NDR dependent housing and business developments are summarised in Table 3.5 below. All these developments are located in the Broadland district.

Table 3.5: Summary of NDR Dependent Housing and Business Developments – 2017 to 2032

Development type	Development	Units/m2	Additional details
Housing	Hellesdon Golf Course	729	
	Hellesdon Hospital	225	
	Drayton	151	
	Spixworth	39	
	Rackheath Eco Community*	3,070	
	Brundall	111	
	Biofield	144	
	Sprowston	45	
	Horsham	38	
	Salhouse	14	
	West of North Walsham Road (Beyond Green)*	1,000	
	Between Wroxham and North Walsham Road (Beyond Green)*	1,100	
	Between Salhouse and Wroxham Road (W House Farm)	680	
	Between Plumstead and Salhouse Road	280	
Business	Rackheath Eco Community*	87,500m2	B1/B2/B8

Development type	Development	Units/m2	Additional details
	Airport*	105,000m2	B1/B2/B8

Notes: *A conservative assumption was made to calculate planning gain benefits for Rackheath Eco Community and Beyond Green housing developments only. Both business developments are considered for planning gain in addition to GVA calculations.

3.5.7 The transport scheme will enable the commercial developments at the above locations to take place which will contribute GVA to the local economy as a result of additional jobs. GVA benefits of JCS developments are reported in detail in DCO Document Reference 10.3. For the purpose of this sensitivity test GVA benefits of dependent business developments are directly available from above report.

4 Revised Scheme Costs with Postwick in DM

4.1.1 Revised scheme costs with Postwick costs excluded were provided by NCC and summary costs are given below in Table 4.1. Costs were adjusted as per Document Reference 5.7. The adjusted costs were used in the sensitivity test scenarios where Postwick Scheme is in the DM.

Table 4.1: Summary Costs of NDR Excluding Postwick Costs

Cost type	Cost (£m) in 2013Q1 prices	
	DCO Scheme	NDR only
<i>Investment costs</i>		
Construction	110.2	88.5
Land	22.0	21.9
Preparation	7.8	8.3
Supervision	1.3	0.9
Total investment Cost	141.3	119.6
<i>Other costs</i>		
Maintenance	27.8	24.2
Operation	15.9	14.5

Notes: These are initial costs before adjusting for construction price inflation and optimism bias

5 New WebTAG Guidance Sensitivity Test Results

5.1 Flow Analysis Results

5.1.1 Base flow calibration and validation results with new WebTAG parameters are compared with DCO results in Table 5.1 to Table 5.4. The comparison indicates that the results are very similar.

Table 5.1: Summary of Screenline Flow Calibration Results (All Vehicles)

Criteria	Cases	AM	IP	PM	Target
Total screenline within 5% of observed	15/ 16 IP	12 (13)	12 (11)	13 (13)	All or nearly all screenlines
Total screenline flow GEH<4	15/ 16 IP	13 (12)	14 (16)	14 (13)	All or nearly all screenlines
Individual link flows (proximity)	171	91% (91%)	98% (98%)	94% (94%)	>85% of cases
Individual link flows GEH<5	171	85% (86%)	93% (94%)	91% (90%)	>85% of cases

Notes: Values in (xx) refer to corresponding DCO values

Table 5.2: Summary of Screenline Flow Calibration Results (Cars)

Criteria	Cases	AM	IP	PM	Target
Total screenline within 5% of observed	15/ 16 IP	14 (14)	13 (13)	13 (14)	All or nearly all screenlines
Total screenline flow GEH<4	15/ 16 IP	14 (14)	14 (16)	15 (14)	All or nearly all screenlines
Individual link flows (proximity)	171	93% (93%)	98% (98%)	97% (96%)	>85% of cases
Individual link flows GEH<5	171	87% (87%)	95% (95%)	92% (92%)	>85% of cases

Notes: Values in (xx) refer to corresponding DCO values

Table 5.3: Summary of Screenline Flow Validation Results (All Vehicles)

Criteria	Cases	AM	IP	PM	Target
Total screenline within 5% of observed	6	4 (4)	4 (4)	5 (5)	All or nearly all screenlines
Total screenline flow GEH<4	6	4 (4)	5 (5)	5 (5)	All or nearly all screenlines
Individual link flows (proximity)	58	84% (84%)	84% (84%)	83% (84%)	>85% of cases
Individual link flows GEH<5	58	84% (81%)	78% (78%)	86% (86%)	>85% of cases

Notes: Values in (xx) refer to corresponding DCO values

Table 5.4: Summary of Screenline Flow Validation Results (Cars)

Criteria	Cases	AM	IP	PM	Target
Total screenline within 5% of observed	6	5 (5)	5 (4)	4 (5)	All or nearly all screenlines
Total screenline flow GEH<4	6	5 (5)	5 (5)	5 (5)	All or nearly all screenlines
Individual link flows (proximity)	58	88% (86%)	86% (84%)	83% (84%)	>85% of cases
Individual link flows GEH<5	58	86% (86%)	79% (81%)	84% (86%)	>85% of cases

Notes: Values in (xx) refer to corresponding DCO values

5.1.2 Base journey time validation results with new WebTAG parameters are compared with DCO results in Table 5.5. Again the comparison indicates that the results are very similar.

Table 5.5: Journey Time Validation Summary

Time period	Number of routes	Number achieving validation criteria	Percentage achieving validation criteria
AM Peak	22	17 (17)	77% (77%)
Inter Peak	22	22 (22)	100% (100%)
PM Peak	22	17 (17)	77% (77%)

Notes: Values in (xx) refer to corresponding DCO values

5.1.3 Based on revised flow calibration and validation results and journey time validation results, it can be concluded that new WebTAG parameters do not have a significant impact on base year calibration and validation.

5.1.4 The revised base model was then used with DCO reference forecast matrices but with updated networks for revised generalised cost parameters (based on new WebTAG parameters) to run demand model for 2032DS.

5.1.5 In Table 5.6 below a comparison of AADT figures is made between the Updated VOT assignment and the DCO submission assignment. There is a small decrease on the majority of the NDR links, with a small increase at A71, which is the NDR link between Plumstead Road and Salhouse Road. The changes overall suggest that using the revised VOTs in the modelling would produce similar forecast traffic flows on the NDR and thus similar Scheme impacts.

Table 5.6: NDR Locations AADT Comparison

Location	Link	Direction	Updated VOT	DCO Submission	Difference	% Difference
A66	Holt Road - Cromer Road Link	WB/EB	28,500	30,400	-1900	-6%
A67	Cromer Road - Airport Link	NEB/SWB	28,200	29,800	-1600	-5%
A68	Airport - North Walsham Road Link	WB/EB	28,200	29,800	-1600	-5%
A69	North Walsham Road - Wroxham Road Link	WB/EB	38,500	39100	-600	-2%
A70	Wroxham Road - Salhouse Road Link	NWB/SEB	42,800	43900	-1100	-3%
A71	Salhouse Road - Plumstead Road Link	NWB/SEB	46,600	46000	600	1%
A72	Plumstead Road - Postwick Hub Link	NB/SB	46,200	46400	-200	0%
A73	Postwick Hub - A47 Link	NB/SB	41,800	42900	-1100	-3%
A79	Fakenham Road - Fir Covert Road Link	NEB/SWB	15,900	16500	-600	-4%
A90	Fir Covert Road - Reepham Road Link	NEB/SWB	19,400	20800	-1400	-7%
A91	Reepham Road - Holt Road Link	WB/EB	24,600	26400	-1800	-7%

5.2 Safety Analysis Results

5.2.1 Accident benefits were calculated using the same approach reported in Document Reference 5.7. Table 5.7 reports summary accident benefits using local accident rates for this sensitivity tests.

5.2.2 For the purpose of WebTAG sensitivity test only parameters related to accident casualty costs and compound growth rates have been changed compared to DCO. Both these are lower in the latest WebTAG. As a result the accident benefit valuation reduces substantially although there are no changes to number of personal injury accidents or casualty numbers saved by the Scheme.

Table 5.7: Accident Benefits of WebTAG Sensitivity Test

60 Year Appraisal Period		Scenario	
		DCO	WebTAG
Do Minimum			
Number of PIAs		70,984	70,984
Casualties	Fatal	1,890	1,890
	Serious	12,597	12,597
	Slight	91,490	91,490
Accident Costs		5,999,332	4,833,201
Do Something			
Number of PIAs		69,944	69,944
Casualties	Fatal	1,898	1,898
	Serious	12,488	12,488
	Slight	90,226	90,226
Accident Costs		5,958,113	4,806,333
Accident Benefits			
Number of PIA savings		1,041	1,041
Casualties	Fatal	-7	-7
	Serious	109	109
	Slight	1,263	1,263
Accident Savings		41,219	26,868

Notes: All monetary values are expressed in £000's in 2010 prices discounted to 2010

5.3 Economic Analysis Results

5.3.1 Table 5.8 below compares monetised costs and benefits including accident benefits for new WebTAG parameters sensitivity test against the DCO scheme.

Table 5.8: Analysis of Monetised Costs and Benefits – New WebTAG Parameters

Item	Accidents included (£000)	
	DCO	New WebTAG
Accidents (not assessed by TUBA)*	41,219	26,868
Greenhouse Gases	-22,756	-23,153
Economic Efficiency: Consumer Users (Commuting)	51,164	63,007
Economic Efficiency: Consumer Users (Other)	380,623	438,270
Economic Efficiency: Business Users and Providers	267,797	220,621
Wider Public Finances (Indirect Taxation Revenues)	55,270	65,187
Present Value of Benefits (PVB)	773,317	790,800
Broad Transport Budget Present Value of Costs (PVC)	185,542	185,542

Item	Accidents included (£000)	
	DCO	New WebTAG
OVERALL IMPACTS		
Net Present Value (NPV)	587,775	605,258
Benefit to Cost Ratio (BCR)	4.168	4.262

Notes: All monetary values are expressed in 2010 prices discounted to 2010 and calculated using TUBA1.9.3.
*Detailed summary results can be found in Section 6. The lower conservative accident benefit is included based upon the use of local accident data, as explained in section 7 of Reference Document 5.7.

5.3.2 The results show that the Present Value of Benefits (PVB) for this sensitivity test is estimated to be £791m (inclusive of accident benefits), outweighing the £186m Present Value of Costs (PVC).

5.3.3 The Benefit Cost Ratio (BCR) of the scheme for this sensitivity test is 4.26 including accidents. Under the DfT's value for money criteria, this represents a Very High value for money category.

5.3.4 Table 5.9 below compares summary economic appraisal results including wider impacts and journey time reliability for new WebTAG parameters sensitivity test against the DCO scheme.

Table 5.9: Summary of Economic Appraisal including Wider Benefits – New WebTAG Parameters

Item	Scenario also including WEBs and JTR (£000)	
	DCO	New WebTAG
Present Value of Benefits (PVB)	989,063	1,004,921
Present Value of Costs (PVC)	185,542	185,542
Net Present Value (NPV)	803,521	819,379
Benefit to Cost Ratio (BCR)	5.331	5.416

Notes: All monetary values are in £000's and expressed in 2010 prices discounted to 2010

5.3.5 The BCR for this sensitivity test is improved further to 5.42 once journey time reliability benefits (£28m) and wider economic benefits (£186m) are included in the appraisal. These additional benefits amount to £214m (2010 prices discounted to 2010). The inclusion of these benefits increases the BCR to a higher level within the Very High value for money category.

5.3.6 Table 5.10 below summarises monetised costs and benefits including accident benefits of four sensitivity test results for +/-25% VOT.

Table 5.10: Analysis of Monetised Costs and Benefits – VOT Sensitivity Tests

Item	Accidents included (£000)			
	Non-work VOT -25%	Non-work VOT +25%	Work VOT -25%	Work VOT +25%
Accidents (not assessed by TUBA)*	26,868	26,868	26,868	26,868

Item	Accidents included (£000)			
	Non-work VOT -25%	Non-work VOT +25%	Work VOT -25%	Work VOT +25%
Greenhouse Gases	-23,153	-23,153	-23,153	-23,153
Economic Efficiency: Consumer Users (Commuting)	44,615	81,399	63,007	63,007
Economic Efficiency: Consumer Users (Other)	348,285	528,847	438,270	438,270
Economic Efficiency: Business Users and Providers	220,621	220,621	175,006	266,291
Wider Public Finances (Indirect Taxation Revenues)	65,187	65,187	65,187	65,187
Present Value of Benefits (PVB)	682,423	899,769	745,185	836,470
Broad Transport Budget Present Value of Costs (PVC)	185,542	185,542	185,542	185,542
OVERALL IMPACTS				
Net Present Value (NPV)	496,881	714,227	559,643	650,928
Benefit to Cost Ratio (BCR)	3.678	4.849	4.016	4.508

Notes: All monetary values are expressed in 2010 prices discounted to 2010 and calculated using TUBA1.9.3.
*Detailed summary results can be found in Section 6. The lower conservative accident benefit is included based upon the use of local accident data, as explained in section 7 of Reference Document 5.7.

5.3.7 The Benefit Cost Ratio (BCR) of the scheme varies between 3.68 and 4.85 including accidents for these sensitivity tests. Under the DfT's value for money criteria, these represent High / Very High value for money categories.

5.3.8 Table 5.11 below provides summary economic appraisal results including wider impacts and journey time reliability for +/-25% VOT sensitivity tests.

Table 5.11: Summary of Economic Appraisal including Wider Benefits – VOT Sensitivity Tests

Item	Scenario also including WEBs and JTR (£000)			
	Non-work VOT -25%	Non-work VOT +25%	Work VOT -25%	Work VOT +25%
Present Value of Benefits (PVB)	881,218	1,125,384	952,360	1,056,344
Present Value of Costs (PVC)	185,542	185,542	185,542	185,542
Net Present Value (NPV)	695,676	939,842	766,818	870,802
Benefit to Cost Ratio (BCR)	4.749	6.065	5.133	5.693

Notes: All monetary values are in £000's and expressed in 2010 prices discounted to 2010

5.3.9 The BCRs range between 4.75 and 6.07 once journey time reliability benefits and wider economic benefits are included in the appraisal. The inclusion of these benefits increases the BCR to a higher level within the Very High value for money category.

6 Low and High Growth Sensitivity Test Results

6.1 Flow Analysis Results

6.1.1 Low growth scenario results in reduced traffic levels over the network. However even with low growth traffic flows on inappropriate routes would increase substantially without the Scheme. Figure 6.1 below shows that for the low growth scenario the Scheme will produce substantial traffic reductions on inappropriate routes.

Figure 6.1: Comparison of Traffic Flows on Inappropriate Routes_Low Growth

6.1.2 Traffic flow analysis plots for low growth scenario are shown in Figure 10.1 to Figure 10.5 of Appendix A. This comparison shows a reasonable distribution of decreased growth across the network in all forecast years and time periods as expected.

6.1.3 Traffic flow analysis plots for high growth scenario are shown in Figure 10.6 to Figure 10.10 of Appendix A. This comparison shows a reasonable distribution of increased growth across the network in all forecast years and time periods, as expected.

6.2 Safety Analysis Results

6.2.1 Low and High growth COBAs are based on same accident parameters as the DCO. The only change is the corresponding flows. The results in Table 6.1 indicate that number of personal injury accidents and casualty numbers decrease or increase for low and high growth scenarios respectively (hence the accident costs) for both DM and DS scenarios as expected. The difference between the figures for low growth produce a similar level of savings to that for the DCO submission, but this difference increases with high growth, though the savings are very much of a similar order.

Table 6.1: Accident Benefits of Low and High Sensitivity Test Scenarios

60 Year Appraisal Period		Scenario		
		DCO	Low	High
Do Minimum				
Number of PIAs		70,984	65,448	76,449
Casualties	Fatal	1,890	1,739	2,041
	Serious	12,597	11,594	13,596
	Slight	91,490	84,389	98,495
Accident Costs		5,999,332	5,537,051	6,456,500
Do Something				
Number of PIAs		69,944	64,415	75,501
Casualties	Fatal	1,898	1,746	2,050
	Serious	12,488	11,486	13,498
	Slight	90,226	83,128	97,353
Accident Costs		5,958,113	5,495,141	6,422,172
Accident Benefits				
Number of PIA savings		1,041	1,033	948
Casualties	Fatal	-7	-7	-9
	Serious	109	108	98
	Slight	1,263	1,261	1,142
Accident Savings		41,219	41,910	34,328

Notes: All monetary values are expressed in £000's in 2010 prices discounted to 2010

6.3 Economic Analysis Results

6.3.1 Table 6.2 below compares monetised costs and benefits including accident benefits for low and high growth sensitivity tests against the DCO scheme.

Table 6.2: Analysis of Monetised Costs and Benefits – Low and High Growth

Item	Accidents included (£000)		
	Low growth	DCO	High growth
Accidents (not assessed by TUBA)*	41,910	41,219	34,328
Greenhouse Gases**	-23,060	-22,756	-25,145
Economic Efficiency: Consumer Users (Commuting)	43,164	51,164	63,031
Economic Efficiency: Consumer Users (Other)	337,245	380,623	410,054
Economic Efficiency: Business Users and Providers	233,031	267,797	299,450
Wider Public Finances (Indirect Taxation Revenues)	56,286	55,270	60,879
Present Value of Benefits (PVB)	688,576	773,317	842,597
Broad Transport Budget Present Value of Costs (PVC)	182,798	185,542	187,910
OVERALL IMPACTS			
Net Present Value (NPV)	505,778	587,775	654,687
Benefit to Cost Ratio (BCR)	3.767	4.168	4.484

Notes: All monetary values are expressed in 2010 prices discounted to 2010
 *Detailed summary results can be found in Section 6. The lower conservative accident benefit is included based upon the use of local accident data, as explained in section 7 of Reference Document 5.7,
 **Greenhouse gas impacts were calculated using TUBA1.9.2 since there was a bug in TUBA 1.9.1

6.3.2 The results show that overall benefits are reduced with low growth and increased with high growth which is the usual outcome of low and high growth sensitivity tests. The Benefit Cost Ratios (BCR) of the scheme are 3.77 and 4.48 including accidents for low and high growth scenarios respectively. Under the DfT's value for money criteria, these represent High / Very High value for money categories respectively.

6.3.3 Table 6.3 below compares summary economic appraisal results including wider impacts and journey time reliability for low and growth sensitivity tests against the DCO scheme.

Table 6.3: Summary of Economic Appraisal including Wider Benefits – Low and High Growth

Item	Scenario also including WEBs and JTR (£000)		
	Low growth	DCO	High growth
Present Value of Benefits (PVB)	867,854	989,063	1,063,924
Present Value of Costs (PVC)	182,798	185,542	187,910
Net Present Value (NPV)	685,056	803,521	876,014
Benefit to Cost Ratio (BCR)	4.748	5.331	5.662

Notes: All monetary values are in £000's and expressed in 2010 prices discounted to 2010

6.3.4 The BCRs are improved further to 4.75 and 5.66 respectively for low and high growth once journey time reliability benefits and wider economic benefits are

included in the appraisal. The inclusion of these benefits increases the BCRs to higher levels within the Very High value for money category.

7 Postwick Scheme in the Do Minimum Sensitivity Test Results

7.1 Flow Analysis Results

7.1.1 Traffic flow analysis plots for Postwick in DM scenario are shown in Figure 10.6 to Figure 10.15 of Appendix A. AADT flow comparisons between DCO DM and Postwick in DM indicate that changes are localised to Postwick area and there are very small changes on the wider network.

7.2 Operational Analysis Results

7.2.1 Table 7.1 to Table 7.3 compare maximum RFC/DoS, maximum queue and delay for Postwick junctions between DCO DS and Postwick in DM scenario for 2032 AM and PM peaks. It should be noted that the comparison is between a DS scenario (DCO DS) and a DM scenario (Postwick scheme in Do Minimum, referred to as Postwick in DM in the tables below). A direct comparison of the two DM scenarios is not possible because the new Postwick junctions do not exist in DCO DM. The results indicate that there are some differences in junction operational performance between these two scenarios mainly because of the absence of NDR in Postwick in DM scenario.

Table 7.1: Junction Operational Assessment Results: DCO DS / Postwick in DM – 2032 Max RFC/DoS

Junction	AM		PM	
	DCO DS	Postwick in DM	DCO DS	Postwick in DM
Online junctions				
Business Park	0.87	0.56	0.95	0.44
Postwick junctions				
Broadland Gate	0.95	0.76	0.55	0.63
Peachman Way	1.01	0.91	0.67	0.95
Postwick North West	0.88	0.98	1.06	1.13
Postwick North East	1.02	0.29	0.69	0.50
Oaks Lane	0.75	0.57	0.34	0.30
Park and Ride*	94.8%	94.8%	120.0%	118.7%

Notes: *This is a signalised junction while all other junctions are roundabouts/priority junction
 The Ratio of Flow to Capacity (RFC) output from ARCADY/PICADY is the primary measure of a junction arm performance of a roundabout/priority junction. RFC less than 0.85 indicates that a junction arm operates within capacity. RFC greater than 0.85 but less than 1.0 indicates that a junction arm is over its desired capacity but below theoretical capacity. Any RFC greater than 1.0 indicates that a junction arm is in excess of its theoretical capacity. Degree of Saturation (DoS) output from LINSIG is the primary measure of performance of a signalised junction. DoS less than 90% indicates that a junction arm operates within capacity. DoS greater than 90% but less than 100% indicates that a junction arm is over its desired capacity but below theoretical capacity. Any DoS greater than 100% indicates that a junction arm is in excess of theoretical capacity.

Table 7.2: Junction Operational Assessment Results: DCO DS / Postwick in DM – 2032 Max Queue (PCUs)

Junction	AM		PM	
	DCO DS	Postwick in DM	DCO DS	Postwick in DM
Online junctions				
Business Park	7	1	17	1
Postwick junctions				
Broadland Gate	13	3	1	2
Peachman Way	31	9	2	13
Postwick North West	7	19	19	26
Postwick North East	45	0	2	1
Oaks Lane	3	1	1	0
Park and Ride*	24	23	57	53

Notes: *This is a signalised junction while all other junctions are roundabouts/priority junction

Table 7.3: Junction Operational Assessment Results: DCO DS / Postwick in DM – 2032 Max Delay (sec/PCU)

Junction	AM		PM	
	DCO DS	Postwick in DM	DCO DS	Postwick in DM
Online junctions				
Business Park	14	3	23	3
Postwick junctions				
Broadland Gate	34	10	5	6
Peachman Way	71	26	7	44
Postwick North West	20	61	166	228
Postwick North East	74	3	7	4
Oaks Lane	21	11	7	7
Park and Ride*	115	83	383	366

Notes: *This is a signalised junction while all other junctions are roundabouts/priority junction

7.2.2 Most junctions tend to perform better in the Postwick in DM Scenario. This is due to the Postwick junctions being used to access this area and not to also perform the function of a feeder route for NDR as in the DCO DS. This is particularly evident for Postwick North East junction. The more western Postwick junctions however (Peachman Way and Postwick North West) attract significant traffic without the NDR in place.

7.2.3 The results show that in the AM peak, all junctions perform within their theoretical capacity in the Postwick in the DM scenario with overall queues and delays being lower than in the DCO DS scenario.

7.2.4 The results also show that in the PM peak, the same two junctions as in the DCO DS are operating above their theoretical capacity. For the remaining junctions, the results are mixed with the eastern junctions showing a better

performance and the western junctions showing a worse performance than in the DCO DS scenario.

7.3 Safety Analysis Results

7.3.1 Postwick in the DM safety analysis results in Table 7.4 indicate that there would be a small increase in the number of personal injury accidents and the casualty types hence overall there are more benefits compared to the DCO Scheme submission analysis. It should be noted here that Postwick in the DM accident costs are based on the reference JCS matrices as per DCO DM.

Table 7.4: Accident Benefits of Postwick in DM Sensitivity Test Scenario

60 Year Appraisal Period		Scenario	
		DCO	Postwick in DM
Do Minimum			
Number of PIAs		70,984	71,004
Casualties	Fatal	1,890	1,896
	Serious	12,597	12,623
	Slight	91,490	91,510
Accident Costs		5,999,332	6,009,164
Do Something			
Number of PIAs		69,944	69,944
Casualties	Fatal	1,898	1,898
	Serious	12,488	12,488
	Slight	90,226	90,226
Accident Costs		5,958,113	5,958,113
Accident Benefits			
Number of PIA savings		1,041	1,060
Casualties	Fatal	-7	-2
	Serious	109	135
	Slight	1,263	1,284
Accident Savings		41,219	51,051

Notes: All monetary values are expressed in £000's in 2010 prices discounted to 2010

7.4 Economic Analysis Results

7.4.1 Table 7.5 below compares monetised costs and benefits including accident benefits for Postwick in DM sensitivity test against the DCO scheme.

Table 7.5: Analysis of Monetised Costs and Benefits – Postwick in DM

Item	Accidents included (£000)	
	DCO	Postwick in DM
Accidents (not assessed by TUBA)*	41,219	51,051
Greenhouse Gases**	-22,756	-22,349
Economic Efficiency: Consumer Users (Commuting)	51,164	51,806
Economic Efficiency: Consumer Users (Other)	380,623	419,949
Economic Efficiency: Business Users and Providers	267,797	297,406
Wider Public Finances (Indirect Taxation Revenues)	55,270	54,256
Present Value of Benefits (PVB)	773,317	852,119
<hr/>		
Broad Transport Budget Present Value of Costs (PVC)	185,542	161,046
<hr/>		
OVERALL IMPACTS		
Net Present Value (NPV)	587,775	691,073
Benefit to Cost Ratio (BCR)	4.168	5.291

Notes: All monetary values are expressed in 2010 prices discounted to 2010
 *Detailed summary results can be found in Section 6. The lower conservative accident benefit is included based upon the use of local accident data, as explained in section 7 of Reference Document 5.7.
 **Greenhouse gas impacts were calculated using TUBA1.9.2 since there was a bug in TUBA 1.9.1

7.4.2 The results show that the Present Value of Benefits (PVB) is estimated to be £852m (inclusive of accident benefits), outweighing the £161m Present Value of Costs (PVC).

7.4.3 The Benefit Cost Ratio (BCR) of the scheme is increased to 5.29 including accidents. Under the DfT's value for money criteria, this represents a Very High value for money category.

7.4.4 Table 7.6 below compares summary economic appraisal results including wider impacts and journey time reliability for Postwick in DM sensitivity test against the DCO scheme.

Table 7.6: Summary of Economic Appraisal including Wider Benefits – Postwick in DM

Item	Scenario also including WEBs and JTR (£000)	
	DCO	Postwick in DM
Present Value of Benefits (PVB)	989,063	1,090,480
Present Value of Costs (PVC)	185,542	161,046
Net Present Value (NPV)	803,521	929,434
Benefit to Cost Ratio (BCR)	5.331	6.771

Notes: All monetary values are in £000's and expressed in 2010 prices discounted to 2010

7.4.5 The BCR is improved further to 6.77 once journey time reliability benefits (£30m) and wider economic benefits (£208m) are included in the appraisal.

These additional benefits amount to £238m (2010 prices discounted to 2010). The inclusion of these benefits increases the BCR to a higher level within the Very High value for money category.

8 Dependent Development Sensitivity Test Results

8.1 Flow Analysis Results

8.1.1 Traffic flow analysis plots for two dependent development sensitivity test scenarios are shown in Figure 10.16 to Figure 10.25 of Appendix A.

8.1.2 In Table 8.1 below a comparison of AADT figures is made between the dependent development assignment and the DCO submission assignment. The changes overall suggest that dependent development sensitivity test would produce similar forecast traffic flows on the NDR and thus similar Scheme impacts.

Table 8.1: NDR Locations AADT Comparison

Location	Link	Direction	Dependent dev	DCO Submission	Difference	% Difference
A66	Holt Road - Cromer Road Link	WB/EB	30,200	30,400	-200	-1%
A67	Cromer Road - Airport Link	NEB/SWB	28,200	29,800	-1,600	-5%
A68	Airport - North Walsham Road Link	WB/EB	28,200	29,800	-1,600	-5%
A69	North Walsham Road - Wroxham Road Link	WB/EB	37,700	39,100	-1,400	-4%
A70	Wroxham Road - Salhouse Road Link	NWB/SEB	45,400	43,900	1,500	3%
A71	Salhouse Road - Plumstead Road Link	NWB/SEB	43,800	46,000	-2,200	-5%
A72	Plumstead Road - Postwick Hub Link	NB/SB	44,700	46,400	-1,700	-4%
A73	Postwick Hub - A47 Link	NB/SB	42,600	42,900	-300	-1%
A79	Fakenham Road - Fir Covert Road Link	NEB/SWB	16,500	16,500	0	0%
A90	Fir Covert Road - Reepham Road Link	NEB/SWB	20,700	20,800	-100	0%
A91	Reepham Road - Holt Road Link	WB/EB	26,800	26,400	400	2%

8.2 Operational Analysis Results

8.2.1 The dependent development scenario provides an alternative growth when Postwick Hub is in place. More details on this scenario can be found in Section 3. Table 8.2 to Table 8.4 compare maximum RFC/DoS, maximum queue and delay for online NDR and Postwick junctions between DCO and dependent development scenario (developer links included) for 2032DS AM

and PM peaks. The results indicate that there is no substantial difference in junction operational performance between these two scenarios.

8.2.2 The flows used in the DS operational assessments refer to the DM dependent development reference matrices assigned onto DS networks. These will provide an alternative development scenario where only Postwick Hub released developments are spatially allocated.

Table 8.2: Junction Operational Assessment Results_Dependent Development – 2032 Max RFC/DoS

Junction	AM		PM	
	DCO	Dependent dev	DCO	Dependent dev
Online junctions				
Fakenham Road	0.52	0.52	0.52	0.52
Fir Covert Road	0.55	0.53	0.51	0.55
Reepham Road	0.57	0.59	0.64	0.66
Drayton Lane	1.09	1.13	0.96	0.96
Holt Road/Drayton Lane	0.51	0.55	0.44	0.48
Cromer Road South	0.86	0.66	0.97	0.94
Cromer Road North	0.98	0.82	0.61	0.63
Airport	0.87	0.85	0.79	0.68
North Walsham Road	1.10	1.01	0.83	0.78
Wroxham Road	0.99	0.97	0.95	1.01
Salhouse Road	0.95	0.96	0.97	0.93
Plumstead Road North	0.40	0.29	0.40	0.50
Plumstead Road South	0.98	0.96	0.88	0.91
Business Park	0.87	0.78	0.95	0.92
Postwick junctions				
Broadland Gate	0.95	0.98	0.55	0.49
Peachman Way	1.01	1.03	0.67	0.61
Postwick North West	0.88	0.89	1.06	1.10
Postwick North East	1.02	1.03	0.69	0.73
Oaks Lane	0.75	0.72	0.34	0.37
Park and Ride*	94.8%	93.3%	120.0%	121.7%

Notes: *This is a signalised junction while all other junctions are roundabouts/priority junction

The Ratio of Flow to Capacity (RFC) output from ARCADY/PICADY is the primary measure of a junction arm performance of a roundabout/priority junction. RFC less than 0.85 indicates that a junction arm operates within capacity. RFC greater than 0.85 but less than 1.0 indicates that a junction arm is over its desired capacity but below theoretical capacity. Any RFC greater than 1.0 indicates that a junction arm is in excess of its theoretical capacity.

Degree of Saturation (DoS) output from LINSIG is the primary measure of performance of a signalised junction. DoS less than 90% indicates that a junction arm operates within capacity. DoS greater than 90% but less than 100% indicates that a junction arm is over its desired capacity but below theoretical capacity. Any DoS greater than 100% indicates that a junction arm is in excess of theoretical capacity.

Table 8.3: Junction Operational Assessment Results_Dependent Development – 2032 Max Queue (PCUs)

Junction	AM		PM

Junction	AM		PM	
	DCO	Dependent dev	DCO	Dependent dev
Plumstead Road South	36	25	11	13
Business Park	14	8	23	47
Postwick junctions				
Broadland Gate	34	49	5	4
Peachman Way	71	94	7	7
Postwick North West	20	19	166	193
Postwick North East	74	83	7	8
Oaks Lane	21	19	7	7
Park and Ride	115	98	383	402

Notes: *This is a signalised junction while all other junctions are roundabouts/priority junction

8.2.3 Though some of the priority junctions and roundabouts are over capacity, further tests indicated that a slight adjustment of flare/ entry width can bring junction performance to an acceptable level. Such a change, where sufficient land is available, could be implemented by the highways authority should monitoring show increased delays at these junctions.

8.2.4 Postwick P&R signal junction would work above its theoretical capacity on the Yarmouth Road arm in 2032DS PM peak. Comparing these results with those reported for existing roundabout in Document Reference 5.5, however, represents a significant improvement on the Yarmouth Road arm.

8.3 Safety Analysis Results

8.3.1 These results have been produced for two scenarios, one with and one without developer link roads included. Table 8.5 shows that the two scenarios produce slightly different accident benefits compared to DCO. These scenarios include Postwick in the DM and are based on different matrices as described in Section 3.

Table 8.5: Accident Benefits of Dependent Development Sensitivity Test Scenarios

60 Year Appraisal Period		Scenario		
		DCO	Dep dev_dev links included	Dep dev_dev links excluded
		Do Minimum		
Number of PIAs		70,984	71,577	71,501
Casualties	Fatal	1,890	1,909	1,906
	Serious	12,597	12,716	12,698
	Slight	91,490	92,236	92,133
Accident Costs		5,999,332	6,052,206	6,042,491
		Do Something

Casualties	Fatal	-7	10	7
	Serious	109	201	184
	Slight	1,263	1,733	1,630
Accident Savings		41,219	80,550	71,454

Notes: All monetary values are expressed in £000's in 2010 prices discounted to 2010

8.4 Economic Analysis Results

8.4.1 Table 8.6 below compares monetised costs and benefits including accident benefits for the dependent development sensitivity tests against the DCO Scheme. It should be noted that dependent development benefits relates to NDR in isolation.

Table 8.6: Analysis of Monetised Costs and Benefits – Dependent Development (NDR in Isolation)

Item	Accidents included (£000)		
	DCO	Developer links included	Developer links excluded
Accidents (not assessed by TUBA)*	41,219	80,550	71,454
Greenhouse Gases**	-22,756	-26,011	-26,293
Economic Efficiency: Consumer Users (Commuting)	51,164	37,823	38,890
Economic Efficiency: Consumer Users (Other)	380,623	389,813	391,528
Economic Efficiency: Business Users and Providers	267,797	225,078	226,759
Wider Public Finances (Indirect Taxation Revenues)	55,270	62,057	63,523
Present Value of Benefits (PVB)	773,317	769,310	765,861
Broad Transport Budget Present Value of Costs (PVC)	185,542	161,668	161,882
OVERALL IMPACTS			
Net Present Value (NPV)	587,775	607,642	603,979
Benefit to Cost Ratio (BCR)	4.168	4.759	4.731

Notes: All monetary values are expressed in 2010 prices discounted to 2010

*Detailed summary results can be found in Section 6. The lower conservative accident benefit is included based upon the use of local accident data, as explained in section 7 of Reference Document 5.7.

**Greenhouse gas impacts were calculated using TUBA1.9.2 since there was a bug in TUBA 1.9.1

8.4.2 The Benefit Cost Ratio (BCR) of the scheme is 4.76 and 4.73 (including accidents) for developer links included and excluded scenarios respectively.

Under the DfT's value for money criteria, these represent Very High value for money category.

8.4.3 Table 8.7 below compares summary economic appraisal results including wider impacts and journey time reliability for dependent development sensitivity test again when the transport scheme is assessed in isolation against the DCO scheme.

Table 8.7: Summary of Economic Appraisal including Wider Benefits – Dependent Development (NDR in Isolation)

Item	Scenario also including WEBs and JTR (£000)		
	DCO	Developer links included	Developer links excluded
Present Value of Benefits (PVB)	989,063	968,674	969,650
Present Value of Costs (PVC)	185,542	161,668	161,882
Net Present Value (NPV)	803,521	807,006	807,768
Benefit to Cost Ratio (BCR)	5.331	5.992	5.990

Notes: All monetary values are in £000's and expressed in 2010 prices discounted to 2010

8.4.4 The BCRs are improved further to 5.99 in both instances once journey time reliability benefits and wider economic benefits are included in the appraisal. The inclusion of these benefits increases the BCRs to higher levels within the Very High value for money category.

8.4.5 As discussed in the previous section there are additional development benefits for this scenario. These are reported below and would increase the scheme benefits in total by £1,146m in terms of TECs and £422m in terms of GVA benefits in 2010 prices discounted to 2010 for both scenarios.

8.4.6 GVA benefits for NDR dependent business developments are reported in Table 8.8 below. These were direct extractions just for dependent business developments from Document Reference 10.3 of the DCO submission. Total GVA of the dependent business developments is £422.4m in 2010 prices discounted to 2010.

Table 8.8: GVA Benefits of NDR Dependent Developments

Year	GVA (£m)			Total
	Rackheath Eco Town	Airport Site 3	Airport Industrial State	
2018	1.6	1.3	0	2.9
2019	3.1	2.4	0.1	5.6
2020	4.3	3.4	0.1	7.8
2021	5.4	4.3	0.1	9.8
2022	6.4	5.1	0.1	11.6
2023	7.3	5.8	0.1	13.2

Year	GVA (£m)			Total
	Rackheath Eco Town	Airport Site 3	Airport Industrial State	
2024	8	6.4	0.2	14.6
2025	8.6	6.9	0.2	15.7
2026	9.1	7.3	0.2	16.6
2027	9.6	7.6	0.2	17.4
2028	9.9	7.9	0.2	18
2029	10.2	8.1	0.2	18.5
2030	10.5	8.3	0.2	19
2031	10.6	8.5	0.2	19.3
2032	10.7	8.5	0.2	19.4
2033	10.8	8.6	0.2	19.6
2034	10.8	8.6	0.2	19.6
2035	10.2	8.1	0.2	18.5
2036	9.6	7.7	0.2	17.5
2037	9.1	7.2	0.2	16.5
2038	8.6	6.8	0.2	15.6
2039	8.1	6.4	0.2	14.7
2040	7.6	6.1	0.1	13.8
2041	7.2	5.7	0.1	13
2042	6.8	5.4	0.1	12.3
2043	6.4	5.1	0.1	11.6
2044	6.1	4.8	0.1	11
2045	5.7	4.5	0.1	10.3
2046	5.4	4.3	0.1	9.8
2047	5.1	4	0.1	9.2
Total	232.8	185.1	4.5	422.4

Notes: All monetary values are expressed in 2010 prices discounted to 2010, directly copied from Table A-5 of Document Reference 10.3 of the DCO submission

8.4.7 Planning gain has been calculated for the Eco Town, Airport and Beyond Green developments assuming that the total development areas reported below will be unlocked on non-previously developed land in 2032 and there is a linear development profile from 2017 to 2032. Planning gain benefits for NDR dependent developments are reported in Table 8.9. The total net planning gain of the dependent developments is £121m in 2010 prices discounted to 2010.

Table 8.9: Planning Gain Benefits of NDR Dependent Developments

Site	Development type	Total development area (ha)	Value of developed work (£000)	Value of land in existing use (£000)	Net externalities (£000)	Net planning gain (£000)
Eco	Residential	141	1,600	19	838	104,739

Site	Development type	Total development area (ha)	Value of developed work (£000)	Value of land in existing use (£000)	Net externalities (£000)	Net planning gain (£000)
Town	Business	25	1,187	19	838	8,240
Airport	Business	30	1,187	19	838	9,888
Beyond Green	Residential	105	1,600	19	838	77,653
Total planning gain (£000s in 2010 prices, undiscounted)						200,520
Total planning gain (£m in 2010 prices discounted to 2010)						121

8.4.8 Transport external costs of NDR dependent developments are reported in Table 8.10 and Table 8.11 for the two scenarios. TEC was calculated for a 30 year period from 2017 to 2046 using two transport model runs namely, without the new developments but with the transport intervention and with the new developments and with the transport intervention. The negative result for TEC occurs because a transport intervention is being provided to cater for the development traffic, and both scenarios are controlled to NTEM.

Table 8.10: Transport External Costs of NDR Dependent Developments_developer links included

Scenario	User Time (£000s)	User Charges (£000)	Vehicle Operating Costs (£000)	Operator Revenues (£000)	CO2 Emissions (£000)
With the new developments and with transport intervention	50,907,354	1,907,360	36,905,802	-3,786,646	-5,191,720
Without the new developments but with the transport intervention	51,235,324	1,953,564	36,998,622	-3,878,372	-5,201,374
Development only costs	500,778	37,386	229,282	-74,240	-34,102
TEC (£000s)	-828,748	-83,590	-322,102	165,966	43,756
TEC total (£m)	-1,025				

Notes: All monetary values are expressed in 2010 prices discounted to 2010

Table 8.11: Transport External Costs of NDR Dependent Developments_developer links excluded

Scenario	User Time (£000s)	User Charges (£000)	Vehicle Operating Costs (£000)	Operator Revenues (£000)	CO2 Emissions (£000)
With the new developments and with transport intervention	50,906,846	1,907,442	36,910,506	-3,786,796	-5,192,058
Without the new developments but with the transport intervention	51,234,812	1,953,638	37,003,316	-3,878,528	-5,201,712
Development only costs	500,778	37,386	229,282	-74,240	-34,102
TEC (£000s)	-828,744	-83,582	-322,092	165,972	43,756
TEC total (£m)	-1,025				

Notes: All monetary values are expressed in 2010 prices discounted to 2010

8.4.9 Derivation of total dependent development benefits of NDR dependent developments are reported in Table 8.12. It should be noted that as the TECs are negative and they are subtracted from the planning gain, this results in positive total benefits for the developments.

Table 8.12: Derivation of Total Development Benefits of NDR Dependent Developments

Item	Benefits (£m)	
	Developer links included	Developer links excluded
Planning Gain	121	121
Transport External Costs	-1,025	-1,025
Other Externalities*	0	0
Total Development Benefits	1,146	1,146

Notes: All monetary values are expressed in 2010 prices discounted to 2010, *assumed zero

9 Conclusion

- 9.1.1 The series of sensitivity tests has been undertaken primarily to test the robustness of the economic appraisal of the Scheme to changes in parameters, forecast assumptions and methodology. The traffic flow forecasts of the Scheme in these test scenarios have also been reviewed and where appropriate operational performance has been assessed.
- 9.1.2 The submission showed that the DCO Scheme would deliver a benefit-to-cost ratio (BCR) of 4.17 (inclusive of accident benefits) and a BCR of 5.33 when WEBs and JTR are included. Both of these represent very high value for money (BCR above 4) according to DfT's VfM criteria.
- 9.1.3 The sensitivity test results indicate that benefit-to-cost ratio (BCR) ranges from 3.68 to 5.36 (inclusive of accident benefits) and 4.75 to 6.86 when WEBs and JTR are included. Both of these represent high/very high value for money (BCR above 3/4) for all the sensitivity test scenarios according to DfT's VfM criteria. It is therefore concluded that the transport benefits reported in the submission are robust and that the Scheme would deliver high or very high value for money.
- 9.1.4 In addition to the transport benefits the testing using the dependent development methodology shows that the completion of the NDR would deliver very high development benefits amounting to £1,146m. In addition the business development dependent on completion of the NDR could realise £422m of GVA benefits, though these should not simply be added to development benefits.

10 Appendices

10.1 Appendix A – Flow Diagrams

- 10.1.1 Figure 10.2 to Figure 10.6 contain traffic flow information for low growth scenario. Figure 10.6 to Figure 10.10 contain traffic flow information for high growth scenario.
- 10.1.2 Figure 10.11 to Figure 10.15 contain traffic flow information for Postwick in DM scenario. There are no changes to DS traffic flows compared to the DCO Scheme.
- 10.1.3 Figure 10.16 to Figure 10.20 contain traffic flow information for dependent development with developer link roads included and Figure 10.21 to Figure 10.25 contain traffic flow information for dependent development with developer link roads excluded. The flows for DS here refer to the DM dependent development reference matrices assigned onto DS networks. These provide an alternative development scenario where only developments unlocked by Postwick Hub are spatially allocated.

11 Abbreviations

AADT	Annual Average Daily Traffic
ARCADY	Assessment of Roundabout Capacity and Delay software
AST	Appraisal Summary Table
ATC	Automatic Traffic Count
B1/B2/B8	Development categories: business (including office) / general industrial / storage and distribution
BAFB	The Best And Final funding Bid submitted by Norfolk County Council to the Department for Transport in 2011 for the combined Postwick and NDR schemes
BCIS	Building Cost Information Service
BCR	Benefit Cost Ratio
BGBP	Broadland Gate Business Park development
COBA	Cost Benefit Appraisal – software released by the Department of Transport that has been used to undertake an accident appraisal
DfT	Department for Transport
DIADEM	Dynamic Integrated Assignment and Demand Modelling - software released by the Department for Transport
DM	Do Minimim
DMRB	Design Manual for Roads and Bridges – a Highways Agency publication setting out guidance and good practice for design and appraisal of road schemes
DS	Do Something
EB	Employer's Business
GAP	Minimum gap (in seconds) accepted by a vehicle which gives way at priority junctions or traffic signals. Also a measure of Wardrop equilibrium assignment convergence
GAPR	As GAP above in relation to junctions but for entry onto roundabouts
GDP	Gross Domestic Product
GEH	A comparison statistic named after GE Havers
GIS	Geographic Information System - designed to capture, store, manipulate, analyse, manage, and present all types of geographical data
GNDP	Greater Norwich Development Partnership
GPS	Global Positioning System
GVA	Gross Value Added
HA	Highways Agency
HB	Home Based (trips)
HBEB	Home Based Employers' Business (trips)
HBO	Home Based Other (trips)
HBW	Home Based Work (commuter trips)
HGV	Heavy Goods Vehicle
IP	Inter-peak

JT	Journey Time
JCS	Joint Core Strategy
JTR	Journey Time Reliability
LGV	Light Goods Vehicle
LINSIG	Traffic signal analysis software
LMVR	Local Model Validation Report
MCC	Manual Classified Count (for a link)
MCTC	Manual Classified Turning Counts
ME	Matrix Estimation
NATS	Norwich Area Transportation Strategy
NCC	Norfolk County Council
NDR	Norwich Northern Distributor Road
NHB	Non-Home Based (trips)
NHBEB	Non-home-based Employer's Business
NHBO	Non-home-based Other
NPV	Net Present Value – given by subtracting the Present Value Costs (PVC) from Present Value Benefits (PVB)
NTEM	National Trip End Model – a database containing trip-end, journey mileage, car ownership and population/workforce planning data
NTM	National Transport Model
NTS	National Travel Survey
OD	Origin Destination
OE	Other Externalities
OGV	Other Goods Vehicle (sometimes called HGV)
OGV1	A sub-category of OGV. Includes all rigid vehicles over 3.5 tonnes gross vehicle weight with two or three axles
OGV2	A sub-category of OGV. Includes all rigid vehicles with four or more axles and all articulated vehicles
OP	Off-peak
PA	Production Attraction
PCU	Passenger Car Unit
PDL	Previously Developed Land
PG	Planning Gain
PIA	Personal Injury Accident
PPK	Pence Per Kilometre
PPM	Pence Per Minute
PT	Public Transport
PVB	Present Value Benefits – the stream of benefits over the appraisal period (60 years) that are converted to 2010 prices and discounted to 2010 to give a 'present value'
PVC	Present Value Costs – the costs of the scheme over the construction period as well as maintenance and operational costs that are converted to 2010 prices and discounted to 2010 to give a 'present

	value'
PYV	Present Year Validation
P&R	Park and Ride
QRA	Quantified Risk Assessment
RFC	Ratio of Flow to Capacity
RPI	Retail Price Index
RSI	Road Side Interview
RTF	Road Transport Forecasts
SATME2	Matrix estimation module of the SATURN software
SATURN	Simulation – Assignment model of Traffic on Urban Road Networks software
SRN	Strategic Road Network
TA	Transport Assessment
TEC	Transport Externality Cost
TRADS	Traffic flow Data System – the Highways Agency’s database of traffic count data
TRICS	National Trip Generation database
TEMPRO	Trip End Model presentation Program is software released by the Department for Transport to allow detailed analysis of NTEM data
TUBA	Transport User Benefit Appraisal – software released by the Department for Transport that is used to assess transport user benefits of transport schemes
VDM	Variable Demand Modelling
VfM	Value for Money
VISUM	Transport modelling software used (in this case) for public transport modelling
VOC	Vehicle Operating Costs
VOT	Value Of Time
WEBS	Wider Economic Benefits
WebTAG	Web-based Transport Appraisal Guidance produced by the Department for Transport
WITA	Wider Impacts in Transport Appraisal

12 Glossary

Assignment	A process of loading a trip matrix onto routes through a network that accounts for travel costs on the network in identifying the optimum route choice for every trip
Buffer network	The external part of a highway network in which travel is represented by speed/ flow relationships or cruise speeds
Calibration	A process of adjusting the model input data or model parameters to improve the model and its validation
Convergence	An equilibrium between model outputs, in assignment between the flows and travel costs and in demand models between the demand and the costs from the supply model
Cost matrix	A table of travel costs for journeys that may include travel time, operating costs and charges such as tolls or fares
Cruise speeds	Average travel speed along a network link
Demand model	See variable demand model
Demand segment	Travel demand is divided into a number of segments for the purposes of applying different demand modelling procedures. The division is usually by trip purpose and whether the trips are home-based or non-home-based
DMRB	Design Manual for Roads and Bridges – a Highways Agency publication setting out guidance and good practice for design and appraisal of road schemes
Dependent development	Housing or commercial development that can only proceed with the implementation of a transport intervention
Discounting	Discounting is a technique used to compare costs and benefits that occur in different time periods. It is based on the principle known as time preference that people prefer goods and services now rather than later. This preference for goods and services now rather than later applies to both individuals and society. By applying a discount rate, streams of costs and benefits are reduced to their present values.
Do Minimum	The forecast scenario without the proposed transport scheme, but that includes committed transport network improvements and developments
Do Something	The Do Minimum network but with the proposed transport scheme and developments added
Generalised cost	A combination of time and money costs (operating costs and charges) that are expressed in time or money units which are used to represent the total travel costs for a journey within the assignment or demand models
Journey purpose	Trips are divided into different travel purposes, usually work (or commute), employers' business and other. These trip purposes have different generalised costs applied and different demand model responses
Matrix estimation	A process used to adjust an initial or 'prior' matrix so that the resulting assignment of the adjusted matrix matches count data as closely as possible
Network	A mathematical representation of a transport network in a supply-side assignment model, either a highway network which represents vehicle travel, or a public transport network that represents bus and rail services
Speed / flow relationships	Relationship between traffic speed and traffic flow on a network link

Reference trip matrix	A forecast reference matrix based on applying growth from national (or other) datasets, but before the application of adjustments due to the impact of how travel costs will change with growth in travel
User classes	Trips are aggregated into several user classes for the purposes of assignment. These usually represent different types of vehicle (e.g. car, HGV) and different trip purposes
Trip matrix	A table representing travel in a model area between land areas or zones
Validation	A process of comparing the model data with independent data
Variable demand modelling	A model that forecasts changes in travel behaviour such as trip frequency, choice of mode, time of travel and trip distribution
Zone	An area of land or development which is used in a transport model to aggregate individual households or commercial premises into a manageable number of units that can be used to represent journey patterns in the study area. Usually the zone size will be relatively small in the study area, but progressively larger further away from it.

1 Key Summary

- 1.1.1 Funding approval for the Norwich Northern Distributor Road (NDR) was sought in 2011 through the Department for Transport's (DfT) Development Pool process. A business case was developed and submitted in accordance with the guidance in the Treasury Green Book. Ministerial decisions were made in December 2011 to award funding.
- 1.1.2 The NDR is a project of national significance which requires a Development Consent Order (DCO) under the Planning Act 2008. The submission was made in January 2014.
- 1.1.3 The Transport Assessment for the Scheme is set out in submission Document Ref. 5.5. This included an operational assessment of the Scheme design with traffic forecasts based on the full implementation of JCS, as set out in the Traffic Forecasting Report Document Ref. 5.6. The forecasts were based on the transport model described in the Highway and Public Transport Local Model Validation Reports (Document Refs. 5.9 and 5.10). The transport assessment concluded that the Scheme design is considered to be the best possible balance between relieving the existing network whilst ensuring acceptable conditions on this new part of the network.
- 1.1.4 The Economic Appraisal Report (Document Ref. 5.7) shows that the Scheme would deliver very high value for money (VfM), the Benefit Cost Ratio (BCR) value exceeding 4, according to DfT's VfM criteria. In addition the Land Use and Economic Development Report (Document Ref. 10.3) sets out the substantial benefits of jobs, GVA and infrastructure investment that the Scheme would help to bring to the City.
- 1.1.5 Traffic and economic assessments for four of the Alternatives listed in Section 3.10.13 of the Environmental Statement (Document Ref 6.1) have been carried out using the latest version of the Transport Model (Alternative 4 was not tested as its traffic impacts and economic appraisal would be very similar to the DCO Scheme). These assessments provide comparative quantitative information on the same basis as that provided for the Scheme in the Traffic Forecasting Report (Document Ref 5.6) and the Economic Appraisal Report (Document Ref 5.7). The results assessments are presented in this report.
- 1.1.6 **The DCO Scheme** delivers a BCR of 4.17 (inclusive of accident benefits) and a BCR of 5.33 when WEBs and JTR are included. Both of these represent very high value for money (BCR above 4) according to DfT's VfM criteria.

- 1.1.7 **Alternative 1** (single carriageway NDR) provides the required transport connections, but the lower standard means that there would be a poorer operational performance compared with the DCO Scheme. The forecast traffic flows on a number of the single carriageway links are forecast to be substantially higher than the economic flow range upper limit in TA46/97 of 13,000 AADT for a single carriageway road in the opening year. This reduces the attractiveness of the route for some journeys so that there is less relief of existing routes. The analysis shows less relief on inappropriate routes and for cross city traffic using the Outer Ring Road. The economic appraisal shows a much lower level of benefits than the DCO Scheme resulting in a BCR of 2.42 with accidents and 2.67 with JTR benefits and WEBs included.
- 1.1.8 **Alternative 2** (dual carriageway NDR between Postwick Junction and A140) will not provide the connectivity for journeys west of the A140 and thus will not relieve roads and communities to the west of the A140. In some cases there would be traffic increases, especially on a minor road Hall Lane between the A140 Cromer Road junction and the A1067 which is an inappropriate route for the forecast increases in traffic. The economic appraisal shows a lower level of benefits than the DCO Scheme due to the lack of improved transport connections west of the A140 with a BCR of 3.81 including accidents. The benefits are increased with the inclusion of JTR and WEBs to give a BCR of 4.11, but the level of these additional benefits is much lower than calculated for the DCO Scheme due to the poorer connectivity provided by the Alternative.
- 1.1.9 **Alternative 3** (single / dual carriageway NDR) provides the required transport connections, but the lower standard west of the A140 Cromer Road means that there would be a poorer operational performance compared with the DCO Scheme. The forecast traffic flow on the Holt Road – Cromer Road single carriageway link is forecast to be substantially higher than the economic flow range upper limit in TA46/97 of 13,000 AADT for a single carriageway road in the opening year. This together with the A140 at grade junction reduces the attractiveness of the route for some journeys so that there is less relief of existing routes. The analysis shows less relief on inappropriate routes in the northwest sector. The economic appraisal shows a lower level of benefits than the DCO Scheme resulting in a BCR of 3.68 with accidents and 4.84 with JTR benefits and WEBs included.
- 1.1.10 **Alternative 5** (developer link roads) singularly fails to reduce traffic on inappropriate routes and relieve the existing network. Whilst the Alternative includes the city centre traffic management measures the reductions of cross

city centre traffic are much smaller compared with the DCO Scheme, especially for trips crossing the Outer Ring Road Cordon. The junction analyses show that North Walsham Road and Wroxham Road junctions would operate substantially over their theoretical capacity with long queues and delays, with delays of over 10 minutes at North Walsham Road Junction in the 2032 AM peak and 5 minutes in the 2032 PM peak. On these grounds the developer link roads would not operate satisfactorily and they would cause particularly severe difficulties in implementing the proposed shared use high street-type design envisaged in the development proposals. The delays would also mean that the Alternative would fail to meet the improved transport connectivity objective for the Scheme. The economic appraisal results highlight that the performance of Alternative 5 is especially poor and does not offer good value for money. The Alternative produces economic disbenefits as any benefits of the extended link roads are outweighed by the reduced performance due to overcapacity and due to the effects of introducing city centre traffic management measures without significant traffic relief being provided by the Alternative. The calculated BCR is -11.42 with accidents included and even worse with JTR and WEBs giving -20.34 although the BCR is not a meaningful term when the benefits are negative.

1.1.11 The table below provides a summary of the economic appraisal results.

Scenario	Brief Description	BCR (including accidents)	BCR (also including WEBs and JTR)
DCO Scheme		4.17	5.33
<i>Alternatives</i>			
Alternative 1	Single carriageway NDR	2.42	2.67
Alternative 2	NDR terminating at A140	3.81	4.11
Alternative 3	Dual NDR to A140 and single west of A140	3.68	4.84
Alternative 5	Developer links extending in place of NDR	-11.42	-20.34

Notes: A detailed description of Alternatives can be found in DCO Document Reference 6.1

1.1.12 In addition to the Alternatives tested, an option comprising significant improvements to public transport provision has been appraised, and details of this are presented in Appendix B. The results indicate that such an option would not meet the Scheme objectives or deliver good value for money. The calculated BCR is -34.42 with accidents included and even worse with JTR and WEBs giving -46.22, although the BCR is not a meaningful term when the benefits are negative.

2 Introduction

2.1 Background

- 2.1.1 Mott MacDonald (MM) has been appointed by Norfolk County Council (NCC) to assist with the development and appraisal of the Norwich Northern Distributor Road, known as the NDR or referred to as the Scheme.
- 2.1.2 The Scheme would be a dual carriageway all-purpose strategic distributor road, to be classified as the A1270 Principal Road, which would link the A1067 Fakenham Road near Attlebridge, to the A47(T) Trunk Road at Postwick. This will be over a length of approximately 20.4km.
- 2.1.3 The NDR is a project of national significance which requires a Development Consent Order (DCO) under the Planning Act 2008 and this formal planning process began in early 2013. It is currently anticipated that the process will be completed in time for the Scheme to start construction in 2015 and to be opened in 2017.
- 2.1.4 This document is one of a number that support the DCO, each of which has its own unique document reference number, and should therefore be read in conjunction with the other documentation. The proposed layout of the NDR is shown in the General Arrangement Plans contained in Document Ref. 2.6, whilst the full needs case for the NDR is explained in the Statement of Reasons (Document Ref. 4.1) and the Environmental Statement (Document Ref. 6.1).
- 2.1.5 Funding approval for the NDR was sought in 2011 through the Department for Transport's (DfT) Development Pool process. A business case was developed and submitted in accordance with the guidance in the Treasury Green Book. Ministerial decisions were made in December 2011 to award funding.
- 2.1.6 The NDR DCO submission was submitted on 8th January 2014 and has been accepted for examination by the planning inspectorate on 4th February 2014.

2.2 Purpose and Layout of Report

- 2.2.1 This report provides traffic and economic assessments for four of the Alternatives listed in Section 3.10.13 of the Environmental Statement (Document Ref 6.1). The assessments have used the latest version of the Transport Model and comparative quantitative information is set out on the

same basis as that provided for the Scheme in the Traffic Forecasting Report (Document Ref 5.6) and the Economic Appraisal Report (Document Ref 5.7).

2.2.2 The report sets out to provide:

- A review of the traffic impact of the Alternative and, where appropriate, operational assessments.
- An assessment of the safety impact using COBA.
- An assessment of economic benefits for consumer and business users from Alternatives based on the variable demand model (VDM) forecasts and the likely expenditure profile during the assessment period where appropriate.
- An assessment of the scheme Value for Money (VfM) under these Alternatives based on the corresponding VDM model outputs and the latest available costs of the Alternatives. The Guidance on Value for Money describes the criteria used to determine the VfM of various types of schemes.

2.2.3 The methodology used to produce the economic appraisal is described in detail in DCO submission Document Ref. 5.7. This methodology was retained for these Alternative tests.

2.2.4 This report contains the following sections after the current introductory section:

- Section 3 – describes the methodology and the details of the Alternatives;
- Section 4 – contains scheme costs of Alternatives;
- Section 5 to 8 – includes traffic, operational, safety and economic assessment results of each Alternative assessed;
- Section 9 – presents conclusions from the Alternative appraisals.

2.2.5 Supporting information is included in Appendices in Section 10. Appendix B contains the results for the assessment of an option that includes significant improvements to public transport provision.

2.2.6 Sections 11 and 12 contain Abbreviations and Glossary.

3 Methodology and Description of Alternatives

3.1 Methodology

- 3.1.1 The DCO submission appraisal was based on an updated NATS transport model rebased to 2012 with variable demand forecasts for the NDR proposed opening year of 2017 and design year of 2032. The forecasts assumed full JCS growth both with and without the Scheme. The DCO Scheme comprised both NDR and Postwick.
- 3.1.2 For this testing of the Alternatives the same transport model and forecast assumptions were used as applied to the appraisal of the DCO Scheme in the submission.
- 3.1.3 For each Alternative economic and safety appraisals have been carried out. As with the DCO submission, the economic appraisal calculates TUBA benefits, wider economic benefits (using WITA) and journey time reliability benefits. Safety appraisal was based on COBA.
- 3.1.4 The costs of the Alternatives are shared between local authority, central government and private sector as appropriate depending on the Alternative.
- 3.1.5 In addition a review of traffic impacts of each Alternative has been carried out and, where appropriate, operational assessment of key junctions has been undertaken. Analysis of cross city traffic has been undertaken for the two cases where this would be most affected, for Alternatives 1 and 5.
- 3.1.6 The following assumptions are made for the analysis of all the Alternatives:
- The Do Minimum for each Alternative will be identical to that for the DCO submission.
 - All Alternative schemes include Postwick and the proposed city centre measures.
 - All assignments are based on full JCS traffic as reference demand.
 - Each Alternative will be subject to variable demand modelling so the reference demand will be adjusted according to the forecast travel costs due to each Alternative.

3.2 Alternatives to the DCO Scheme

3.2.1 Alternatives to the DCO Scheme have been examined and more details on these can be found in Document Reference 6.1. Table 3.1 summarises key assumptions and the appraisal required; the Alternative numbering system corresponds with Document Reference 6.1.

Table 3.1: Summary of Requirements – Alternatives to the DCO Scheme

Alternative	Modelling required	Appraisal required
Alt1 – single carriageway standard along the entire DCO alignment	Coding DS highway network and running through demand model for 2017 and 2032	Economic and safety appraisal. Traffic forecast changes with DCO Operational assessment of key junctions
Alt2 – NDR terminating at A140	Coding DS highway network and running through demand model for 2017 and 2032	Economic and safety appraisal. Traffic forecast changes with DCO Operational assessment of key junctions
Alt3 – NDR dual carriageway to A140 then single carriageway west of A140	Coding DS highway network and running through demand model for 2017 and 2032	Economic and safety appraisal. Traffic forecast changes with DCO Operational assessment of key junctions
Alt 4 – Single carriageway NDR between Fir Covert Road and A1067	This Alternative is a relatively small change from the DCO Scheme and therefore has not been retested.	-
Alt5 – Developer link roads extending to A140 in place of NDR	Coding DS network and running through demand model for 2017 and 2032	Economic and safety appraisal. Traffic forecast changes with DCO Operational assessment of key developer junctions

3.2.2 Document Reference 6.1 contains plans of the highway Alternatives and indicative diagrams are shown in the AADT diagrams in the Appendices to this report.

4 Costs of Alternatives

4.1.1 The costs for the Alternatives have been provided by NCC and are summarised in Table 4.1 below. Costs for Alternatives 1, 2 and 3 are allocated to central and local governments while the costs for Alternative 5 are allocated to local government and private sector. It is assumed that developer links will be adopted by the local highway authority once completed, hence maintenance and operation costs will pass to the local authority.

Table 4.1: Summary Costs of Alternatives

Cost type	Cost (£m) in 2013Q1 prices				
	DCO Scheme	Alt1	Alt2	Alt3	Alt5
<i>Investment costs</i>					
Construction	110.2	90.4	82.3	102.8	37.7
Land	22.0	19.4	14.7	20.7	2.4
Preparation	7.8	9.0	8.2	10.3	3.8
Supervision	1.3	1.1	1.0	1.2	0.4
Total investment Cost	141.3	119.9	106.2	135.0	44.3
<i>Other costs</i>					
Maintenance	27.8	12.3	16.8	20.7	5.5
Operation	15.9	15.2	10.9	15.2	1.4

Notes: These are initial costs before adjusting for construction price inflation and optimism bias

4.1.2 Costs were adjusted as per Document Reference 5.7 before inputting into TUBA. It should also be noted that the profiles of costs in calendar years input into TUBA for all the Alternatives were derived by assuming a similar proportionate profile to that used for the DCO scheme.

5 Traffic and Economic Assessment Results for Alternative 1 (single carriageway NDR)

5.1 Traffic Analysis Results

5.1.1 Figure 5.1 shows the forecast AADTs for the single carriageway sections of Alternative 1 between locations A79 and A72, as well as for the Postwick business park link A73 which is a dual carriageway standard.

Figure 5.1: Alternative 1 AADT on Online Sections

Notes: A79: Fakenham Road - Fir Covert Road Link, A90: Fir Covert Road - Reepham Road Link, A91: Reepham Road - Holt Road Link, A66: Holt Road - Cromer Road Link, A67: Cromer Road - Airport Link, A68: Airport - North Walsham Road Link, A69: North Walsham Road - Wroxham Road Link, A70: Wroxham Road - Salhouse Road Link, A71: Salhouse Road - Plumstead Road Link, A72: Plumstead Road - Postwick Hub Link and A73: Postwick Hub - A47 Link.

5.1.2 The traffic forecasts for the Alternative 1 online sections vary between 10,900 AADT at the western end (at the A1067) and 24,700 towards the eastern end (at Postwick/the A47) in the opening year of 2017. Most of the sections contain traffic flows close to or higher than the economic flow range upper limit in TA46/97 of 13,000 AADT for a single carriageway road in the opening year. Whilst Alternative 1 will meet the transport connections objective, the lower standard means that there would be a poorer operational performance

of Alternative 1 compared with the DCO scheme due to over capacity of the single carriageway and thus reduced attractiveness, so that a proportion of traffic will remain on the existing network. A significant traffic increase (an average increase of 1/3 of the 2017 AADT level) is also forecast between 2017 and 2032 and all the sections would have a poorer operational performance in 2032.

5.1.3 Figure 5.2 shows traffic levels on inappropriate routes with Alternative 1.

Figure 5.2: Traffic on Inappropriate Routes – Alternative 1

5.1.4 This shows that Alternative 1 is not capable of reducing traffic levels at these locations to the same degree as the DCO Scheme. The Woodbastwick Road and Church Road routes are, for example, forecast to have reductions in two way AADT flows of 2,400 (56%) and 3,800 (61%) respectively in 2017 in comparison with the traffic flows that would otherwise occur in the 'Do Minimum' scenario. In 2032 the reduction is 3,200 (55%) and 5,600 (57%) respectively. In the DCO scenario the reductions would be higher at these two sites: 3,000 (70%) and 4,100 (66%) in 2017 and 3,900 (67%) and 7,100 (72%) in 2032 respectively.

5.1.5 Table 5.2 below shows city centre through traffic across three cordons. More details on these cordons can be found in Document Reference 5.6. The table shows that traffic crossing the city centre Inner Ring Road cordons is reduced

by a similar degree with Alternative 1 compared with the DCO Scheme. This is achieved by the combination of the city centre measures that are assumed to be implemented in both cases as well as the NDR route providing relief for strategic through movements. However the city centre traffic crossing the outer cordon is reduced significantly more with the DCO Scheme, with the single carriageway Alternative 1 being a less attractive route for some journeys that would continue to use the Outer Ring Road.

Table 5.1: City Centre Through Traffic (AADT)

Cordon*	2012		2017			2032	
		DM	DCO Scheme	ALT1	DM	DCO Scheme	ALT1
Inner Ring Road Inner Cordon			6,787	6,985		4,726	4,734
	9,477	8,159	(-17%)	(-14%)	9,236	(-49%)	(-49%)
Inner Ring Road Outer Cordon			78,369	78,469		80,352	80,325
	77,825	82,152	(-5%)	(-4%)	88,368	(-9%)	(-9%)
Outer Ring Road Outer Cordon			63,421	65,784		66,780	69,664
	68,117	73,691	(-14%)	(-11%)	79,151	(-16%)	(-12%)

Notes: *More details on Cordons can be found in Document Reference 5.6

5.1.6 Graphical presentations of these results are shown in Figure 5.3 and Figure 5.4. This illustrates that Alternative 1’s fulfilment of the Scheme objectives is limited by the attractiveness of its single carriageway.

Figure 5.3: Through Traffic Crossing Cordons in 2017 – Alternative 1

Figure 5.4: Through Traffic Crossing Cordon in 2032 – Alternative 1

5.2 Junction Analyses

5.2.1 Table 5.2 to Table 5.4 compare maximum RFC/DoS values, queues and delays for online NDR and Postwick junctions between the DCO Scheme and Alternative 1 for 2032DS AM and PM peaks. Overall the results are not dissimilar to those of the DCO submission. The single carriageway with flaring to two lanes at junctions as tested within Alternative 1 leads to a significantly lower amount of traffic attracted to the NDR and its side roads with reductions of over 25% in traffic for example on Drayton Road.

5.2.2 The results show that between Fakenham Road and North Walsham Road, the attraction of NDR is reduced to a level that leads to the junctions performing better in Alternative 1 than in the DCO scenario. Cromer Road junction however is not directly comparable, with the junction in Alternative 1 comprising an at-grade roundabout and the DCO Scheme providing a grade-separated junction. For Wroxham Road and Salhouse Road junctions, the results show that despite the lane reduction along the NDR, these two junctions are still sufficiently attractive to lead to results in excess of theoretical capacity in 2032.

5.2.3 The layout of the Business Park junction in Alternative 1 is the same as in the DCO with the north-south ahead filter lane along the NDR and the left filter lane from NDR to Broadland Gate Link in place, with the only change being the NDR southbound approach being one lane rather than two lanes. Due to

the reduction in flows, the junction therefore operates significantly better in Alternative 1.

Table 5.2: Junction Operational Assessment Results_Alternative 1 – 2032 Max RFC/DoS

Junction	AM		PM	
	DCO Scheme	Alternative 1	DCO Scheme	Alternative 1
Online junctions				
Fakenham Road	0.52	0.52	0.52	0.48
Fir Covert Road	0.55	0.52	0.51	0.55
Reepham Road	0.57	0.58	0.64	0.54
Drayton Lane	1.09	0.81	0.96	0.80
Holt Road/Drayton Lane	0.51	0.50	0.44	0.43
Cromer Road South	0.86	-	0.97	-
Cromer Road North	0.98	-	0.61	-
Cromer Road	-	0.77	-	0.86
Airport	0.87	0.58	0.79	0.54
North Walsham Road	1.10	0.82	0.83	0.83
Wroxham Road	0.99	1.01	0.95	0.95
Salhouse Road	0.95	1.03	0.97	1.04
Plumstead Road North	0.40	0.34	0.40	0.16
Plumstead Road South	0.98	0.97	0.88	0.85
Business Park	0.87	0.56	0.95	0.57

Notes: The Ratio of Flow to Capacity (RFC) output from ARCADY/PICADY is the primary measure of a junction arm performance of a roundabout/priority junction. RFC less than 0.85 indicates that a junction arm operates within capacity. RFC greater than 0.85 but less than 1.0 indicates that a junction arm is over its desired capacity but below theoretical capacity. Any RFC greater than 1.0 indicates that a junction arm is in excess of its theoretical capacity.

Degree of Saturation (DoS) output from LINSIG is the primary measure of performance of a signalised junction. DoS less than 90% indicates that a junction arm operates within capacity. DoS greater than 90% but less than 100% indicates that a junction arm is over its desired capacity but below theoretical capacity. Any DoS greater than 100% indicates that a junction arm is in excess of theoretical capacity.

5.3 Safety Analysis Results

5.3.1 Table 5.5 show that there would be a fewer personal injury accidents saved compared with the DCO Scheme submission analysis. An important change is a significant increase in fatalities and no savings in serious casualties. Consequently overall the cost benefit analysis for Alternative 1 shows a small accident disbenefit of £0.842m.

Table 5.5: Accident Benefits – Alternative 1

60 Year Appraisal Period		Scenario	
		DCO Scheme	Alternative 1
Do Minimum			
Number of PIAs		70,984	70,984
Casualties	Fatal	1,890	1,890
	Serious	12,597	12,597
	Slight	91,490	91,490
Accident Costs		5,999,332	5,999,332
Do Something			
Number of PIAs		69,944	70,044

	Serious	12,488	12,598
	Slight	90,226	90,206
Accident Costs		5,958,113	6,000,174
Accident Benefits			
Number of PIA savings		1,041	940
Casualties	Fatal	-7	-36
	Serious	109	-1
	Slight	1,263	1,284
Accident Savings		41,219	-842

Notes: All monetary values are expressed in £000's in 2010 prices discounted to 2010

5.4 Economic Analysis Results

5.4.1 Table 5.6 below compares monetised costs and benefits including accident benefits for Alternative 1 against the DCO scheme.

Table 5.6: Analysis of Monetised Costs and Benefits – Alternative 1

Item	Accidents included (£000)	
	DCO Scheme	Alternative 1
Accidents (not assessed by TUBA)*	41,219	-842
Greenhouse Gases**	-22,756	-14,117
Economic Efficiency: Consumer Users (Commuting)	51,164	12,026
Economic Efficiency: Consumer Users (Other)	380,623	241,290
Economic Efficiency: Business Users and Providers	267,797	87,850
Wider Public Finances (Indirect Taxation Revenues)	55,270	34,895
Present Value of Benefits (PVB)	773,317	361,102
<hr/>		
Broad Transport Budget Present Value of Costs (PVC)	185,542	149,386
<hr/>		
OVERALL IMPACTS		

Item	Accidents included (£000)	
	DCO Scheme	Alternative 1
Net Present Value (NPV)	587,775	211,716
Benefit to Cost Ratio (BCR)	4.168	2.417

Notes: All monetary values are expressed in 2010 prices discounted to 2010
 *Detailed summary results can be found in Section 6. The lower conservative accident benefit is included based upon the use of local accident data, as explained in section 7 of Reference Document 5.7
 **Greenhouse gas impacts were calculated using TUBA1.9.2 since there was a bug in TUBA 1.9.1

5.4.2 The results show that the Present Value of Benefits (PVB) of Alternative 1 is estimated to be £361m (inclusive of accident benefits), outweighing the £149m Present Value of Costs (PVC).

5.4.3 The Benefit Cost Ratio (BCR) of Alternative 1 is 2.42 including accidents. Under the DfT's value for money criteria, this represents a high value for money category.

5.4.4 Table 5.7 below compares summary economic appraisal results including wider impacts and journey time reliability for Alternative 1 against the DCO scheme.

Table 5.7: Summary of Economic Appraisal including Wider Benefits – Alternative 1

Item	Scenario also including WEBs and JTR (£000)	
	DCO Scheme	Alternative 1
Present Value of Benefits (PVB)	989,063	399,456
Present Value of Costs (PVC)	185,542	149,386
Net Present Value (NPV)	803,521	250,070
Benefit to Cost Ratio (BCR)	5.331	2.674

Notes: All monetary values are in £000's and expressed in 2010 prices discounted to 2010

5.4.5 The Alternative 1 BCR is improved further to 2.67 once journey time reliability benefits (£2m) and wider economic benefits (£37m) are included in the appraisal, although these are substantially lower than the additional benefits for the DCO Scheme (£28m for JTR and £187m for WEBs). These additional benefits for Alternative 1 amount to £39m (2010 prices discounted to 2010). The inclusion of these benefits increases the BCR of Alternative 1 to a higher level within the high value for money category. However comparison with DCO scheme shows that Alternative 1 provides much lower BCR.

6 Traffic and Economic Assessment Results for Alternative 2 (dual carriageway NDR between Postwick Junction and A140)

6.1 Traffic Analysis Results

6.1.1 Figure 6.1 shows traffic levels on inappropriate routes with Alternative 2.

Figure 6.1: Traffic on Inappropriate Routes – Alternative 2

6.1.2 As shown in the above graph with Alternative 2, traffic conditions in the northwest sector (sites 7 and 10) will not be relieved as much as those in the northeast sector. The Waterloo Road route is, for example, forecast to have a reduction in two way AADT flow of 1,200 (25%) in 2017 in comparison with the traffic flow that otherwise would occur in the 'Do Minimum' scenario. In 2032 the reduction is 2,200 (32%). By contrast, in the DCO scenario, the reduction on the same site is 2,900 (60%) in 2017 and 4,500 (66%) in 2032 respectively.

6.1.3 Alternative 2 will not provide any relief to roads and communities to the west of the A140, and in some cases there would be increases. As an example the traffic levels on School Road in Drayton are forecast to increase from an AADT level in 2017 in the Do Minimum of 11,400 to 12,400 with Alternative 2.

Similarly in 2032 the traffic level in the Do Minimum of 12,600 AADT would increase to 13,400.

6.2 Junction Analysis

6.2.1 The key junction to consider in this case is the A140 Cromer Road junction which is grade separated in the DCO Scheme but provides an at grade terminal roundabout for Alternative 2; all other junctions on Alternative 2 are identical to the DCO Scheme junctions. Table 6.1 to Table 6.3 compare maximum RFC values, queues and delays for Cromer Road junctions between the DCO Scheme and Alternative 2 for 2032DS AM and PM peaks. The results show that the junction would operate within its theoretical capacity. The form of the junction is significantly different in Alternative 2 compared with the DCO Scheme and the results are therefore not directly comparable. However, RFC values and the levels of maximum queues and delays are similar in both scenarios.

Table 6.1: Junction Operational Assessment Results_Alternative 2 – 2032 Max RFC

Junction	AM		PM	
	DCO Scheme	Alternative 2	DCO Scheme	Alternative 2

Cromer Road	-	51	-	17

6.3 Safety Analysis Results

6.3.1 Alternative 2 safety analysis results in Table 6.4 shows that there would be fewer injury accident savings but with a change in the severity split overall of the casualty savings then there would be slightly higher safety economic benefits compared with the DCO Scheme.

Table 6.4: Accident Benefits – Alternative 2

60 Year Appraisal Period		Scenario

6.4 Economic Analysis Results

6.4.1 Table 6.5 below compares monetised costs and benefits including accident benefits for Alternative 2 against the DCO scheme.

Table 6.5: Analysis of Monetised Costs and Benefits – Alternative 2

Item	Accidents included (£000)	
	DCO Scheme	Alternative 2
Accidents (not assessed by TUBA)*	41,219	48,279

Item	Accidents included (£000)	
	DCO Scheme	Alternative 2
Greenhouse Gases**	-22,756	-17,981
Economic Efficiency: Consumer Users (Commuting)	51,164	17,438
Economic Efficiency: Consumer Users (Other)	380,623	273,670
Economic Efficiency: Business Users and Providers	267,797	143,940
Wider Public Finances (Indirect Taxation Revenues)	55,270	44,045
Present Value of Benefits (PVB)	773,317	509,391
<hr/>		
Broad Transport Budget Present Value of Costs (PVC)	185,542	133,695
<hr/>		
OVERALL IMPACTS		
Net Present Value (NPV)	587,775	375,696
Benefit to Cost Ratio (BCR)	4.168	3.810

Notes: All monetary values are expressed in 2010 prices discounted to 2010

*Detailed summary results can be found in Section 6. The lower conservative accident benefit is included based upon the use of local accident data, as explained in section 7 of Reference Document 5.7

**Greenhouse gas impacts were calculated using TUBA1.9.2 since there was a bug in TUBA 1.9.1

6.4.2 The results show that the Present Value of Benefits (PVB) of Alternative 2 is estimated to be £509m (inclusive of accident benefits), outweighing the £134m Present Value of Costs (PVC). However the benefits are lower than those for the DCO Scheme reflecting the lack of improved transport connections west of the A140 Cromer Road and the Airport.

6.4.3 The Benefit Cost Ratio (BCR) of Alternative 2 is 3.81 including accidents. Under the DfT's value for money criteria, this represents a high value for money category.

6.4.4 Table 6.6 below compares summary economic appraisal results including wider impacts and journey time reliability for Alternative 2 against the DCO scheme.

Table 6.6: Summary of Economic Appraisal including Wider Benefits – Alternative 2

Item	Scenario also including WEBs and JTR (£000)	
	DCO Scheme	Alternative 2
Present Value of Benefits (PVB)	989,063	549,983
Present Value of Costs (PVC)	185,542	133,695
Net Present Value (NPV)	803,521	416,288
Benefit to Cost Ratio (BCR)	5.331	4.114

Notes: All monetary values are in £000's and expressed in 2010 prices discounted to 2010

6.4.5 The Alternative 2 BCR is improved further to 4.11 once journey time reliability benefits (£9m) and wider economic benefits (£31m) are included in the

appraisal, although these are substantially lower than the additional benefits for the DCO Scheme (£28m for JTR and £187m for WEBs). These additional benefits for Alternative 2 amount to £40m (2010 prices discounted to 2010). The inclusion of these benefits increases the BCR from the High to the Very High value for money category.

7 Traffic and Economic Assessment Results for Alternative 3 (single / dual carriageway NDR)

7.1 Traffic Analysis Results

7.1.1 Figure 7.1 below shows the forecast Alternative 3 AADTs on the NDR single carriageway sections between A1067 and A140.

Figure 7.1: Alternative 3 AADT on Online Sections between A1067 and A140

Notes: A79: Fakenham Road - Fir Covert Road Link, A90: Fir Covert Road - Reepham Road Link, A91: Reepham Road - Holt Road Link and A66: Holt Road - Cromer Road Link

7.1.2 The traffic forecasts on the single carriageway sections of Alternative 3 vary between 11,500 AADT between Fakenham Road and Fir Covert Road at the western end of the NDR and 19,500 AADT west of the A140 in the 2017 opening year. Traffic levels on Reepham Road – Holt Road link and Holt Road – Cromer Road link are higher than the economic flow range upper limit in TA46/97 of 13,000 AADT for a single carriageway road. In addition the Alternative requires a roundabout junction with the A140 Cromer Road to provide a safe transition between the single and dual carriageway sections of the Alternative. This would cause additional delays compared with the DCO Scheme and previous work concluded that the roundabout would need to be

upgraded by 2032 to a signal controlled hamburger-type junction in order to function effectively. Whilst Alternative 3 will meet the transport connections objective, the lower standard of the western section and the A140 junction means that there would be a poorer operational performance of Alternative 3 compared with the DCO scheme due to over capacity of the single carriageway and thus reduced attractiveness, such that a proportion of traffic will remain on the existing network. It can also be seen that further traffic increases are forecast for these locations between 2017 and 2032.

7.1.3 Figure 7.2 shows traffic levels on inappropriate routes with Alternative 3.

Figure 7.2: Traffic on Inappropriate Routes – Alternative 3

7.1.4 As shown in the above figure traffic conditions in the northwest sector (sites 7 and 10) will not be relieved as much as those in the northeast sector with Alternative 3. This trend is similar to the Alternative 2 but with more relief in this case. Taking Waterloo Road route as an example, it is forecast to experience a reduction in two way AADT flow of 2,400 (50%) in 2017 in comparison with the traffic flow that would otherwise would occur in the 'Do Minimum' scenario. In 2032 the reduction is 3,200 (47%). By contrast, in the DCO scenario, the reduction on the same site is 2,900 (60%) in 2017 and 4,500 (66%) in 2032 respectively.

Alternative 3 will provide relief to roads and communities to the west of the A140, but to a lesser degree than the DCO Scheme. The traffic levels on School Road in Drayton are forecast to reduce from an AADT level in 2017 in

the Do Minimum of 11,400 to 10,100 with Alternative 3 (9,400 with the DCO Scheme). Similarly in 2032 the traffic level in the Do Minimum of 12,600 AADT would reduce to 10,500 (10,200 with the DCO Scheme).

7.2 Junction Analyses

7.2.1 Table 7.1 to Table 7.3 compare maximum RFC/DoS values, queues and delays for online NDR junctions to the west of A140 between the DCO Scheme and Alternative 3 for 2032DS AM and PM peaks. The results show that the junctions generally perform very slightly better in Alternative 3 than in the DCO Scheme. This is due to the overall attractiveness of NDR being reduced due to it being a single carriageway to the west of A140 which results in slightly lower flows all along its length. The reductions in traffic flows on the junctions shown in Table 7.1 are however smaller in Alternative 3 than in Alternative 1 where the whole length of the NDR is single carriageway. Accordingly, the differences in results between Alternative 3 and the DCO Scheme are smaller than those for Alternative 1 compared with the DCO Scheme.

Table 7.1: Junction Operational Assessment Results_Alternative 3 – 2032 Max RFC/DoS

Notes: *Some arms of this roundabout are signalised in 2032

7.3 Safety Analysis Results

7.3.1 Alternative 3 safety analysis results in Table 7.4 show that there would be a slight reduction in the number of personal injury accidents compared with the DCO Scheme submission analysis. However there is an increase in fatal and serious injury casualty types due to part of the scheme being a single carriageway standard. Hence overall there is a slight reduction in safety economic benefits compared with the DCO Scheme.

Table 7.4: Accident Benefits – Alternative 3

<hr/>		
Broad Transport Budget Present Value of Costs (PVC)	185,542	167,205
<hr/>		
OVERALL IMPACTS		
Net Present Value (NPV)	587,775	448,149
Benefit to Cost Ratio (BCR)	4.168	3.680

Notes: All monetary values are expressed in 2010 prices discounted to 2010

*Detailed summary results can be found in Section 6. The lower conservative accident benefit is included based upon the use of local accident data, as explained in section 7 of Reference Document 5.7

**Greenhouse gas impacts were calculated using TUBA1.9.2 since there was a bug in TUBA 1.9.1

7.4.2 The results show that the Present Value of Benefits (PVB) of Alternative 3 is estimated to be £615m (inclusive of accident benefits), outweighing the £167m Present Value of Costs (PVC).

7.4.3 The Benefit Cost Ratio (BCR) of Alternative 3 is 3.68 including accidents. Under the DfT's value for money criteria, this represents a High value for money category.

7.4.4 Table 7.6 below compares summary economic appraisal results including wider impacts and journey time reliability for Alternative 3 against the DCO Scheme.

Table 7.6: Summary of Economic Appraisal including Wider Benefits – Alternative 3

Item	Scenario also including WEBs and JTR (£000)	
	DCO Scheme	Alternative 3
Present Value of Benefits (PVB)	989,063	809,516
Present Value of Costs (PVC)	185,542	167,205
Net Present Value (NPV)	803,521	642,311
Benefit to Cost Ratio (BCR)	5.331	4.841

Notes: All monetary values are in £000's and expressed in 2010 prices discounted to 2010

7.4.5 The BCR of Alternative 3 is improved further to 4.84 once journey time reliability benefits (£16m) and wider economic benefits (£178m) are included in the appraisal. These are lower than the additional benefits for the DCO Scheme (£28m for JTR and £187m for WEBs), but not to the same degree as the other Alternatives that have been tested in this report. These additional benefits amount to £194m (2010 prices discounted to 2010). The inclusion of these benefits increases the BCR to a higher level within the very high value for money category. However comparison with the DCO scheme shows that Alternative 3 provides an overall lower BCR.

8 Traffic and Economic Assessment Results for Alternative 5 (developer link roads)

8.1 Traffic Analysis Results

8.1.1 Figure 8.1 shows traffic levels on inappropriate routes for Alternative 5.

Figure 8.1: Traffic on Inappropriate Routes – Alternative 5

8.1.2 As shown in the above figure the traffic levels on the inappropriate routes would remain as high as in the Do Minimum or even increase. The Church Road and Church St routes are, for example, forecast to have a slight increase in two way AADT flows of 900 (15%) and 100 (1%) respectively in 2017 in comparison with the traffic flows in the 'Do Minimum' scenario. In 2032 the increase is 700 (7%) and 500 (5%) respectively. By contrast, in the DCO scenario, the reduction on these two sites are 4,100 (66%) and 2,400 (35%) in 2017 and 7,100 (72%) and 4,900 (52%) in 2032 respectively. These figures demonstrate the Alternative 5 is not capable of reducing traffic on these inappropriate routes and would singularly fail to meet this scheme objective.

8.1.3 Table 8.1 below shows city centre through traffic across three cordons. More details on these cordons can be found in Document Reference 5.6. The table shows that traffic crossing the city centre Inner Ring Road cordons is reduced

by a smaller degree with Alternative 5 compared with the DCO Scheme, mostly achieved by the city centre measures that are assumed to be implemented in both cases. However the city centre traffic crossing the outer cordon is reduced by a relatively small amount with Alternative 5 when compared with the reductions achieved by the DCO Scheme and thus there would be significant increases in this traffic over existing levels on the Outer Ring Road with Alternative 5 whereas with the DCO Scheme they are forecast to reduce.

Table 8.1: City Centre Through Traffic (AADT)

Cordon*	2012		2017			2032	
		DM	DCO Scheme	ALT5	DM	DCO Scheme	ALT5
Inner Ring Road Inner Cordon	9,477	8,159	6,787 (-17%)	7,467 (-8%)	9,236	4,726 (-49%)	4,970 (-46%)
Inner Ring Road Outer Cordon	77,825	82,152	78,369 (-5%)	81,058 (-1%)	88,368	80,352 (-9%)	83,413 (-6%)
Outer Ring Road Outer Cordon	68,117	73,691	63,421 (-14%)	70,119 (-5%)	79,151	66,780 (-16%)	76,613 (-3%)

Notes: *More details on Cordons can be found in Document Reference 5.6

8.1.4 A graphical presentation of these results are shown in Figure 8.2 and Figure 8.3.

Figure 8.2: Through Traffic Crossing Cordons in 2017 – Alternative 5

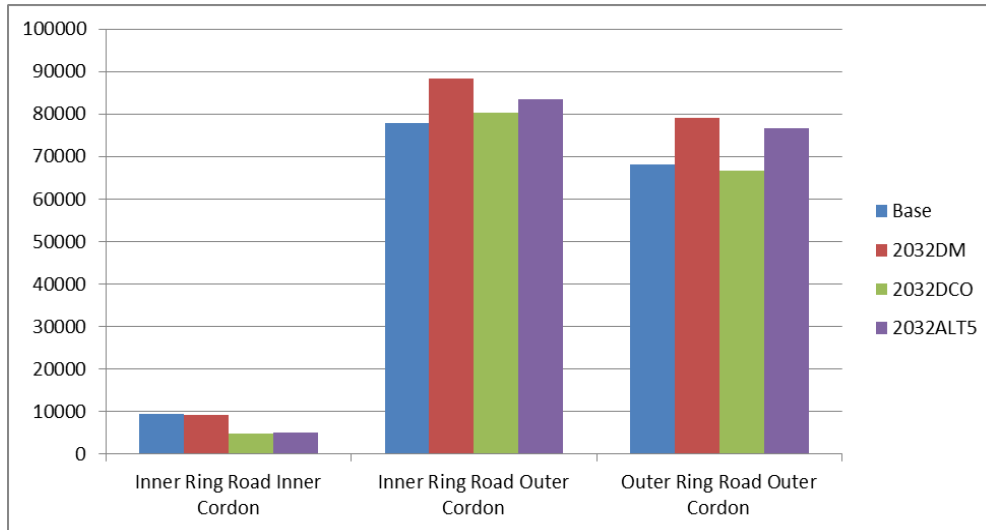

Figure 8.3: Through Traffic Crossing Cordon in 2032 – Alternative 5

8.2 Junction Analyses

8.2.1 Table 8.2 to Table 8.4 compare maximum DoS values, queues and delays for key developer link road signal-controlled junctions between the DCO Scheme and Alternative 5 for 2032DS AM and PM peaks. The results show that the junctions of Spixworth Main Street and St Faith Main Street (new or modified junctions in Alternative 5 so there are not comparable DCO Scheme results) would operate within desirable capacity in Alternative 5. However the junctions of North Walsham Road and Wroxham Road (coded with the developer’s proposals) would operate substantially over their theoretical capacity with long queues and delays, with delays of over 10 minutes at North Walsham Road Junction in the 2032 AM peak, and 5 minutes in the 2032 PM peak. On these grounds the developer link roads would not operate satisfactorily and they would cause particularly severe difficulties in implementing the proposed shared use high street-type design envisaged in the development proposals. The delays would also mean that the Alternative would fail to meet the improved transport connectivity objective for the Scheme.

Table 8.2: Junction Operational Assessment Results_Alternative 5 – 2032 Max DoS

Junction	AM		PM	
	DCO Scheme	Alternative 5	DCO Scheme	Alternative 5

8.3 Safety Analysis Results

8.3.1 Alternative 5 safety analysis results in Table 8.5 show that there would be a small number of personal injury accidents saved but that the changes in the numbers of casualties would result overall in safety economic dis-benefits.

Table 8.5: Accident Benefits – Alternative 5

60 Year Appraisal Period		Scenario	
		DCO Scheme	Alternative 5
Do Minimum

<hr/>		
Broad Transport Budget Present Value of Costs (PVC)	185,542	24,382
<hr/>		
OVERALL IMPACTS		

Item	Accidents included (£000)	
	DCO Scheme	Alternative 5
Net Present Value (NPV)	587,775	-302,837
Benefit to Cost Ratio (BCR)	4.168	-11.421

Notes: All monetary values are expressed in 2010 prices discounted to 2010
 * Detailed summary results can be found in Section 6. The lower conservative accident benefit is included based upon the use of local accident data, as explained in section 7 of Reference Document 5.7
 **Greenhouse gas impacts were calculated using TUBA1.9.2 since there was a bug in TUBA 1.9.1

8.4.2 The results show that the Present Value of Benefits (PVB) of Alternative 5 is estimated to be £-278m (inclusive of accident benefits). A significant factor in this are the private sector costs of -£44m for the developer link roads which TUBA allocates as negative benefits rather than costs to public accounts as they are private sector funded. The Alternative also produces transport efficiency economic disbenefits as any benefits of the extended link roads are outweighed by the reduced performance due to overcapacity and due to the effects of introducing city centre traffic management measures without significant traffic relief being provided by the Alternative. Set against these PVB results is the £24m Present Value of Costs (PVC) to public accounts.

8.4.3 The Benefit Cost Ratio (BCR) of the scheme is -11.42 including accidents and does not represent good value for money.

8.4.4 Table 8.7 below compares summary economic appraisal results including wider impacts and journey time reliability for Alternative 5 against the DCO scheme.

Table 8.7: Summary of Economic Appraisal including Wider Benefits – Alternative 5

Item	Scenario also including WEBs and JTR (£000)	
	DCO Scheme	Alternative 5
Present Value of Benefits (PVB)	989,063	-495,814
Present Value of Costs (PVC)	185,542	24,382
Net Present Value (NPV)	803,521	-520,196
Benefit to Cost Ratio (BCR)	5.331	-20.335

Notes: All monetary values are in £000's and expressed in 2010 prices discounted to 2010

8.4.5 The BCR of Alternative 5 deteriorates even further to -20.34 once journey time reliability benefits (£-30m) and wider economic benefits (£-187m) are included in the appraisal. These additional dis-benefits amount to £-217m (2010 prices discounted to 2010). The inclusion of these dis-benefits result in a further deterioration of the BCR although it should be noted that the BCR is not a meaningful term when the benefits are negative.

- 8.4.6 The economic appraisal results highlight that the performance of Alternative 5 is especially poor and does not offer good value for money. It should be noted however that the appraisal has not attempted to assess any development benefits that may arise with the link roads.

9 Conclusions

- 9.1.1 **The DCO Scheme** delivers a benefit-to-cost ratio (BCR) of 4.17 (inclusive of accident benefits) and a BCR of 5.33 when WEBs and JTR are included. Both of these represent very high value for money (BCR above 4) according to DfT's VfM criteria.
- 9.1.2 **Alternative 1** (single carriageway NDR) provides the required transport connections, but the lower standard means that there would be a poorer operational performance compared with the DCO Scheme. The forecast traffic flows on a number of the single carriageway links are forecast to be substantially higher than the economic flow range upper limit in TA46/97 of 13,000 AADT for a single carriageway road in the opening year. This reduces the attractiveness of the route for some journeys so that there is less relief of existing routes. The analysis shows less relief on inappropriate routes and for cross city traffic using the Outer Ring Road. The economic appraisal shows a much lower level of benefits than the DCO Scheme resulting in a BCR of 2.42 with accidents and 2.67 with JTR benefits and WEBs included.
- 9.1.3 **Alternative 2** (dual carriageway NDR between Postwick Junction and A140) will not provide the connectivity for journeys west of the A140 and thus will not relieve roads and communities to the west of the A140. In some cases there would be traffic increases, especially on a minor road Hall Lane between the A140 Cromer Road junction and the A1067 which is inappropriate route for the forecast increases in traffic. The economic appraisal shows a lower level of benefits than the DCO Scheme due to the lack of improved transport connections west of the A140 with a BCR of 3.81 including accidents. The benefits are increased with the inclusion of JTR and WEBs to give a BCR of 4.11, but the level of these additional benefits is much lower than calculated for the DCO Scheme due to the poorer connectivity provided by the Alternative.
- 9.1.4 **Alternative 3** (single / dual carriageway NDR) provides the required transport connections, but the lower standard west of the A140 Cromer Road means that there would be a poorer operational performance compared with the DCO Scheme. The forecast traffic flow on the Holt Road – Cromer Road single carriageway link is forecast to be substantially higher than the economic flow range upper limit in TA46/97 of 13,000 AADT for a single carriageway road in the opening year. This together with the A140 at grade junction reduces the attractiveness of the route for some journeys so that there is less relief of existing routes. The analysis shows less relief on inappropriate routes in the

northwest sector. The economic appraisal shows a lower level of benefits than the DCO Scheme resulting in a BCR of 3.68 with accidents and 4.84 with JTR benefits and WEBs included.

- 9.1.5 **Alternative 4** (single / dual carriageway NDR) has not been retested as it provides a small change to the DCO Scheme and therefore the traffic impacts and economic appraisal would be similar.
- 9.1.6 **Alternative 5** (developer link roads) singularly fails to reduce traffic on inappropriate routes and relieve the existing network. Whilst the Alternative includes the city centre traffic management measures the reductions of cross city centre traffic are much smaller compared with the DCO Scheme, especially for trips crossing the Outer Ring Road Cordon. The junction analyses show that North Walsham Road and Wroxham Road junctions would operate substantially over their theoretical capacity with long queues and delays, with delays of over 10 minutes at North Walsham Road Junction in the 2032 AM peak, and 5 minutes in the 2032 PM peak. On these grounds the developer link roads would not operate satisfactorily and they would cause particularly severe difficulties in implementing the proposed shared use high street-type design envisaged in the development proposals. The delays would also mean that the Alternative would fail to meet the improved transport connectivity objective for the Scheme. The economic appraisal results highlight that the performance of Alternative 5 is especially poor and does not offer good value for money. The Alternative produces economic disbenefits as any benefits of the extended link roads are outweighed by the reduced performance due to overcapacity and due to the effects of introducing city centre traffic management measures without significant traffic relief being provided by the Alternative. The calculated BCR is -11.42 with accidents included and even worse with JTR and WEBs giving -20.34 although the BCR is not a meaningful term when the benefits are negative.

10.2 Appendix B – Public Transport (PT) Option

Methodology

10.2.1 The DCO submission appraisal was based on an updated NATS transport model rebased to 2012 with variable demand forecasts for the NDR proposed opening year of 2017 and design year of 2032. The forecasts assumed full JCS growth both with and without the Scheme. The DCO Scheme comprised both NDR and Postwick.

10.2.2 In addition to the Alternatives tested, an option comprising significant improvements to public transport provision has been assessed. This PT Option comprises significant service improvements as well as quality enhancements and it has been combined with the extended developer link roads defined in Alternative 5.

10.2.3 The same transport model and forecast assumptions were used as applied to the appraisal of the DCO Scheme in the submission and the Alternatives.

10.2.4 Traffic and economic appraisals have been carried out for the PT Option. As with the DCO submission, the economic appraisal calculates TUBA benefits, wider economic benefits (using WITA) and journey time reliability benefits. The safety appraisal was based on COBA.

10.2.5 The costs of the PT Option are shared between the local authority and private sector, as appropriate.

10.2.6 A review of traffic impacts of the PT Option has been carried out and, where appropriate, operational assessment of key junctions has been undertaken.

10.2.7 The following assumptions are made for the analysis:

- The Do Minimum for the PT Option will be identical to that for the DCO Scheme submission.
- The PT Option includes the improvement at Postwick, the proposed city centre measures and the extended developer link roads defined in Alternative 5.
- All assignments are based on full JCS traffic as reference demand.
- The PT Option will be subject to variable demand modelling so the reference demand will be adjusted according to the forecast travel costs. This allows for trips switching between the modelled modes of transport.

Description of the PT Option

10.2.8 Table 10.1 summarises key assumptions and the appraisal required for the PT Option.

Table 10.1: Summary of the PT Option

Option	Modelling Required	Appraisal Required
PT Option (including developer link roads extending to A140 in place of NDR)	<p>Coding DS PT and highway networks and running through demand model for 2017 and 2032</p> <p>Assume 10min frequency throughout the day (0700-1900) for both core and BRT buses. No changes to fare structure. Assumed generalised time savings of 5min and 3.8min for BRT and core buses respectively for soft measures (see Table 3.2 for more details).</p>	<p>Economic and safety appraisal.</p> <p>Traffic forecast changes with DCO</p> <p>Operational assessment of key developer junctions</p> <p>Network performance assessment compared with the DCO scheme</p>

10.2.9 The PT Option contains new Bus Rapid Transit (BRT) services and improvements to core bus routes. These routes are shown in Figure 10.21. In both cases the services are assumed to operate with a high frequency of every 10 minutes. For core bus routes existing services are recoded with the higher frequency, but the BRT services are assumed to be entirely additional to the existing public transport network. A new orbital bus is also added and assumed to operate with a high frequency of every 10 minutes and has a route via extended developer link roads between the Airport P&R and Postwick P&R and stops at major development locations. In total the service improvements would require around an additional 120 buses to be provided by the operators.

10.2.10 The developer link roads and junctions have been coded with proposed highway layouts set out in the developers planning application information.

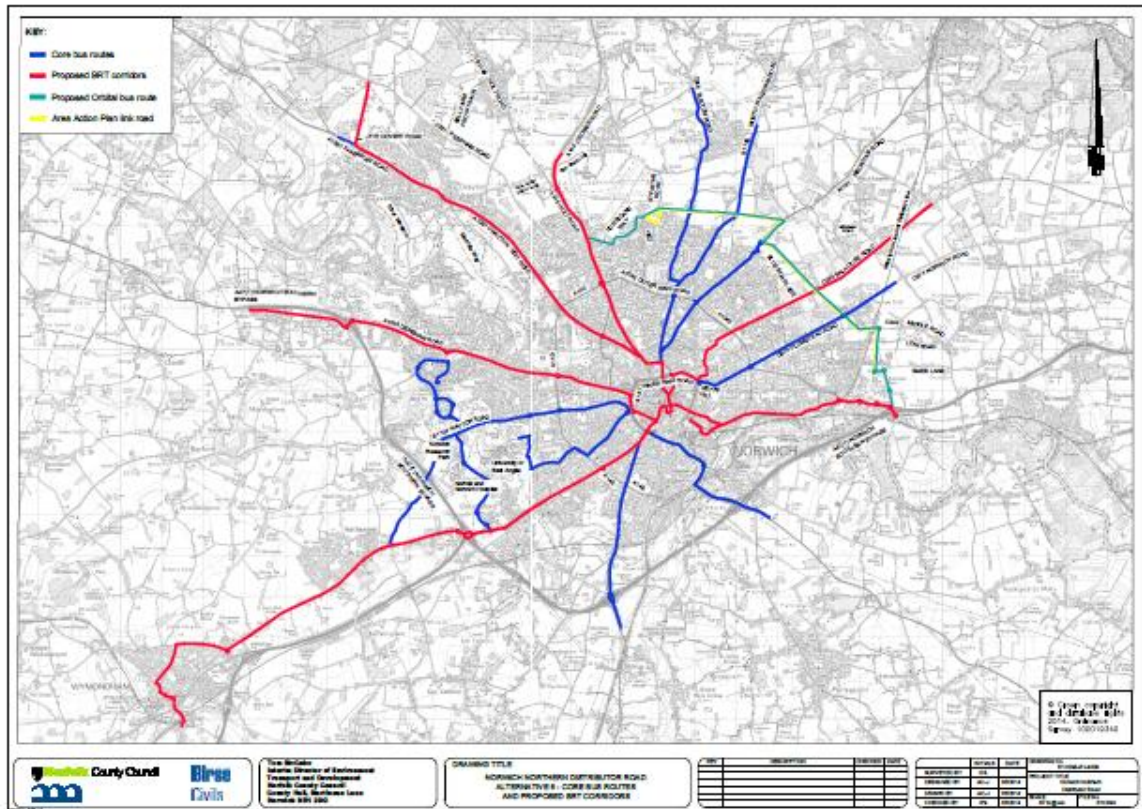

10.2.11 For the PT Option quality improvements are represented using generalised cost savings, in accordance with latest WebTAG guidance. Table 10.2 below shows the assumed generalised time savings for quality improvements for BRT, Core and orbital route buses. The individual savings are those recommended in WebTAG M3.2.

Table 10.2: Generalised Time Savings Assumed for Soft Quality Improvements

Soft Measure	WebTAG Savings* (mins)			Proposed Improvements?		Savings Assumed (mins)	
	Bus users	Car users	Overall	Core/Orbital bus	BRT	Core/Orbital bus	BRT
Audio Announcements	1.22			Yes	Yes	1.22	1.22
Climate Control	1.24			No	Yes	-	1.24
New Interchange Facilities	1.27			Yes	Yes	1.27	1.27
On-Screen Displays	1.90	0.89	1.29	Yes	Yes	1.29	1.29
Total savings						3.78	5.02

Notes: *WebTAG M3.2 Table M3.2.1

Figure 10.21: BRT and Core Bus Routes of the PT Option

PT Option Costs

10.2.12 The PT Option is assumed to include Alternative 5 with the extended developer link roads, so the costs comprise both the link roads and the PT services. The developer link roads in Alternative 5 allow for the orbital bus service to be defined.

10.2.13 The costs for the PT Option have been provided by NCC and are summarised in Table 10.3 below. Costs for the PT Option are allocated to both local government and private sector. It is assumed that the developer link roads will be adopted by the local highway authority once completed, hence the maintenance and operation costs will pass to the local authority. Otherwise the costs of implementing the link roads and expanding the bus fleet to provide the additional buses for the proposed service enhancements is allocated to the private sector.

Table 10.3: Summary Costs of the PT Option

Cost Type	Cost (£m) in 2013Q1 Prices	
	DCO Scheme	PT Option
<i>Investment costs</i>		
Construction	110.2	37.7
Land	22.0	2.4
Preparation	7.8	3.8
Supervision	1.3	0.4
Total investment Cost	141.3	44.3
<i>Other costs</i>		
Maintenance	27.8	5.5
Operation	15.9	1.4
Cost of buses*		1,211.9

Notes: These are initial costs before adjusting for construction price inflation and optimism bias

*These include cost of buying buses, maintenance and operation costs. From the total cost mentioned above (£1211.9m), £1,084.5m of this is due to BRT and core bus operating costs over the 60 year appraisal period, the remainder is for bus procurement and maintenance.

10.2.14 Costs were adjusted as per Document Reference 5.7 before inputting into TUBA. It should also be noted that the profiles of construction costs in calendar years input into TUBA for the PT Option were derived by assuming a similar profile to that used for the DCO Scheme.

Traffic Analysis Results

10.2.15 Figure 10.22 shows traffic levels on inappropriate routes for PT Option.

Figure 10.22: Traffic on Inappropriate Routes – PT Option

10.2.16 As shown in the above figure the traffic levels on the inappropriate routes would remain as high as in the Do Minimum or even increase with the PT Option. The Church Road and Church St routes are, for example, forecast to have a slight increase in two way AADT flows of 900 (15%) and 100 (1%) respectively in 2017 in comparison with the traffic flows in the 'Do Minimum' scenario. In 2032 the increase is 700 (7%) and 500 (5%) respectively. By contrast, in the DCO scenario, the reduction on these two sites are 4,100 (66%) and 2,400 (35%) in 2017 and 7,100 (72%) and 4,900 (52%) in 2032 respectively. These figures demonstrate that the PT Option is not capable of reducing traffic on inappropriate routes.

10.2.17 Table 10.4 below contains city centre through traffic across three cordons. More details on these cordons can be found in Document Reference 5.6. The table shows that traffic crossing the city centre Inner Ring Road cordons is reduced by a smaller degree with the PT Option compared with the DCO Scheme, mostly achieved by the city centre measures that are assumed to be implemented in both cases. However the city centre traffic crossing the outer cordon is reduced by a relatively small amount with the PT Option when compared with the reductions achieved by the DCO Scheme and thus there would be significant increases in this traffic over existing levels on the Outer Ring Road with the PT Option whereas with the DCO Scheme they are forecast to reduce.

Table 10.4: City Centre Through Traffic (AADT) for PT Option

Cordon*	2012		2017			2032		
		DM	DCO	PT Option	DM	DCO	PT Option	
Inner Ring Road Inner Cordon			6,787	7,428		4,726	5,025	
	9,477	8,159	(-17%)	(-9%)	9,236	(-49%)	(-46%)	
Inner Ring Road Outer Cordon			78,369	81,105		80,352	83,606	
	77,825	82,152	(-5%)	(-1%)	88,368	(-9%)	(-5%)	
Outer Ring Road Outer Cordon			63,421	70,117		66,780	76,584	
	68,117	73,691	(-14%)	(-5%)	79,151	(-16%)	(-3%)	

Notes: *More details on Cordons can be found in Document Reference 5.6

10.2.18 Graphical presentations of these results are shown in Figure 10.23 and Figure 10.24.

Figure 10.23: Through Traffic Crossing Cordons in 2017 – PT Option

Figure 10.24: Through Traffic Crossing Cords in 2032 – PT Option

Junction Analyses

10.2.19 Table 10.5 to Table 10.7 compare maximum DoS, maximum queue and delay for key developer link junctions between the DCO Scheme and the PT Option for 2032DS AM and PM peaks. The results show that the junctions of Spixworth Main Street and St Faith Main Street (new or modified junctions in the PT Option so they are not comparable with the DCO Scheme results) would operate within desirable capacity in the PT Option. However the junctions of North Walsham Road and Wroxham Road (coded with the developer’s proposals) would operate substantially over their theoretical capacity with long queues and delays, with delays of over 9 minutes in the 2032 AM peak, and 4 minutes in the 2032 PM peak at these two junctions. On these grounds the developer link roads would not operate satisfactorily and they would cause particularly severe difficulties in implementing the proposed shared use high street-type design envisaged in the development proposals. The delays would also mean that the PT Option would fail to meet the improved transport connectivity objective for the Scheme.

Table 10.5: Junction Operational Assessment Results_PT Option – 2032 Max DoS

Junction	AM		PM	
	DCO	PT Option	DCO	PT Option
Developer junctions				
Spixworth Main Street*	-	84.3%	-	64.1%
St Faith Main Street*	-	81.3%	-	77.6%
North Walsham Road	92.4%	135.7%	73.6%	111.4%
Wroxham Road	77.7%	133.3%	76.6%	110.7%

Notes: All these are signalised junctions, *These refer to modified/new junctions in PT Option

Degree of Saturation (DoS) output from LINSIG is the primary measure of performance of a signalised junction. DoS less than 90% indicates that a junction arm operates within capacity. DoS greater than 90% but less than 100% indicates that a junction arm is over its desired capacity but below theoretical capacity. Any DoS greater than 100% indicates that a junction arm is in excess of theoretical capacity.

Table 10.6: Junction Operational Assessment Results_PT Option – 2032 Max Queue (PCUs)

Junction	AM		PM	
	DCO	PT Option	DCO	PT Option
Developer junctions				
Spixworth Main Street*	-	7	-	5
St Faith Main Street*	-	5	-	8
North Walsham Road	22	144	13	53
Wroxham Road	16	88	18	62

Notes: All these are signalised junctions, *These refer to modified/new junctions in PT Option

Table 10.7: Junction Operational Assessment Results_PT Option – 2032 Max Delay (sec)

Junction	AM		PM	
	DCO	PT Option	DCO	PT Option
Developer junctions				
Spixworth Main Street*	-	80	-	47
St Faith Main Street*	-	57	-	46
North Walsham Road	75	565	54	269
Wroxham Road	89	566	91	258

Notes: All these are signalised junctions, *These refer to modified/new junctions in PT Option

Safety Analysis Results

10.2.20 The PT Option safety analysis results in Table 10.8 show that there would be a small number of personal injury accidents saved but that the changes in the numbers of casualties would result overall in safety economic dis-benefits.

Table 10.8: Accident Benefits – PT Option

60 Year Appraisal Period		Scenario	
		DCO	PT Option
Do Minimum			
Number of PIAs		70,984	70,984
Casualties	Fatal	1,890	1,890
	Serious	12,597	12,597
	Slight	91,490	91,490
Accident Costs		5,999,332	5,999,332
Do Something			
Number of PIAs		69,944	70,957
Casualties	Fatal	1,898	1,898
	Serious	12,488	12,624
	Slight	90,226	91,479
Accident Costs		5,958,113	6,011,050
Accident Benefits			
Number of PIA savings		1,041	27
Casualties	Fatal	-7	-8
	Serious	109	-27
	Slight	1,263	11
Accident Savings		41,219	-11,718

Notes: All monetary values are expressed in £000's in 2010 prices discounted to 2010

Economic Analysis Results

10.2.21 Table 10.9 below compares monetised costs and benefits including accident benefits for PT Option against the DCO scheme.

Table 10.9: Analysis of Monetised Costs and Benefits – PT Option

Item	Accidents Included (£000)	
	DCO	PT Option
Accidents (not assessed by TUBA)*	41,219	-11,718
Greenhouse Gases**	-22,756	-5,431
Economic Efficiency: Consumer Users (Commuting)	51,164	-38,950
Economic Efficiency: Consumer Users (Other)	380,623	-52,941
Economic Efficiency: Business Users and Providers	267,797	-827,699
Wider Public Finances (Indirect Taxation Revenues)	55,270	20,803
Present Value of Benefits (PVB)	773,317	-915,936
Broad Transport Budget Present Value of Costs (PVC)	185,542	26,611
OVERALL IMPACTS		

Item	Accidents Included (£000)	
	DCO	PT Option
Net Present Value (NPV)	587,775	-942,547
Benefit to Cost Ratio (BCR)	4.168	-34.419

Notes: All monetary values are expressed in 2010 prices discounted to 2010
 *Detailed summary results can be found in Section 6. The lower conservative accident benefit is included based upon the use of local accident data, as explained in section 7 of Reference Document 5.7
 **Greenhouse gas impacts were calculated using TUBA1.9.2 since there was a bug in TUBA 1.9.1

10.2.22 The results show that the Present Value of Benefits (PVB) of the PT Option is estimated to be £-916m (inclusive of accident benefits). A major factor in this is the private sector costs which TUBA allocates as negative benefits rather than costs to public accounts as they are private sector funded. This includes the costs of the developer link roads and the additional bus services which amount to -£502. The PT Option also produces transport efficiency economic disbenefits as any benefits of the extended link roads and the bus services are outweighed by the reduced performance due to overcapacity and due to the effects of introducing city centre traffic management measures without significant traffic relief being provided by the PT Option. Set against these PVB results is the £27m Present Value of Costs (PVC) to public accounts.

10.2.23 The Benefit Cost Ratio (BCR) of PT Option is -34.42 including accidents which does not represent good value for money.

10.2.24 Table 10.10 below compares summary economic appraisal results including wider impacts and journey time reliability for PT Option against the DCO scheme.

Table 10.10: Summary of Economic Appraisal including Wider Benefits – PT Option

Item	Scenario also including WEBs and JTR (£000)	
	DCO	PT Option
Present Value of Benefits (PVB)	989,063	-1,230,045
Present Value of Costs (PVC)	185,542	26,611
Net Present Value (NPV)	803,521	-1,256,656
Benefit to Cost Ratio (BCR)	5.331	-46.223

Notes: All monetary values are in £000's and expressed in 2010 prices discounted to 2010

10.2.25 The BCR of the PT Option deteriorates even further to -46.22 once journey time reliability benefits (£-30m) and wider economic benefits (£-284m) are included in the appraisal. These additional dis-benefits amount to £-314m (2010 prices discounted to 2010). The inclusion of these dis-benefits result in

a more negative BCR although it should be noted that the BCR is not a meaningful term when the benefits are negative.

- 10.2.26 The economic appraisal results highlight that the performance of the PT Option is especially poor and does not offer good value for money. It should be noted however that the appraisal has not attempted to assess any development benefits that may arise with the link roads.

Conclusion

- 10.2.27 **PT Option** (PT improvements and developer link roads) fails to reduce traffic on inappropriate routes and relieve the existing network. Whilst it includes the improvements to PT services and city centre traffic management measures the reductions of cross city centre traffic are much smaller compared with the DCO Scheme, especially for trips crossing the Outer Ring Road Cordon. The junction analyses show that the junctions between the developer link roads and North Walsham Road and Wroxham Road would operate substantially over their theoretical capacity with long queues and delays, with delays of over 9 minutes in the 2032 AM peak and 4 minutes in the 2032 PM peak. On these grounds the developer link roads would not operate satisfactorily and they would cause particularly severe difficulties in implementing the proposed shared use high street-type design envisaged in the development proposals. The delays would also mean that the PT Option would fail to meet the improved transport connectivity objective for the Scheme. The economic appraisal results highlight that the performance of the PT Option is especially poor and does not offer good value for money. The Option produces transport efficiency economic disbenefits as any benefits of the extended link roads and the improvements to PT are outweighed by the reduced performance due to overcapacity and due to the effects of introducing city centre traffic management measures without significant traffic relief being provided by the Option. The calculated BCR is -34.42 with accidents included and even worse with JTR and WEBs giving -46.22, although the BCR is not a meaningful term when the benefits are negative.

11 Abbreviations

AADT	Annual Average Daily Traffic
ARCADY	Assessment of Roundabout Capacity and Delay software
AST	Appraisal Summary Table
ATC	Automatic Traffic Count
B1/B2/B8	Development categories: business (including office) / general industrial / storage and distribution
BAFB	The Best And Final funding Bid submitted by Norfolk County Council to the Department for Transport in 2011 for the combined Postwick and NDR schemes
BCIS	Building Cost Information Service
BCR	Benefit Cost Ratio
BGBP	Broadland Gate Business Park development
COBA	Cost Benefit Appraisal – software released by the Department of Transport that has been used to undertake an accident appraisal
DfT	Department for Transport
DIADEM	Dynamic Integrated Assignment and Demand Modelling - software released by the Department for Transport
DM	Do Minimum
DMRB	Design Manual for Roads and Bridges – a Highways Agency publication setting out guidance and good practice for design and appraisal of road schemes
DS	Do Something
EB	Employer's Business
GAP	Minimum gap (in seconds) accepted by a vehicle which gives way at priority junctions or traffic signals. Also a measure of Wardrop equilibrium assignment convergence
GAPR	As GAP above in relation to junctions but for entry onto roundabouts
GDP	Gross Domestic Product
GEH	A comparison statistic named after GE Havers
GIS	Geographic Information System - designed to capture, store, manipulate, analyse, manage, and present all types of geographical data
GNDP	Greater Norwich Development Partnership
GPS	Global Positioning System
GVA	Gross Value Added
HA	Highways Agency
HB	Home Based (trips)
HBEB	Home Based Employers' Business (trips)
HBO	Home Based Other (trips)
HBW	Home Based Work (commuter trips)
HGV	Heavy Goods Vehicle
IP	Inter-peak

JT	Journey Time
JCS	Joint Core Strategy
JTR	Journey Time Reliability
LGV	Light Goods Vehicle
LINSIG	Traffic signal analysis software
LMVR	Local Model Validation Report
MCC	Manual Classified Count (for a link)
MCTC	Manual Classified Turning Counts
ME	Matrix Estimation
NATS	Norwich Area Transportation Strategy
NCC	Norfolk County Council
NDR	Norwich Northern Distributor Road
NHB	Non-Home Based (trips)
NHBEB	Non-home-based Employer's Business
NHBO	Non-home-based Other
NPV	Net Present Value – given by subtracting the Present Value Costs (PVC) from Present Value Benefits (PVB)
NTEM	National Trip End Model – a database containing trip-end, journey mileage, car ownership and population/workforce planning data
NTM	National Transport Model
NTS	National Travel Survey
OD	Origin Destination
OE	Other Externalities
OGV	Other Goods Vehicle (sometimes called HGV)
OGV1	A sub-category of OGV. Includes all rigid vehicles over 3.5 tonnes gross vehicle weight with two or three axles
OGV2	A sub-category of OGV. Includes all rigid vehicles with four or more axles and all articulated vehicles
OP	Off-peak
PA	Production Attraction
PCU	Passenger Car Unit
PDL	Previously Developed Land
PG	Planning Gain
PIA	Personal Injury Accident
PPK	Pence Per Kilometre
PPM	Pence Per Minute
PT	Public Transport
PVB	Present Value Benefits – the stream of benefits over the appraisal period (60 years) that are converted to 2010 prices and discounted to 2010 to give a 'present value'
PVC	Present Value Costs – the costs of the scheme over the construction period as well as maintenance and operational costs that are converted to 2010 prices and discounted to 2010 to give a 'present

	value'
PYV	Present Year Validation
P&R	Park and Ride
QRA	Quantified Risk Assessment
RFC	Ratio of Flow to Capacity
RPI	Retail Price Index
RSI	Road Side Interview
RTF	Road Transport Forecasts
SATME2	Matrix estimation module of the SATURN software
SATURN	Simulation – Assignment model of Traffic on Urban Road Networks software
SRN	Strategic Road Network
TA	Transport Assessment
TEC	Transport Externality Cost
TRADS	Traffic flow Data System – the Highways Agency’s database of traffic count data
TRICS	National Trip Generation database
TEMPRO	Trip End Model presentation Program is software released by the Department for Transport to allow detailed analysis of NTEM data
TUBA	Transport User Benefit Appraisal – software released by the Department for Transport that is used to assess transport user benefits of transport schemes
VDM	Variable Demand Modelling
VfM	Value for Money
VISUM	Transport modelling software used (in this case) for public transport modelling
VOC	Vehicle Operating Costs
VOT	Value Of Time
WEBS	Wider Economic Benefits
WebTAG	Web-based Transport Appraisal Guidance produced by the Department for Transport
WITA	Wider Impacts in Transport Appraisal

12 Glossary

Assignment	A process of loading a trip matrix onto routes through a network that accounts for travel costs on the network in identifying the optimum route choice for every trip
Buffer network	The external part of a highway network in which travel is represented by speed/ flow relationships or cruise speeds
Calibration	A process of adjusting the model input data or model parameters to improve the model and its validation
Convergence	An equilibrium between model outputs, in assignment between the flows and travel costs and in demand models between the demand and the costs from the supply model
Cost matrix	A table of travel costs for journeys that may include travel time, operating costs and charges such as tolls or fares
Cruise speeds	Average travel speed along a network link
Demand model	See variable demand model
Demand segment	Travel demand is divided into a number of segments for the purposes of applying different demand modelling procedures. The division is usually by trip purpose and whether the trips are home-based or non-home-based
DMRB	Design Manual for Roads and Bridges – a Highways Agency publication setting out guidance and good practice for design and appraisal of road schemes
Dependent development	Housing or commercial development that can only proceed with the implementation of a transport intervention
Discounting	Discounting is a technique used to compare costs and benefits that occur in different time periods. It is based on the principle known as time preference that people prefer goods and services now rather than later. This preference for goods and services now rather than later applies to both individuals and society. By applying a discount rate, streams of costs and benefits are reduced to their present values.
Do Minimum	The forecast scenario without the proposed transport scheme, but that includes committed transport network improvements and developments
Do Something	The Do Minimum network but with the proposed transport scheme and developments added
Generalised cost	A combination of time and money costs (operating costs and charges) that are expressed in time or money units which are used to represent the total travel costs for a journey within the assignment or demand models
Journey purpose	Trips are divided into different travel purposes, usually work (or commute), employers' business and other. These trip purposes have different generalised costs applied and different demand model responses
Matrix estimation	A process used to adjust an initial or 'prior' matrix so that the resulting assignment of the adjusted matrix matches count data as closely as possible
Network	A mathematical representation of a transport network in a supply-side assignment model, either a highway network which represents vehicle travel, or a public transport network that represents bus and rail services
Speed / flow relationships	Relationship between traffic speed and traffic flow on a network link

Reference trip matrix	A forecast reference matrix based on applying growth from national (or other) datasets, but before the application of adjustments due to the impact of how travel costs will change with growth in travel
User classes	Trips are aggregated into several user classes for the purposes of assignment. These usually represent different types of vehicle (e.g. car, HGV) and different trip purposes
Trip matrix	A table representing travel in a model area between land areas or zones
Validation	A process of comparing the model data with independent data
Variable demand modelling	A model that forecasts changes in travel behaviour such as trip frequency, choice of mode, time of travel and trip distribution
Zone	An area of land or development which is used in a transport model to aggregate individual households or commercial premises into a manageable number of units that can be used to represent journey patterns in the study area. Usually the zone size will be relatively small in the study area, but progressively larger further away from it.

1 THE APPLICATION

- 1.1. This document is submitted in relation to the application for a Development Consent Order by Norfolk County Council to the Secretary of State, under the Planning Act 2008.
- 1.2. The application is for the Norfolk County Council (Norwich Northern Distributor Road (A1067 to A47(T))) Order, to grant development consent for the construction of a new highway running west to east, to south, between the A1067 Fakenham Road and the A47 Trunk Road at Postwick, including improvements to the existing highway network to the north and north east of Norwich.
- 1.3. This document comprises part of Norfolk County Council's proposals to make minor amendments to the form of the Norwich Northern Distributor Road which it has applied for.

2 INTRODUCTION

- 2.1. On 7 of January 2014, Norfolk County Council (NCC) submitted an application for development consent (the 'application') to the Planning Inspectorate for the Norwich Northern Distributor Road (NDR). The application was accepted for examination on 4 February 2014.
- 2.2. As a result of on-going discussion and engagement with local residents, the Police and Drayton Parish Council, NCC would like to make a minor change to the application in relation to the proposed closure of Drayton Lane (south) at its junction with Reepham Road.
- 2.3. The proposed change would remove the proposed closure of Drayton Lane (south) at its junction with Reepham Road so as to keep Drayton Lane (south) open, and therefore retaining the existing road layout west of Reepham Road.
- 2.4. The Department for Communities and Local Government document *Planning Act 2008: Guidance for the examination of applications for development consent* (paras. 105 to 107, p. 21) recognises that applicants may need to change a proposal after an application has been accepted for examination. The proposed change is not considered to result in a materially different project and this point is considered further in relevant sections of this report.
- 2.5. This proposed change would address local residents', Drayton Parish Council and Police concerns raised in connection with highway safety on Reepham Road, Hall Lane and their junctions. It is considered that the change will provide a more acceptable solution for the local community and road users in general.
- 2.6. This document demonstrates that the proposed change to the application is minor and does not materially affect the scheme which is the subject of the DCO application. NCC has undertaken engagement with the principal parties potentially affected by the proposed change, and has taken their representations into account.
- 2.7. This document is structured as follows:
 - a) Section 3 introduces the proposed modification to the original application Scheme
 - b) Section 4 summarises the need for the changes

- c) Section 5 explains the process of stakeholder engagement undertaken.
- d) Section 6 assesses the engineering and buildability effects of the proposed changes.
- e) Section 7 assesses the environmental effects of the proposed changes.
- f) Section 8 assesses the traffic, safety and economics effects of the proposed changes.
- g) Section 9 concludes the document, summarising the need and the impacts of the proposed change

3 THE PROPOSED MODIFICATION TO THE SCHEME

3.1. Description of proposed changes

- 3.1.1. As proposed in the application, the C282 Reepham Road would be realigned to form a T-junction with the new Link Road from the Drayton Lane Roundabout (on the NDR). As part of the proposed junction arrangement, the application proposed to stop up the C261 Drayton Lane (south) with the construction of a cul-de-sac turning head at its south westerly point of stopping up.
- 3.1.2. The proposed change would remove the stopping up and the construction of the cul-de-sac on Drayton Lane (south), keeping Drayton Lane (south) open with the construction of a T-junction with the improved/realigned C261 Reepham Road.
- 3.1.3. The proposed change is shown in drawings R1C150-MP-5157 and R1C150-MP-5158 included in Appendix A.

3.2. Proposed changes to the application documents

- 3.2.1. The proposed changes to the Scheme would require the following amendments to application documents. Following acceptance of the change by the Planning Inspectorate, NCC proposes to submit revised versions of any application documents which the Planning Inspectorate considers necessary, and in accordance with a timetable to be agreed. It may be, for instance, that other changes are required to the draft DCO early in the examination period, and it would be sensible for the below changes to be made at the same time as those, rather than submitting two versions of the draft DCO in relatively quick succession.

3.3. Works descriptions

- 3.3.1. The proposed change would involve minor amendments to the Draft DCO (Application Document 3.1) as indicated in the tables below.

Table 3.1 Schedule 1 Authorised Development - Work No. 7(vii) (page 44 of application draft DCO):

Application text	Proposed change
<i>"(vii) the improvement of the C282 Drayton Lane (south), on its west side, by the construction of a cul-de-sac turning head at its south westerly point of stopping up, to the south of the C261 Reepham Road"</i>	Text deleted entirely – subsequent numbering and cross reference in Work No. 7 to be updated accordingly.

3.4. Plans/drawings/sections

3.4.1. The proposed change would involve minor amendments to the plans/drawings/sections submitted as part of the DCO application as indicated in Table 3.9 below.

Table 3.9 Plans/drawing/sections

Title	Sheet	Drawing number	Status
Reference: 2.1 Location Plan			
'Plan number R1C093-R1-5000' replaced with 'Plan number R1C093-R1-5000A' and which removes the closure of Drayton Lane (south) identification.			
Reference: 2.2 Land Plans			
'Plan Number DCO-LP-04 Plan Revision: 0' replaced with 'Plan Number DCO-LP-04A Plan Revision: A' and which has an area of land from Plot 4/30 deleted, and former Plot 4/31 deleted, from the plan.			
Reference: 2.3 Work Plans			
'Plan number R1C093-R1-5005' replaced with 'Plan number R1C093-R1-5005A' to reflect the amended DCO boundary.			
Reference: 2.4 Street Plans			

'Plan Number DCO-SP-04 Plan Revision: 0' replaced with 'Plan Number DCO-SP-04A Plan Revision: A' and which shows the amended Street and Access provisions identified in the above amendments.

Reference: 2.6 General Arrangement Plans

'Plan number R1C093-R1-5018' replaced with 'Plan number R1C093-R1-5018A' which shows the amended Street and Access provisions identified in the above amendments.

3.5. Book of Reference

3.5.1. The proposed change would involve the minor amendments to the Book of Reference (Application Document 4.3) as indicated in Table 3.10 below:

Table 3.10 Book of Reference

	Proposed change
<i>Part 1</i> <i>Plot 4/30</i> <i>Page XX</i>	The area measurement included in the description included in the 'Extent, description and situation of the land or right' column, in Part 1, is reduced from '3,999 square metres' to '3669 square metres'
<i>Part 1</i> <i>Plot 4/31</i> <i>Page XX</i>	All details included in the 'Owners or reputed owners'; 'Lessees or reputed lessees'; 'Tenants or reputed tenants (other than lessees)'; and 'Occupiers', columns are deleted; The details included in the 'Extent, description and situation of the land or right' column are substituted with the words 'Not used'

3.6. Statement of Reasons

3.6.1. The proposed change would involve minor amendments to the Statement of Reasons (Application Document 4.1), as shown in the table below.

Table 3.11 Statement of reasons

	Proposed change
<i>Appendix 1: Table 1</i> <i>Page 60</i>	Delete plot 4/31 from Work No.7
<i>Appendix 1: Table 1A</i>	Delete plot 4/31 from "Required for new highway (Non-NDR)

Page 64	
Appendix 2: Paragraph 37	Delete "4/31" from paragraph heading
Page 83	

3.7. Reports/statements

3.7.1. The proposed change would involve minor amendments to the NDR Traffic Forecasting report (Application Document 5.6) and Economic Appraisal Report (Application Document 5.7) as shown in the tables below.

Table 3.12 NDR Traffic Forecasting Report: Application Document ref. 5.6 Volume 3 Appendix I

Application	Proposed change
Traffic flow plot Figure I.1	Replace with revised Figure 6.4 in the technical report in Appendix E
Data in Tables I.3 and I.5	Replace with new data contained in Table 6.1 and Table 6.2 in the technical report in Appendix E

Table 3.13 Economic Appraisal Report Application Document ref. 5.7

Application	Proposed change / New Text
<i>(page 7) para 1.1.4 "The economic appraisal results show that the NDR is likely to deliver present value of benefits (including TUBA transport user benefits and COBA accident benefits) of £773m over a 60 year appraisal period in 2010 prices discounted to 2010. This compares with present value costs of £186m."</i>	The economic appraisal results show that the NDR is likely to deliver present value of benefits (including TUBA transport user benefits and COBA accident benefits) of £783m over a 60 year appraisal period in 2010 prices discounted to 2010. This compares with present value costs of £186m.
<i>(page 7) para 1.1.5 "Additional benefits in relation to wider economic impacts (WEBs) and journey time reliability (JTR) amount to a further £216m in 2010 prices discounted to 2010 which</i>	Additional benefits in relation to wider economic impacts (WEBs) and journey time reliability (JTR) amount to a further £221m in 2010 prices discounted to 2010 which improve the value for

---	--

3.8. Environmental statement

3.8.1. The proposed change would involve minor amendments to the Environmental Statement (Application Document 6.1) as shown in the table below.

Table 3.14 Environmental Statement Volume 1 Table 2.9 Road Closures (page 30)

Application text	Proposed change
<i>C282 Drayton Lane – a 892 metres length from its junction with the C261 Reepham Road: Chainage 5350</i>	Text deleted

4 NEED FOR PROPOSED CHANGES

- 4.1. Early iterations of the scheme design prior to 2013 had both Hall Lane (North) and Drayton Lane (South) junctions with Reepham Road open. However, following discussions with Drayton Parish Council it was agreed that design would be changed to close Drayton Lane (south) in order to reduce traffic through the centre of Drayton. Written representations have been made by local residents voicing objections to this closure were received before and through the formal statutory pre-application consultation. NCC considered the different views and at the time of making the application, decided to close Drayton Lane (south) as part of the NDR scheme.
- 4.2. A number of meetings have been held between NCC, Drayton Parish Council, members of the local community representing the views of Hall Lane and Reepham Road, and the local County Councillor. At these meetings local residents raised, in their opinion, fundamental concerns regarding the current NDR proposals for Drayton. These concerns relate mainly to the proposed main route between the NDR and Drayton being via the Reepham Road, Hall Lane (North) and their junction, and in particular the closure of Drayton Lane (south) at its junction with Reepham Road.
- 4.3. The 54 households (87 residents) of Drayton Hall Park, Hall Lane (represented by the chairman of the residents association) have also expressed strong objections to the closure of Drayton Lane (south) and have expressed concerns about safety issues with Reepham Road, Hall Lane and their junction being used as the main route between Drayton and the NDR.
- 4.4. The issues raised by local residents and the community are summarised in Appendix B.
- 4.5. In response to the concerns raised by the local community, Parish Council and the Police, NCC tested a number of alternatives to keep Drayton Lane (south) open using the NDR's strategic transport model and also carried out a Stage 1 Road Safety Audit on the options.
- 4.6. The Road Safety Audit submission, Report and Designers Response is included as Appendix C.
- 4.7. The Road Safety Audit concluded that a roundabout at either the junction of Drayton Lane or Hall Lane (north) with Reepham Road would be a safer option for these junctions if either of the roads were to be closed. However the installation of a roundabout is likely to generate more traffic through the

centre of Drayton. This increase is considered by NCC to conflict with the concept of the NDR, which is to reduce traffic within communities where possible.

- 4.8. The results of this work were discussed with the local residents and Drayton Parish Council. The outcome from the discussions was that the local community's preference was a roundabout at the Reepham Road/Drayton Lane (south) junction and Hall Lane (North) being closed. There was an agreement to seek a modification to the scheme that would keep the junctions of Reepham Road with both Drayton Lane (south) and Hall Lane (north) open, which would retain the current road layout. The proposed modification provides a safer and more acceptable solution for the local community and road users with only a slight increase in forecast traffic on School Road south of Hall Lane compared to the current scheme.
- 4.9. The local community has made it clear to NCC that they would strongly object to the NDR scheme as applied for.
- 4.10. In consultation with representatives from the local community, the Parish Council and the Police, NCC is proposing to implement traffic calming measures on Hall Lane and to introduce a speed limit on Drayton Lane (south). These measures are not part of the NDR scheme and are proposed to be implemented irrespective of whether the NDR goes ahead. They are currently planned to address existing local concerns about traffic flows, HGV use, speed, safety and accidents in this location. Whilst these measures do not form part of the NDR scheme for which an application has been made, they have been taken into account in arriving at the forecast traffic flows discussed in Section 8 of this report.

5 STAKEHOLDER ENGAGEMENT

- 5.1. NCC has undertaken a targeted consultation on the potential scheme change to ensure that relevant stakeholders and the local community were given an opportunity to consider it and comment.
- 5.2. A letter, dated 27 March 2014, setting out NCC proposals was sent to a consultation area that was agreed with the relevant Parishes and District Council and included those considered to be most likely to be impacted by the proposed change. Consultees included Parish and District councils, 63 stakeholders and land owners as well as 4312 residential and business addresses. A copy of the letter and the drawing showing the area of consultation (**R1C093-R1-4801**) is included in Appendix D.
- 5.3. 45 responses were received by the end of the consultation on the Friday 25 April 2014 and can be summarised as follows;
- 5 Councils in favour of keeping the junction open (including Broadland District Council, Hellesdon, Drayton, Horsford & Felthorpe Parish Councils)
 - 1 response from the Norfolk Constabulary in favour of keeping the junction open
 - 27 Individual responses in favour of keeping the junction open
 - 1 response representing 54 households in favour of keeping the junction open
 - 6 Contained no comment relating to closure
 - 3 Against keeping the junction open
 - 2 For keeping open if a roundabout provided instead of the proposed junction.
- 5.4. A number of responses also raised concerns about the impact of the proposals (both with or without the closure) on Hall Lane, in particular the safety at the junctions with Reephams Road or Drayton Lane (south).
- 5.5. NCC has considered the responses, alongside its continued discussions with the local community, and given the support as mentioned above considers that it should seek to make the change to the NDR scheme proposed in this report.

6 ENGINEERING AND BUILDABILITY EFFECTS

6.1. Design and Geometry

- 6.1.1. The proposed change would remove the closure of the existing section of Drayton Lane (South) at its junction with Reepham Road. The layout of the bellmouth of Drayton Lane (south) would remain as the current existing layout. Drayton Lane (north) would remain closed therefore the existing junction arrangement would change from a crossroads to a simple T-junction.

6.2. Structures

- 6.2.1. The proposed change would have no impact on existing or proposed structures.

6.3. Non Motorised Users

- 6.3.1. The NMU provision would remain unchanged on the north side of Reepham Road, however the removal of the stopping up of Drayton Lane (south) would result in the loss of a suitable route for the use by pedestrians/cyclists and horse riders along the potential minor road.

6.4. Drainage

- 6.4.1. The proposed change would have no impact on the drainage design.

6.5. Public Utilities

- 6.5.1. There is no impact on the existing public utilities as a result of the proposed change.

6.6. Private Means of Access

- 6.6.1. The proposed change would remove the closure of Drayton Lane (south) at Reepham Road, therefore the need for a combined turning head and field access would be removed. The existing field access from Drayton Lane (south) will be retained.

6.7. Construction

- 6.7.1. The proposed change would have a minimal impact on the Scheme construction works - the existing Drayton Lane (south) junction with Reepham Road would remain as per the existing layout, and therefore works to stop up the existing junction mouth would not be required.

7 ENVIRONMENTAL EFFECTS

- 7.1. This section describes the potential environmental effects of the proposed minor changes to the scheme to keep Drayton Lane (south) open compared to the scheme which is the subject of the DCO application.
- 7.2. The environmental impacts associated with the proposed change to keep Drayton Lane (south) open during construction and the operational environment associated with the removal of the Drayton Lane Closure are listed in the tables below:
- 7.3. **Table 7.1:** Construction Environmental Impacts Associated with the Removal of Drayton Lane Closure

Closure of Drayton Lane as Proposed within the ES	Removal of Drayton Lane Closure compared with ES
Groundwater	No significant change
Surface Water	No significant change
Flora and Fauna	No significant change
Geology	No significant change
Soils	No significant change
Motorised Users	Large adverse temporary impact reduced
Landscape	No significant change
Non-Motorised users	Slight adverse due to loss of potential segregated cycle route
Air Quality	No significant change
Noise	No significant change

- 7.4. **Table 7.2:** Operational Environmental Associated with the Removal of Drayton Lane Closure

Closure of Drayton Lane as Proposed within the ES	Removal of Drayton Lane Closure compared with ES
Groundwater	No significant change
Surface Water	No significant change
Flora and Fauna	No significant change
Geology	No significant change
Soils	No significant change
Motorised Users	The removal of the closure will result in slight increases in forecast traffic on the NDR (east), School Road (south of Hall Lane), Drayton Lane

	and Costessey Lane and reductions of traffic on NDR (west) Reepham Road and Hall Lane. Traffic calming on Hall Lane, between School Road and Reepham Road may impact on traffic speeds, however, the changes will not have significant impacts on road users overall.
Landscape	No significant change
Non-Motorised users	Slight adverse due to loss of potential segregated cycle route.
Air Quality	The overall numbers of vehicles in the area will not change and threshold limits for Air Quality will not be approached. The impacts are not significant.
Noise	There will be noise associated with changes to traffic movements, however there are no sensitive receptors along Drayton Lane where the most significant changes occur (0 to 5700 vehicles per day) in addition the road is in use at the present time. Therefore it is anticipated there will be no significant impacts.

8 TRAFFIC, SAFETY AND ECONOMIC EFFECTS

- 8.1. A traffic, safety and economic appraisal was undertaken in April 2014 to assess the impacts of the Drayton Lane (south) modification.
- 8.2. The variable demand model (VDM) forecasts, which make allowance for traffic generation, redistribution and mode choice effects arising from the introduction of the Scheme, have been prepared for the NDR proposed opening year of 2017 and the design year of 2032. These were used in the assessment of the possible modification to Drayton Lane (south).
- 8.3. The modelling shows that the main traffic impact of keeping Drayton Lane (south) open at its junction with Reepham Road, compared with the currently submitted Scheme, is a change in traffic movements from Hall Lane (north) to Drayton Lane (south). The model suggests that there is also a reduction through Drayton on School Road, but that there is not quite the same reduction with Drayton Lane (south) kept open.
- 8.4. The key changes in Annual Average Daily Traffic (AADT) flows with the Drayton Lane (south) modification compared to the submitted Scheme are set out in section 4.2 of the full report by Mott MacDonald contained in Appendix E. This report also contains full details of the operational assessment of junctions, safety appraisal and economic appraisal.
- 8.5. Operational analysis results show that the junctions on Reepham Road with Drayton Lane (south), Hall Lane (north) and the link to the NDR will operate within desirable capacity in forecast years even with all traffic movements uplifted by an additional 10-20% in sensitivity tests. It is therefore concluded that the modification would be acceptable in operational terms.
- 8.6. A cost benefit accident analysis has been undertaken for the modified network. This shows that there would be fewer serious and slight casualties as a result of the shorter journey distance for traffic travelling between Drayton and Horsford and the NDR, including taking account of the effect of the traffic management measures noted above.
- 8.7. The economic analysis shows that with the modification the Benefit Cost Ratio (BCR) will increase slightly to 4.22 (inclusive of accident benefits) and 5.41 when wider economic benefits and journey time reliability are included. Both of these represent very high value for money (BCR above 4) according to the Department for Transport's Value for Money criteria. It is not expected

that the modification would have any impact on the economic development analysis.

9 CONCLUSION

- 9.1. The proposed change is minor, does not materially affect the Scheme and does not result in any materially worse or different environmental effects.
- 9.2. The responses received from the targeted consultation for the proposed change indicates a majority of responses including Broadland District Council, Horsford Parish Council, Drayton Parish Council, Hellesdon Parish Council and Felthorpe Parish Council support the proposed change.
- 9.3. The proposed change would address a number of local residents, Drayton Parish Council and Police concerns raised in connection with highway safety on both Reepham Road, Hall Road and their junction and it is considered that the change will provide a safer and more acceptable solution for the local community and road users in general.

Appendix B: Example consultation letter

1 THE APPLICATION

- 1.1. This document is submitted in relation to the application for a Development Consent Order by Norfolk County Council to the Secretary of State, under the Planning Act 2008.
- 1.2. The application is for the Norfolk County Council (Norwich Northern Distributor Road (A1067 to A47(T))) Order, to grant development consent for the construction of a new highway running west to east, to south, between the A1067 Fakenham Road and the A47 Trunk Road at Postwick, including improvements to the existing highway network to the north and north east of Norwich.
- 1.3. This document comprises part of Norfolk County Council's proposal to make minor amendments to the form of the Norwich Northern Distributor Road which it has applied for.

2 INTRODUCTION

- 2.1. On 7 of January 2014, Norfolk County Council (NCC) submitted an application for development consent (the 'application') to the Planning Inspectorate for the Norwich Northern Distributor Road (NDR). The application was accepted for examination on 4 February 2014.
- 2.2. As a result of on-going discussion and engagement with local landowners, NCC would like to make a minor change to the application in relation to the proposed Private Means of Access (PMA) track between Broad Lane and Plumstead Road.
- 2.3. The proposed change would remove the proposed PMA track as shown R1C093-R1-5160 included in Appendix A.
- 2.4. The Department for Communities and Local Government document *Planning Act 2008: Guidance for the examination of applications for development consent* (paras. 105 to 107, p. 21) recognises that applicants may need to change a proposal after an application has been accepted for examination. The proposed change is not considered to result in a materially different project, and this point is considered further in relevant sections of this report.
- 2.5. This proposed change would reflect local landowner concerns about potential security issues surrounding use of the PMA track.
- 2.6. This document demonstrates that the proposed change to the application is minor and not material and does not materially affect the scheme which is the subject of the DCO application. NCC has undertaken targeted engagement with the principal parties potentially affected by the changes and has taken their representations into account.
- 2.7. This document is structured as follows:
 - a) Section 3 introduces the proposed modification to the original application published Scheme
 - b) Section 4 summarises the need for the changes.
 - c) Section 5 explains the process of stakeholder engagement undertaken.
 - d) Section 6 assesses the engineering and buildability effects of the proposed changes.

- e) Section 7 assesses the environmental effects of the proposed changes.
- f) Section 8 assesses the traffic, safety and economics effects of the proposed changes.
- g) Section 9 provides the conclusion to this report

3 THE PROPOSED MODIFICATION TO THE SCHEME

3.1. Description of proposed changes

- 3.1.1. As proposed in the application a new PMA track was to be provided from the improved C258 Broad Lane, where a turning head is to be provided opposite 'Leighton House' running south westerly and then south easterly to the C874 Plumstead Road. As the land required to provide this track was to be acquired from a fuel allotment charity, and as such is special category land, replacement land was to be acquired and transferred to the charity.
- 3.1.2. The proposed modification would remove the PMA track. The proposed stopping up of the Broad Lane and Plumstead Road junction is not affected by the proposed change and remains part of the application scheme.
- 3.1.3. The use of the land now to be acquired from the fuel allotment charity has implications on the need for provision of replacement land. The proposed modification includes the removal of the replacement land provision.
- 3.1.4. The proposed modification includes the provision of a new field access into the land which was previously identified to be acquired as replacement land.

3.2. Proposed changes to the application documents

- 3.2.1. The proposed modification would amend the following application documents as shown in the tables below. Following acceptance of the change by the Planning Inspectorate, NCC proposes to submit revised versions of any application documents which the Planning Inspectorate considers necessary, and in accordance with a timetable to be agreed. It may be, for instance, that other changes are required to the draft DCO early in the examination period, and it would be sensible for the below changes to be made at the same time as those, rather than submitting two versions of the draft DCO in relatively quick succession.
- 3.2.2. The proposed change would involve minor amendments to the Draft DCO (Application Document 3.1) as indicated in the tables below.

Table 3.1 Preamble (page 7 of application draft DCO):

Application text	Proposed change
<i>The Secretary of State is satisfied, in accordance with section 131(3)(a) and section 131(4) of the 2008 Act, that the fuel allotment first replacement land and fuel allotment second replacement land will be given for the fuel allotment land and that such replacement land will vest in the prospective seller and subject to the same rights, trusts and incidents as attach to the fuel allotment land.</i>	The Secretary of State is satisfied, in accordance with section 131(5) of the 2008 Act, that the fuel allotment land is required for the widening or drainage of an existing highway and that the giving of exchange land is unnecessary, whether in the interests of persons, if any, entitled to rights of common or in the interest of the public.

Table 3.2 Article 2 Interpretation (page 8 of application draft DCO):

Application text	Proposed change
<i>"fuel allotment first replacement land" means that land numbered as plot 10/41 in the book of reference and which is so numbered and shown delineated, and coloured green and stippled black on the land plans;</i>	Text deleted entirely
<i>"fuel allotment second replacement land" means that land numbered as plot 10/42 in the book of reference and which is so numbered and shown delineated, and hatched orange and green and stippled black on the land plans;</i>	Text deleted entirely

Table 3.3 Article 32 Special Category Land (page 31 of application draft DCO):

Application text	Proposed change
32.—(1) <i>On the giving of notice by the undertaker to the relevant planning authority pursuant to this paragraph and subject to the undertaker having first complied with paragraph (1) of requirement 24 (Alternative Route for Marriott's Way), the Marriott's Way open space land shall vest in the undertaker and shall be discharged from all rights, trusts and incidents to which it was</i>	32.—(1) On the giving of notice by the undertaker to the relevant planning authority pursuant to this paragraph and subject to the undertaker having first complied with paragraph (1) of requirement 24 (Alternative Route for Marriott's Way), the Marriott's Way open space land shall vest in the undertaker and shall be discharged from all rights, trusts and incidents to which it was

previously subject.

(2) Prior to the opening of the NDR classified road for public use the undertaker must obtain certification from the relevant planning authority that a scheme for the provision of the Marriott's Way replacement open space land as open space has been implemented to its satisfaction, and on the provision of such certificate the Marriott's Way replacement open space land shall vest in the persons in whom the Marriott's Way open space land was vested immediately before it was vested in the undertaker and shall be subject to the same rights, trusts and incidents as attached to the Marriott's Way open space land.

(3) The fuel allotment land shall not vest in the undertaker until the undertaker has acquired the fuel allotment first replacement land and the relevant planning authority has certified that a scheme for the provision of the fuel allotment first replacement land as fuel allotment land has been implemented to its satisfaction.

(4) On the requirement of paragraph (3) being satisfied, the fuel allotment first replacement land shall vest in the persons in whom the fuel allotment land was vested immediately before it was vested in the undertaker and shall be subject to the same rights, trusts and incidents as attached to the fuel allotment land, and the fuel allotment land shall be discharged from all rights, trusts and incidents to which it was previously subject.

(5) On the giving of notice by the undertaker to the relevant planning authority pursuant to this paragraph, such notice to be given no later than the date that is three months after the date of the opening of the NDR classified road for

previously subject.

(2) Prior to the opening of the NDR classified road for public use the undertaker must obtain certification from the relevant planning authority that a scheme for the provision of the Marriott's Way replacement open space land as open space has been implemented to its satisfaction, and on the provision of such certificate the Marriott's Way replacement open space land shall vest in the persons in whom the Marriott's Way open space land was vested immediately before it was vested in the undertaker and shall be subject to the same rights, trusts and incidents as attached to the Marriott's Way open space land.

(3) As from the date on which this Order becomes operative or the date on which the fuel allotment land, or any part of it, is acquired by or vested in the undertaker, whichever is the later, the fuel allotment land shall be discharged from all rights, trusts and incidents to which it was previously subject.

<p><i>public use, the fuel allotment second replacement land shall vest in the persons in whom the fuel allotment land was vested immediately before it was vested in the undertaker and shall be subject to the same rights, trusts and incidents as attached to the fuel allotment land.</i></p>

Application text			Proposed change		
<i>PMA 58</i>	<i>Field access to farmland of Dairy Farm, from the C874 Plumstead Road, at a point 15 metres north east of the existing railway crossing on the C874 Plumstead Road, north westwards for 2 metres.</i>		Text deleted entirely		
<i>None – New Text to be Inserted (below the line included for X57)</i>			PMA 59	Field access to Fuel Allotment land, from the C874 Plumstead Road, at a point 280 metres south west of its junction with the C258 Broad Lane, north westwards for a distance of 2 metres.	

Table 3.10 Schedule 12 Land of Which Temporary Possession May be Taken (pages 140 and 141 of application draft DCO):

Application text	Proposed change			
<i>None – New Text to be Inserted (below the line included for Plot 10/39 and above the line included for Plot 10/42)</i>	To the north west of the C874 Plumstead Road and to the south east of the Norwich to Cromer & Sheringham Railway line.	Plot 10/41	Bridge compound.	Part of Work No. 18

3.3. Plans/drawings/sections

3.3.1. The proposed change would involve minor amendments to the plans/drawings/sections submitted as part of the DCO application as indicated in Table 3.7 below.

Table 3.11 Plans/drawing/sections

Title	Sheet	Drawing number	Status
Reference: 2.2 Land Plans			
<p>'Plan Number DCO-LP-04 Plan Revision: 0' is replaced with 'Plan Number DCO-LP-04A Plan Revision: A' and which –</p> <ul style="list-style-type: none"> - Amends the plot symbol for Plot 10/41 to orange (from green stippled black). - Amends the plot symbol for Plot 10/42 to orange (from green hatched orange stippled black). - Shows the reduced area for Plot 10/45, as included in the amended description above. - Has <i>deleted</i> the green hatched orange symbol and the wording 'Land to be used temporarily and subsequently given in exchange' alongside the symbol, from the Key on the Plan. 			
Reference: 2.3 Work Plans			
'Plan number R1C093-R1-5011 and R1C093-R1-5012' replaced with 'Plan number R1C093-R1-50011A and R1C093-R1-5012A' to reflect the amended DCO Boundary.			

Reference: 2.4 Street Plans
'Plan Number DCO-SP-10 Plan Revision: 0' is replaced with 'Plan Number DCO-SP-10A Plan Revision: A' and which shows the amended Street and Access provisions identified in the above amendments.
Reference: 2.6 General Arrangement Plans
'Plan number R1C093-R1-5024 and R1C093-R1-5025' replaced with 'Plan number R1C093-R1-5034A and R1C093-R1-5025A' which shows the amended provisions identified in the above amendments.

3.4. **Book of Reference**

3.4.1. The proposed change would involve the minor amendments to the Book of Reference (Application Document 4.3) as listed below:

	Proposed change
<i>Part 1</i> <i>Plot 10/41</i> <i>Page 99</i>	In the 'Number on Plan Sheet/Plot' column, in Part 1, the words 'Temporary Use' are inserted under the plot number.
<i>Part 1</i> <i>Plot 10/45</i> <i>Page 101 and 102</i>	The area measurement included in the description included in the 'Extent, description and situation of the land or right' column is reduced from '3,101 square metres' to '298 square metres'
<i>Part 5</i> <i>Plot 10/42</i> <i>Page 223</i>	The plot in its entirety is deleted from Part 5
<i>Part 5</i> <i>Plot 10/42</i> <i>Pages 223</i>	The plot in its entirety is deleted from Part 5
<i>Part 5</i> <i>Plot 10/45</i> <i>Pages 223 and 224</i>	The area measurement included in the description included in the 'Extent, description and situation of the land or right' column is reduced from '3,101 square metres' to '298 square metres'

3.5. Statement of Reasons

3.5.1. The proposed changes would involve amendments to the Statement of Reasons (Application Document 4.1), as shown in the table below:

Table 3.10 Statement of Reason

	Application text	Proposed change
<i>Paragraph 1.9.4 (page 8)</i>	<i>“The draft DCO includes for the compulsory acquisition of part of a fuel allotment (plot 10/45), which is also special category land. Replacement land is proposed to be provided”</i>	“The draft DCO includes for the compulsory acquisition of part of a fuel allotment (plot 10/45), which is also special category land. No replacement land is proposed to be provided”
<i>Paragraph 10.2.2 (page 46)</i>	<i>“Plot 10/45 (which covers some 3117 square metres) forms part of a fuel allotment and would be acquired to create a new Private Means of Access.”</i>	“Plot 10/45 (which covers 298 square metres) forms part of a fuel allotment and would be acquired to create a new turning head.”
<i>Paragraph 10.2.3 (page 46)</i>	<i>“Replacement land is proposed to be provided for plot 10/45. This replacement land consists of two areas of land, plot 10/41, which covers some 3117 square metres, and plot 10/42, which covers some 9209 square metres. Plot 10/41 will be provided at the same time as plot 10/45 and is acquired for the scheme. Plot 10/42 will be provided once its temporary use as a Bridge Compound has finished. This replacement land would vest in the Trustees of the Great Plumstead Fuel Allotment Charity and be subject to the same rights, trusts and incidents as attached to the use of the land which it replaces. In view of this NCC is content that its proposals accord with section 131(4) of the</i>	“No replacement land is proposed to be provided for plot 10/45. The land to be acquired is required for the widening of an existing highway. The agent for the Trustees of the Great Plumstead Fuel Allotment Charity (who control the special category fuel allotment land) has confirmed that he is satisfied that replacement land is not necessary given the small area of land to be lost. In view of this NCC is content that its proposals accord with section 131(5) of the PA 2008 (a matter upon which the Secretary of State is required to be satisfied).

	<i>PA 2008 (a matter upon which the Secretary of State is required to be satisfied. “</i>	
<i>Appendix 1: Table 1 Page 61</i>		Delete plots 10/41 and 10/42 from Work No 18
<i>Appendix 1: Table 1A Page 64</i>		Insert plot 10/45 within “Required for new highway (Non-NDR)”
<i>Appendix 1: Table 1A Page 65</i>		Delete plot 10/45 from “Required for provision of new Private Means of Access”
<i>Appendix 1: Table 1A Page 65</i>		Delete plots 10/41 and 10/42 from “Required as replacement land”
<i>Appendix 1 Table 3 Page 67</i>		Insert plots 10/41 and 10/42 within “Work No. 18”
<i>Appendix 1 Table 3A Page 67</i>		Insert plots 10/41 and 10/42 within “Required for bridge compound”
<i>Appendix 2 Paragraph 76.3 Page 96</i>	<i>“The land is required for the Scheme to be developed as part of the new NDR highway alignment, including the NDR Bridge (Over Railway Line), the Plumstead Road Roundabouts link road and for improvements to the C874 Plumstead Road. This will also include provision of land for environmental mitigation measures and temporary land to</i>

	<i>facilitate construction activities. Land is also being acquired to provide replacement land for Special Category Land.</i>	facilitate construction activities.”
Appendix 2 Paragraph 78.3 Page 96	<i>“The land is required to provide a new Private Means of Access. As the land comprises Special Category Land replacement land is being provided immediately to the west.”</i>	“The land is required to provide a new turning head on the C258 Broad Lane. It is Special Category Land, but no replacement land is to be provided.”

4 NEED FOR PROPOSED CHANGES

4.1. Ongoing affected landowner discussions

- 4.1.1. Initial discussions with local landowners had raised concerns about the impact of the proposed Broad Lane / Plumstead Road junction closure on their agricultural operations. In particular the field immediately north of the railway line was severed by the NDR and access between the two areas would involve a significant journey including travelling along part of the NDR. To mitigate this impact a PMA link was included in the application which would enable the landowner and their tenant farmer only to gain access between Broad Lane and Plumstead Road. This would significantly reduce the journey distance between the two severed land areas.
- 4.1.2. Following submission of the application, and ongoing land acquisition discussions with the parties' representative, concerns were raised with NCC about safety and security issues from the potential misuse of the PMA track by the general public. This ultimately resulted in a request from the landowner and their tenant that the PMA track be removed.
- 4.1.3. The removal of the PMA link would reduce the land acquisition requirements from the fuel allotment charity to just that required to provide the new turning head.
- 4.1.4. One of the parties who would have used the proposed PMA link is also the owner of the proposed replacement land.
- 4.1.5. Discussions with the representatives of both the fuel allotment charity and owner of the replacement land landowner have considered the issue of whether replacement land is still appropriate.
- 4.1.6. The representative for the fuel allotment charity has confirmed that they do not need to receive replacement land. The other landowner is content to retain ownership of the previously identified replacement land, following its temporary use as a bridge compound, provided that a new field access to the land is created.

5 STAKEHOLDER ENGAGEMENT

- 5.1. NCC has undertaken a targeted consultation on the potential change to ensure that relevant stakeholders were given an opportunity to consider and comment.
- 5.2. A letter, dated 25 March 2014, setting out the potential change was sent to those parties with a legal interest in either the directly affected or proposed replacement land, as well as their professional advisers, together with the three residential properties adjacent to the proposed PMA link. A total of 21 letters were sent. The letter requested responses by Friday 25 April 2014. A copy of the letter is included in Appendix B.
- 5.3. 3 responses have been received.
- 5.4. The Secretary to the Fuel Allotment Charity advised that he had no comment to make on the proposals at this stage.
- 5.5. A further response was received on behalf of the Fuel Allotment Charity confirming that they had no objection to the PMA removal and seeking confirmation that there was a field access from their land onto Plumstead Road.
- 5.6. The third response was from an agent on behalf of his two clients, namely the tenant of the land severed by the NDR, who would have used the proposed PMA link, and the owner of the proposed replacement land (who is also the owner of the severed field). He confirmed on behalf of both clients that they wholly support the removal of the PMA on safety grounds. His clients also acknowledge that they will have to take a longer route to access all parts of their property.
- 5.7. The agent also confirmed on behalf of the previously proposed replacement landowner that he is content to retain ownership of the previously identified replacement land, following its temporary use as a bridge compound, provided that a new field access to the land is created.
- 5.8. Given the supportive responses to the consultation exercise NCC has decided to progress the proposed modification to the NDR scheme.

6 ENGINEERING AND BUILDABILITY EFFECTS

6.1. Design and Geometry

6.1.1. The proposed change would require a minor change to the Scheme design at the location of the turning head on Broad Lane and the provision of a new field access on Plumstead Road.

6.2. Structures

6.2.1 The proposed change would have no impact on existing or proposed structures.

6.3. Non Motorised Users

6.3.1. The NMU provision would remain unchanged as a result of the proposed change.

6.4. Drainage

6.4.1. The proposed change would have no impact on the drainage design.

6.5. Public Utilities

6.5.1. There is no impact on the existing public utilities as a result of the proposed change.

6.6. Private Means of Access

6.6.1. The proposed change would remove the PMA track between Broad Lane and Plumstead Road. Access between the two severed land areas would be solely via the public highway.

6.6.2. A new field access would be provided into the land which was previously identified to be acquired as replacement land.

6.7. Construction

6.7.1 The proposed change would have a minimal impact on the construction works.

7 ENVIRONMENTAL EFFECTS

- 7.1. There are no envisaged environmental impacts predicted if the PMA track is removed with no anticipated additional or different effects of significance with regard to water, landscape, ecology or social and economic impacts.
- 7.2. The proposed change will however impact on the area of land to be acquired from Great Plumstead Fuel Allotment Charity. Fuel and Field Garden Allotments consist of land that was allotted for public or semi-public purposes under the Enclosure Acts. It is not technically common land but is held in trust by its owner and generally falls within the jurisdiction of the Charity Commissioners.
- 7.3. Under the NDR scheme as applied for, a 3,101m² area was to be acquired from the Great Plumstead Fuel Allotment Charity land to provide a PMA for agricultural vehicles to bypass the local road that is closed by the NDR. An adjoining, larger, area of agricultural land was to be given in exchange to the Charity.
- 7.4. As a consequence there was no predicted loss of amenity or use associated with this land take.
- 7.5. With the PMA link removed (as now proposed) a significantly smaller area of land will be required for the NDR scheme (298m²). No replacement land from the adjoining field is proposed to be given as exchange land to the Charity. Whilst this will result in a small loss of land area fuel allotment charity, it is not considered to be a significant adverse impact.

8 TRAFFIC, SAFETY AND ECONOMIC EFFECTS

- 8.1. The proposed changes are not considered to have any traffic, safety or economic effects on the proposed scheme and therefore an operational, safety and economic appraisal on the change has not been undertaken.

9 CONCLUSIONS

- 9.1. The PMA was included in the DCO application at the request of the landowner and tenant farmer who were concerned about the distance to be travelled between two severed areas of their landholding.
- 9.2. The landowner and tenant have now indicated that they no longer want this PMA provided.
- 9.3. The consultation on the proposed change has not raised any objection to the proposed change to the scheme.
- 9.4. NCC therefore considers that the PMA link should therefore be removed from the DCO application.
- 9.5. The requirement for replacement land for the fuel allotment charity is also no longer required and should be removed from the DCO application.

This document is issued for the party which commissioned it and for specific purposes connected with the above-captioned project only. It should not be relied upon by any other party or used for any other purpose.

We accept no responsibility for the consequences of this document being relied upon by any other party, or being used for any other purpose, or containing any error or omission which is due to an error or omission in data supplied to us by other parties.

This document is submitted in relation to the application for a proposed development by Norfolk County Council to the Planning Inspectorate, under the Planning Act 2008.

The application is for the Norfolk County Council (Norwich Northern Distributor Road (A1067 to A47(T))) Order, to grant development consent for the construction of a new highway running west-east between the A1067 Fakenham Road and the A47 Trunk Road at Postwick, including improvements to the existing highway network to the north and north east of Norwich.

This document comprises part of the application documents and relates to Regulation 5(2)(a) of the Infrastructure Planning (Applications: Prescribed Forms and Procedure) Regulations 2009.

1. Introduction

1.1 The Scheme

- 1.1.1 This Environmental Statement (ES) has been prepared by Mott MacDonald on behalf of Norfolk County Council (NCC), in support of an application, by NCC, for a Development Consent Order (DCO) in accordance with the Planning Act 2008 as amended.
- 1.1.2 The proposed Scheme (the Norwich Northern Distributor Road, known as the NDR) is a dual carriageway all-purpose strategic distributor road, which would link the A1067 Fakenham Road, near Attlebridge to the A47 Trunk Road (T) at Postwick. This would be over a length of approximately 20.4km. See General Arrangement Plans, drawing number R1C093-R1-5015 to 5026 (Appendix 1). A full description of the proposed Scheme can be found in Chapter 2 The Scheme Description.

1.2 The Legislative Context

- 1.2.1 In December 2012 NCC decided to promote the proposed Scheme as a Nationally Significant Infrastructure Project (NSIP) and, at the time of NCC's initial contact with The Planning Inspectorate (PINS) in January 2013, the proposed Scheme fell within the definition of an NSIP set out in Section 22 of the Planning Act 2008 (PA 2008) as it was at that time. As a result, consent for the construction and operation of the proposed Scheme was to be obtained via a Development Consent Order (DCO).
- 1.2.2 In December 2012 the Government commenced a public consultation on proposals to amend the definitions in the PA 2008 of “nationally significant infrastructure” rail and highways projects. As a result of this consultation, The Highway and Railway (Nationally Significant Infrastructure Project) Order 2013 (SI 2013/1883) came into force in July 2013.
- 1.2.3 The Order amended Section 22 of the PA 2008 so that a project such as the proposed Scheme would not fall within the definition of a NSIP
- 1.2.4 In July 2013, a qualifying request was made by NCC, under section 35(10) of the PA 2008, to the Secretary of State for Transport, seeking that he direct that the proposed Scheme be treated as development for which development consent is required.
- 1.2.5 On 9 August 2013, the Secretary of State confirmed he was satisfied that:

- "the development does not currently fall within the definition of a 'nationally significant infrastructure project' and therefore it is appropriate to consider use of the power in section 35; and
- "Norfolk County Council's request constitutes a 'qualifying request' in accordance with section 35(10) of the Act."

1.2.6 The Secretary of State issued a direction under section 35 of the PA 2008 that the proposed Scheme by itself is a project of national significance and is to be treated as development for which development consent is required. His reasons were given as:

- The Scheme "provides a direct connection to/from an international airport to the Trans European Network-Transport (TEN-T) and the Strategic Road Network. The TEN-T link is to the A47, one of only a limited number of Roads in the East of England which is recognised as such; and
- in addition the scheme:
- supports national growth potential including by directly supporting over 135ha of proposed employment growth; and
- improves connection to/from the Great Yarmouth Enterprise Zone and supports the offshore energy industry and supply chain."

1.2.7 As a project for which development consent under the PA 2008 is required, the need for the proposed scheme to be subject to Environmental Impact Assessment (EIA) has to be considered with regard to the Infrastructure Planning (Environmental Impact Assessment) Regulations 2009 (as amended) (the EIA Regulations 2009). The proposed Scheme is EIA development because it falls within the description of development given in paragraph 7(c) of Schedule 1 of those Regulations, in that it is:

1.2.8 "Construction of a new road of four or more lanes, or realignment and/or widening of an existing road of two lanes or less so as to provide four or more lanes, where such new road, or realigned and/or widened section of road would be 10 kilometres or more in a continuous length".

1.2.9 Section 104 of the PA 2008 highlights the importance of national policy statements (NPSs) in the determination of DCO applications. At the time of making this application for development consent for the proposed Scheme, however, there is no national policy statement in place for highway schemes.

1.2.10 Chapter 2 of this ES therefore provides a summary of national policy and guidance that is of relevance to the principle of the proposed Scheme. This is, in turn, followed by a brief summary of the local policy and guidance relevant to the proposed Scheme.

Habitat Regulations Assessment

1.2.11 Due to the proximity of the proposed Scheme to the River Wensum Special Area of Conservation (SAC), there is a requirement for a Habitat Regulations Assessment to be undertaken in order to identify whether the proposed Scheme is likely to have any significant effect on the Natura 2000 site under the The Conservation of Habitats and Species Regulations 2010 (The Habitats Regulations) (SI 201/490 (see ES Chapter 8 Nature Conservation). The Habitat Regulations Assessment for the proposed Scheme is presented within the Volume 2, Chapter 17.

1.3 Scheme Objectives

1.3.1 The objectives of the proposed Scheme are to:

- Reduce traffic levels, and thereby relieve congestion, on the existing road network within the urban area and beyond to the north of the city centre;
- Facilitate journeys that are already difficult and congested and require traffic to use residential and minor roads that are inappropriate for the type and volume of traffic that is currently accommodated;
- Provide access to and thereby help to deliver, planned and potential areas of growth, and enable those areas to be free of the need to incorporate provision for extraneous through traffic;
- Provide improved transport connections between existing and future areas of residential and employment development and with the national strategic road network as well as improving connections with Norwich International Airport and the wider area of North Norfolk;
- Increase the opportunities for improving provision for public transport and other sustainable forms of transport and for improving traffic management within the city centre, thereby encouraging modal shift; and
- Improve traffic related environmental conditions for those communities in the northern suburbs of Norwich and outlying villages whilst minimising the environmental impact of the NDR

- 1.3.2 A number of options have been assessed in order to ascertain whether or not they could achieve the aims of the NDR. These options, and the outcome of the assessment of them, are outlined in ES Chapter 3 Alternatives.
- 1.3.3 Value engineering and environmental considerations have been incorporated throughout the design process. The design development also took into account, where possible, the responses made through the informal and formal pre-application consultation process.

1.4 Environmental Impact Assessment

- 1.4.1 The EIA scoping exercise has been undertaken in accordance with the EIA Regulations which implement Council Directive 85/337/EEC (as amended) on the assessment of the effects of certain public and private projects on the environment.
- 1.4.2 In February 2013, NCC submitted a Scoping Report to the Secretary of State, under Regulation 8 of the EIA Regulations, requesting a scoping opinion for the Scheme. The Scoping Opinion, setting out the information to be included in the Environmental Statement (ES) accompanying the DCO application, was provided by the Planning Inspectorate on behalf of the Secretary of State in April 2013.
- 1.4.3 NCC confirmed with PINS that the proposed Scheme constituted a development requiring Environmental Impact Assessment (EIA) under Schedule 1 Section 7(c) of the Infrastructure Planning (Environmental Impact Assessment) Regulations 2009. In accordance with Regulation 6(1)(b) of the aforementioned regulations it stated that an Environmental Statement (ES) in respect of the proposed Scheme would be submitted with the application for a DCO.
- 1.4.4 As part of the pre-application requirements for projects requiring development consent under the PA 2008, it is necessary to produce and consult upon preliminary environmental information. A Preliminary Environmental Information Report (PEIR) was made public from the start of consultation.

Scope of the Environmental Statement

- 1.4.5 This ES presents the findings of the EIA. It follows the guidance provided in the Department for Transport's Design Manual for Roads and Bridges (DMRB) Volume 11, Section 1, Part 6 and Part II of Schedule 4 of the EIA Regulations and comprises the following documents:

- Non-Technical Summary;
- Volume 1 Environmental Statement; and
- Volume 2 Technical Appendices (including plans) to the Chapters in Volume 1 and supplementary technical information relevant to the assessments in Volume 1 and the DCO application.

1.4.6 Due to the size of the ES and the quantity of information presented, each Appendix in Volume 2 corresponding to the chapters in Volume 1 is a self-contained section, comprised of all relevant documents and plans.

1.4.7 Following the scoping exercise and the receipt of the Scoping Opinion from PINS, the structure of the ES is as follows:

- Chapter 1. Introduction
- Chapter 2. The Scheme
- Chapter 3. Need and Alternatives
- Chapter 4. Air Quality
- Chapter 5. Carbon
- Chapter 6. Cultural Heritage
- Chapter 7. Landscape
- Chapter 8. Nature Conservation
- Chapter 9. Geology and Soils
- Chapter 10. Materials
- Chapter 11. Noise
- Chapter 12. Effects on All Travellers
- Chapter 13. Community and Private Assets
- Chapter 14. Road Drainage and the Water Environment
- Chapter 15. Cumulative Impacts
- Chapter 16. Conclusions

- Chapter 17 References
- Glossary

1.4.8 It was initially proposed to submit a Sustainability Appraisal in which carbon would be assessed. However, Scoping Opinion stated that carbon should be assessed within the ES. Therefore, a carbon chapter has been added, and other sustainability issues assessed within the various chapters, so a separate Sustainability Appraisal it considered not to be required.

Overall Methodology

1.4.9 The EIA for the proposed Scheme has been prepared in accordance with guidance and standards set out in the Department for Transport's Design Manual for Roads and Bridges (DMRB) Volume 11 Sections 2 and 3, WebTAG and The Planning Inspectorate's Advice Note 7 (April 2012): Environmental Impact Assessment: screening and scoping.

1.4.10 For some topics, the assessment has gone beyond the requirements of DMRB to follow current best practice as detailed within the individual topic chapters. WebTAG is a web based resource setting out transport assessment guidance (<http://www.Webtag.org.uk>). It originally brought together the Department for Transport's existing guidance, including the Government's Guidance on the Methodology for Multi-Modal Studies (GOMMMS). WebTAG is particularly useful for the guidance it gives on determining environmental capital and environmental significance criteria. The following table (Table 1.1) sets out how this ES complies with the EIA Regulations 2009, and describes how this regulatory compliance is achieved under the DMRB Guidance.

Table 1.1 ES Regulatory Compliance

Regulatory Requirement	Location within the ES	DMRB Reference
Regulation 6 EIA requirement	NCC informed PINS that an ES would be submitted with the DCO application – Regulation 6(1)(b)	Volume 11, Section 2, Part 3 (HA 202/08)
Regulation 8 – request for a Scoping Opinion	NCC submitted a request for a Scoping Opinion in the form of a Scoping Report including a	Volume 11, Section 2, Part 4 (HD 204/08) addresses

Regulatory Requirement	Location within the ES	DMRB Reference
	plan sufficient to identify the land, a description of the proposal and the possible effects on the environment in February 2013 (see Appendix 4 of this document). The Scoping Opinion received from PINS is contained in (Appendix 5 of this document).	Scoping
Regulation 10 – Consultation Statement requirements	The Statement of Community Consultation (SoCC) (prepared under section 47 of the Planning Act 2008) set out how the applicant will publicise and consult on the Preliminary Environmental Information Report (PEIR). The Consultation Report (Document 5.1 of the DCO Application) sets out the results of that consultation.	Volume 11, Section 2, Part 6 (HD 48/08) states that the requirements of the EIA Regulations in relation to public participation must be met (para.1.1).
Regulation 11 – Pre-application publicity under S48 of the Planning Act 2008 (duty to publicise)	The Consultation Report lists those bodies that were contacted by the applicant when it was publicising its intention to prepare and submit the DCO application, including those that were also consulted regarding the Scoping Opinion (Appendix 5)	Volume 11, Section 2, Part 6 (HD 48/08) states that the requirements of the EIA Regulations in relation to public participation must be met (para.1.1).
Regulation 20 – Availability of copies of the ES	Sets out the information regarding where a copy of the ES can be viewed or obtained.	Volume 11, Section 2, Part 6 (HD 48/08) states that obligations of public access must be fulfilled

Regulatory Requirement	Location within the ES	DMRB Reference
		(para.1.1(vi)).
Schedule 1 – Definition of development where EIA is required.	Schedule 1 section 7(c) described in Chapter 1 of the ES	Not applicable
Schedule 4, Part 1, para 17 (a) – description of the physical characteristics of the whole development and land use requirements during construction and operation	This is described in Chapter 2 of the ES.	Volume 11, Section 2, Part 6 (HD 48/08) Describes what the required content of the ES (para 3.12).
Schedule 4, Part 1, para 17 (b) – description of the main characteristics of the production process, for instance, nature and quantity of materials used.	This is described in Chapter 2 and Chapter 10 of the ES	Volume 11 Section 2 Part 6 (HD 48/08) Describes what the required content of the ES (para 3.12).
Schedule 4, Part 1, para 17 (c) – an estimate, by type and quantity, of expected residues and emissions (water, air and soil pollution, noise, vibration, light, heat, radiation, etc) resulting from the operation of the proposed development	This is described in Chapters 4,5,7,9,11,13,14 of the ES	Volume 11 Section 2 Part 6 (para 3.20) and Section 3, Parts 1-12)
Schedule 4, Part 1, para 18 – outline of the main alternatives studied by the applicant and an indication of the main reasons for the applicant’s choice, taking into account the environmental effects	This is described in Chapter 3	Volume 11, Section 2, Part 6 (HD 48/08) (para 2.5(iv); para 3.3(iv); paras 3.13 and 3.14)

Regulatory Requirement	Location within the ES	DMRB Reference
<p>Schedule 4, Part 1, para 19 - description of the aspects of the environment likely to be significantly affected by the development, including, in particular, population, fauna, flora, soil, water, air, climatic factors, material assets, including the architectural and archaeological heritage, landscape and the interrelationship between the above factors.</p>	<p>This is described in Chapters 4 -15 and on Drawings MMD-233906-DT-0881, 0883, 0884, 0885, 0909 and 0937 Environmental Constraints Plans, Appendix 2</p>	<p>DMRB Volume 11, Section 3, Parts 1-12), describes the required content of the ES.</p>
<p>Schedule 4, Part 1, para 20 – Description of likely significant effects on the environment resulting from: (a) the existence of the development; (b) the use of natural resources; and (c) the emission of pollutants, the creation of nuisances and the elimination of waste. Description of the forecasting methods used to assess the effects on the environment.</p>	<p>See Chapters 4 - 15</p>	<p>DMRB Volume 11, Section 3, Parts 1-12 describes the required content of the ES</p>
<p>Schedule 4, Part 1, para 21 - description of the measures envisaged to prevent, reduce and where possible offset any significant adverse effects on the environment.</p>	<p>See Chapters 4 – 16 and Drawing MMD-233906-DT-0552-0563 Environmental Mitigation Plan</p>	<p>DMRB Volume 11, Section 3 Parts 1-12 describes the required content of the ES</p>
<p>Schedule 4, Part 1, para 22 – Non Technical Summary of the information provided above.</p>	<p>Separate Non – Technical Summary – this is provided as a separate document (DCO Reference 6.3a)</p>	<p>Volume 11, Section 2, Part 6 (HD 48/08) (Para 3.3(v))</p>

Regulatory Requirement	Location within the ES	DMRB Reference
Schedule 4, Part 1, para 23 – indication of any difficulties encountered by the applicant.	See Chapters 4 – 15 of ES	Volume 11, Section 2, Part 6 (HD 48/087), Paras 3.14, 3.15 and 3.20 includes a requirement to identify any difficulties encountered.

Overall Approach to the EIA

1.4.11 This section sets out the generic approach taken to EIA. There are methods and requirements specific to each assessment topic and these are detailed on the basis of topic relevancy in Chapters 4 - 15. However, the approach set out below is common to all topics, in accordance with regulatory requirements and best practice.

1.4.12 The EIA has to be considered having regard to the EIA Regulations 2009. The proposed Scheme is EIA development as it falls within the description of development given in paragraph 7(c) of Schedule 1 of those Regulations, as explained in above.

Scoping Report

1.4.13 The submission of the Scoping Report and the Scoping Opinion produced in response are described in paragraph xx above. As required by Regulation 8(6) of the EIA Regulations 2009, the Secretary of State was under a duty to consult widely before adopting his scoping opinion. The consultation responses were provided with the Scoping Opinion (Volume 1 Appendix 5). An explanation of the manner in which these consultation responses have been addressed within the ES can be found in Volume 1 Appendix 6.

1.4.14 The Scoping Report proposed that Carbon be assessed as part of the Sustainability Appraisal. However, the Secretary of State requested in his Scoping Opinion that carbon be considered within the ES. As a result, Carbon has been assessed in Chapter 5 of the ES.

1.4.15 There are no un-navigable, disused or abandoned waterways affected by or connected with the proposed Scheme footprint and the Secretary of State therefore agreed that they could be scoped out of the ES.

1.4.16 Appendix 6 of Volume 1 lists all the items noted in the Scoping Opinion as requiring environmental impact assessment, together with a commentary to explain how they have been assessed.

Temporal Scope of the EIA

1.4.17 The EIA assessed effects arising from the construction of, temporary and permanent land take for, and operation of the proposed Scheme as follows:

- construction effects that may arise directly from construction activities (e.g. piling) and from the temporary use of land (e.g. construction sites), and/or from associated changes in traffic movements (e.g. diversions); and
- operational effects that may arise from the new infrastructure and traffic flows associated with the NDR.

1.4.18 The 'baseline' year for the purposes of the assessment is identified for each topic in the baseline section of each topic chapter, depending on when the baseline information was gathered (generally between 2011 and 2013). For traffic modelling this is referred to as the 'base year' and is 2012. With construction anticipated to take approximately 2 years to complete, 2017 is expected to be the 'opening' year for the purposes of the assessment. The 'design' year (usually 15 years after scheme opening) will therefore be 2032. The opening and design years are based on the assessment years set out in the Transport Assessment (Mott MacDonald, 2013), which has been submitted with the DCO Application.

1.4.19 Subject to obtaining development consent under the PA 2008, construction of the proposed Scheme is due to commence in May 2015 and to continue until May 2017. The design life of the proposed Scheme is 60 years and maintenance will be undertaken throughout the lifetime of the road.

Spatial Scope of the EIA

1.4.20 The overall spatial scope of the EIA has taken into account:

- the footprint of the proposed works including areas required for construction, enabling work and mitigation;

- the footprint of the traffic model where traffic flows are used for the air quality and noise assessments;
- the nature of the existing baseline environment;
- the manner in which effects are likely to be propagated (for example noise and air quality effects will extend significantly beyond the footprint of the works) ;
- the area affected (positively and negatively) by transport movements;
- the geographical boundaries of the political and administrative authorities which provide the planning and policy context for the proposed Scheme; and
- the alignment, both vertically and horizontally, of the proposed Scheme has been assessed with regard to certain tolerances or design parameters.(These are detailed in Chapter 2 The Scheme)

1.4.21 The spatial scope will vary for each topic discipline, and the factors which are relevant in determining the spatial scope of each topic assessment are described in the individual topic Chapters 4 to 15, as appropriate.

Assessment Methodology

1.4.22 DMRB Volume 11 provides environmental assessment guidance in relation to EIA carried out for trunk roads. This guidance has been used for assigning value or importance to environmental features and determining the magnitude of impacts and significance of effects. If DMRB assessment guidance was not considered the most appropriate form of guidance for a particular topic, or if other best practice guidance was considered useful to supplement the DMRB guidance, then this has been employed, as described in the relevant topic chapters of the ES. Topic assessments have used the latest versions of the relevant guidance unless otherwise stated.

1.4.23 The significance of an effect is a factor of the value or sensitivity of the resource affected, and the magnitude of the impact upon it. The relevant criteria used to define the value of a resource are explained in each topic assessment. Unless otherwise stated, guidance in DMRB Volume 11, Section 2, Part 5, has been used to determine the value of an affected resource. This methodology is set out in Table 1.2 below.

Table 1.2: Description of the Value or Sensitivity of an Environmental Resource

Value or Sensitivity	Example Description
Very high	Very high importance and rarity, international scale and very limited potential for substitution.
High	High importance and rarity, national scale, and limited potential for substitution.
Medium	High or medium importance and rarity, regional scale, limited potential for substitution.
Low	Low or medium importance and rarity, local scale.
Negligible	Very low importance and rarity, local scale.

Source: DMRB Volume 11 s2 p5, Table 2.1

1.4.24 Assessment of the magnitude of impact has been based on the degree of direct and indirect impact and whether the impact was permanent or temporary. Criteria for establishing the magnitude of impact have been taken from DMRB Volume 11, Section 2 Part 5, Table 2.2, and are shown in Table 1.3 below. Any use of other criteria has been explained and justified within the relevant assessment topic.

Table 1.3: Magnitude of Impact

Magnitude of Impact	Impact	Example Description
Major	Adverse or Beneficial	Loss of resource and/or quality and integrity of resource; severe damage to key characteristics ,features or elements or Large scale or major improvement of resource

Magnitude of Impact	Impact	Example Description
		quality; extensive restoration or enhancement; major improvement of attribute quality
Moderate	Adverse or Beneficial	Loss of resource, but not adversely affecting the integrity; partial loss of/damage to key characteristics, features or elements or Benefit to, or addition of, key characteristics, features or elements; improvement of attribute quality
Minor	Adverse or Beneficial	Some measurable change in attributes, quality or vulnerability; minor loss of, or alteration to, one (maybe more) key characteristics features or element or Minor benefit to, or addition of, one (maybe more) key characteristics, features or elements; some beneficial impact on attribute or a reduced risk of negative impact occurring
Negligible	Adverse or Beneficial	Very minor loss or detrimental alteration to one or more characteristics, features or elements or Very minor benefit to or positive addition of one or more characteristics, features or elements
No change	Not Applicable	No loss or alteration of characteristics, features or elements; no observable change in either direction.

Source: DMRB Volume11, Section 2, Part 5, Table 2.2

1.4.25 Once the value of resources and magnitude of impacts were considered, the overall significance of effects was assessed using the matrix in DMRB

Volume 11, Section 2 Part 5, Table 2.4 (see Table 1.4 below). Where a different methodology has been adopted for specific environmental topics, this has been explained in the relevant sections of this ES.

Table 1.4: Significance of Effects

Sensitivity	Magnitude of Impact or Degree of Change				
	No change	Negligible	Minor	Moderate	Major
Very High	Neutral	Slight	Moderate/ Large	Large/ Very Large	Very Large
High	Neutral	Slight	Slight/ Moderate	Moderate/ Large	Large/ Very Large
Medium	Neutral	Neutral/ Slight	Slight	Moderate	Moderate/ Large
Low	Neutral	Neutral/ Slight	Neutral/ Slight	Slight	Slight/ Moderate
Negligible	Neutral	Neutral	Neutral/ Slight	Neutral/Slig ht	Slight

Source: DMRB Volume 11, Section 2 Part 5, Table 2.4

1.4.26 Only those effects that are considered moderate or above adverse/beneficial are considered significant for the purposes of the EIA.

Mitigation and Monitoring

1.4.27 Mitigation is defined as “measures intended to avoid, reduce and, where possible, remedy significant adverse environmental effects” (DMRB Volume 11, Section 2, Part 7 (HA 218/08)).

1.4.28 The EIA has been made on the assumption that the proposed Scheme incorporates measures to prevent, reduce and where possible offset environmental impacts from the earliest stage of the project. Specific details of the proposed mitigation measures are included in the individual topic sections of this ES. The proposed measures were designed according to statutory and

non-statutory guidance and the DMRB to provide proposals that are proportionate to the significance of the relevant effect. Such mitigation measures are set out in the requirements in the DCO and NCC is committed to delivering them as an integral part of the proposed Scheme.

1.4.29 Monitoring is defined as ‘a continuing assessment of the performance of the project, including mitigation measures. This determines if effects occur as predicted or if operations remain within acceptable limits, and if mitigation measures are as effective as predicted’ (DMRB Volume 11, Section 2, Part 7 (HA 218/08)). Where monitoring is proposed over and above statutory requirements it is set out in the individual topic chapters.

Combined and Cumulative Effects

1.4.30 A cumulative impact may arise as the result of: a) the combined impact of a number of different environmental topic-specific impacts from a single environmental impact assessment project on a single receptor/ resource; and b) the combined impact of a number of different projects within the vicinity (in combination with the environmental impact assessment project) on a single receptor/resource. Combined effects are additional impacts arising from interrelationships within the same scheme.

1.4.31 Those impacts arising from the scheme in combination with other proposed developments are termed cumulative. This includes development under construction; permitted applications which have not yet been implemented; submitted applications which have not yet been determined; projects on the Planning Inspectorate’s programme of projects; projects identified in development plans and emerging development plans and projects identified in other plans and programmes which set the framework for future development consents/approvals and which are reasonably likely to come forward. Combined and Cumulative effects are assessed within Chapter 15 of the ES.

Consultation

1.4.32 1.1.48 The results of the informal and formal public consultation on the Scheme in accordance with Sections 42, 47 and 48 of the PA 2008 are summarised in the Consultation Report, document 5.1 of the DCO submission.

1.4.33 As described in Chapter 2, the proposed Scheme has been the subject of assessment since 2003. During that time extensive informal and formal

consultation with Statutory Stakeholders/consultees has been conducted on a regular basis. This consultation, particularly with the Statutory Environmental Bodies, has been the basis for the focus of the EIA work to date. Volume 2 of the ES details the relevant consultation undertaken for each of the chapter topics.

Other Environmental Documents

1.4.34 The following environmental information has been prepared and will be submitted as part of the DCO application:

- Transport Assessment;
- Habitat Regulations Assessment;
- Arboricultural Impact Assessment;
- Construction Environmental Management Plan (CEMP) containing the Site Waste Management Plan (SWMP);
- Health Impact Assessment;
- Draft EPS Licence; and
- Non-Technical Summary

2. The Scheme

2.1 Introduction

2.1.1 The Scheme (the Norwich Northern Distributor Road, known as “the NDR”) is a dual carriageway all-purpose strategic distributor road, to be classified as the A1270 Principal Road, which would link the A1067 Fakenham Road, near Attlebridge, to the A47 Trunk Road (T) at Postwick. This will be over a length of approximately 20.4 km. Refer to the General Arrangement Plans in document number 2.6.

2.2 General Description: Scheme Route

2.2.1 From west to east, the scheme will start with a realignment of 750m of the A1067 Fakenham Road to the north of the existing carriageway, where the NDR (A1270) starts at a new at-grade roundabout junction, located to the west of Taverham. The NDR would then continue eastwards as a dual carriageway to its new at-grade roundabout junction with the C262 Fir Covert Road. From this roundabout, the NDR would then cross the Marriott’s Way (a permissive path providing a pedestrian, cycling and horse riding facility along the route of a disused railway) which will be taken across the NDR via a new bridge), to a new at-grade roundabout junction with the C261 Reepham Road. The NDR would then continue south eastwards, crossing Bell Farm Track/Horsford Restricted Byway No. 5 (which will be taken up over the NDR via a new Restricted Byway and private access accommodation bridge) before connecting with a new at-grade roundabout junction, just west of the existing C282 Drayton Lane, and which new roundabout will have two new link road connections, one with the C261 Reepham Road and one with the B1149 Holt Road, to replace the existing Drayton Lane.

2.2.2 From here, the NDR would then continue south eastwards to a new grade-separated junction (provision of a bridge over the NDR with slip roads to/from the NDR) with the A140 Cromer Road, located close to and just north west of Norwich International Airport. The provision of this grade-separated junction will require the stopping up of lengths of the B1149 Holt Road and Holly Lane (U57142), as well as a length of the A140 Cromer Road, which will be replaced by a new highway west of its existing position, which will be taken over the NDR and provide the connection for its four connecting slip roads. East of the A140, the NDR would continue as a dual carriageway, turning north eastwards around the northern boundary of the airport to a further new at-grade roundabout junction at the northern tip of the airport. The primary

purpose of this roundabout is to allow the NDR to undertake a roughly 90 degree change of direction around the Airport site. From this roundabout, the NDR would continue south eastwards, skirting the north east boundary of the airport, before turning eastwards and passing under a new highway, which will be carried by bridge over the NDR, immediately to the east of the existing C246 Buxton Road, and which would provide the new connection for its realignment sections north and south of the NDR.

- 2.2.3 The route of the dual carriageway NDR would then continue eastwards through the north of Beeston Park. It would then connect with both the B1150 North Walsham Road and the A1151 Wroxham Road via a new at-grade roundabout at each location, before turning south eastwards and entering the north eastern section of Rackheath Park approximately 250 metres from the western end of Sir Edward Stracey Road (U57538). It would then continue south eastwards, passing under a new bridleway and access bridge across the NDR, some 200 metres south west of the junction of Newman Road (U57490) with Long's Crescent (U57852).
- 2.2.4 The NDR would then connect with the C283 Salhouse Road via a new at-grade roundabout, before rising up on an embankment (maximum height approximately 8.5 metres), to cross both the Norwich to Cromer & Sheringham rail line and the C874 Plumstead Road on individual bridges in close proximity, prior to a new at-grade roundabout on the NDR, which would connect it via a new link road to a further small at-grade roundabout on the C874 Plumstead Road.
- 2.2.5 The NDR route would then continue southwards, crossing under the C442 Middle Road (which would be raised to pass over the NDR, on its existing alignment, via a new bridge) before connecting with a new at-grade roundabout known as the Business Park Roundabout.
- 2.2.6 At this point a single carriageway link is provided westwards to the existing C829/C830 Broadland Way/C831 Peachman Way roundabout and includes an at-grade roundabout on the link road to the proposed Broadland Gate Business Park.
- 2.2.7 From the Business Park roundabout the NDR proceeds southwards as a dual carriageway to a new Postwick north east at-grade roundabout immediately north of the A47(T) Norwich Southern Bypass. This roundabout has links from a new A47(T) eastbound diverge slip road and a new A47(T) eastbound merge slip road. The NDR continues over the A47(T) as a four lane carriageway, one lane north and three south, on a new bridge and terminates

at its southernmost point at a signalised junction, which replaces the existing Park and Ride roundabout with the A1042 Yarmouth Road.

2.2.8 This signalised junction provides further links:

- Directly to and from the park and ride site for buses;
- West to the existing Postwick North West roundabout, via the existing Postwick bridge over the A47(T);
- East to the proposed park and ride site entrance at the proposed Oak's Lane roundabout and further east to the Brundall Low Road junction with the A1042 Yarmouth Road to Postwick village; and
- West to the A47(T) via an existing westbound merge slip road.

2.2.9 The works at Postwick Junction, will include modifications to the existing Postwick north west roundabout (as a result of closing the existing eastbound diverge slip road) and to the existing A1042 Yarmouth Road overbridge of the A47(T), to provide revised traffic lanes and the provision of a shared use cycle/footway.

2.2.10 The route of the NDR that has been described above is, for the majority of its length, within Broadland District. It does, however, for a short stretch close to Norwich International Airport, fall within the administrative area of Norwich City Council. A very small part of the works at Postwick falls within the administrative area of The Broads Authority. The new road from west to east runs through the following parishes:

- Attlebridge;
- Taverham;
- Drayton;
- Horsford;
- Horsham St. Faith and Newton St. Faith;
- Spixworth;
- Beeston St. Andrew;
- Sprowston;
- Rackheath;

- Great and Little Plumstead; and
- Postwick with Witton.

2.3 Overview of scheme features

2.3.1 As described above, the scheme consists of a number of different features which are detailed further below. The location of the proposed Scheme features is measured by reference to the “chainage”, which is the distance from the start of the scheme, at its junction with the A1067 Fakenham Road, in metres.

2.3.2 There will be ten new highway structures, which consist of six overbridges and four underbridges carrying the following existing routes, or new routes as necessary, either under or over the NDR.

Table 2.1: Overbridges

Overbridge	Chainage
Marriott’s Way – permissive path providing a pedestrian, cycling and horse riding facility along the route of a disused railway	2390
Bell Farm Track – Horsford Restricted Byway No. 5 and private means of access	3980
New A140 Cromer Road	6800
New road - C246 Buxton Road replacement	10940
Private means of access and new bridleway leading from Newman Road (U57490)	15500
C442 Middle Road	18060

Table 2.2: Underbridges

Underbridge	Chainage
Norwich to Cromer & Sheringham railway line	16920
C874 Plumstead Road	17010
New flood culvert/bat underpass which will be located to the west of Rackheath	14810
A47 Trunk Road at Postwick	20220

Table 2.3: Grade separated junctions

Junction	Chainage
A140 Cromer Road (to include eastbound and westbound merge and diverge slip roads)	6800
A47 Trunk Road at Postwick (to include new roundabout east of the existing roundabout with provision of new eastbound diverge and eastbound merge slip roads to/from the A47(T))	19450 - 20400

Table 2.4: At-grade roundabout junctions

Junction	Chainage
A1067 Fakenham Road	510
C262 Fir Covert Road	1750
C261 Reepham Road	2910
New Highway links just west of C282 Drayton Lane	5330
B1150 North Walsham Road	12100
A1151 Wroxham Road	14240
C283 Salhouse Road	16100
C874 Plumstead Road (South)	17300

Table 2.5: On-line access roundabouts

Access roundabouts	Chainage
Northernmost point of Norwich Airport to include a new highway access to the Petans offshore training facilities and secure access to Norwich International Airport	9120
At the proposed Broadland Gate Business Park location to link the NDR to the proposed Broadland Gate Link Road	19450 – 20400

Table 2.6: Off-line roundabouts

Off-line roundabouts	Chainage
C282 Drayton Lane/B1149 Holt Road junction	Off-line
C874 Plumstead Road (North)	Off-line
Proposed site of the Broadland Gate Business Park, off the Broadland Gate Link Road	Off-line

Table 2.7: Major/minor priority junction

Junction	Chainage
C282 Drayton Lane/C261 Reepham Road	Off-line

Table 2.8: Bat gantries

Bat gantry	Chainage
Along the line of Attlebridge Restricted Byway No.3	760
Along the line of track to Glebe Farm	5780
Approximately 150 metres south west of Quaker Farm	10020
Approximately 150 metres north east of North Park Cottage	12650
Along the line of track approximately 400 metres east of Park Farm	13140
Along the line of track approximately 250 metres north west of Oak's Farm	17730
Parallel with Smee Lane (U59400)	19000

2.3.3 To convey natural runoff under the NDR, a number of culverts will be provided.

Table 2.9: Road closures

Road closures	Chainage
Breck Farm Lane (U57168) to the south of the NDR	2525
Furze Lane (U57168) to the north of the NDR	2525
C282 Drayton Lane – a 892 metres length from its junction with the C261 Reepham Road	5350
B1149 Holt Road to north of the NDR	6600
Holly Lane (U57142) to the South of the NDR	6600
C251 Bullock Hill to the North of the NDR	8900
Road closures	Chainage
Quaker Lane (U57188) to the North of the NDR	9820
C251 St. Faiths Road to the South of the NDR	9990
C258 Broad Lane at its junction with C874 Plumstead Road/Norwich Road (by Traffic Regulation)	17010
Low Road (U59392) to the east and west of the NDR	18380
Smee Lane (U59400) to the east and west of the NDR	19000
A length of the existing A47(T) eastbound diverge slip road, from the A47(T) connection point with the new eastbound diverge slip road, eastwards to the existing Postwick North West roundabout	19500
A length of the existing A47(T) eastbound merge slip road, from its junction with Postwick North West roundabout, eastwards to the connection point with the new A47(T) eastbound merge slip road	19500

Table 2.10: Public and Private Rights of Way to be stopped up/diverted

Tracks and Rights of Way	Chainage
Private: Access Track running north-south between the A1067 Fakenham Road and Attlebridge Restricted Byway No.3, to the north of the NDR)	700
Public: A 386 metre length of Attlebridge Restricted Byway No. 3, north westwards from its junction with the A1067 Fakenham Road (a diverted route from the northern side of the A1067 Fakenham Road Roundabout to be provided)	760
Private: A length of Access Track running along a co-existent route with Attlebridge Restricted Byway No.3, to the north of the NDR	760
Private: A length of Access Track running along a co-existent route with Drayton Restricted Byway No.6, north eastwards off the C261 Reepham Road, to Felthorpe Woods	3000
Private: A length of Access Track running north eastwards, to agricultural land, off the C261 Reepham Road	3000
Private: Access Track, leading to Bell Farm, from the C261 Reepham Road, opposite Long Dale (U51249), to Dog Lane (U57176), to the north and south of the NDR	3750
Private: Bell Farm Track to be placed on a diverted route on overbridge of the NDR	4000
Private: Access Track running from the C261 Reepham Road to Glebe Farm on B1149 Holt Road, to the north and south of the NDR	5150
Public: Horsford Restricted Byway No.7 – a 60 metre length from its junction with the C282 Drayton Lane (remaining length will connect with new Drayton Lane (north) Link Road))	5300
Private: Access Track at the southern termination point of C250 Old Norwich Road, to Norwich International Airport Control Tower and Airport curtilage, to the north of the NDR	7900
Public: Horsham St. Faith and the Newton St. Faith Bridleway No.6, to the west of the NDR	8900

Public: Spixworth Bridleway No.1, to the east of the NDR	9800
Private: Access Track leading north of Red Hall Farm, Beeston Lane (U57186), to the north and south of the NDR	11730
Private: AccessTrack leading north off Beeston Lane (U57186), approximately 400 metres east of Park Farm, to the north and south of the NDR	13150
Private: Access Track leading south west from the C258 Green Lane West, to the pumping station, to the north and south of the NDR	14800
Private: AccessTrack leading from the existing Newman Track west of Gazebo Farm in a northerly direction for approximately 250 metres.	15200
Private: Access Track leading from the realigned Newman Track on the east of overbridge leading northwards for approximately 80 metres.	15500
Private: Access Track leading southwards from Newman Road (U57490)/Long's Crescent (U57852) junction, over its length to the circulatory track around March Farm, Park Gardens etc.	15500
Private: Access Track leading from C258 Green Lane West to Hall Farm, west of the NDR	15800
Public: Great and Little Plumstead Footpath No.5, to the east and west of the NDR	18750
Private: Access Track running along a co-existent route with Great and Little Plumstead Footpath No.5 to the Nurseries, to the east and west of the NDR	18750
Public: Postwick Footpath No.2 – a 700 metre length from its junction with the A1042 Yarmouth Road.	19000

2.3.4 A number of other highways are to be stopped up under the NDR proposals, but which are to be replaced by the NDR itself, or parts of it, or by other new highways.

2.3.5 A number of other private means of access to premises are to be stopped up under the NDR proposals, but which are to be replaced by other new means

of access to premises, other than where another reasonably convenient means of access to those premises already exists.

Table 2.11: Diversions of Public Rights of Way

Track and Rights of Way diversions	Chainage
Public: Attlebridge Restricted Byway No. 3 (to the North of the NDR) diverted alongside the NDR to join the A1067 Fakenham Road roundabout.	750
Public: Drayton Restricted Byway No. 6 diverted around the north of the NDR Reepham Road roundabout to join the roundabout.	3000
Public: Horsford Restricted Byway No. 5 diverted over the new Bell Farm Overbridge.	3950

2.4 New links

- 2.4.1 Approximately 25 kilometres of new links suitable for use by pedestrians, cyclists and equestrians where permitted would be provided alongside, over, and connecting with, in places, the NDR route, together with improved surfacing provided on some existing rights of way.
- 2.4.2 The new links provided for use by pedestrians, cyclists and equestrians would be provided alongside the NDR route within the landscape strip. These would link to existing facilities and be screened from the NDR carriageway by a combination of low mounds and/or hedge and tree planting.
- 2.4.3 Where individual or joint access to premises will be severed by the NDR, new accesses will be provided to link these to the NDR or to other existing roads, other than where the premises are already served by another reasonably convenient means of access.

2.5 Statutory undertakers

Table 2.12: Utility works

Utility company	Number of diversions
EDF	22
Government pipelines	1
National Grid Gas	9
National Grid Gas (High P)	1
Utility company	Number of diversions
British Telecom	16
Anglian Water (potable)	16
Anglian Water (Sewers)	7
Biffa	1
Virgin Media	1

2.6 Complimentary works

2.6.1 It is proposed to carry out the following off-line complimentary works:

2.6.2 Relocation of the C258 Green Lane West junction with the A1151 Wroxham Road, by provision of a new highway connection from the C258 Green Lane West to the A1151 Wroxham Road, 75 metres to the south west of its existing junction, together with closure of the existing junction (by Traffic Regulation) and turning the remaining C258 Green Lane West into a residential cul-de-sac;

2.6.3 Closure of the C249 Rackheath Lane at its junction with the B1150 North Walsham Road (by Traffic Regulation), together with widening of the C249 Crostwick Lane arm of the junction;

2.6.4 Highway improvements measures on the C874 Plumstead Road through Thorpe End; and

2.6.5 The provision of a shared use footway/cycleway, within the northern highway verge of the C261 Reepham Road, between its junction with Horsford Restricted Byway No.5 and Long Dale (U51249).

2.7 Lighting

The majority of the proposed scheme will not be lit. The exception to this is the Postwick Junction area of the scheme which will provide lighting as follows:

Table 2.13: Lighting

Illumination	Chainage
From the Business Park roundabout westwards to the C829 Broadland Way/C831 Peachman Way roundabout.	19450 - 20400
From the Business Park roundabout southwards to and including the Postwick North East roundabout.	19450 - 20400
South from the Postwick North East roundabout across the new NDR overbridge of the A47(T) to the signalised junction on the A1042 Yarmouth Road.	19450 - 20400
The A1042 Yarmouth Road signalised junction.	19450 - 20400
On the existing A1042 Yarmouth Road bridge over the A47(T).	19450 - 20400
From the existing A1042 Yarmouth Road bridge over the A47(T) to and including Postwick North West roundabout.	19450 - 20400

2.8 Proposed Traffic Regulation

2.8.1 In addition to the above scheme features, it is proposed that the following Permanent Traffic Regulation measures will be brought into effect:

- 2.8.2 Clearway for the entire length of the NDR between and including the A1067 Fakenham Road roundabout and A47(T) at Postwick and roads forming the Postwick Hub junction and Broadland Gate link;
- 2.8.3 Amendment to speed limits on existing routes where these are bisected by the NDR;
- 2.8.4 Extension of the existing 30 mph speed limit on the C442 Middle Road westwards to a point immediately west of the proposed bridge over the NDR, to include the built-up extents of Toad Lane closest to Middle Road;
- 2.8.5 40 mph speed limit to roads forming the Postwick Junction, south of and including the proposed Broadland Gate link.
- 2.8.6 Prohibition of entry on the NDR Diverge Slip Roads at the A140 Cromer Road junction (at their connection points with the NDR Cromer Road Roundabout North and the A140 Cromer Road Roundabout South) and on the new A47(T) eastbound Diverge Slip Road at its connection point with Postwick North East Roundabout;
- 2.8.7 30 mph, 40 mph and 50 mph speed limits on components of the Drayton Lane Link Road.
- 2.8.8 Extension of 30 mph speed limit on the B1149 Holt Road to include the new roundabout.
- 2.8.9 Extension of 30 mph speed limit on the C283 Salhouse Road.
- 2.8.10 Extension of 40 mph speed limit on the C874 Plumstead Road/Norwich Road.
- 2.8.11 40 mph speed limit on new Plumstead Road Link Road.
- 2.8.12 Amendments to existing 7.5T weight restrictions on the U59400 Smee Lane, the U59393 Low Road, the U57188 Quaker Lane and the C251 St. Faiths Road.
- 2.8.13 Prohibition of Motor Vehicles on the C249 Rackheath Lane at its junction with the B1150 North Walsham Road.
- 2.8.14 Prohibition of Motor Vehicles on the C258 Green Lane West at its junction with the A1151 Wroxham Road.
- 2.8.15 Prohibition of Motor Vehicles on the C258 Broad Lane (north western leg) at its junction with the C874 Norwich Road.

2.8.16 Prohibition of Motor Vehicles (except for buses) at the western entrance to the Postwick Park and Ride site.

2.9 Overview of Policy and Legislation

Introduction

- 2.9.1 This section covers two matters. The first is an outline of the legislative context against which the proposed NDR scheme is being considered. The second is an overview of policy and guidance relevant to both the principle of, and the need for the proposed NDR scheme.
- 2.9.2 The detailed analysis of wider relevant legislation, policies and guidance, and of the policy implications of the proposed NDR scheme, are provided on a chapter by chapter basis within this Environmental Statement (ES). In particular, each topic assessment chapter of the ES sets out the national (and where relevant international) legislation and policy and local policies and guidance relevant to the specific environmental topic that it is considering.
- 2.9.3 Regard has been had to policy and legislative material both in drawing up the NDR proposals and in the assessment of the environmental effects of the proposed NDR scheme. Further analysis of the policy and guidance outlined in the second part of the overview below, the focus of which relates to planning and transport matters, is given in Chapter 3 of the ES: Need and Alternatives, together with an assessment of how the proposed NDR scheme relates to the policy objectives identified in that material.

Legislative Context

- 2.9.4 In December 2012, Norfolk County Council (NCC) decided to promote the proposed NDR scheme as a Nationally Significant Infrastructure Project (NSIP). At that time the proposed NDR scheme fell within the definition of an NSIP set out in section 22(2) of the Planning Act 2008 (PA 2008) (as it was at that time) because it included works to the Postwick junction of the A47(T) and was to be constructed for a purpose connected with the A47(T).
- 2.9.5 In July 2013 the Highway and Railway (Nationally Significant Infrastructure Project) Order 2013 (SI 2013/1883) (the Order) came into force. The Order amended section 22 of the PA 2008 so that a project such as the NDR would not fall within the definition of a NSIP. However, in August 2013 the Secretary of State for Transport made a direction under section 35 of the PA 2008 that the NDR was a project of national significance and was to be treated as development for which development consent (under the PA 2008) was

required. Consent for the construction and operation of the proposed NDR scheme therefore needs to be obtained via a Development Consent Order (DCO).

- 2.9.6 As proposed development for which development consent under the PA 2008 is required, the need for the proposed NDR scheme to be subject to Environmental Impact Assessment (EIA) has to be considered having regard to the Infrastructure Planning (Environmental Impact Assessment) Regulations 2009 (as amended) (the EIA Regulations). The proposed NDR scheme is EIA development because it falls within the description of development given in paragraph 7(c) of Schedule 1 of those Regulations.
- 2.9.7 A formal Scoping Opinion as to the information to be included in the ES accompanying the DCO application has been provided by the Planning Inspectorate (the body who will, on behalf of the Secretary of State, examine the DCO application when it is submitted). In addition, NCC has (in accordance with Regulation 6 of the EIA Regulations) notified the Planning Inspectorate of its intention to provide an ES in respect of the proposed NDR scheme.
- 2.9.8 Section 104 of the PA 2008 highlights the importance of National Policy Statements (NPS) in the determination of applications for development consent. The draft NPS for National Networks was published by the Department for Transport in December 2013, the underlying substance of which has been addressed in the NDR application.
- 2.9.9 At the time of making the application for development consent for the proposed NDR scheme, there is no designated NPS in place for highway schemes. In the absence of a designated NPS, the application for development consent for the proposed NDR will need to be determined under section 105 of the PA 2008, which requires the Secretary of State for Transport, in determining the application, to have regard to:
- Any local impact report submitted to the Secretary of State;
 - Any matters prescribed in relation to the development of the description to which the application relates; and
 - Any other matters which the Secretary of State thinks are both important and relevant to the Secretary of State's decision.
- 2.9.10 The following section therefore provides a summary of national planning and transport policy and guidance that is of relevance both to the principle of, and

the need for, the proposed NDR scheme. This is then, in turn followed by a summary of relevant local policy and guidance. As the Secretary of State is required under section 105 of the PA 2008 to have regard to any other matters which he thinks are both important and relevant to his decision, such matters may also include the draft NPS if it has not yet been formally designated.

2.10 National Policy and Guidance

The Plan for Growth (March 2011) (HM Treasury)

2.10.1 Produced soon after the Government came to power, the Plan for Growth set out the objective of the Government's economic policy as being the achievement of strong, sustainable and balanced growth across the country and between industries (Executive Summary, page 5). The Plan for Growth contains four overarching ambitions to ensure progress is made towards achieving this economic objective; those ambitions are:

- to create the most competitive tax system in the G20;
- to make the UK one of the best places in Europe to start, finance and grow a business;
- to encourage investment and exports as a route to a more balanced economy; and
- to create a more educated workforce that is the most flexible in Europe.

2.10.2 It was further made clear (Plan for Growth, paragraph 1.34) that to achieve the second of these ambitions, one of the steps the Government intended to take was to produce a shorter, more focused and inherently pro-growth National Planning Policy Framework to deliver more development in suitable and viable locations. In order to achieve the third ambition the Government indicated (Plan for Growth, paragraph 1.54) that it would seek to increase investment in infrastructure by, amongst other things, publishing the UK's long-term forward view of infrastructure projects and programmes as part of a National Infrastructure Plan. Support for the creation of Local Enterprise Partnerships (LEP) and the introduction of Enterprise Zones are highlighted as steps taken to achieve this ambition.

National Planning Policy Framework (NPPF) (March 2012) (Department for Communities and Local Government)

- 2.10.3 The National Planning Policy Framework (NPPF) sets out the Government's planning policies for England and explains how these are expected to be applied (NPPF, paragraph 1). It is made clear that whilst the NPPF does not contain specific policies for NSIPs (which are determined in accordance with the decision-making framework set out in the PA 2008) it may be considered relevant in the determination of NSIP applications (NPPF, paragraph 3).
- 2.10.4 The NPPF highlights that the purpose of the planning system is to contribute to the achievement of sustainable development, which is recognised as having three dimensions: economic, social and environmental (NPPF, paragraphs 6 and 7). It is further recognised that these roles should not be undertaken in isolation, as they are mutually dependent (paragraph 8). A presumption in favour of sustainable development is at the heart of the NPPF and is seen as a golden thread through both plan making and decision taking (NPPF, paragraph 14) (although it is noted that this presumption does not apply in relation to development requiring appropriate assessment under the Birds or Habitats Directives (NPPF, paragraph 119)).
- 2.10.5 A series of twelve core planning principles are identified (NPPF, paragraph 17). These emphasise, amongst other things, that planning should: be genuinely plan led; proactively drive and support sustainable economic development to deliver the homes, business and industrial units, infrastructure and thriving local places that the country needs; and, actively manage patterns of growth to make the fullest use of public transport, walking and cycling, and focus development in locations which are or can be made sustainable.
- 2.10.6 In respect of its policies aimed at building a strong, competitive economy, the NPPF highlights the fact that the Government is committed to ensuring that the planning system does everything that it can to support sustainable economic growth. It adds that planning should operate to encourage and not act as an impediment to sustainable growth (NPPF, paragraph 19).
- 2.10.7 The NPPF also makes clear that transport policies have an important role to play in facilitating sustainable development and in contributing to wider sustainability and health objectives. It states that local authorities should develop strategies for the provision of viable infrastructure to support sustainable development, including transport investment to support the growth of airports or other major generators of travel demand in their areas (NPPF,

paragraph 31). Notwithstanding this emphasis, the Government acknowledges (NPPF, paragraph 29) that opportunities to maximise sustainable transport solutions will vary from urban to rural areas. The NPPF states (at paragraph 33) that when planning for ports, airports and airfields that are not subject to a separate national policy statement, plans should take account of their growth and role in serving business, leisure, training and emergency service needs. In the absence of a NPS for highways development it would seem reasonable to extend this approach to road proposals also.

2.10.8 Where new development has to be accommodated (in line with the NPPF's central objective to meet each area's objectively assessed needs) and that doing so will have transport implications, the NPPF expects that opportunities for sustainable travel should be taken up wherever practicable, so as to reduce the need for major transport infrastructure (paragraph 32). However, the NPPF goes on to advise that improvements to the transport network should be undertaken, where this can cost effectively limit the significant impacts of development, and that development should only be prevented on transport grounds if the residual impacts (after the provision of such infrastructure improvements) would be severe (paragraph 32). The message of the NPPF is therefore that transport infrastructure should be provided where necessary to support new development (having regard to the opportunities to minimise the need for such infrastructure through sustainable travel initiatives) and that it is only where development cannot be accommodated without severe impacts that it should be prevented on transport grounds.

The National Infrastructure Plan 2011 (November 2011), Infrastructure Delivery Update March 2012, National Infrastructure Plan update (December 2012), Infrastructure Delivery Update March 2013, and National Infrastructure Plan 2013 (December 2013) (HM Treasury and Infrastructure UK)

2.10.9 The National Infrastructure Plan 2011 (NIP) sets out a strategy for meeting the infrastructure needs of the UK economy. It recognises that infrastructure networks form the backbone of a modern economy and are a major determinant of growth and productivity. The Government considers that historically, UK infrastructure has suffered from under-investment and lack of coherent strategic forward planning. The Government makes it clear in the NIP that, "To remain globally competitive, the UK needs to address these failures and develop an infrastructure capable of supporting a dynamic, modern economy" (NIP, Executive Summary, page 5).

- 2.10.10 The NIP states that local transport systems “must enable suburban areas to grow” and that “the transport system must be efficient but also resilient and responsive to infrequent and unexpected pressures” (NIP, paragraph 3.2). It also highlights that the nation's airports and ports are gateways to international trade and that the Government will work to improve the road and rail connectivity to major ports and airports (NIP, paragraph 3.3). Congestion – particularly in and around the major cities – is identified as still being a significant issue in the UK, and one which is likely to significantly worsen as the economy recovers (following the recession) and the pressure on the road system increases as a result of growth (NIP, paragraph 3.8).
- 2.10.11 The NIP cites the Eddington Study (jointly commissioned by the Chancellor of the Exchequer and the Secretary of State for Transport and published in December 2006) which examined the long-term links between transport and the UK's economic productivity, growth and stability, within the context of the Government's broader commitment to sustainable development, and found that congestion had a significant detrimental economic effect upon all road users including businesses (NIP, paragraph 3.9).
- 2.10.12 As part of the Government's strategy for meeting the infrastructure needs of the UK economy, the NIP identifies 40 key areas of infrastructure investment. Referred to as 'Priority infrastructure investments' these priority areas include “Local authority major transport schemes – development pool projects” (see NIP Table 2.B page 23 and NIP Appendix C, Table C1: Transport). The NDR had been placed in the development pool as a result of the 2010 Comprehensive Spending Review whilst the Government assessed which of the schemes in the development pool it would prioritise for investment. Local Authority 'development pool' schemes considered by the Government to fall within this priority infrastructure investment area were initially announced in stages in late 2011. The Norwich Northern Distributor Road (NDR) was given funding approval as a Local Authority Major transport scheme in December 2011 (see item 14 on the DfT's list entitled: Local Authority Majors - Development Pool Schemes - Scheme Decisions - December 2011).
- 2.10.13 An update on the delivery of priority infrastructure was published alongside the Budget in March 2012 (Infrastructure Delivery Update 2012). In this update the Government reiterated its intention to take an active role in ensuring the efficient and on time delivery of infrastructure. An update to the NIP – the National Infrastructure Plan Update 2012 (the NIP Update 2012) –

was published in December 2012 alongside the Government's Autumn Statement 2012.

- 2.10.14 Building on its statement in the NIP that infrastructure is a major determinant of growth and productivity, in the NIP Update 2012 the Government reported on its progress in delivering priority infrastructure projects and in sustaining its commitments to infrastructure set out in the NIP. In the NIP Update 2012, the Government restates its commitment to: progress the development pool schemes (Appendix B); to "ensuring that infrastructure investment is not subject to any unnecessary delays" (page 8), and "to ensuring that the road network is fit for the UK's future transport needs" (page 15).
- 2.10.15 A further update on the delivery of priority infrastructure investments was published alongside the Budget in March 2013 (Infrastructure Delivery Update 2013). In this update the Government restated its belief that "Infrastructure is vital to the success of any modern economy; it drives growth, creates jobs and generates the networks that allow businesses and organisations to thrive. Investing in and improving this country's infrastructure in order to make the UK globally competitive is a key part of the Government's economic strategy" (paragraph 1.1). The delivery summary (at pages 7 to 16) includes reference to Local Authority Major Transport Schemes – development pool projects (which include the proposed NDR scheme).
- 2.10.16 The NIP 2013 confirms the Government's commitment to developing and maintaining a road network that will facilitate people's day-to-day activities, drive economic growth and meet the needs of road-users now and in the future. Strategic objectives for roads include addressing road quality, increasing capacity and tackling congestion, and ensuring the network provides critical connections and securing the network, by fixing the instability and institutional problems that have led to 20 years of underinvestment (paragraph 3.6).
- 2.10.17 In the 2013 NIP the NDR is specifically identified as a top 40 priority infrastructure investment (see Table 5.H Top 40 priority infrastructure investments; local infrastructure) as a regional priority, i.e. a project of either high strategic importance or capital value in a particular region (paragraph 5.17).

*Creating Growth, Cutting Carbon – Making Sustainable Local Transport Happen
(January 2011) (Department for Transport)*

- 2.10.18 In this local transport White Paper the Government sets out its vision for local transport as being, “a transport system that is an engine for economic growth, but one that is also greener and safer and improves quality of life in our communities” (White Paper, paragraph 1.3).
- 2.10.19 This vision is recognised as requiring immediate attention. The improvement of links that help to move people and goods around is recognised by the Government as an important factor in helping to build the balanced dynamic low carbon economy that is essential for the UK's future prosperity (White Paper, Executive Summary, paragraph 1). Also key to this vision is the need to reduce carbon emissions from transport (paragraph 1.4), a proposed strategy for which is set out at Figure 1.1 of the White Paper.
- 2.10.20 The White Paper makes it clear that alongside technological change to address carbon output, measures will need to be taken to tackle the problem of congestion (paragraph 1.8) and that the tackling of such issues encourages sustainable local travel and economic growth (paragraph 1.9). The White Paper goes on to emphasise that the Government believes that “it is at the local level that most can be done to enable people to make more sustainable transport choices and to enable the mainstream use of more genuinely sustainable transport modes – environmentally as well as fiscally, economically and socially sustainable” (paragraph 1.11).
- 2.10.21 The Government makes it clear that it recognises that “it is simply not possible for public transport, walking or cycling to represent a viable alternative to the private car for all journeys...”. As such, the Government is committed to making car travel greener (Executive Summary, paragraph 5). Eliminating the use of passenger cars altogether is seen as the wrong approach given that “for many people, particularly in rural areas and for medium-distance or multi-leg trips, the car is the only practical choice and will remain so” (paragraph 1.5).

Government's Response to the Heseltine Review (March 2013) (HM Treasury and Department for Business Innovation and Skills)

- 2.10.22 The Heseltine review, “No Stone Unturned” (commissioned by the Government and issued in October 2012), reviews all parts of Government policy affecting economic growth, and makes recommendations relating to wealth creation. In its response to the Heseltine review the Government

recognises that historically London and the south-east have been relied on as the primary source of UK economic growth, but that greater success can be achieved by having multiple thriving centres each with their own strengths throughout the country. It is made clear by Government that every locality must be able to fulfil its full potential by taking responsibility for decisions and resources that affect its local economy.

- 2.10.23 Transport provision is key to this approach, and the Government sets out its belief (in paragraph 2.21) that there is a very strong case for the funding of major local transport schemes (which, as is noted above, include the proposed NDR scheme) within the transport budget. This is because such spending is integral to economic development and momentum needs to be maintained in delivering the new infrastructure that is vital to the economy (Box 2.C: Local Authority Transport Majors).

Investing in Britain's Future (June 2013) (HM Treasury)

- 2.10.24 Investing in Britain's Future builds on the process, begun by the publication of the National Infrastructure Plan 2011, of providing clarity and visibility on the investment needed to deliver the infrastructure required to grow, rebalance and enhance the economy (paragraphs 1.1 to 1.5).
- 2.10.25 Chapter 2, which deals with roads, begins by describing the road network as fundamental to the UK economy. It sets out the Government's commitment to major investment in the road network, but also makes clear that improvements to the road network must be brought forward in a way that supports the nation's overall quality of life and environment. It states that "there is no longer a choice between a well-functioning road network and a well-protected environment" (paragraph 2.14). The Government's commitment to supporting technology which will enable transport to play its part in meeting carbon budgets and other environmental targets is stated as a key component of sustainable economic growth (paragraph 2.15). Annex A of the document details the Government's road programme, and includes as a local transport scheme in Table A.2 the Norwich Northern Distributor Road (NDR).

Action for Roads: A network for the 21st century (July 2013) (Department for Transport)

- 2.10.26 Within the foreword to this Command Paper, the Secretary of State for Transport makes clear that "We need to maximise every one of our economic

advantages, and deal with every factor that holds us back if we are to succeed in the global race”. Transport is identified as one of the most important factors in making the country prosper (Foreword) and the road network in particular is described as being “vital to our economy and to our way of life” (Box at start of Chapter 1) and “the life-blood of the economy, performing a crucial function in supporting jobs and growth” (paragraph 1.5).

2.10.27 1.37 The Command Paper outlines how parts of the road network have been left in an inadequate state, with historic underinvestment leaving the UK in an unfavourable position in comparison to its European competitors, despite its clear advantage in terms of its compactness and the comparatively short distances between its major cities (paragraphs 1.7 and 1.8). Indeed, more than 60% of overseas investors said that good road transport is critical or important to their investment decisions and nearly all small, medium and large firms in the UK said that road transport plays an important role in their business (paragraph 1.12).

2.10.28 The Command Paper sets out an expectation that, as a result of the return to economic growth in combination with other factors, traffic and congestion will grow (paragraph 1.21). Even assuming the worst economic circumstances and low population growth, traffic levels on strategic roads are predicted to be 24% higher in 2040 in comparison to today's levels (paragraph 1.22). It is predicted that without action, “growing demand will place unsustainable pressure on our roads, constraining the economy, limiting our personal mobility and forcing us to spend more time stuck in traffic” (paragraph 1.23). The paper goes on to highlight that without investment, congestion will, amongst other things, work against current efforts to help the economy grow (paragraph 1.25).

2.10.29 In respect of local roads (i.e. those that do not form part of the national strategic road network) the Command Paper highlights that the local highway network is the country's most valuable public asset (paragraph 1.40). It also makes it clear that local authorities know their own network better than any national body or outside observer and that they remain best placed to manage their assets (paragraph 1.44). There is also a recognition that until recently, little could be done to free up funding for an authority to tackle congestion or build better links to the outside world, if Whitehall had decided funding should be spent in a particular way (paragraph 1.46).

2.10.30 In the chapter of the Command Paper which specifically covers the support given to local roads (chapter 5) the paper discusses the links provided by local roads to the strategic road network. It is made clear that motorists

almost always start and end their journeys on local roads and that not only, therefore, do decisions about strategic roads have to take account of the impacts on local transport infrastructure, but well maintained and improved local roads are needed for a successful strategic road network (paragraph 5.32). The paper indicates that focusing on problems from both a national and a local perspective with central and local authorities working together will result in a better chance of the respective national and local networks functioning better. The Government's emphasis on the need to pursue decarbonisation strategies and to provide suitable environmental mitigation to counter the effects of road development is maintained in the Command Paper (paragraph 3.4).

Transport – an engine for growth (August 2013) (Department for Transport)

2.10.31 This publication repeats a number of the themes and points highlighted in the Command Paper referenced above. It explains that an efficient transport system depends on effective maintenance, management and capacity improvements, as well as expansion. It also confirms the Government's intention to provide a broad and balanced investment package: striking a balance between maintenance of the UK's existing transport assets and developing new schemes, and achieving balance in geographical terms by supporting a wide range of benefits in all parts of the country.

Planning Policy Statement: Eco-Towns A supplement to Planning Policy Statement 1

2.10.32 This PPS1 Supplement on eco-towns (which remains as extant policy guidance after the publication of the NPPF) sets out the principles and locational criteria for eco-towns (section ET 1 and ET 2). At Annex A the supplement identifies four locations with the potential to be eco-towns, which Government considers should be exemplar projects that encourage and enable residents to live within managed environmental limits and in communities that are resilient to climate change (paragraphs 5 and 6). Rackheath to the north-east of Norwich is identified in Annex 1 as one of the four eco town locations.

2.11 Local Policy and Guidance

2.11.1 This section considers the principle of, and the need for, the proposed NDR scheme in respect of policy and guidance at the local level. It begins by outlining key elements of the statutory development plan relevant to the proposed scheme before then providing an overview of other policy and

guidance. Further analysis of this material, together with an assessment of how the proposed NDR scheme relates to the objectives identified in the material, is set out in Chapter 3 of the ES: Need and Alternatives.

Adopted Joint Core Strategy for Broadland, Norwich and South Norfolk (Adopted March 2011) (Broadland District Council, Norwich City Council, South Norfolk District Council and Norfolk County Council – together the Greater Norwich Development Partnership (GNDP))

2.11.2 The alignment of the proposed NDR scheme is predominantly located within Broadland District. The strategic development plan for this area has been produced in partnership with the neighbouring authorities (Norwich City and South Norfolk District) supported by the County Council – it is known as the Joint Core Strategy (JCS).

2.11.3 The JCS sets out the long term vision and objectives for the area and provides strategic policies for steering and shaping development. It identifies Greater Norwich as having the region's largest economy and being one of the most important city regions in the east of England. The JCS sets out a far reaching spatial vision to be achieved by 2026. In order to monitor the success of achieving the defined spatial vision, a series of twelve spatial planning objectives are set out. In respect of transport, Objective 7 seeks, *"To enhance transport provision to meet the needs of existing and future populations while reducing travel need and impact."*

2.11.4 JCS Policy 6 deals with access and transportation matters. It states that,

"The transportation system will be enhanced to develop the role of Norwich as a regional Transport Node, particularly through the implementation of the Norwich Area Transportation Strategy, and will improve access to rural areas. This will be achieved by: implementation of the Norwich Area Transportation Strategy (NATS) including construction of the Northern Distributor Road (NDR)"

2.11.5 The supporting text to policy 6 explains that:

"The transport strategy will promote sustainable economic development, improve local quality of life, reduce the contribution to climate change, promote healthy travel choices and minimise the need to use the private car."

Social exclusion, deprivation and isolation will be reduced and accessibility to all jobs, services and facilities enhanced” (paragraph 5.44).

- 2.11.6 Implementation of NATS, including the proposed scheme, is identified as being fundamental to the delivery of this transport strategy. The JCS refers to the corridor protected for the proposed scheme being shown on the adopted Proposals Map of Broadland District Council (paragraph 5.45). The supporting text to the policy also highlights that the NDR scheme is a strategic improvement required to deliver growth and facilitate modal shift (paragraph 5.47).
- 2.11.7 Policy 9 of the JCS deals with the strategy for growth in the Norwich Policy Area (NPA) and explains that this area is the focus for major growth and development. The construction of the NDR (to provide strategic access, significantly improve quality of life and environmental conditions in the northern suburbs and nearby villages, and provide capacity for comprehensive improvements for buses, cycling and walking as well as facilitating economic development) is highlighted as a piece of transport infrastructure required to deliver growth and support the local economy. Supporting text at paragraph 6.8 further highlights that the NDR is the fundamental part of NATS and the growth strategy identified in the policy.
- 2.11.8 The Implementation Framework at Appendix 7 of the JCS lists infrastructure required to facilitate development promoted in the JCS. The Implementation Framework identifies the NDR as Priority 1 Infrastructure, which is defined as infrastructure which "is fundamental to the [JCS] strategy or must happen to enable physical growth". The Implementation Framework goes on to state that "Failure to deliver infrastructure that is fundamental to the strategy would have such an impact that it would require the strategy [in the JCS] to be reviewed. This particularly applies to the NDR and the associated package of public transport enhancement. The sustainable transport requirements of the strategy and much of the development to the north of the built up area is dependent on these key elements of NATS."
- 2.11.9 Following its adoption in March 2011, the JCS was subject to a legal challenge which resulted in certain parts of the JCS (including elements of Policy 9) being remitted and treated as not having been adopted. The Councils then undertook further work on the remitted parts of the plan to address the judgement, and submitted those parts of the plan for independent examination in February 2013. The examination took place between May and July 2013. Further modifications were produced as a result of the examination and these were consulted upon in September and October 2013. The

Inspector reported in November 2013 that the remitted JCS (with some further modifications) was sound. The GNDP has indicated that the remitted JCS is likely to be adopted in January 2014.

Norfolk's Local Transport Plan 3: Connecting Norfolk (April 2011) (Norfolk County Council)

2.11.10 The Local Transport Plan (LTP3) sets out the strategy and policy framework for transport within Norfolk up to 2026. The transport vision set out in LTP3 is for *"A transport system that allows residents and visitors a range of low carbon options to meet their transport needs and attracts and retains business investment in the county"* (Executive Summary and Chapter 2).

2.11.11 One of the six aims that support this vision is identified as being to 'Deliver sustainable growth' (paragraph 2.2). LTP3 recognises that there will be significant growth in Norfolk and sets out a strategy which provides a framework for this growth to be delivered. An element of this framework is *"Ensuring necessary infrastructure to support growth is secured, including a Norwich Northern Distributor Road to facilitate economic growth in the greater Norwich area"* (Executive Summary). The supporting text for Policy 6 'Transport Infrastructure to Support Growth' states that *"a Northern Distributor Road, running from the A47 in the east at Postwick to the A1067 in the north-west, is vital to help unlock development to the north-east of the city and improve connectivity between North Norfolk and the trunk road network"* (paragraph 4.11).

2.11.12 A further aim (Policy 7) is identified as improving 'Strategic connections'. The key strategic connections which are identified and where opportunities will be taken to enhance them through partnership working include *"A Norwich Northern Distributor Road to facilitate strategic access to north-east Norfolk and Norwich Airport"*.

Norwich Area Transportation Strategy (NATS) 2006 (as amended 2010) (Norfolk County Council)

2.11.13 This strategy replaces and builds upon earlier transportation strategies for the Norwich Area. It highlights that transport plays an important part in allowing the Norwich Area to fulfil its potential, but that it can also cause problems. The transportation strategy is seen as an important tool, setting out not only how any problems can be minimised, but also to ensure that transport can bring the maximum benefits to the area (paragraph 1.7). The

provision of a Northern Distributor Road is identified as an important element of the transportation strategy for the Norwich area to enable growth in and around the city (Executive Summary).

2.11.14 The Northern Distributor Road is the subject of policy 2 of NATS, which states that:

“A Norwich Northern Distributor Road will be developed for implementation, in conjunction with other measures including:

- Traffic mitigation measures on minor rural and suburban residential streets around the north of Norwich
- Provision of facilities for cycling and walking.”

Delivering Economic Growth in Norfolk ‘The Strategic Role for Norfolk County Council’ 2012 – 2017 (March 2012) (Norfolk County Council)

2.11.15 This document outlines how Norfolk County Council will support the economic growth of Norfolk. It sets out the following five priority themes, below which sit more detailed action plans:

- to provide support for growth and removing infrastructure constraints
- to help businesses to start up and grow
- to improve perceptions of Norfolk’s business offer and secure inward investment and growth in key sectors
- to address Norfolk’s skills and employability challenges
- to provide fair access to the public sector

2.11.16 In respect of the first theme, the aim that is set out is “To ensure Norfolk can meet its economic growth potential through properly funded strategic infrastructure (roads, rail, broadband, utilities etc)” (paragraph 5.2.1). In terms of priorities to meet this aim, the document highlights the NDR as being “vital to the continued economic success of the Greater Norwich area, also benefiting North Norfolk and Gt Yarmouth” (paragraph 5.2.1).

Norfolk Infrastructure Plan (October 2012) (Norfolk County Council)

- 2.11.17 A key aim of Norfolk County Council's Economic Growth Strategy (which is discussed in the preceding paragraphs) is to address the infrastructure constraints that are preventing further economic growth in Norfolk. An infrastructure plan has therefore been produced, which *"pulls together information on the key infrastructure needed to deliver economic growth in Norfolk"* (Chapter 1).
- 2.11.18 The NDR is identified as a key infrastructure project which "will bring much needed traffic relief for communities to the north and east of Norwich and the city centre, and deliver rapid and sustained economic benefits for Norwich and a large part of north Norfolk. For existing business, the benefits of easy and reliable access to the national trunk road network and the Airport are considerable. The road also unlocks the potential for new businesses and jobs." (page 18).
- 2.11.19 The plan highlights the NDR as "key to the Norwich Area Transportation Strategy, allowing the development of a modern, sustainable transport system for Norwich, including Bus Rapid Transit and facilities for cyclists and pedestrians. Government support for the road is conditional upon progress being made on these elements of the Strategy" (page 18). It is further recognised in the Plan that "while the NDR's primary purpose is to reduce traffic on unsuitable roads and allow progress on the Norwich Area Transportation Strategy, the new road will help the area to the north and east of Norwich cope with unavoidable growth pressures" (page 18).

Towards a Growth Plan Consultation Draft (July 2013) (New Anglia Local Enterprise Partnership (LEP))

- 2.11.20 Within the emerging version of the New Anglia LEP growth plan ('Towards a Growth Plan – Consultation Draft, July 2013) the LEP sets out its commitment to supporting the proposed NDR scheme, acknowledging that the NDR is *"essential to unlock the potential of sustainable new settlements to the north of Norwich."* (Chapter 6, Enabling Infrastructure for Business, para 6.16).

3. Needs and Alternatives

3.1 Introduction

3.1.1 This chapter of the Environmental Statement sets out the need which the Norwich Northern Distributor Road (NDR) proposals have been designed to meet. It also explains the consideration Norfolk County Council (NCC) has given to potential alternatives to meeting the need. Supporting Figures for this chapter are provided in Volume 2, Chapter 3 Needs and Alternatives.

3.2 Summary

3.2.1 The NDR is needed to improve connectivity and accessibility across both the northern part of the Norwich urban area and areas of the county in an arc from the north west to the east of this main urban area. Such improvement will ease the relative disadvantage of the peripheral location of these areas and provide the basis of the transport infrastructure required to both address existing and future problems and achieve the growth objectives which have been identified for Norwich and its surrounding area.

3.2.2 The requirement to improve connectivity and accessibility arises out of the analysis that led to the production of the Norwich Area Transportation Strategy (NATS) and the conclusions reached. This strategy sets out Norfolk County Council's (i.e., the highway authority's) approach to the delivery of sustainable transport in and around Norwich.

3.2.3 The overall strategy set out in NATS is that a package of transport improvements, interventions and measures, which includes the NDR scheme, needs to be implemented. Together these improvements, interventions and measures will (amongst other things) deliver a reliable, efficient and long-term sustainable transport network which will improve accessibility and connectivity and which will support the continued economic and physical growth of the Norwich area. In setting out the authority's approach to current and future needs, NATS seeks to improve the overall economic competitiveness of Norwich as a focus for inward investment, create conditions in which sustainable forms of transport can be promoted and improve the quality of life.

3.2.4 The possibility that the need could be met in some other way, for example by a different standard NDR, by an NDR following a different route, or without road construction has been addressed in principle and detail over a lengthy period. The necessary environmental, traffic and economic studies and analyses have been progressed as a central component of the development

of a sustainable transport strategy (NATS) in the context of the evolution of planning and economic policies for Norwich and the surrounding area

- 3.2.5 The studies confirm that the NDR is an essential component of the NATS package of measures to address existing and likely future issues of congestion, connectivity and economic and urban growth. Analysis of other approaches have confirmed that it is not possible to meet the need without the NDR and that the role of the NDR cannot be replicated by improving the existing road network or public transport. Examination of alternative standards and alignments has confirmed that the application proposals are the most appropriate response to the need, taking account of the results of the EIA.

3.3 Context for the Need

- 3.3.1 To assist in understanding the need that has been identified, the following paragraphs provide some historical and background context.

Local connectivity and access

- 3.3.2 Norwich is a key freestanding, medium sized historic city located within the East of England and the largely rural county of Norfolk. It exerts a strong economic, social and cultural influence over a wide area. These facts have had, and continue to have, considerable implications for the growth and development of the transport network that serves the urban area of the City and its surroundings. As a dominant regional City within a largely rural county, Norwich has historically been a focal point on which the road network converges. The most significant transport legacy of the past is, therefore, a road network which is structured around a series of routes which radiate out from the centre of the City like spokes on a wheel. These roads are shown on Figure 3.1 (titled 'Radial and Orbital Route Road Network') and are subsequently referred to as the 'radial routes' or the 'radial network'.
- 3.3.3 As can be seen from both Figures 3.1 and 3.2 (titled 'Norfolk Route Hierarchy') these routes provide links between the city and an extensive area that includes most of the county of Norfolk and substantial areas of north Suffolk. A number of these routes converge on the City Centre, which, as the Local Plan for the City makes clear, is especially rich in terms of historic assets and associations. The need for these assets and associations to be managed and, where possible, preserved within the context of a growing and developing City is also made clear in the Local Plan (paragraph 3.1). This has

been (and remains today) a fundamental issue in respect of the consideration of the City's transport problems and possible solutions to those problems.

- 3.3.4 It was during the early part of the 20th century, as a result of increasing car ownership and use, that the need to deal with the issue of traffic congestion within the historic centre, amongst other areas, was identified. By the mid 20th century Norwich's radial road framework was under growing pressure from motor vehicles seeking both access into and through the City Centre.
- 3.3.5 One aspect of the response to this issue was to link the radials by the construction or formalisation of Inner and Outer Ring Roads (shown on Figure 3.1). The Inner Ring Road was implemented in stages between the post war years (when the City of Norwich Plan 1945 provided a blue print for the future of the City) through to the 1960's. Today, the western side of the Inner Ring Road consists of a route of two traffic lanes in either direction. The eastern side is mainly single carriageway. The Outer Ring Road was formalised along its current alignment in the 1960's, and today consists of a mainly single carriageway route. A further description of the key routes in and around the city is provided in the Transport Assessment submitted as part of the NDR DCO application (document reference 5.5).
- 3.3.6 An alternative route for east – west through traffic, avoiding the City Centre, was provided in 1992 with the construction of the A47(T) Norwich Southern bypass (shown in black on Figure 3.1). This bypass was constructed as part of the national trunk road network to carry east – west traffic, but also acts as an orbital distributor road, distributing traffic between the southern radials beyond the limits of the principal urban area. No equivalent provision has been made to the north of the City.
- 3.3.7 Various measures have also been put in place to restrict the use of the private car within the City Centre. This has included the pedestrianisation of certain City Centre streets (including the first such street in the UK – London Street – in the 1960's) and the implementation of various car parking policies.
- 3.3.8 Alongside these measures, considerable progress has been made in providing the infrastructure required to support alternatives to the use of the private car within the City. Most notably this has involved the provision of six bus-based park and ride facilities comprising car parks on certain radial routes at the fringes of the City linking the City Centre with the central area via some of the radial routes where, in certain instances, bus priority measures are provided.

Strategic connectivity and access

3.3.9 For obvious reasons of geography, the county of Norfolk is on the periphery of the national road and rail networks. Despite being the fifth largest English county by land area there are no motorways in the county and only three trunk roads. A short stretch of the A12(T) runs to the south of Great Yarmouth towards Lowestoft, the A11(T) links Norwich with London and Cambridge and the east-west A47(T) crosses the county from Great Yarmouth to King's Lynn (including as part of its route the dual carriageway southern bypass to Norwich) and thence to the Midlands. Completion of the Fiveways to Thetford improvement, on the border with Suffolk, in 2014 will mark the completion of a dual carriageway A11(T) between Norwich and its connection with the east-west A14(T) and south with the M11 to London. The A47(T), however, remains of variable standard with sections of single and dual carriageway road.

3.3.10 In addition to providing access to other towns and cities and the wider strategic road network of the country, the trunk roads and other principal roads (such as the A140) link Norwich and the rest of Norfolk to various international gateways into and out of the UK including Stansted Airport, the Haven Ports (Felixstowe, Harwich and Ipswich) and the Port of Great Yarmouth (East Port). Norwich International Airport (NIA), which is not on the strategic road network, has scheduled services to international and domestic destinations. The airport plays a nationally significant role in the offshore energy industry, as a base for four of the leading offshore helicopter transport services - Bristow, Bond, NHV and Dancopter – and the location for offshore survival training. It is understood that in NIA's last full year these companies transported over 85,000 passengers to and from offshore installations. Scheduled flights to and from the airport are also important to this industry. It provides frequent passenger services to a range of locations including Aberdeen (5 flights a day) and Amsterdam (4 flights a day) from where passengers connect to international destinations.

3.3.11 The A47(T) forms part of the Trans European Network – Transport (TEN-T). This network was established by the European Commission as a key element in the overall strategy for competitiveness and employment within Europe. Figure 3.2 shows the route hierarchy for the whole of Norfolk, from the strategic trunk routes described above to the local access roads.

3.3.12 The rail network that serves Norwich and the surrounding county is similarly at the periphery of the national system. It plays a much smaller role in providing local transport opportunities than the road network. Norwich station is

located to the south east of the City Centre. The principal strategic route is to London Liverpool Street via Ipswich with a further route available to Kings Cross via Thetford and Cambridge. Local connections are provided by stations on this route including Wymondham, Attleborough and Thetford, and local lines to Sheringham in the north of the county and to Great Yarmouth and Lowestoft in the east. Longer distance services to the Midlands and northern England and Scotland are via Ely, on the London/Cambridge/King's Lynn line.

Urban Form

3.3.13 Norwich is one of the largest urban areas in the East of England, and a significant centre for employment, tourism and culture. The City exerts a powerful economic, social and cultural influence well beyond its administrative boundaries. The City, for example, is consistently within the top 15 national destinations for shopping; it is currently ranked 13th.

3.3.14 Over recent years Norwich has seen the demise or relocation of some of the traditional industries that previously occupied sites in the City Centre. Significant areas of the City Centre and its environs have been regenerated, including large areas of higher density residential development, leisure attractions and cultural and retail facilities.

3.3.15 Norwich is one of the most important employment centres in the East of England. The economy of the City and surrounding area is diverse and has seen fundamental change over recent years. Although still of great significance, in common with the national picture, employment in the manufacturing and agriculture sectors has declined relative to other sectors. There has been major development of the service sector, with particular strengths being the growing knowledge economy (particularly life sciences and health), financial services, retail, media, arts, and cultural and information technology based industries. The Norwich Research Park, located on the south western outskirts of the City, is identified as an international centre of excellence in life sciences and is a world class asset of the Greater Norwich area. The City and its surrounds also benefit from a strong and growing tertiary education sector led by the University of East Anglia and Norwich University of the Arts.

3.3.16 The urban area has expanded beyond the historic and administrative boundaries of the city (into Broadland district to the north and South Norfolk district to the south). To the south, the spread has been contained by natural

and man-made features, such as the River Yare and its valley (which is crossed in only a few locations), the A47(T) Norwich Southern Bypass and the Norwich – Cambridge rail line, which collectively create a distinct break point between the urban and the rural areas. These features have, amongst other things, restricted the number of access points into the City from the south.

3.3.17 The area beyond the northern edge of the urban area of the City is significantly more permeable in respect of routes in and out of the City. This edge is characterised by a mixture of urban fringe, open countryside and Norwich International Airport. To the north-west, the urban fringe extends some way along the slopes of the River Wensum valley, which does constrain development and forms a wedge of relatively undeveloped land extending into the heart of the urban area.

3.3.18 The rich concentration of historic assets in the area is dominated by the medieval city centre, which helps to make the City a major visitor destination in its own right and provides a high quality residential and commercial environment. River valleys and green areas extend into or adjoin the built up areas, creating a close relationship between the urban and rural environments. For many visitors, Norwich is also a gateway to the Broads, and much of Norfolk's attractive coast and countryside.

Future Objectives

3.3.19 The following aspect of the contextual picture explains certain future objectives and aspirations which have been identified for Norwich and its surrounding area. These have been identified at the local level by those authorities and organisations charged with undertaking functions relating to the management and future development of the area. They are explained firstly by reference to the strategic element of the development plan for the area and then by reference to other local strategies and plans. This section then explains that, although set at the local or sub-regional level, these objectives and aspirations for Norwich and its surrounding area are supported by and consistent with objectives set at the national level.

The Development Plan

3.3.20 Strategic land use planning for the Norwich area is undertaken jointly by the City Council and the District Councils of Broadland and South Norfolk, working with Norfolk County Council, through the Greater Norwich Development Partnership (GNDP). The adopted Joint Core Strategy (JCS),

prepared by the Councils sets out an overall spatial vision for the future of the area. This vision outlines how the area will develop, and highlights that Norwich is a main focus for growth in the East of England, for new homes and jobs, leisure, cultural and educational development. The spatial vision is wide ranging but, in summary, seeks to ensure that by 2026 the extended communities of Broadland, Norwich and South Norfolk will be strong, cohesive, creative and forward looking (Spatial Vision).

- 3.3.21 JCS policy 5 (titled 'The Economy') promotes the sustainable development of the local economy in both rural and urban locations. It makes clear that the local economy needs to grow to provide for a growing population and to develop its role as an engine of the wider economy (i.e. the wider regional and national economy). A target of at least 27,000 additional jobs within the period 2008 to 2026 is set. It is further made clear that sufficient employment land will be allocated in accessible locations, consistent with the detailed policies for specific places set out in JCS policies 9 to 19, to meet identified need and provide for choice. It is also made clear that, amongst other things, investment strategies will focus on overcoming constraints to the release and development of key sites.
- 3.3.22 The level of housing growth planned for is detailed in Policy 4 (titled 'Housing Delivery'). It indicates that allocations will be made to ensure at least 36,820 new homes are delivered within the period 2008 to 2026 (JCS Policy 4). This level of growth is planned for to both address identified housing need, and to support the growth potential of the local economy (JCS Paragraph 5.22).
- 3.3.23 Policy 4 highlights that a large proportion of the planned overall level of housing growth is to be focused within the 'Norwich Policy Area' (NPA). The NPA is defined in Appendix 4 of the JCS and consists of 50 parishes within and around Norwich. JCS Policy 4 indicates that within the NPA approximately 33,000 dwellings will be delivered within the period 2008 to 2026.
- 3.3.24 Policy 9 of the JCS (titled 'Strategy for Growth in the Norwich Policy Area') provides specific policy guidance for the NPA. The text supporting the policy identifies that the Norwich area has historically been recognised as a regional engine of growth (JCS Paragraph 6.4) and that development is focused within the established urban area and in sustainable locations elsewhere in the NPA (JCS Paragraph 6.5).
- 3.3.25 Following its adoption in March 2011, the JCS was subject to a legal challenge which resulted in certain parts of the JCS (including elements of

Policy 9) being remitted and treated as not having been adopted. The Councils then undertook further work on the remitted parts of the plan to address the judgement, and submitted those parts of the plan for independent examination in February 2013. The examination took place between May and July 2013. Further modifications, which did not impact on the locational policies, were produced as a result of the examination and these were consulted upon in September and October 2013. The Inspector reported in November 2013 that the remitted JCS (with some further modifications) was sound. The GNDP has indicated that the remitted JCS is likely to be adopted in January 2014.

- 3.3.26 JCS Policy 9, as published in the remitted JCS and now found to be sound, identifies a location for growth, known as the Old Catton, Sprowston, Rackheath and Thorpe St Andrew growth triangle, to the north east of the Norwich urban area. This is considered by the Councils to be a sustainable location for growth and will deliver a minimum of 7,000 dwellings by 2026 growing to around 10,000 dwellings eventually.
- 3.3.27 The text in the JCS to support this proposal makes clear that this growth triangle incorporates land at Rackheath that is promoted as an eco-community under the Government's eco-towns programme. It is further made clear that development of the rest of the area will be expected to reflect similar high standards (JCS paragraph 6.7).
- 3.3.28 Within those parts of JCS Policy 9 that were unaffected by the legal challenge, strategic locations for employment development within the NPA are identified, including at locations around the east and north of the city. These locations include a new business park of around 30ha associated with Norwich International Airport and focussed on uses benefiting from an Airport location and an extension to the Broadland Business Park of around 25ha. Within the remitted JCS Policy 9 is a further 25ha of new employment land at Rackheath, identified as part of the proposed growth triangle.
- 3.3.29 The JCS, amongst other things, indicates that to aid delivery and economic success specific support is given to improvements at Norwich International Airport that will expand business opportunities and provide for a wide range of international and domestic destinations (Paragraph 5.48).

Other local plans and strategies

- 3.3.30 Economic and population growth are matters which are also considered by the 'New Anglia' Local Enterprise Partnership (LEP), whose area includes

Norwich and its surrounds. The New Anglia LEP, which along with other LEPs was formed to create an economy which is driven by private sector growth and which is evenly balanced across the country and between sectors, has been asked by Government to develop a growth plan for its area. The LEP has produced a consultation document ('Towards a Growth Plan') setting out its vision and strategy and the way in which they currently propose the growth plan to be developed.

3.3.31 The LEP's vision includes making Greater Norwich one of the most competitive City Regions in Europe for domestic and foreign investment by 2025. The following four 'Priority Sectors' (described as having high growth potential) and five 'Other growth sectors' (described as having great potential to grow and develop) are identified.

Priority Sectors	Other growth sectors
Energy	Advanced manufacturing
Tourism	Digital and Cultural Creative Industries
Information and Communications Technology (ICT)	Food, Drink and Agriculture
Life Sciences and Biotechnology	Financial Services
	Ports and Logistics

3.3.32 Collectively, these nine sectors are identified as being at the heart of the wealth creation capacity of Norfolk and Suffolk (paragraph 2.4). The next stage of the strategy is expected to be published in draft and it is understood that these priority sectors are being revisited.

3.3.33 In addition to the emerging LEP growth plan, Norfolk County Council's own economic strategy – covering the period 2012 to 2017 – outlines how the County Council will support the economic growth of Norfolk. An aim of ensuring Norfolk meets its economic growth potential is identified under the priority theme relating to supporting growth (Paragraph 5.2.1).

3.3.34 The sub-regional Greater Norwich area economic strategy also has a vision that Greater Norwich will be recognised as one of England's major city

regions with a rapidly growing diverse and sustainable economy providing all of its residents with opportunities and a great quality of life (Paragraph 3.1). The foreword to this strategy makes plain that the challenges set for Greater Norwich in terms of the delivery of new homes and jobs is immense, but that meeting this challenge will showcase the dynamism, creativity and economic potential of the area.

National support for the future objectives

3.3.35 Soon after it came to power, the Government produced a plan for growth which it described as an urgent call for action. This 2011 Growth Plan highlights that the Government's economic policy objective is to achieve strong, sustainable and balanced growth that is more evenly spread across the country and between sectors (Executive Summary). The plan also set out four overarching ambitions to ensure progress is made towards achieving the stated economic objective.

3.3.36 One of the four ambitions of the Growth Plan is defined as making the UK 'one of the best places in Europe to start, finance and grow a business' (Ambition 2). One of the steps the Government indicated it would take to achieve this ambition was to reform the planning system radically and fundamentally (Paragraph 1.34) through, amongst other things, the production of a "shorter, more focused and inherently pro-growth National Planning Policy Framework (NPPF) to deliver more development in suitable and viable locations."

3.3.37 The National Planning Policy Framework (NPPF) that was subsequently published in March 2012 highlights the importance of building a strong and competitive economy. In this respect, the Government in NPPF makes clear it is committed to ensuring that the planning system does everything that it can to support sustainable economic growth, and as a result, significant weight should be given to supporting economic growth through the planning system (paragraph 19).

3.3.38 Within the core planning principles set out within the NPPF is the expectation that every effort should be made objectively to identify and then meet the housing, business and other development needs of an area, and respond positively to wider opportunities for growth (paragraph 17).

3.3.39 Furthermore in respect of economic growth, the Government supports the strong recommendation made in the Heseltine Review that more should be done to allow the potential of local economies to be unlocked. It makes clear

that it recognises that the economic wellbeing and performance of cities located outside of London and the South East (such as Norwich) is significant to the nation as a whole. Amongst other things, it agrees that “Every locality must be able to fulfil its potential”..., and seeks a rebalanced economy “where every part of the UK – not just London and the south-east – drives strong and lasting growth” (paragraph 1.11). The importance of City Deals and the role of empowered LEPs in reinvigorating local economies are also highlighted in this aspect of the Government’s response.

- 3.3.40 City Deals are a Government initiative aimed at giving powers to a city in exchange for it taking on the responsibility of creating economic growth. The City Deal for Greater Norwich was agreed by Government in December 2013. The City Deal approach is focussed on delivering significantly enhanced job growth for Greater Norwich. A key knowledge based cluster is already growing at Norwich International Airport with the emerging 40ha Aeropark and associated Norwich International Aviation Academy. The City Deal is expected to create more than 19,000 jobs, including 3,000 high value jobs at Norwich Research Park, 2,000 jobs around Norwich International Airport, 1,000 jobs based around Norwich University of the Arts and 6,000 construction jobs.
- 3.3.41 A further ambition of the Government’s 2011 Growth Plan is to ‘encourage investment and exports as a route to a more balanced economy’ (Ambition 3). Support for the creation of LEPs and the introduction of Enterprise Zones are highlighted as steps taken to achieving this ambition. The Government also explains that to help achieve this ambition they would seek to increase investment in infrastructure by, amongst other things, publishing the UK’s long-term forward view of infrastructure projects and programmes as part of a National Infrastructure Plan (paragraph 1.54).
- 3.3.42 The National Infrastructure Plan 2011 made clear that infrastructure networks form the backbone of a modern economy and are a major determinant of growth and productivity (Executive Summary). The updates to the National Infrastructure Plan produced in 2012 and 2013 continue to support this approach. The National Infrastructure Plan (NIP) 2013 explicitly identifies the NDR as a top 40 priority infrastructure investment project.
- 3.3.43 In respect of transport infrastructure in particular, the Government through recent publications has highlighted its importance to economic growth. The 2011 White Paper ‘Creating Growth, Cutting Carbon’ sets out the Government’s vision for a transport system that is an engine for economic

growth, but one that is also greener and safer and improves the quality of life in communities.

- 3.3.44 The July 2013 Command Paper 'Action for Roads: A network for the 21st Century' produced by the Department for Transport identifies that the road network is vital to the economy and our way of life, and performs a crucial function in supporting jobs and growth.
- 3.3.45 Enterprise Zones (EZ) have been set up as a result of Ambition 3 within the 2011 Growth Plan. This includes an EZ, covering some 121 hectares, in and around Great Yarmouth and Lowestoft. This has been defined to capitalise on the area's leading position in the energy sector, the national importance of which is reflected in its designation by the Government as a Centre for Offshore Renewable Engineering (CORE) – a partnership between Central and Local Government and the LEP to ensure businesses looking to invest in manufacturing for the offshore renewable industry receive the most comprehensive support possible
- 3.3.46 In December 2013 the Department for Transport published the draft National Policy Statement for National Networks (NPS) for consultation. The draft NPS sets out the Government's vision and strategic objectives for the national road and rail networks. The objectives of the NDR Scheme are in accordance with the Government's strategic objectives for the delivery of national networks. Those strategic objectives are set out in the draft NPS, and include delivering networks with the capacity and connectivity to support national and local economic growth; facilitate growth and create jobs and support and improve journey quality, reliability and safety.

Summary

3.3.47 Norwich is a dominant regional city located within a largely rural county. In terms of access it is located at the periphery of the national transport network. Its road network is structured around a series of radial routes which provide links between the city and an extensive area beyond. Various measures have been taken historically in response to the issues associated with an increasing amount of traffic within the City. These measures have included the provision of an Inner and Outer Ring road within the urban area, the provision of a strategic A47(T) Norwich Southern Bypass cross radial connection to the south of the City, the implementation of works and strategies to restrict the use of the private car within the City and the implementation of works and strategies to support alternatives to the use of the private car.

3.3.48 The preceding contextual analysis also highlights that a number of objectives and aspirations which centre on substantial population growth and economic development have been identified and determined for the City of Norwich and its surrounding area. These determined objectives and aspirations recognise and reflect:

the overarching national growth agenda;

- the need, identified at national level, for every part of the UK (and not just London and the south-east) to fulfil its potential and thereby drive strong and lasting growth and create a balanced economy;
- the fact that Norwich is one of the largest and most important urban centres in the East of England and has the potential to contribute significantly to the country's growth and economic development needs, and
- the fact that Norwich and surrounding area is a suitable location to provide for development that will contribute to growth and economic development needs.

3.4 The Identified Problems

3.4.1 One of the key issues affecting the City and its surroundings today and which will also affect the ability to achieve the determined objectives and aspirations for Norwich and its surrounding area relates to the transport network.

3.4.2 The problems are fundamentally caused by the limitations of the road network in and around the urban area of Norwich and its resulting incapacity to deal with the demands placed on it. This issue will get worse as Norwich grows, which is what the growth objectives and aspirations outlined for the area seek to achieve.

3.4.3 As has been explained earlier, the road network within and around the urban area of Norwich is dominated by radial routes that provide access from all directions to the City Centre. The principal radial routes within the urban area have, however, restricted capacity with the vast majority being two way single carriageway routes with numerous junctions, frontage development and associated access requirements, on road parking and at-grade pedestrian crossing points.

3.4.4 The more recent Inner and Outer Ring Roads are similarly urban in character and limited in terms of capacity. These characteristics, combined with the amount of traffic that needs to be accommodated, results in routes which suffers from congestion and are inefficient. These routes are also located

within an already built up urban environment which restricts the ability to deliver improvements.

- 3.4.5 Furthermore, whilst to the south of Norwich, movements around the City can take place on the A47(T) Southern Bypass outside of the urban area, no such strategic provision outside the built up area is available to the north of the City. The main cross radial connection remains the Outer Ring Road.
- 3.4.6 The transport and related problems which are caused by the limitations of the road network in and around the urban area of Norwich, and its incapacity to deal with the demands placed on it, are explained in the following sub-sections.

Traffic Levels and Congestion

- 3.4.7 The traffic model information (which is detailed in the NDR Transport Assessment (TA) and Traffic Forecasting Report (TFR)) demonstrates that a significant number of vehicle movements cross the City on a daily basis (Appendix I of the TFR).
- 3.4.8 As illustrated in Figures I.1 and I.2 in Appendix I of the TFR, the northern section of the Outer Ring road (between its junction with the A1067 Fakenham Road/ Drayton High Road in the west to the junction where it becomes the A1242 in the east) currently accommodates flows of between 13,500 and 30,000 Annual Average Daily Traffic (AADT) . Only two sections of this northern part of the Outer Ring Road do not accommodate AADT flows over 20,000. The other sections of this northern part of the Outer Ring Road all currently accommodate flows ranging between 21,500 and 30,000 AADT. The flows that are predicted in the future are between 14,200 and 32,500 AADT in 2032.
- 3.4.9 The radial routes to the north of the City Centre also accommodate significant traffic flows. Current two way AADT flows within the urban area to the north of their respective junctions with the Outer Ring Road range from 18,300 for the A1067 Fakenham Road / Drayton High Road (location A32 on Figure I.1) and 18,100 for the A1151 Wroxham Road (location A43 on Figure I.2), through 17,600 for the A140 Cromer Road (location A35 on Figure I.1) to 13,100 for the C874 Plumstead Road (location A47 on Figure I.2), 12,600 for the C283 Salhouse Road (location A45 on Figure I.2) and 12,400 for the C251 St Faiths Road (location A37 on Figure I.2). These AADT flows are forecast to increase in the future, for instance, on the A1151 Wroxham Road and the C283 Salhouse Road by 26% and 29% respectively by 2032.

3.4.10 The traffic model also shows a considerable number of vehicles currently using the City Centre, the Inner Ring Road and the Outer Ring Road for through trips (see Table 3.1 which is a reproduction of certain information provided in section 7.4 of the TFR).

Table 3.1: City Centre Through Traffic – AADT

	2012	2017	2032
Inner Ring Road Inner Cordon (just inside the Inner Ring Road)	9,477	8,159	9,236
Inner Ring Road Outer Cordon (just outside the Inner Ring Road)	77,825	82,152	88,368
Outer Ring Road Outer Cordon (just outside the Outer Ring Road)	68,117	73,691	79,151

3.4.11 The top row of Table 3.1 (Inner Ring Road Inner Cordon) shows the amount of traffic (in AADT flows) that passes through the City Centre area within the Inner Ring road.

3.4.12 The second row in Table 3.1 (Inner Ring Road Outer Cordon) shows the amount of traffic (in AADT flows) that passes through the City Centre via the network in the centre area or using the Inner Ring Road.

3.4.13 The third row in Table 3.1 (Outer Ring Road Outer Cordon) shows all trips (in AADT flows) that cross the City from areas outside of the Outer Ring Road to another location outside of the Outer Ring Road.

3.4.14 In addition to showing the 2012 base position, Table 3.1 also shows the traffic forecast in 2017 and 2032. The decrease shown in future in respect of trips passing through the City Centre (the first row) is a result of the implementation of works programmed to take place in the City Centre which will restrict traffic – although by 2032 it can be observed that flows are nearly back to current

levels even with such works. For the other trips considered, the figures demonstrate that the number of such trips is forecast to increase by both 2017 and again by 2032.

Use of inappropriate routes

3.4.15 As already made clear, whilst to the south of the City cross radial movements can take place on the A47(T) Norwich Southern Bypass outside of the urban area, no such strategic provision is available to the north of the City. The principal means of moving between the radials to the north of the City is thus provided by the Inner and Outer Ring Roads.

3.4.16 Due to the issues highlighted in the preceding section with the use of the radials and the Ring Roads, traffic seeking to move east / west between one radial route and another also makes inappropriate use of certain residential roads within the urban area, a practice known colloquially as “rat running”. These roads are not designed to accommodate high volumes of strategic through traffic. They are narrow in places, have numerous minor junctions and are fronted by a considerable number of residential properties with many having direct vehicular access. Schools are also located on a number of these roads with 20mph zones and traffic calming to reduce vehicle speeds. Additionally, increased traffic flows adversely affect residential amenity, walking and cycling on and adjacent to these roads. Such inappropriate ‘rats runs’ (which are correspondingly numbered on Figure 3.3) include:

Route 1: Middletons Lane (which provides a connection between the A1067 and the A140) (location A83 and A10, Appendix I, Figure I.1 TFR);

Route 2: Fifers Lane / St Faiths Road / Church Street (which collectively provide a connection between the A140 and the C246 Spixworth Road) (location A11, Appendix I, Figure I.2 TFR);

Route 3: White Woman Lane (which provides a connection between the C246 Spixworth Road and the B1150 North Walsham Road) (location A13, Appendix I, Figure I.2 TFR);

Route 4: Barkers Lane / Church Lane (which collectively provides a connection between the B1150 North Walsham Road and the A1151 Wroxham Road) (location A14, Appendix I, Figure I.2 TFR);

Route 5: Blue Boar Lane (which provides a connection between the A1151 Wroxham Road and C283 Salhouse Road) (location A75, Appendix I, Figure I.2 TFR); and

Route 6: Woodside Road (which provides a connection between the C283 Salhouse Road and the C874 Plumstead Road) (location A20, Appendix I, Figure I.2 TFR).

- 3.4.17 Fifers Lane and White Woman Lane are designated as Local Access Routes within Norfolk County Council's Route Hierarchy. The other routes are not classified. As shown in Table 3.2 below, schools are located along three of the routes and they are subject to 20pmh zones and traffic calming and they all have accesses to properties to varying degrees. These routes are not designed to carry high volumes of strategic through traffic.
- 3.4.18 The traffic model provides details of some of the traffic flows that use these routes (see Table 3.2 which is based on data extracted from Appendix I of the TFR). In certain instances, they are considerable. For example the residential Fifers Lane (location A11 on Figure I.2) and Woodside Road (location A20 on Figure I.2) have two way AADT flows of 10,600 and 11,800 respectively in the 2012 base year. These flows are not very much lower than flows along parts of the Outer Ring Road which provides a needed traffic distribution function. For example, the St Williams Way section of the Outer Ring Road (location A48 on Figure I.2) which has a base year flow of 13,500 AADT.
- 3.4.19 Table 3.2 below shows that the flows will increase in 2017 and 2032 on a number of these routes in the Do Minimum (DM) scenario i.e. in the absence of the NDR. As part of the implementation of the NEGТ required by the JCS a number of developer link roads are required. These are designed to act as urban high streets that would meet the needs of pedestrians and cyclists as well as providing vehicular access to the new development as local distributor roads. At 2017, flows on White Woman Lane and Barkers Lane / Church Lane decrease as a result of the implementation of the developer link roads. A proportion of this traffic will, however, use the new link between Wroxham Road and Buxton Road (locations A94, A95 and A96 on Figure I.2 of the TFR), which itself is not designed to cater for the level of traffic movements predicted. By way of illustration, the proposed developer link road approaching the Wroxham Road junction has flows of 13,500 AADT at 2032.

Table 3.2: AADT Traffic Flows along inappropriate urban routes

Route	2012 AADT Traffic Flows	2017 AADT Traffic Flows (DM Scenario)	2032 AADT Traffic Flows (DM Scenario)	Route Hierarchy Type	Features	Area Type
1. <i>Middletons Lane (locations A10 and A83)</i>	8,900 – 9,600	10,200 - 10,400	11,400 - 11,300	<i>Not categorised</i>	<i>Two schools with 20mph zones and traffic calming, shared cycleway / footway, pedestrian refuge islands</i>	<i>Suburban with individual accesses to properties along the whole length</i>
2. <i>Fifers Land / St Faith's Road / Church Street (location A11)</i>	10,600	11,700	12,600	<i>Local access</i>	<i>School on Church St with 20mph zones and traffic calming</i>	<i>Suburban with individual accesses to properties along 25% of route</i>
3. <i>White Woman Lane (location A13)</i>	3,900	3,000	3,500	<i>Local access</i>	<i>School with 20mph zones and traffic calming, shared cycleway / footway</i>	<i>Suburban with individual accesses to properties along 25% of route</i>

Route	2012 AADT Traffic Flows	2017 AADT Traffic Flows (DM Scenario)	2032 AADT Traffic Flows (DM Scenario)	Route Hierarchy Type	Features	Area Type
4. Barkers Lane / Church Lane (location A14)	6,400	3,100	3,400	Not categorised	Pedestrian refuge islands	Suburban with individual accesses to properties along 50% of route
5. Blue Boar Lane (location A75)	13,000	13,400	12,200	Not categorised	Shared cycleway/footway along part of route, signal controlled pedestrian crossing, no footway on route through woodland area	Suburban/rural with individual accesses to properties along 15% of route
6. Woodside Road (location A20)	11,800	13,000	11,600	Not categorised	Pedestrian refuges, some on street parking and parking in dedicated laybys	Suburban with individual accesses to properties along 30% of route

3.4.20 The movement between radial routes is not just something which occurs within the urban area. Certain rural routes beyond the urban area are utilised by traffic seeking to get around the north of Norwich, or obtain a different radial route for getting into Norwich. Such rural routes are inappropriate for carrying significant volumes of traffic making such movements. To the north of Norwich such routes (which are correspondingly numbered on Figure 3.3) include:

- Route 7: the B1145 between the A1067 at Bawdeswell to the A140 at Aylsham via Reepham and Cawston (location 10, Appendix I, Figure I.4 TFR);
- Route 8: the route between the A140 and Hoveton via Coltishall which utilises the B1354 (location 7, Appendix I, Figure I.4 TFR); and
- Route 9: the Spixworth Road / Church Lane / Buxton Road / Crostwick Lane route between the A140 and the B1150 North Walsham Road (location 12, Appendix I, Figure I.4 TFR).

3.4.21 To the east of Norwich such routes (which are correspondingly numbered on Figure 3.3) include:

- Route 10: Church Road / Broad Lane / Green Lane West through Great Plumstead (location 11, Appendix I, Figure I.4 TFR);
- Route 11: Woodbastwick Road / B1140 Low Road and Bell Lane through Salhouse (location 6, Appendix I, Figure I.4 TFR), and
- Route 12: Green Lane/Green Lane North between the A1042 Yarmouth Road (via Peachman Way and Broadland Way) and the C874 Plumstead Road (location A23, Appendix I, Figure I.2 TFR).

3.4.22 Although the B1145, B1354 and the B1140 are designated as Main Distributor Roads within Norfolk County Council's Route Hierarchy they are narrow in places and pass through rural villages. Woodbastwick Road/Primrose Corner is a Local Access Route from the A47 to the village of Blofield Heath but is no more than a narrow country lane between Blofield Heath and the B1140. Church Road is also a Local Access Route from the A47 to the village of Great Plumstead but is also a narrow country lane.

3.4.23 Crostwick Lane passes through the village of Spixworth. There are numerous minor junctions and a considerable number of residential properties fronting the road with many having direct vehicular access. The road has a 30mph speed limit and traffic calming to reduce vehicle speeds.

3.4.24 The other rural routes are primarily narrow country lanes providing local access to villages and do not form part of Norfolk County Council’s Route Hierarchy. Unacceptable levels of traffic on these routes result in increasing environmental impacts and an increasing future maintenance liability on Norfolk County Council’s rural road network.

3.4.25 In addition high volumes of traffic using these routes and crossing the radial roads give rise to a high number of accidents due to this conflict.

3.4.26 All these rural routes are not designed to carry high volumes of strategic through traffic which should be more appropriately located on Principal Routes within Norfolk County Council’s Route Hierarchy.

3.4.27 Without the NDR, developer link roads would carry significant amounts of strategic through traffic movements. With the flows predicted, these roads would not be able to perform their desired role in enabling walkable neighbourhoods, as envisaged by the emerging North East Growth Triangle Area Action Plan, which seeks to reduce the amount of local short trips being made by car.

Table 3.3: AADT traffic flows along inappropriate rural routes

Route	2012 AADT Traffic Flows	2017 AADT Traffic Flows (DM Scenario)	2032 AADT Traffic Flows (DM Scenario)	Route Hierarchy Type	Width on Traffic Count Section	Area Type
7. B1145 and A1067 to the A140 via Reepham and Cawston (location 10)	3,700	4,100	5,500	Main distributor	5 to 6m	Rural
8. B1354 between A140 and Hoveton via Coltishall / (location 7)	4,300	4,800	6,800	Main distributor	5 to 5.5m	Rural
9. Spixworth Road / Church Lane/	5,700	6,800	9,400	Not	6 to	Rural

Route	2012 AADT Traffic Flows	2017 AADT Traffic Flows (DM Scenario)	2032 AADT Traffic Flows (DM Scenario)	Route Hierarchy Type	Width on Traffic Count Section	Area Type
Buxton Road / Crostwick Lane between the A140 and B1150 North Walsham Road (location 12)				categorised	6.5m	
10. Church Road / Broad Lane / Green Lane West through Great Plumstead (location 11)	3,500	6,200	9,800	Local access / Not categorised	4.5 to 5m	Rural
11. Woodbastwick Road / B1140 Low Road and Bell Lane through Salhouse (location 6)	2,500	4,300	5,800	Local access / Not categorised	5m	Rural
12. Green Lane/Green Lane North between the A1042 Yarmouth Road and the C874 Plumstead Road (location A23)	7,700	0 ¹	0 ¹	Not categorised	4.5 to 5m	Rural

Note: Green Lane/Green Lane North would be closed once the Brook Farm/Laurel Farm developer link road is operational

3.4.28 Orbital traffic movements on these routes are significant for the standard of road being used (see Table 3.3 which is based on data extracted from

Appendix I of the TFR). The transport model analysis has shown that the current two way AADT flows on the three routes north of Norwich added together amount to 13,700, and the flows on the routes to the east added together also amount to 13,700. The traffic model information forecasts that this would increase to 15,700 and 10,500 respectively in 2017 and 21,700 and 15,600 respectively in 2032. This assumes no traffic on Green Lane / Green Lane North at 2017 on the assumption that it would be accommodated on the Brook Farm/Laurel Farm link road assumed to be operational in 2017 at which point Green Lane/ Green Lane North would be closed to traffic. To put this in context, the level of traffic that passes through the City Centre area within the Inner Ring Road is of the order of 10,000 AADT (see Table 3.1 above) and the total traffic using the northern section of the Outer Ring road ranges between 13,500 and 30,000 AADT. This shows that the rural routes are carrying substantial volumes of strategic bypass traffic.

3.4.29 It should be noted that a number of the model links that carry strategic traffic flows are outside the fully modelled area, so base flows may not be fully represented but changes in traffic would be.

Poor strategic accessibility and journey times

3.4.30 The preceding issues highlight the poor accessibility and connectivity which the northern part of the urban area and rural areas beyond the urban area have to the national strategic road network. This is a significant issue.

3.4.31 Reference has earlier been made to the importance of Norwich International Airport which is located to the north-west of Norwich City Centre. The issue of poor strategic accessibility is clearly illustrated by the existing access to the Airport from the A140 Aylsham Road / Cromer Road / Holt Road; it does not have a direct connection to the strategic road network. Although it is served by a regular bus service linking the Park and Ride facility at the Airport with the city centre, as well as coach services operated by First Eastern, traffic accessing the Airport from the south, west and east is obliged to navigate the road network within the urban area of Norwich, or to use inappropriate rural routes to the north.

3.4.32 It is not simply an 'Airport' issue as NCC's MarketMeasures database, for example, suggests that in the order of 12,000 jobs are located within postcode area NR6 6, which contains the Airport and industrial estates to the south.

3.4.33 The traffic model has been used to investigate the time taken for certain journeys in and around Norwich, including journeys between the Airport and

certain locations (section 7.5 and Figure 7.8 of the TFR). These routes are detailed below (and given the number they are referred to in the TFR).

- Between the Airport and the A47(T) to the west of Norwich (TFR Route 1);
- Between the Airport and the A47(T) / A11 (T) roundabout junction at Thickthorn to the south of Norwich (TFR Route 2);
- Between the Airport and the A47(T) Brundall junction to the east of Norwich (TRF Route 3);
- Between the Airport and Attlebridge on the A1067 to the west of Norwich (TFR Route 4), and
- Between the Airport and Rackheath to the north east of Norwich (TRF Route 9).

3.4.34 Figures 7.9 and 7.10 of the TFR demonstrates that the average journey times for these example routes to and from the Airport in the AM and PM peak are predicted to increase in the future. The one exception being the route between the Airport and Attlebridge on the A1067 (Route 4) where the PM peak average journey time in 2032 is predicted to be slightly lower than the base average journey time.

3.4.35 The journey time information (see section 7.5 of the TFR) also identifies the delay (i.e. the time spent stationary at junctions) which occurs on the journeys on these routes. In respect of the example routes to and from the Airport, the delay, in certain instances, makes up a significant proportion of the overall journey time. For example, Table K.3 in Appendix K of the TFR indicates that in the morning peak the delay on the journey from the A47 east of Norwich to the Airport (Route 3) is in the order of six minutes within an overall journey of just under 26 minutes (or approximately 23% of the overall journey time).

3.4.36 Not only are the journey times forecast to increase in the future, the traffic model demonstrates that the length of delay will also increase in the future. Using the same journey between the A47 east of Norwich and the Airport in the AM peak as an example, the journey time is forecast (Table K.4 in Appendix K of the TFR) to increase in 2017 to 27 minutes and 20 seconds with delay accounting for 7 minutes and 27 seconds (or approximately 27% of the overall journey time). In the 2032 AM peak the same journey is forecast (Table K.6 in Appendix K of the TFR) to take 31 minutes and 11 seconds with delay accounting for 11 minutes and 24 seconds (or approximately 36% of the overall journey time).

3.4.37 The journey time and delay information provided in the TFR and referred to in the preceding paragraphs relate to modelled average journey times and delay. Journeys times on the network in and around Norwich are, however, not always predictable or reliable. A problem on one of the radial routes or one of the ring roads has the potential to significantly affect the time taken to undertake a journey and the delay experienced. The amount of traffic needing to be accommodated and the characteristics of the network combine to make delays and journey time unpredictability a high probability. The variability of journey times is a matter further discussed in the context of public transport in subsequent sections.

3.4.38 It is not, however, just strategic access to and from the Airport which is poor. Areas of north and north-east Norfolk do not benefit from direct access to the strategic road network. Instead, connections between these areas and the strategic road network are currently provided via various routes. For example, access from Cromer on the north Norfolk coast to the strategic road network is currently, amongst other potential routes, via the A140 to the urban area of Norwich and then via this route in its role as part of the Outer Ring road of the City to the A47(T) or the A11(T).

Existing business and services, and future growth

3.4.39 The structural inadequacies of the transport network within and around the City, including limited connectivity, generate practical constraints for businesses. Transport has implications for existing businesses as it affects access to workplaces by staff, the importing and exporting of goods and the ability of customers to access the business.

3.4.40 NCC regularly consults and engages with local residents, businesses and other organisations as a means of informing people about its activities, and also as a means of ensuring that the decisions it takes and the services it provides are responsive to local needs and views. A number of these consultation and engagement exercises have made specific reference to travel and transportation matters.

3.4.41 Studies and associated consultations undertaken since 2002 in connection with the review of the Norwich Area Transportation Strategy (NATS) have highlighted that in some instances businesses are either not expanding as a consequence of transport problems or are considering leaving Norwich altogether. In addition, feedback from various consultations undertaken has indicated that the transport network and the problems associated with it are

acting as a disincentive for companies and organisations who might be considering setting up enterprises in Norfolk.

3.4.42 Section 7.8 of the TA summarises the problems with the existing road network and comments on how the network will perform in the future in the absence of the NDR. It notes that such a network would be inadequate to accommodate traffic generation produced by the high levels of employment and residential growth planned for greater Norwich and would lead to a substantial deterioration in operational performance, transport journey times and reliability, thus reducing the economic competitiveness of the City. This would occur with a further deterioration in traffic conditions on inappropriate routes, reductions in operational performance for bus services and worsening conditions for walking and cycling.

3.4.43 The forecast traffic data and information for 2017 and 2032 takes account of, as is further explained in section 5 of the TFR, the development that is envisaged in the JCS. The traffic forecasts which are made are therefore a further demonstration of the negative implications of the existing transport network for the achievement of future growth aspirations.

3.4.44 It is, however, not just growth and development in and around the City of Norwich which is potentially impacted upon by problems with the transport network in and around Norwich. Reference has earlier been made to the establishment of an energy sector based Enterprise Zone in and around Great Yarmouth and Lowestoft. In introducing this zone on its Enterprise Zone website, the Government refers to Norwich International Airport and the ability of the Airport to provide UK and international air connections and helicopter transfers for the oil and gas sector. As previously indicated, there are issues with the accessibility and connectivity of the Airport, in particular with the strategic road network.

Public transport, pedestrian and cycle movements

3.4.45 As part of the evidence and analysis produced to support the JCS (Baseline Conditions Report - BCR) consideration was given to the problems and issues facing pedestrians and cyclists.

3.4.46 The Norwich Policy Area (NPA) was identified as being suitable for cycling trips because it is relatively compact and flat. It was highlighted that the cycle network in and around the NPA consists of a mix of on-street and off-road facilities (BCR section 6.1). There was, however, a recognition that in places

cycle facilities are not joined up and there are many areas with no cycling provision at all, often through difficult junctions.

- 3.4.47 Key issues and problems identified in respect of cycling include a lack of continuity of the cycle network, a lack of cycle paths and a lack of cycle parking facilities. Whilst priority crossing facilities for cyclists are being installed, the priority that is given to cyclists can be affected by the weight of traffic with less priority being provided where traffic flows are heaviest (BCR Section 6.5). The 'stop-start' nature of the existing provision was considered to be an issue because it forces cyclists back into the main flow of traffic suddenly and unexpectedly.
- 3.4.48 It was noted that facilities giving pedestrians priority have been introduced at most traffic signals within the City Centre and dedicated pedestrian crossing facilities have been introduced at specific locations. However, as is the case for cyclists, the time taken to provide a 'green' signal to cross a road can be dependent on the flow of traffic. During times of heavy traffic flow, the length of time between green crossing phases is likely to be extended. Increases in traffic flows would likely see priority for pedestrians at crossings reduce (BCR Section 6.2).
- 3.4.49 The limitations of the existing road network affect the highway authority's ability to work with bus operators to deliver public transport facilities within the City. Whilst initiatives have been put in place in recent years to improve public transport provision and service within the City, the scope for further improvements is limited because of the increasingly congested road network. This is evidenced by work carried out in 2010 to develop public transport improvements as part of a whole corridor strategy for Bus Rapid Transit (BRT) on Dereham Road. Preliminary design development and traffic modelling work undertaken at the time identified that where widening was not possible due to the urban constraints of the corridor, the reallocation to buses of some existing road space, in particular at the Dereham Road junction with the Inner Ring Road, resulted in anticipated increased delays and queue lengths for non bus users. Limited improvement was possible but at the time the delay was not considered acceptable and the scheme was modified with the benefit for public transport reduced.
- 3.4.50 The BCR also considered public transport conditions, including bus journey time data for different links in the northern suburbs of Norwich (BCR sections 5.1.1.5 to 5.1.1.12). The specific links considered were chosen as they had been shown to suffer from worse bus service punctuality than other areas of the City.

- 3.4.51 The evidence demonstrated that the roads experiencing high bus journey time variability include radial routes to / from the north (Figure 5.24). Routes with inbound high bus journey time variability during the weekday AM peak period included the A1067 Fakenham Road / Drayton High Road, the A140 Cromer Road / A1402 Aylsham Road and the A1151 Wroxham Road. The BCR noted that a high level of journey time variability is an indicator of transient congestion and the type of unpredictable delays that are very difficult for bus operators to schedule for (section 5.1.1.15).
- 3.4.52 The BCR highlighted that despite the introduction of measures to improve bus journey times in the Norwich urban area, traffic delays to buses had increased such that the quality of bus journeys was being eroded (section 5.1.1.16). In terms of bus service reliability, the BCR provided evidence to demonstrate that no operator was able to achieve an on-time punctuality of more than 80% across all stops (section 5.1.1.17).
- 3.4.53 The Traffic Commissioners (a tribunal non-departmental public body of the Department for Transport) who, amongst other things, are responsible for the regulation of bus services have set targets regarding the operation of registered bus services. The current punctuality target is one where 95% of services should depart from timing points within the bracket of 1 minute early and up to 5 minutes late.
- 3.4.54 Recent data for the period 2012 to 2013 obtained from the automatic vehicle location bus tracking system demonstrates that on a number of the bus routes into the City, this target is not being achieved. For the three corridors considered (Catton Grove, Cromer Road and Wroxham Road), average on-time performance at bus stops in the AM peak was between 55% and 86% and between 65% and 80% in the interpeak periods (see paragraph 7.8.3 of the TA).
- 3.4.55 The BCR also highlighted the issue of ongoing detrimental impacts on the operation of bus services as a result of increases in traffic flows in the future (section 5.1.3). From the analysis undertaken, the BCR reached a number of conclusions in respect of public transport issues (section 5.9), including:
- Whilst certain initiatives have brought improvements to the quality and reliability of bus services, scope for further benefits are likely to reduce as the transport network becomes increasingly congested in the future;
 - Bus performance varies with traffic levels, suggesting that improvements in bus service could be delivered through reduced traffic flows, and

- Roads affected by low average bus speeds coincide with those with high journey time unreliability, and in general, these are radial routes from the north and bus services along these corridors perform worse than those along corridors from other directions. Bus services along corridors from the south were shown to perform the best at 82 – 86% on time during the period 2006 – 2009 with corridors from the north, in comparison, performing at 69 – 73% over the same period.

Quality of life / environmental conditions

- 3.4.56 High levels of traffic on a road network that is incapable of dealing with it results in various quality of life / environmental issues, including such issues associated with noise, air pollution and road traffic accidents.
- 3.4.57 Within the TFR (section 7.3) an analysis has been undertaken of the effects of traffic on people by calculating the number of dwellings that are located within 50 metres of roads with a Volume to Capacity ratio of over 90%. This provides an indication as to how many residents are affected by daily peak hour congestion. The calculation demonstrates that within the area that is considered by the transport model, the number of such properties in the AM peak amounts to 3,922, whilst in the PM peak the number of properties is lower at 2,973.
- 3.4.58 The analysis undertaken further demonstrates that over time the situation is forecast to get worse. In 2017 the equivalent numbers for the AM and PM peaks are forecast to be considerably worse at 5,676 and 4,432 whilst for 2032 the figures are forecast to increase again to 6,824 and 5,587 respectively.
- 3.4.59 The NDR Transport Assessment (TA), in section 10, provides a high level analysis of Personal Injury Collision (PIC) data for the period July 2008 to June 2013 for principal routes within the defined study area. A total of 89 accident cluster sites were identified from the data analysed. Whilst accident clusters are common at the junctions of key radial routes with the Inner or Outer Ring Road, there is also evidence of accidents occurring at the junction of radial routes with some of the rat run routes, and on the rural routes earlier referred to, including the junction of the A1067 and Middletons Lane and the junction of the C283 Salhouse Road and Blue Boar Lane (TA, Appendix H).
- 3.4.60 Earlier reference has been made to the significant number of trips which occur through the City Centre within the Inner Ring Road. The City Centre is, as also already noted, especially rich in terms of historic assets and associations.

Reducing the dominance of traffic in certain areas of the City Centre is not only important in respect of the cultural importance of the centre, but will also improve the experience of shoppers and other visitors to the City Centre.

Summary

3.4.61 One of the key issues that does and will continue to affect the City of Norwich and its surroundings both today and in the future relates to problems associated with the transport network. Fundamentally the problems are caused by the limitations of the road network in and around the urban area, and its incapacity to deal with the demands placed upon it. The transport and related problems caused can be summarised as including:

- High volumes of traffic on routes such as the Outer Ring Road and the radial routes, which in combination with the physical characteristics of these routes leads to congestion and associated issues.
- High volumes of traffic using inappropriate routes. This includes traffic travelling through the historic City Centre, traffic 'rat running' along urban residential streets and routes to move between the main radial routes and traffic using rural routes in an attempt to get around the north of Norwich.
- Poor access to the strategic road network to and from areas located to the north of Norwich such as Norwich International Airport and areas of north and north-east Norfolk.
- Adverse implications for existing businesses and services in terms of access to workplaces for staff, the importing and exporting of goods and the ability of customers to access businesses and services.
- Adverse implications for the growth and development of both Norwich and its surrounding area, and other locations further afield, which result from an effective restriction on the extent to which planned and proposed development can be brought forward and growth aspirations achieved.
- Adverse implications on the effective operation and attractiveness of public transport within the City and its surroundings, and a limitation on the ability to provide further public transport, walking and cycling improvements.
- Adverse environmental and quality of life implications.

3.5 Resolving the Identified Problems

- 3.5.1 Transport and related problems within and around the City of Norwich have been the subject of analysis, discussion and consultation over the course of many years. The inter-relationships between and interdependence of the City and the surrounding area have been recognised since the 1970s and 80s, since when a cross local authority boundary approach to planning for the future development of the transport system serving Norwich and surrounding area has been taken. This has taken the form of the Norwich Area Transportation Strategy (NATS), which has been developed by Norfolk County Council, working with Norwich City, Broadland District and South Norfolk District Councils. Since 1992, NATS has played a key role, alongside other strategies and plans (including the statutory development plan), in identifying the problems facing the transport system and setting out how the transport system is to be developed to overcome those problems.
- 3.5.2 NATS has been subject to various iterations and updates since it was initially published. The fourth iteration of NATS was adopted in October 2004 and subject to further updates in April 2010. The strategy covers the same area that is defined as the Norwich Policy Area (NPA) within the JCS.
- 3.5.3 The overarching vision of the most recent iteration of NATS is to provide the highest possible level of access to and within the area covered by the strategy to benefit people's individual needs and enhance the economic health of the strategy area, and to do this at the same time as ensuring that journeys minimise any adverse impact on people and the built and natural environment.
- 3.5.4 The overall strategy of NATS is defined through a series of eight policies, aspects of which are then further detailed in subsequent sections and policies of the strategy. The overall strategy set out in NATS is that a package of transport improvements, interventions and measures is needed which will:
- Support and enhance the local economy and the role of the Norwich Area as a regional centre, whilst taking due regard of environmental objectives (Policy 1);
 - Improve the pedestrian environment and the movement of public transport within the city centre (Policy 3);
 - Discourage vehicular traffic from driving through the city centre where appropriate in order to deliver a more pedestrian friendly environment (Policy 4);

- Reduce the impact of traffic on residential roads in the built up area by increasing pedestrian and cycle priority, undertaking traffic management measures to reduce vehicle speeds to 20mph or less and put in place, where appropriate, vehicle access restrictions (Policy 5);
- Restrict access on certain minor rural and residential roads around the north of Norwich (Policy 6);
- Improve public transport, including the improvement of interchange facilities, to enhance Norwich's role as a Strategic Interchange Centre (Policy 7);
- Improve accessibility and travel choice in the Norwich area through the improvement of facilities for all modes of transport, the improvement of access to support economic health and the accommodation of the growth in the number of trips by means other than the car (Policy 8).

3.5.5 The list is complemented by Policy 2, which makes clear that a Norwich Northern Distributor Road will be developed for implementation. The policy and accompanying explanatory text highlight that the proposed NDR should be developed in conjunction with other measures such as traffic mitigation measures on minor rural and suburban residential streets around the north of Norwich and the provision of facilities for cycling and walking.

3.5.6 NATS gives an explanation of the likely achievements of an NDR. Having regard to these and the various considerations and the analysis that has been undertaken, the specific objectives for the NDR are to:

- reduce traffic levels and congestion on the existing road network both within the urban area and beyond to the north;
- facilitate journeys that are currently difficult and require traffic to use roads that are unsuitable for the type and volume of traffic that is currently accommodated;
- provide access to and help to deliver, planned and potential areas of growth, and enable those areas to be free of the need to incorporate provision for extraneous traffic;
- provide improved transport connectivity, including with the national strategic road network, for existing and future areas of residential and employment development, Norwich International Airport and the wider area of North and North East Norfolk;

- increase the opportunities for improving provision for public transport and other sustainable forms of transport and for improving traffic management within the City Centre, thereby encouraging modal shift, and
 - improve traffic related environmental conditions for residents in the northern suburbs of Norwich and outlying villages, whilst minimising the adverse environmental impacts of the NDR.
- 3.5.7 Through the achievement of these objectives, the NDR will facilitate the step change in transport infrastructure that is required to address existing deficiencies and serve the full scale of population and economic expansion identified in the objectives and aspirations for the area.
- 3.5.8 In March 2010, NCC agreed a NATS Implementation Plan (NATSIP) for the future vision of NATS and what that would consist of, in particular in respect of delivering improvements for public transport, walking and cycling. The NATSIP was agreed following significant consultation in 2009, whereby 160,000 booklets were distributed showing the most significant proposals for improving transport within the Norwich area and a series of exhibitions were held.
- 3.5.9 In addition to the NDR, the proposals considered in the NATSIP included public transport Bus Rapid Transit Corridors, Core Bus Route improvements, bus ticketing and bus facility improvements, measures to reduce the dominance of traffic in certain areas of the City Centre and improvements to the walking and cycling network and facilities.
- 3.5.10 Details of the progress made on delivery was reported in November 2013 as part of a process of updating the NATSIP. This update explained that significant improvements had already been delivered through the NATS process. Such improvements include: the publication of a new city wide cycle network and significant investment in delivering improvements along some of the routes on that network; significant improvement work on some bus routes, including elements of some BRT corridors to the south and west of Norwich that benefit from the A47(T) Norwich Southern Bypass; the provision of some City Centre bus priority measures; and improvements to bus ticketing and bus facilities.
- 3.5.11 Whilst some elements of the NATS / NATSIP measures have been progressed, the NDR is needed to realise the full benefits and potential of the measures. Furthermore, failure to implement the NDR proposals would pose a serious risk to the long term future of the City and its surrounding area since a significant element of planned growth is allocated to the north of the City

and requires the delivery of the NDR. The JCS notes that achieving the full economic potential of the area is dependent on improved connectivity (JCS paragraph 5.38). As has already been explained in Chapter 2 of this ES, Policy 6, which covers access and transportation matters specifically highlights the need to implement NATS, including construction of the NDR. Appendix 7 of the JCS identifies the NDR as a 'Priority 1 Infrastructure' requirement which is needed for the overall scale of growth identified in the plan.

- 3.5.12 Although produced and developed in advance of the publication of the NPPF, the approach taken in the production of NATS and the JCS is consistent with policy contained in NPPF which makes clear that local authorities should work with neighbouring authorities, and transport providers, to develop strategies for the provision of viable infrastructure necessary to support sustainable development.
- 3.5.13 It is not just the JCS which highlights that the achievement of the objectives and aspirations for Norwich and surrounding area is dependent on the implementation of NATS, including the NDR proposal.
- 3.5.14 One of the aims supporting the vision for the transport system within the County that is set out in Norfolk County Council's Local Transport Plan is identified as 'Delivering sustainable growth' (Paragraph 2.2). A framework aimed at helping to deliver such growth is provided. The NDR is identified as an element of the framework that will facilitate growth in the Greater Norwich area. A further aim is identified as the enhancement of strategic connections, and in this respect the provision of the NDR is identified as important to facilitate strategic access to north-east Norfolk and Norwich Airport.
- 3.5.15 As has already been explained, NCC's economic growth strategy for Norfolk outlines a series of priority themes, which include providing support for growth and removing infrastructure constraints. The aim set out in respect of this theme is to ensure Norfolk can meet its economic growth potential through properly funded strategic infrastructure. In terms of priorities to meet this aim, the strategy highlights the NDR as being vital to the continued economic success of the Greater Norwich area, and also of benefit to North Norfolk and Great Yarmouth (section 5.2).
- 3.5.16 The infrastructure plan produced to provide further information on the key infrastructure needed to deliver economic growth in Norfolk identifies the NDR as a key infrastructure project. It is indicated that the NDR will address existing traffic issues to the north and east of Norwich and the city centre and

deliver economic benefits for Norwich and North Norfolk. The benefits of the NDR providing easy and reliable access to the national trunk road network and to Norwich Airport are identified as considerable.

- 3.5.17 Within the emerging version of the New Anglia LEP growth plan ('Towards a Growth Plan – consultation draft') the LEP set out its commitment to supporting the NDR scheme within the section that discusses enabling infrastructure for business. The NDR will assist in the achievement of the LEP's vision of making Greater Norwich one of the most competitive City Regions in Europe.
- 3.5.18 Recognition at the local level of the importance of infrastructure to facilitate economic growth is reflected at the national level. As has already been highlighted the Government through their National Infrastructure Plan make it clear that to remain globally competitive the UK needs to address issues and develop infrastructure capable of supporting a dynamic, modern economy. The inclusion of the NDR within one of the key areas of infrastructure investment identified in this national plan has been explained within Chapter 2.
- 3.5.19 The traffic impact of the NDR is detailed within the TA and associated documentation that supports the NDR DCO application. The information provided in those documents demonstrates that the NDR will achieve its objectives. For completeness, however, a short summary of the performance of the NDR is provided below.

Reduced traffic levels and congestion

- 3.5.20 Appendix I of the TFR shows the effect the NDR will have on traffic flows on routes in and around the northern urban area of Norwich.
- 3.5.21 On the northern section of the Outer Ring Road referred to earlier in paragraph 3.4.8 the forecast effect of the NDR is to reduce two way AADT flows between 9% and 19% in 2017 in comparison with what they would otherwise be. In 2032 the reduction is forecast to be between 6% and 18%. In all but one instance the flows shown on the Outer Ring Road in 2032 with the NDR are lower than the existing base flows. The exception to this is the section of the Outer Ring Road between the A1067 and the A140 (location A5 on figure I.1 of Appendix I of the TFR) where the flows in 2032 with the NDR are forecast to be 24,100 in comparison with current flows of 22,400.

3.5.22 A similar situation occurs in respect of flows on the northern radial routes adjacent to the Outer Ring Road referred to earlier in paragraph 3.4.9. In 2017, the forecast effect of the NDR is to reduce two way AADT flows between 2% and 21% on those radials in comparison with what they would otherwise be. In 2032 the reduction is forecast to be between 10% and 19%. In 2032 with the NDR, the flows on the radials are forecast to be either below or similar to the existing base flows.

3.5.23 Section 7.4 of TFR demonstrates that in respect of City Centre through traffic, these flows are forecast to reduce with the NDR in place. It is forecast that with the NDR in combination with City Centre traffic management measures traffic travelling through the City Centre is effectively halved in 2032 in comparison with what it would otherwise be. Cross City traffic that passes through the City Centre via the network in the centre area or uses the Inner Ring Road is forecast to reduce with the NDR in place in comparison with what it would otherwise be by 3,783 AADT (5%) in 2017 and by 8,016 AADT (9%) in 2032. These forecast levels are just higher than existing base levels. These figures demonstrate that the NDR will decrease the amount of traffic that travels through and across the City.

Reduced levels of traffic on unsuitable routes

3.5.24 Reference has been made in the preceding paragraphs to the positive impacts of the NDR of City Centre through traffic. In addition, as a result of the NDR, traffic flows on unsuitable urban residential routes and on rural routes to the north of the urban area are forecast to be reduced.

3.5.25 As shown in Table 3.4 below, in the 'Do Something' (DS) scenario, i.e. with the NDR in place, the residential Fifers Lane (location A11 on Figure I.2 in Appendix I of the TFR) and Woodside Road (location A20 on Figure I.2 in Appendix I of the TFR) routes are, for example, forecast to have reductions in two way AADT flows of 1,400 (12%) and 4,300 (33%) respectively in 2017 in comparison with flows that would otherwise occur. In 2032 the reduction is 1,600 (13%) and 3,300 (28%) respectively.

Table 3.4: AADT traffic flows along inappropriate urban routes

Route	2017 AADT Traffic Flows (DM)	2017 AADT Traffic Flows (DS)	2032 AADT Traffic Flows (DM)	2032 AADT Traffic Flows (DS)
1. Middletons Lane (locations A10 and A83)	10,200 - 10,400	9,100 - 10,200	11,400 - 11,300	10,100 – 11,100
2. Fifers Land / St Faith's Road / Church Street (location A11)	11,700	10,300	12,600	11,000
3. White Woman Lane (location A13)	3,000	2,700	3,500	3,100
4. Barkers Lane / Church Lane (location A14)	3,100	2,500	3,400	2,800
5. Blue Boar Lane (location A75)	13,400	7,200	12,200	7,900
6. Woodside Road (location A20)	13,000	8,700	11,600	8,300

3.5.26 In respect of the rural routes to the north of Norwich highlighted in paragraph 3.4.20, and referred to in Table 3.5 below, the transport model analysis forecasts that the flows on these routes when added together would reduce by 5,700 AADT in 2017 and 10,600 in 2032. For the routes to the east highlighted in paragraph 3.4.20, the forecast reduction added together would be 7,100 AADT in 2017 and 11,000 AADT in 2032.

Table 3.5: AADT traffic flows along inappropriate rural routes

Route	2017 AADT Traffic Flows (DM)	2017 AADT Traffic Flows (DS)	2032 AADT Traffic Flows (DM)	2032 AADT Traffic Flows (DS)
7. B1145 and A1067 to the A140 via Reepham and Cawston (location 10)	4,100	3,700	5,500	4,300
8. A140 and Hoveton via Coltishall (location 7)	4,800	1,900	6,800	2,300
9. Spixworth Road / Church Lane/ Buxton Road / Crostwick Lane between the A140 and B1150 North Walsham Road (location 12)	6,800	4,400	9,400	4,500
10. Church Road / Broad Lane / Green Lane West through Great Plumstead (location 11)	6,200	2,100	9,800	2,700
11. Woodbastwick Road / B1140 Low Road and Bell Lane through Salhouse (location 6)	4,300	1,300	5,800	1,900

3.5.27 In the absence of the NDR, as shown on Figure I.2 of the TFR, the developer link roads would carry very high traffic flows incompatible with their intended purpose. For example, at locations A101 and A102, AADT traffic flows of 17,300 and 16,700 respectively are forecast in 2032.

Improved strategic accessibility and journey times

3.5.28 The NDR provides significantly improved access for north Norwich and north and north east Norfolk to the strategic road network via its junction with the A47(T) at Postwick. Direct dual carriageway access is provided from all of the

key northern radials to the national strategic road network. Access to the Airport is similarly significantly improved through the provision of a direct dual carriageway link to the national strategic road network.

- 3.5.29 The transport model analysis provided in the TFR identifies that with the NDR in place, the average time taken for the journeys on the routes to and from the Airport referred to in paragraph 3.4.33 above are all forecast to reduce in the morning and afternoon peak in 2017 and 2032 in comparison with the situation that would otherwise occur (see Figures 7.9 and 7.10 in section 7.5 of the TFR). In the vast majority of cases the average journey times on these routes in both the morning and afternoon peak in 2017 and 2032 is forecast to be less than the existing base average journey time. The exception to this is the route between the Airport and the A11(T).
- 3.5.30 The transport model analysis also demonstrates that with the NDR in place, the extent of delay on such journeys is forecast, in the vast majority of cases, to be less in 2017 and 2032 than would otherwise be the case (see Tables K.3 – K.7 in Appendix K of the TFR).
- 3.5.31 Overall, as reported in section 9 of the TA, the analysis demonstrates that journey times on key routes linking the strategic road network with the main development areas and the Airport are forecast to significantly decrease in 2017 and 2032 with the NDR in place. In most cases journey times in these future years are predicted to be lower than existing base journey times.
- 3.5.32 An economic appraisal has been carried out for the NDR scheme. This assesses the transport benefits of the scheme, amongst other aspects, and compares these with the costs of the scheme. The appraisal was undertaken in accordance with standard Department for Transport methods and the values obtained show that the benefits are above four times the scheme costs. This means that the NDR scheme represents high value for money.
- 3.5.33 As identified in section 6.3 of the Economic Appraisal Report, the majority of the transport benefits arise from journey time savings. These are broken down in the economic appraisal into three categories: shorter (less than 2 minutes), medium (2-5 minutes) and longer (more than 5 minutes). For the appraisal of the NDR scheme the time benefits in these three categories are, respectively, 26%, 29% and 44%. This shows that the scheme has a large effect on transport times and efficiency, with the vast majority of the time savings comprising medium and longer time savings.

3.5.34 Section 7.1 of the TFR and section 9 of the TA both provide a description of key changes in strategic traffic movements as a result of the NDR. In general terms, this analysis explains that, amongst other things:

- journeys from the east to Norwich become more attractive via the A47(T), with reductions on other routes currently used for such movements;
- certain routes north of Norwich experience substantial reductions in traffic; and
- to the west of Norwich there is an increase in traffic using the A1067 Fakenham Road, with some trips reassigning to this routes from the direction of King's Lynn.

Providing access to enable growth

3.5.35 As earlier explained, the forecast traffic data and information that has been produced is based on national traffic growth forecasts and proposed development spatially allocated in accordance with the JCS, but with growth constrained to national forecasts (NTEM). The inadequacies of the existing road network to accommodate traffic generation produced by the high levels of employment and residential growth planned for greater Norwich are set out in section 7.8 of the TA. The forecasts made for 2017 and 2032 and which are reported throughout the TFR and the TA therefore demonstrate that in order for the growth envisaged for Norwich and surrounding area to be accommodated, the NDR is required.

3.5.36 Earlier reference has also been made to the position that a number of key sites where planned and proposed development is, at least partly, contingent on provision of improvements to the transport network. The NDR provides the necessary step change in transport infrastructure needed to allow planned and proposed growth to come forward.

Improvements for public transport, walking and cycling

3.5.37 The reduction in traffic flows on the road network that are forecast to result with the NDR in place increases the opportunities for improving the provision for pedestrians and cyclists within the urban area. Walking and cycling benefits are made possible with the ability to improve junction arrangements at key locations as a result of reduced traffic flows. Beneficial measures are also made possible in the City Centre by reducing the amount of traffic and

giving more focus to routes used by pedestrians (shoppers, visitors and workers) and cyclists. The envisaged City Centre measures will also seek to provide easier movement for buses by providing space to circulate and drop off / pick up passengers efficiently and conveniently. Such benefits can more easily be realised with a reduction in traffic flows.

3.5.38 Whilst some bus related improvements have been progressed through the NATS / NATSIP process, improvements to the public transport corridors to the north and east of the City have been constrained by the amount of traffic and related congestion on key radial routes and the ring road routes. With the reduction in traffic flows and congestion on these routes forecast to result from the NDR, further improvements in these areas can be made and benefits realised.

3.5.39 Journey time savings on five key bus routes in the north and east of Norwich resulting from the NDR being in place have been assessed. The five routes considered run along: the A1067 Fakenham Road / Drayton High Road to Attlebridge, the Cromer Road to the Holt Road / Cromer Road junction, the Wroxham Road to the Wroxham Road / Green Lane West junction, the Plumstead Road to the Plumstead Road / Broad Lane junction, and Yarmouth Road to the Postwick north west roundabout.

3.5.40 The full analysis is contained in section 7.6 of the TFR. It shows that in 2017, AM peak journey times into the City Centre reduce with the NDR by between 5% and 14%, with a journey time reliability improvement of around 30 seconds. In the 2017 PM peak the journey times out of the City Centre reduce with the NDR by between 1% and 13%, with a journey time reliability improvement of around 15 seconds. Journey time changes in 2032 are more affected by the complementary City Centre measures. In 2032 AM peak journey times into the City Centre change with the NDR by between a 1% increase and an 11% reduction, with the average journey time reliability improvement of 18 seconds. In the 2032 PM peak the journey time for routes out of the City reduce by between 3% and 24%, with a journey time reliability improvement of around 30 seconds.

Quality of life / environmental conditions

3.5.41 The transport model analysis that is provided in the TFR shows that as a result of the NDR, the number of properties within 50 metres of roads with a volume to capacity ratio of over 90% are forecast to reduce in 2017 and 2032 in comparison with the situation that would otherwise occur (TFR section 7.3).

In the AM peak the reductions in the number of affected properties is 21% and 27% in 2017 and 2032 respectively.

3.5.42 The analysis of accident data contained within section 10 of the TA concludes that the NDR is likely to have a beneficial impact at nearly 70% of all existing accident cluster sites considered (62 out of the 89 sites). Further detail of the impact of the NDR on specific accident cluster sites is provided in section 10 and Appendix I of the TA.

3.6 Conclusions on Need

3.6.1 One of the key issues affecting the City of Norwich and its surroundings is the problems associated with the transport network. Fundamentally, the problems are caused by the limitations of the road network in and around the urban area, and its incapacity to deal with the demands placed on it.

3.6.2 The transport and related problems within and around the City have been the subject of analysis, discussion and consultation over the course of many years. A cross local authority boundary approach to planning for the future development of the transport system serving Norwich and surrounding area has been adopted, and takes the form of the Norwich Area Transportation Strategy (NATS).

3.6.3 The overall strategy of NATS is that a package of transport improvements, interventions and measures is needed. Together these improvements, interventions and measures will deliver a reliable, efficient and long-term sustainable transport network which will improve accessibility and connectivity and which will support the continued economic and physical growth of the Norwich area.

3.6.4 NATS identifies the NDR as part of this package. The NDR is needed to improve connectivity and accessibility across both the northern part of the Norwich urban area and areas of the county in an arc from the north west to the east of this main urban area. Such improvement will ease the relative disadvantage of the peripheral location of these areas and provide the basis of the transport infrastructure required to address existing and future problems, and achieve the growth objectives which have been identified for Norwich and its surrounding area.

3.7 Introductions to Alternatives

3.7.1 This part of the Need and Alternatives chapter records how the application proposals for the proposed NDR scheme were prepared and selected in

preference to other possible approaches that might meet be considered to see whether they could address the need identified earlier in the chapter. It explains the account taken of a range of material considerations, including environmental effects, leading to the conclusion that the application proposals are the most appropriate response to the need.

- 3.7.2 A summary of the process follows this introduction. In brief, the requirement for an NDR was first formally identified in 1992 following a review of transportation strategies for the greater Norwich area (NATS). A subsequent review of NATS carried out between 2002 and 2005 centred around a further comparative analysis of possible interventions to resolve the area's transport problems, conserve the historic core of the City, reduce the effect of traffic on the urban area and rural settlements used as rat-runs and facilitate the continued growth of the City in accordance with the policies of the statutory development plan.
- 3.7.3 The 2002 - 2005 NATS review identified as a preferred approach a package of interventions comprising the NDR and measures to improve public transport and encourage modal shift. The route and design of the NDR scheme were then improved by further rounds of iteration to take account of the results of environmental studies, views expressed by residents and stakeholders and up-dated traffic modelling based on surveys undertaken in 2006 and 2012.
- 3.7.4 The 2012-based modelling confirms that implementation of the application proposals is likely to have the required wide-ranging benefits for the City's transport network (section 9 of the TA). It will relieve rural roads currently used to make cross-city journeys and the congested radial and ring roads, making it possible to progress the NATS / NATSIP proposals for further improvements to public transport and take the necessary traffic management measures to effectively remove unnecessary through traffic from the historic core of the City. It will also provide the necessary transport infrastructure to facilitate employment and residential growth.
- 3.7.5 The incorporation of the NDR into the road network will significantly improve connectivity within and across the City and the surrounding area. The provision of a direct connection with the A47(T) will make it much easier for travellers to and from the north and north-east of the City to access the strategic road network and also key regional facilities, such as Norwich International Airport, without negotiating the City's congested road network. The traffic forecasts supporting this analysis can be found in the TFR.

3.7.6 As already noted, the 2002 - 2005 NATS review concluded that whilst the NDR would not, by itself, resolve the area's transport problems, it would be an essential component of any strategy. Improvements to public transport and cycling and walking infrastructure were also required, but those initiatives alone also would not provide the transport infrastructure required to encourage and sustain economic growth, and achieve the other objectives. As well as facilitating employment and housing development, the provision of the NDR will free the radials, the inner and outer ring roads, outlying rural roads, the City Centre and residential streets of the role of catering for cross-city movements for which there is currently no more appropriate alternative route. As explained below, the analysis of other options concludes that these strategically important benefits cannot be as effectively achieved by other means.

3.8 Consideration of Other Approaches Leading to the Development of the Proposals

3.8.1 The need for a distributor road around the north of the City was identified in 1992 through a review of the transport strategy for the Norwich area (NATS). The initial proposal was for a 'full length' NDR, i.e., one which would terminate in junctions with the A47(T) on both the western and the eastern flanks of the City.

3.8.2 The 1992 NATS review acknowledged that the construction of an NDR would inevitably have an impact on the environment of the area through which it passed. Environmental studies showed that adverse effects were particularly likely on the most westerly section of the full NDR route, between the A1067 Fakenham Road and the A47(T)(west), where all possible alignments would have to cross the valley of the River Wensum (designated as a Special Area of Conservation (SAC)).

3.8.3 Over the course of subsequent years, NCC therefore examined and consulted on possible route corridor options and detailed designs, in order to ensure that when the time came to submit an application for the necessary consents, the scheme applied for would as far as possible avoid or minimise significant adverse effects and that the alignment would reflect the comments of stakeholders.

NATS Options Assessment Report 2005

3.8.4 Transport strategy for the Norwich area was next comprehensively reviewed, in the context of strategic land use planning policies, over the period 2002 -

2005. The NDR proposal was revisited. The concept was again compared against other possible approaches and detailed alignments were investigated to identify a scheme that would best meet the need with least adverse environmental effects. A steering group drawn from the membership of NCC, Norwich City Council and Broadland and South Norfolk District Councils oversaw the process.

- 3.8.5 Commencing in 2002, a body of work was carried out to identify and assess transportation strategies that could be considered for adoption as part of a review of the Norwich Area Transportation Strategy (NATS). The detailed results of the studies and analyses were reported in the NATS Options Assessment Report 2005.
- 3.8.6 A wide-ranging 'long list' of over 30 transportation interventions for inclusion in the review of possible strategies was identified. Possibilities included road-based and public transport interventions and the application of land use policies and other measures to reduce the demand for travel and encourage modal shift. Following a qualitative assessment of the performance of each intervention in addressing the problems and issues facing the area, possibilities that performed inadequately against social, environmental, and economic objectives, or were less effective than other options, were not taken forward.
- 3.8.7 For example, the possibility of a short NDR to the north-west of the city, between the A140 or the A1067 and the A47(T)(west), was examined but rejected. It would be much less effective than other versions of the NDR in meeting the economic and conservation objectives, the traffic benefits would be limited and it would not facilitate growth, which is largely planned to the north east of the city. The section between the A1067 and the A47(T) (west) would also be likely to give rise to significant adverse environmental effects, which studies showed and consultation at the time confirmed could not easily be mitigated.
- 3.8.8 Another possibility examined and discarded was improvements to the Outer Ring Road. It was concluded that even if they could be implemented without unacceptable harm to the urban environment, such improvements would be much less effective than the NDR options in improving accessibility and meeting the economic objectives. They would also fail to address the growth issues on the north-east edge of the city. Whilst the possibility of improvements to the existing road network was not taken forward in the Options Assessment Report as an alternative, it was nonetheless retained for later re-examination (see below).

Approach to public transport interventions

3.8.9 A range of public transport interventions was considered for inclusion in the 2002-2005 NATS review, although not necessarily as alternatives to the NDR:

- a light rapid transit (LRT) system;
- a guided bus route along the Marriott's Way corridor;
- orbital bus routes;
- cross-city bus routes linking existing Park and Ride sites;
- a new Park and Ride site at Taverham/Drayton;
- interchange facilities at key nodes within Norwich;
- additional rail stations to the east of Norwich, and
- revenue support for additional bus services.

3.8.10 A qualitative assessment of the performance of these options in resolving the transport problems and issues and the NATS aims and objectives concluded that individual public transport interventions or a combination of them would not meet the need. This did not mean that public transport would not be a key element of a sustainable transport strategy for the City and the surrounding area. It recognised that unless the issue of traffic congestion was addressed, proposals to significantly improve public transport could not be fully implemented. As outlined below, public transport options were therefore retained alongside NDR options.

3.8.11 Orbital bus routes and LRT/bus rapid transit (BRT) emerged as potentially the most effective of the public transport interventions. A guided bus route on Marriott's Way had potential, if combined with a new Park and Ride site at Taverham / Drayton, to offer a solution to the difficulty of providing comprehensive bus priority measures along the A1067 corridor. Marriott's Way, however, was important for wildlife and informal recreation and as significant lengths also run along an undeveloped river valley it serves little existing or potential development. Moreover, as the route of a former railway line, it was a location-specific.

Options Assessment 2005

3.8.12 Following the initial assessment, six possible strategies were identified and assessed using an approach based on the Department for Transport's WebTAG methodology. Each option was assessed against its likely environmental effects; its benefits for road safety, the economy and accessibility; and the degree to which it reflected planning and other policies.

3.8.13 The following strategies were compared:

- Option 1 – A 'full length' NDR linking the northern radial routes with the A47(T) on both the east and west sides of the City; complementary measures to reduce the impact of traffic on minor roads and residential streets around the north of Norwich; improvements to junctions on the Inner and Outer Ring Roads; improvements to radial bus services, and measures to reduce through traffic in the City Centre.
- Option 2 – As Option 1 but a 'half length' NDR between the A47(T) at Postwick and the A140 Cromer Road, adjacent to Norwich International Airport.
- Option 3 – As Option 1, but a 'three quarter length' NDR from the A47(T) at Postwick, past Norwich International Airport to the A1067 Fakenham Road.
- Option 4 – A new orbital bus service around Norwich; major improvements to existing radial bus services; improvements to junctions on the Inner and Outer Ring Roads, and a 'Ring and Loop' system to prevent car drivers making through trips within the Inner Ring Road.
- Option 5 – A Light Rapid Transit service on a route linking Thickthorn Park and Ride, Norfolk & Norwich Hospital, University of East Anglia (UEA), the City Centre and railway station, Postwick Park and Ride, Broadland Business Park and residential development in the north east fringe of Norwich; improvements to junctions on the Inner and Outer Ring Roads; road user charging or workplace parking charging within the Inner Ring Road; a Ring and Loop system to prevent car drivers making through trips within the Inner Ring Road, plus additional physical restrictions on car access to the City Centre as a consequence of the LRT alignment through the City Centre.
- Option 6 – Planning new development so as to reduce the distance between home, work and services; financial incentives to implement workplace travel plans (including targets for reduced car use, by existing businesses as well as those expanding or relocating), improvements to walking and cycling

networks, including measures to support safer and healthier journeys to school; the promotion of alternative modes of transport and alternative fuels, and delivery of individualised marketing campaigns in support of travel plans.

- 3.8.14 The object of the assessment was to identify the comparative performance of contrasting strategies, including ascertaining whether reliance could be placed on approaches that did not involve road construction. Discarding a strategy because it failed as a standalone option did not, however, necessarily mean that elements of that approach could not be included, perhaps in combination with others, in the overall NATS strategy. This is especially the case in respect of Option 6, the policy option, the content of much of which encapsulates the approach taken in statutory land-use plans. As with option 5 (public transport strategy) the question being asked in the assessment was whether a particular approach on its own would suffice to meet the need.
- 3.8.15 The evidence, analysis and conclusions of the assessment were documented in a “NATS Options Assessment Report” published in August 2005, and a full report on the further work, including appendices summarising the evidence, was made to NCC's Cabinet the following month.
- 3.8.16 As the officer report to Cabinet noted, the assessment concluded that an NDR was required in order to address the area’s transport problems. It drew attention to the significantly superior performance of the NDR options over other interventions. At the same time it acknowledged that the NDR options, especially a ‘full length NDR’ were also likely to have significant adverse effects on the environment:

“An NDR as part of an area wide transportation strategy, and implemented with a suite of complementary measures made possible by the freeing up of capacity on the existing road network, would help alleviate many of the problems and issues currently highlighted within the NATS area, in particular: congestion on the outer ring road; access to the airport; and accommodation of future housing requirements. It also gives rise to the most economic benefits and is the only strategy to provide a strategic transport link to North Norfolk. However, whilst an NDR option affords the most benefits within the NATS area, it also gives rise to the most adverse environmental impacts of all options considered, some of which could not be mitigated.” (Paragraph 4.1 of Appendix 3 to the Cabinet report “Statement on Justification of Need”).

- 3.8.17 The reference in the last phrase to the impacts ‘which could not be mitigated’ is to the likely effects of constructing a ‘full NDR’, which between the A1067

and the A47(T) to the west of the city would have to cross the Wensum Special Area of Conservation (SAC) and pass through a landscape containing historic parkland. The evidential position to support the officers' judgement is documented in Appendix 4 to the Cabinet report.

3.8.18 The review concluded that even if the link between the A1067 and the A47(T) were not built, a 'three-quarter length' NDR would still achieve the objectives set by the NATS review. Option 3 (an NDR linking the A47(T) at Postwick with the A1067 Fakenham Road) was therefore preferred. The Cabinet deferred a decision on a preferred route pending further assessment of options, including mitigation measures.

3.8.19 The officer report summarised the superiority of an option based on the construction on an NDR over other possibilities that did not include an NDR, in the following terms:

"Other outcomes to the aims and objectives of NATS do not offer solutions to the full range of problems and issues. It is only the NDR option that answers the majority of these concerns. In addition, it is only the NDR option that frees up capacity on the existing road network to allow the maximum use of the complementary measures to make improvements to public transport and provisions for non-motorised users." (Paragraph 4.2 of Appendix 3 to the Cabinet report.)

3.8.20 In respect of the public transport options, the assessment concluded that cross-city bus routes linking existing Park and Ride sites, the development of interchange facilities at key nodes within Norwich and additional rail stations on the Cromer line to the east of Norwich would not have sufficient impact across the NATS area to be considered as strategic alternatives in their own right or in combination, but they could play an important role to complement the NDR options.

3.8.21 An experimental orbital bus service was subsequently operated within the built up area of Norwich between November 2005 and March 2007. The service ceased because it covered less than one-third of its operating costs. Its lack of success may have reflected the unavoidably long journey times on a route linking major residential areas with key employment sites around the busy Outer Ring Road.

3.8.22 The NATS review thus concluded that though improvements in public transport were desirable, they were not an alternative to an NDR. They would not by themselves address the fundamental economic and accessibility

problems of the area, including the needs of settlements in the wider area, nor would they provide the essential road infrastructure required to support the growth of the city.

Consultation input to the 2002 – 2005 Review

3.8.23 The Options Assessment Report was prepared with the benefit of responses to a wide-ranging consultation on the draft proposals. In autumn 2003, NCC distributed information brochures and questionnaires to residents and stakeholders around Norwich, describing the Council's preferred NATS strategy and requesting views on route options for a northern distributor road. (The work carried out on route options, which was recorded in a Stage 2 Environmental Assessment Report of October 2004, is described later in this chapter.) The questionnaire and related information was also available for viewing and completion on the Internet. Twenty-five exhibitions and ten public meetings were held.

3.8.24 A further public consultation on alternative routes for the NDR was carried out in autumn 2004. Preliminary engineering designs were published alongside the results of environmental studies and an assessment of the traffic and economic implications of each of the route options. Some 132,000 information brochures and questionnaires were distributed to residents and stakeholders around Norwich, and exhibitions were held in the consultation area.

Further assessment work

3.8.25 In accordance with the 7th March 2005 Cabinet decision, NCC undertook further studies in consultation with key stakeholders, using more detailed environmental assessments to refine the preferred route of the NDR.

3.8.26 After careful consideration of the more detailed environmental studies, and of the need to plan effectively for transport infrastructure to serve the expansion of the city, in September 2005 NCC's Cabinet resolved to proceed with a preferred scheme for a dual carriageway NDR between the A1067 Fakenham Road and the A47(T) at Postwick to the east of the City. Substantial economic and traffic benefit was seen in providing an NDR of consistent, high standard throughout its length. A road of this nature would improve connectivity across the whole of the northern part of the city and its catchment and provide maximum relief of residential and rural roads that were currently carrying significant flows of extraneous traffic.

NDR Major Scheme Business Case, 2008 - 2009

3.8.27 In 2009, following the submission by NCC of a Major Scheme Business Case, the Department for Transport (DfT) granted funding for the NDR from the A140 to the A47(T) at Postwick, subject to progression by NCC of the NATS public transport measures which were complementary to the NDR. At its April 2010 meeting, NCC's Cabinet re-affirmed its commitment to the NDR as a dual carriageway from Postwick to the A1067.

Further studies of public transport

3.8.28 A public transport model was developed to test public transport options in preparing the Major Scheme Business Case (MSBC) for the NDR.

3.8.29 The work carried out is recorded in the Position Statement on Development of Public Transport Option of December 2007. It began with the two public transport strategy options appraised in the NATS Options Assessment Report. Variations were developed to cover the range of public transport interventions that could realistically be considered as potential options. The appraisal resulted in a total of four options for initial consideration. Two involved improvements to conventional bus services and two involved alternative forms of light rapid transit - Bus Rapid Transit (BRT) and Light Rail Transit (LRT).

3.8.30 A heavy rail option was not developed because the geography of the National Rail network within the NATS area is such that, even allowing for the possibility of new stations, a very small percentage of the population of the NATS area would have access to a heavy rail service for local travel. A heavy rail option thus could not meet the objectives set for the NDR scheme. Improvements to local rail services were therefore appropriately taken forward as one of the complementary measures within NATS.

3.8.31 It was considered that BRT was more likely than LRT to be economically viable to serve a city of the scale of Norwich. A combination of BRT and the best performing bus improvements was therefore adopted as the preferred public transport option for modelling and a WebTAG appraisal for the MSBC. The option comprised improvements to the frequency of radial services on existing routes; a new bus service on a part of the Outer Ring Road, which would provide service to areas similar to that of the NDR; and a BRT corridor linking Sprowston, the City Centre, the University (UEA), Norfolk and Norwich Hospital and the Norwich Research Park.

- 3.8.32 Following submission of the MSBC, DfT asked the County Council to investigate the sensitivity of the Benefit/Cost Ratio (BCR) for the Public Transport (PT) Option presented in the MSBC to higher levels of patronage on the new and enhanced services, thus generating additional revenue and reducing the level of subsidy required.
- 3.8.33 The results of these tests suggested that additional bus services included in the PT Option would have to operate without subsidy to achieve a BCR of 1.5 or above. In addition, patronage on the existing core bus routes enhanced under the PT Option (either through the introduction of a more frequent bus service or a new BRT service) would need to increase by 25% to achieve a BCR of circa 1.5 and by 32% to achieve a BCR of circa 2.0. These scenarios were considered to be implausible as they meant that the orbital bus service would have to generate sufficient patronage and revenue to operate without subsidy. As noted earlier, the experimental orbital bus service that operated between November 2005 and March 2007 covered less than one-third of its operating costs.
- 3.8.34 Following submission of the test results, DfT granted funding for the NDR. It was recognised that NATS included public transport measures that were complementary to the NDR, and NCC gave an assurance that those measures would be progressed.

Development Pool Bid 2011

- 3.8.35 Following a Government spending review, the NDR was included in a 'Development Pool' of schemes requiring a new funding bid. The required Development Pool submission document sent to DfT in September 2011 included an updated MSBC and supporting documents. In December 2011, DfT re-confirmed its funding for the NDR and added it to its list of approved "Local authority major transport schemes – development pool projects" included in the National Infrastructure Plan in November 2011. In December 2013, the NDR was explicitly identified as a 'Top 40' priority infrastructure investment project in the National Infrastructure Plan 2013.

3.9 Overall Review of Options and Alternatives 2013

- 3.9.1 Before deciding on the application proposals, the conclusions of previous analyses of options and alternatives were reviewed in the light of traffic surveys undertaken in 2012, the final results of the environmental studies (recorded elsewhere in this ES) feedback from stakeholder and public consultation, and the progress of the Joint Core Strategy to adoption.

3.9.2 The two options that had previously been discarded as alternatives to the NDR, i.e., improvement of the existing highway network and of public transport (referred to in the Options Assessment Report, see paragraphs 3.8.8 above) were re-examined and the remaining feasible alternatives to the application proposals were compared. This analysis is summarised in the following paragraphs. A standard approach has been adopted: a short written analysis is followed by an assessment table.

3.9.3 A common key has been used to indicate how the degree to which the option or alternative meets (positive) or does not meet (negative) the objectives. As a comparator, the application proposals are assessed to have a large positive rating in respect of each of the objectives:

Key to tables

+++	Large positive
++	Moderate positive
+	Slight positive
=	Neutral
-	Slight negative
--	Moderate negative
---	Large negative

Measures to enhance the existing highway network as an alternative to the NDR (Option 1)

3.9.4 The 2002-2005 NATS review had considered whether forecast traffic growth in and around the north of Norwich could be accommodated on the existing network without an NDR. It concluded that this would require widespread major works to widen and reconfigure many carriageways and junctions, including several with frontage properties necessitating extensive property purchase and/or demolition. The scale of the works required would be likely to be greater if, as would be desirable, measures were also introduced to give priority to public transport.

3.9.5 The interconnected nature of the radial and orbital road system serving the City means that small-scale piecemeal improvements to sections where schemes might be feasible in isolation would not resolve the current traffic

issues since other links and junctions, where improvement was impractical, would remain congested, leaving overall route capacity and journey time reliability little changed and the propensity and opportunity for continued rat-running undiminished.

- 3.9.6 To provide significantly increased highway capacity for movements between the A47(T) at Postwick and the Airport, it would be necessary to significantly improve the capacity of the A1042 and the A140 radials. Selective widening and junction improvement would be required. Between the A47(T) and the Airport, the A140 and the A1042 are single carriageways lined with residential and commercial properties. A short stretch of the A1042 abuts Mousehold Heath, a local nature reserve. There are four junctions with other 'A' or 'B' classified roads and many others with significant urban distributors and local connections, and a railway under-bridge.
- 3.9.7 The final link from the A140 to the A1067 would require improvement of one or other of the minor roads that run between the A140 and the Fakenham Road and pass through the centre of Hellesdon or Drayton.
- 3.9.8 An improvement scheme of this nature through the urban area would only partly replicate the functions of an NDR and would not resolve many cross-city connectivity issues or serve new development. It would unavoidably have a very significant direct and/or indirect physical and environmental impact on many residential and commercial properties, and would require property acquisition and demolition in order to provide the necessary additional highway capacity. It would be likely to face considerable objection, especially from affected occupiers.
- 3.9.9 Such a scheme would thus partially meet the traffic need at the expense of widespread impacts on urban and residential environments. Traffic would continue to be drawn into the urban area and many cross-city journeys that would be facilitated by the NDR would not be facilitated or would be less well served by such a scheme, resulting in continued urban and rural rat-running.
- 3.9.10 It would be less effective than an NDR in supporting urban expansion to the north east of the City and in stimulating and serving economic growth generally. To improve its performance in those respects, it would be necessary either to rely on the link roads likely to be associated with development proposals (considered below) or improve local rural roads, which would result in a further range of adverse impacts.
- 3.9.11 It was therefore concluded that it is not possible to replicate the benefits that would arise from the construction of the NDR by improving the existing road

network. A very significant adverse impact on the urban environment would be likely to result, which was likely to be judged unacceptable. The effect on residential properties in particular would be such as to make it unlikely that such a scheme would be promoted and if it was, that the necessary powers of compulsory purchase of residential properties would be forthcoming. It was therefore not considered to be a feasible alternative.

3.9.12 The table below summarises the performance of this option.

Table 3.6: Summary of performance of Option 1 against the objectives

Objective	Scoring	Comment
Reduce traffic levels and congestion on the existing road network both within the urban area and beyond to the north	=	There would be some reduction in congestion but no reduction in traffic levels in the urban area
Facilitate journeys that are currently difficult and require traffic to use roads that are unsuitable for the type and volume of traffic that is currently accommodated	+	Some journeys might be facilitated and congestion eased
Provide access to and help to deliver, planned and potential areas of growth, and enable those areas to be free of the need to incorporate provision for extraneous traffic	- -	This option would not provide access to development areas, which are planned on the basis of the construction of the NDR
Provide improved transport connectivity, including with the national strategic road network, for existing and future areas of residential and employment development, Norwich International Airport and the wider area of North and North East Norfolk	=/+	Connectivity would be improved but limited to the route(s) improved. Other existing constraints to cross-city accessibility would remain

Objective	Scoring	Comment
Increase the opportunities for improving provision for public transport and other sustainable forms of transport and for improving traffic management within the City Centre, thereby encouraging modal shift	++	The improvements to public transport would be limited unless priority measures were built into the scheme, which would increase its scale and increase the likelihood that it could not be delivered
Improve traffic related environmental conditions for residents in the northern suburbs of Norwich and outlying villages, whilst minimising the environmental effects of the proposed intervention	-/--	The propensity for rat running using convenient cross-radial routes might increase as planned growth areas are developed. There would be limited opportunity to mitigate the effects of improving rural and urban roads on the environment

Improvement to public transport provision as an alternative to the NDR (Option 2)

3.9.13 As explained earlier, extensive and detailed analyses of the potential for public transport improvements formed part of the reviews of NATS and supported the MSBC submission to the DfT. Each previous iteration of the analysis has reached the conclusion that public transport initiatives are an essential complement to the NDR and key to the implementation of a sustainable transport policy but, even in combination, they do not constitute an alternative to it. By relieving the radials of traffic, the NDR would in practice help to facilitate the introduction of bus priority measures and an orbital bus service. By freeing the internal road networks of new development areas of the need to cater for extraneous through traffic, better residential environments could be created, which would be more easily penetrated by local bus services and walking and cycling routes.

3.9.14 A review of the studies undertaken shows that these conclusions remain valid. Proposals coming forward for major development to the north east of the city in accordance with the Joint Core Strategy support the view that reliance on the NDR to accommodate through traffic that would otherwise pass through the development or along adjoining radials, (thereby adding to congestion on

routes used by bus services) will facilitate the development of high quality residential environments.

3.9.15 The table below summarises the performance of the public transport option considered as an alternative to the NDR.

Table 3.7: Summary of performance of Option 2 against the objectives

Objective	Scoring	Comment
Reduce traffic levels and congestion on the existing road network both within the urban area and beyond to the north	=	Whilst there would be an uncertain effect on traffic levels, the introduction of bus priority measures would be likely to increase local congestion. The viability of cross-city bus routes would continue to be constrained by congestion
Facilitate journeys that are currently difficult and require traffic to use roads that are unsuitable for the type and volume of traffic that is currently accommodated	--	As above, a significant proportion of trips using rat-runs would not be served by public transport. Additional traffic congestion may encourage more rat-running
Provide access to and help to deliver, planned and potential areas of growth, and enable those areas to be free of the need to incorporate provision for extraneous traffic	---	Public transport measures would need to be supplemented by road construction
Provide improved transport connectivity, including with the national strategic road		Public transport measures would not

Objective	Scoring	Comment
network, for existing and future areas of residential and employment development, Norwich International Airport and the wider area of North and North East Norfolk	---	significantly benefit the wider area
Increase the opportunities for improving provision for public transport and other sustainable forms of transport and for improving traffic management within the City Centre, thereby encouraging modal shift	=	The provision of more effective public transport would be constrained and offset by congestion. It could serve only a limited variety of cross-city journeys and would not enable the closure of the City Centre to most through trips
Improve traffic related environmental conditions for resident in the northern suburbs of Norwich and outlying villages, whilst minimising the environmental effects of the proposed intervention	-	As above, rat-running is related to cross-radial journeys and unlikely to be served by public transport

3.10 Alternatives to the Application Proposals

3.10.1 The analyses described above reaches the conclusion that the need can only be met by the construction of a NDR alongside the implementation of measures to improve public transport. The possibility of a 'full length' NDR was discarded because of the likelihood of a significant impact on the environment of the Wensum Valley SAC, which would have to be crossed between the A1067 and the A47(T) to the west of the City.

3.10.2 The feasible alternatives to the application proposals are thus variations of the standard and alignment of the NDR between the A1067 and the A47(T) at Postwick, including the possibility that its role could be performed by a developer-funded link road constructed as part of the physical expansion of the City.

- 3.10.3 The consideration given to each of these alternatives is explained below, but it is first necessary to record how the preferred alignment of the NDR was determined. Environmental considerations figured largely in the judgements that have been made about the most appropriate route. A prime concern was to avoid or reduce the impact on the natural environment and features of landscape or cultural value. Once identified, these were matched against highway engineering considerations and likely effects on the human environment (advised by the results of public consultation) and a judgement reached as to the most appropriate alignment and design.
- 3.10.4 In summary, therefore, the alignment and form of the proposals are the result of iteration of options, informed by the output of land-use/transportation modelling, and the preliminary conclusions of the studies carried out for the environmental impact assessment. Studies of the nature and quality of the existing natural and human environment have confirmed the most appropriate design and alignment and the requirement for mitigation measures.
- 3.10.5 As recorded earlier in the chapter, the process of identifying a corridor and refining the standard, alignment and design to reach an application proposal was addressed and reported as part of the work undertaken during the 2002-2005 review of NATS. Figure 3.4 is a composite plan showing the majority of the routes considered at that time and in subsequent consultations. Possible corridors were initially split into western and eastern options, the dividing line being the crossing of the A140 Cromer Road in the vicinity of Norwich International Airport. The extended period of study and consultation means that the figure shows several overlapping possibilities.
- 3.10.6 As noted earlier, examination of possible routes between the A1067 and the A47(T) (west) concluded that none were free of the possibility of a significant impact on the Wensum Valley SAC. NCC took the decision not to proceed with a 'full NDR'. The routes examined between the A1067 and the A47(T)(west) are therefore not shown on the plan.
- 3.10.7 Five possible routes were identified between the A140 and the A1067, four of them being variations on a direct route to the north of Taverham, Thorpe Marriott and Drayton (options 1-4 on Figure 3.4). The fifth option would retain the A1067 through those settlements with a shorter link to the A140 between Drayton and Hellesdon. It would do nothing to relieve the settlements or the built-up section of the A1067 through them and was not considered further.
- 3.10.8 The outer options (1 and 2) would have a greater impact on the landscape and nature conservation and were also discarded. Of the remaining routes,

option 3 was preferred to option 4 because it would have less impact on property. From this point, the open landscape supported the direct route common to options 1-4 and became the basis of the application proposals.

3.10.9 East of the A140, three broad route options were identified: an inner route immediately north of the then existing urban edge; an outer route to the south of Rackheath, Spixworth and Horsham St Faith, and a central route between the two. An NDR following the inner route would have greater impact on the existing urban area and would also be less well related to the proposed areas of new development. A road following the central route would have greater impact on the natural environment and would leave less room for growth than the outer route. The outer route was mainly through farmland and was best located to serve new development. It was therefore used as the basis for working up the application proposals.

3.10.10 Subsequent effort has been concentrated on identifying the alignment and design that would minimise environmental impacts. Inclusion of the preferred route in the JCS (the statutory development plan) has meant that residential and employment sites in the area could be planned and designed in the knowledge that the role of providing for extraneous or through traffic would be taken by the NDR.

3.10.11 Several detailed variations within a corridor between the Airport and Horsham St Faith were investigated. The selected route passes as far as possible from dwellings in Horsham St Faith and Spixworth without interfering with the operation of the Airport.

3.10.12 Between Thorpe End and the junction with the A47(T) at Postwick, the selected route is part of the arrangement of the junction with the A47(T) and the development of the Broadland Gate Business Park.

Alternatives to the Scheme

3.10.13 To confirm that the preferred option is the one that best meets the need, the application proposals (the Scheme) have been compared with the following five variations, which constitute the potential alternatives to the application proposals. Their relative merits and disadvantages have been assessed in relation to the objectives set in the need section of this chapter:

- Alternative 1 – a single carriageway road following the same route as the proposed scheme

- Alternative 2 – a dual carriageway from the A47(T) at Postwick on a route the same as that of the preferred scheme but terminating at the A140
- Alternative 3 – as alternative 2 but with the addition of a single carriageway from the A140 to the A1067
- Alternative 4 – the preferred scheme except as a single carriageway between Fir Covert Road and the A1067
- Alternative 5 – Developer-funded link roads between the north east radials (in the segment between the A47(T) at Postwick and the A140) in conjunction with the development of planned growth areas

3.10.14 Following a detailed description of each option the same assessment methodology was followed as previously described, i.e., a scoring system based on the following seven point scale:

- +++ Large positive
- ++ Moderate positive
- + Slight positive
- = Neutral
- Slight negative
- Moderate negative
- Large negative

3.10.15 As a comparator in order to calibrate the relative effectiveness of the alternatives, the application proposals have been assessed as providing large positive benefits (+++) under each objective.

Table 3.8: Performance against the objectives: The NDR Scheme (NDR)

Objective	Scoring	Comment
Reduce traffic levels and congestion on the existing road network both within the urban area and beyond to the north	+++	Dual carriageway copes best with traffic flows and provides the most attractive alternative for existing

Objective	Scoring	Comment
		journeys. Sufficient capacity to accommodate future planned growth
Facilitate journeys that are currently difficult and require traffic to use roads that are unsuitable for the type and volume of traffic that is currently accommodated	+++	As above, a dual carriageway performs best and will provide the most attractive alternative route because it has the greatest capacity
Provide access to and help to deliver, planned and potential areas of growth, and enable those areas to be free of the need to incorporate provision for extraneous traffic	+++	Dual carriageway provides high quality and capacity transport connections, attractive to potential investment in employment and housing. Removes any requirement for new residential areas to accommodate through traffic
Provide improved transport connectivity, including with the national strategic road network, for existing and future areas of residential and employment development, Norwich International Airport and the wider area of North and North East Norfolk	+++	Dual carriageway provides high quality transport connections with the national road network through the Postwick Hub
Increase the opportunities for improving provision for public transport and other sustainable forms of transport and for improving traffic management within the City Centre, thereby encouraging modal shift	+++	Dual carriageway provides an attractive alternative and thus relieves existing corridors to ease conditions for

Objective	Scoring	Comment
		sustainable modes
Improve traffic related environmental conditions for those communities in the northern suburbs of Norwich and outlying villages, whilst minimising the environmental effects of the proposed intervention	+++	Dual carriageway reduces traffic on inappropriate roads and best alleviates environmental conditions associated with traffic

3.11 Alternative 1 – Single Carriageway Road on the Same Route as the Proposed NDR Scheme

Description

3.11.1 Alternative 1 comprises a single 7.3m wide carriageway (Design Manual for Roads and Bridges (DMRB) TA 46/97 standard S2) highway on the same alignment as the proposed NDR Scheme (the Scheme), and with the same end points.

3.11.2 Alternative 1 would be connected to the same side roads as the Scheme. The junction with the A140 would be an at-grade roundabout (the Scheme has a grade-separated roundabout junction at that location). Other junctions, including the junction with the A47(T) at Postwick, would be in the same form as those in the Scheme.

3.11.3 The single 7.3 metre wide carriageway (standard S2) has been used in preference to the 10 metre wide single carriageway standard (standard WS2) because WS2 roads have a higher than expected percentage of accidents involving overtaking than S2. This collision type has a high risk of death or serious injury as the outcome.

3.11.4 Alternative 1 would have a design speed of 100kph with a proposed speed limit of 60mph.

3.11.5 A plan of Alternative 1 is shown in Figure 3.5.

Engineering and Buildability

Design and Geometry

- 3.11.6 Alternative 1 would be a single carriageway road designed to broadly match the alignment of the Scheme as closely as possible taking geometric design criteria into account.
- 3.11.7 The principles of horizontal and vertical alignment design for single and dual carriageway roads are fundamentally different. Dual carriageway design is based on sinuous curves to maintain optimum design speed for light vehicles, with visibility designed to achieve desirable minimum Stopping Sight Distance (SSD). Single carriageway design is based on long straight or nearly straight sections to provide Full Overtaking Sight Distance with short curves to maximise overtaking opportunities. It is likely that optimisation of the alignment would be necessary to maximise overtaking opportunities. No detailed assessment of overtaking provision has been undertaken.
- 3.11.8 The predicted flows for the Scheme are in excess of the economic flow range for a single carriageway (S2) recommended in the Design Manual for Roads and Bridges (DMRB) TA 46/97 Traffic Flow Ranges for Use in the Assessment of New Rural Roads, with the exception of the section between the A1067 and Fir Covert Road.
- 3.11.9 The proposed junction at Postwick would be a modification of the existing grade separated junctions similar to proposals in the preferred Scheme. All of the remaining junctions would be at-grade roundabouts including the junction with the A140 close to the Airport.

Structures

- 3.11.10 A new three span overbridge to cross the A47 would be required at Postwick similar to the preferred Scheme. Alternative 1 would also cross Plumstead Road and the Sheringham to Norwich railway line on new bridges similar to those proposed in the preferred Scheme. All-purpose road bridges would be provided at Middle Road and Buxton Road which would include facilities for non-motorised users.
- 3.11.11 Bridge crossings for private means of access and non-motorised users would be provided at Newman Road and Bell Farm Track. A bridge crossing for non-motorised users would be provided at Marriotts Way

Non-motorised Users

3.11.12 For non-motorised users, Alternative 1 would include similar provision to the Scheme.

Drainage

3.11.13 Sustainable Drainage Systems (SuDS) would be provided, similar to the Scheme.

Statutory Undertakers Apparatus

3.11.14 Alternative 1 crosses an existing high-pressure gas main (HPGM) close to the A1067. The HPGM would need to be diverted as it would in the Scheme.

3.11.15 The route is mainly through greenfield land. There are service diversions detailed for the Scheme, which would also be required for this alternative. These would consist of the relocation of overhead and underground electric cables, gas mains, overhead and underground telephone cables and water mains.

Private Means of Access

3.11.16 Alternative 1 would include similar provision to that proposed by the Scheme.

Construction

3.11.17 Construction methodology would be similar to the preferred Scheme with the majority of the scheme being constructed on greenfield land. It is anticipated that these works could be undertaken in 125 weeks.

Economy

3.11.18 A single carriageway alternative was assessed as a Low Cost Option for the MSBC in 2009. It was similar to but not identical to Alternative 1. The results of its economic assessment indicated that it had transport disbenefits – “The Low Cost Option performs poorly, failing to deliver journey time savings, due to the impacts of additional traffic using existing road links.” (MSBC Vol 3 Section 3.5.6).

3.11.19 The traffic forecasts for the proposed NDR Scheme vary between 12300 AADT at the western end (at the A1067) and 35200 AADT towards the eastern end (at Postwick / the A47) in the 2017 opening year. The range overall is substantially higher than the upper limit in TA46/97 of 13000 AADT for a single carriageway road. Whilst Alternative 1 will meet the transport connections objective, the lower standard means that there would be a poorer operational performance of Alternative 1 compared with the Scheme due to overcapacity of the single carriageway and thus reduced attractiveness, so that a proportion of traffic will remain on the existing network. Consequently the economic performance of Alternative 1 would be significantly reduced compared with the Scheme, as would the reliability benefits for business users and the wider economic impacts.

Environmental

3.11.20 A single carriageway would result in much the same environmental benefits and disbenefits as the preferred dual carriageway Scheme. Disbenefits associated with ecology and land use would be marginally reduced, and any benefits associated with noise and air quality would also be reduced as a result of a less efficiently functioning network.

Social

3.11.21 The performance of Alternative 1 compared with the Scheme for commuters and other users would be similar to that described for business users in the section on economy above. However, the travel benefits would be reduced with this alternative, as would reliability benefits.

3.11.22 Dual carriageways have a better safety record than single carriageways. In addition, due to the limited capacity of the single carriageway, there will be higher traffic levels on the existing unimproved network. For these reasons the safety benefits of the single carriageway Alternative 1 would be significantly reduced compared with the Scheme.

Public Accounts

3.11.23 The construction cost of the Scheme and of Alternative 1 has been estimated on the same basis to give an overall cost comparison for each of the designs. The results are summarised below:

Value in £m	Scheme	Alternative 1
Construction	110.2	90.4
Preparation	10.9	9.0
Supervision	1.3	1.1
Land Cost	15.3	14.3
Total	137.7	114.8

3.11.24 The construction cost estimate has been produced in consultation with the Contractor and reflects Quarter 1 of 2013 prices. The construction cost shown for the Alternative is a very early design estimate that includes a notional allowance for further design development and risk. The preparation and supervision costs have been estimated pro rata from those for the proposed Scheme.

3.11.25 It is estimated that there would be an approximate 6% reduction in the land taken compared to the proposed Scheme.

3.11.26 Through the reduced land take requirements some landowners affected by the proposed Scheme may not be affected by this Alternative, or may be affected by it to a lesser degree than they would be affected by the proposed Scheme.

3.11.27 It is assumed that all of the land acquisition would require the exercise of compulsory purchase powers.

Overall Assessment

3.11.28 The table below provides an objective assessment of the performance of Alternative 1 against the Scheme objectives.

Table 3.9: Performance of Alternative 1 against Scheme Objectives

Objective	Scoring	Comment
Reduce traffic levels and congestion on the existing road network both within the urban area and beyond to the north	+ +	Limited by capacity and attractiveness of single carriageway
Facilitate journeys that are currently difficult and require traffic to use roads that are unsuitable for the type and volume of traffic that is currently accommodated	+ +	Limited by capacity and attractiveness of single carriageway
Provide access to and help to deliver, planned and potential areas of growth, and enable those areas to be free of the need to incorporate provision for extraneous traffic	+ +	Limited by capacity and attractiveness of single carriageway
Provide improved transport connectivity, including with the national strategic road network, for existing and future areas of residential and employment development, Norwich International Airport and the wider area of North and North East Norfolk	+ +	Limited by capacity and attractiveness of single carriageway
Increase the opportunities for improving provision for public transport and other sustainable forms of transport and for improving traffic management within the City Centre, thereby encouraging modal shift	+	Limited by capacity and attractiveness of single carriageway
Improve traffic related environmental conditions for those communities in the northern suburbs of Norwich and outlying villages, whilst minimising the environmental effects of the proposed intervention	+	Noise and air quality may be improved

Conclusion

3.11.29 Alternative 1's fulfilment of the Scheme objectives is limited by the traffic capacity and attractiveness of its single carriageway to traffic. Its lower cost has resulted in a better assessment for effects on Public Accounts. However, this is outweighed by its assessments for other aspects. It has therefore been assessed as not performing as well as the Scheme, and has not been pursued.

3.12 Alternative 2 – Dual Carriageway from Postwick Terminating at the A140

Description

3.12.1 Alternative 2 comprises a curtailed version of the Scheme, extending from the A140 to the A47(T) at Postwick. It would follow the same route as the Scheme, and comprise dual 7.3 metre wide carriageways (standard D2AP).

3.12.2 A plan of Alternative 2 is shown in Figure 3.6.

Engineering and Buildability

Design and Geometry

3.12.3 Alternative 2 would be a dual carriageway road designed to match the alignment of the preferred scheme from the A140 Cromer Road to A47(T) at Postwick.

3.12.4 As Alternative 2 would be designed along the alignment of the Scheme, it would be designed to the same horizontal and vertical alignment as that proposed for the Scheme.

3.12.5 Alternative 2 would be connected to the same side roads as the Scheme over its length. The terminal junction with the A140 would be an at-grade roundabout (the Scheme proposes a grade-separated roundabout junction). Other junctions, including the junction with the A47(T) at Postwick, would be in the same form as those in the Scheme.

Structures

3.12.6 A new three span overbridge to cross the A47 would be required at Postwick as proposed in the preferred Scheme. Alternative 2 would also cross Plumstead Road and the Sheringham to Norwich railway line on new bridges.

All-purpose road bridges would be provided at Middle Road and Buxton Road which would include facilities for non motorised users.

3.12.7 A bridge crossing for private means of access and non-motorised users would be provided at Newman Road.

Non – Motorised Users

3.12.8 Similar provision to the Scheme between the A140 and A47 at Postwick.

Drainage

3.12.9 Sustainable Drainage Systems (SuDS) would be adopted similar to the Scheme.

Statutory Undertakers Apparatus

3.12.10 The new dual carriageway link is mainly on greenfield land. There are service diversions detailed for the Scheme, which would also be required for this Alternative. These would consist of overhead and underground electric cables, gas mains, overhead and underground telephone cables and water mains.

Private Means of Access

3.12.11 Similar provision to the preferred Scheme between the A140 and A47 at Postwick.

Construction

3.12.12 Construction methodology would be similar to that proposed for the Scheme with the majority of the scheme constructed on greenfield land. It is anticipated that these works could be undertaken in 104 weeks.

Economy

3.12.13 Alternative 2 would provide similar traffic relief and safety benefits in the northeast sector but not in the northwest sector, compared with the Scheme. The overall scale of these benefits would be smaller than those for the Scheme due to its shorter length.

- 3.12.14 A consequence of Alternative 2 is that it does not provide an improved transport connection to the west of the A140 and Airport, and thus traffic conditions are not relieved on Fakenham Road through Taverham and Drayton. In addition the minor route via Hall Lane between Drayton and the termination of Alternative 2 at the A140 would carry much higher traffic flows. These are forecast to increase by up to 9800 AADT.
- 3.12.15 The business user travel time benefits would be reduced with Alternative 2 compared with the Scheme, as would reliability benefits and wider economic impacts.

Environmental

- 3.12.16 There would be environmental disbenefits associated with ecology and landscape arising from this Alternative. However, there is development proposed for the northeastern area of Norwich. As this already has permission it is likely to result in significant habitat loss in the area of this proposed Alternative. There would be benefits to noise and air quality as this Alternative would take traffic away from residential roads.

Social

- 3.12.17 The performance of Alternative 2 compared with the Scheme for commuters and other users will be similar to that described for business users in the section on economy above. Consequently the travel benefits will be reduced with the alternative, as will reliability benefits.
- 3.12.18 The absence of a western section for the distributor route means that traffic will be increased on unsuitable routes such as Hall Lane and that Fakenham Road will not experience any relief. Consequently there would be a poorer safety record compared with providing the western section of the Scheme as the new road would be designed to modern highway standards and would have a superior safety performance compared with the existing roads.

Public Accounts

3.12.19 The construction cost of the Scheme and the cost of implementing Alternative 2 have been estimated on the same basis to give an overall cost comparison for each of the designs. The results are summarised below:

Value in £m	Scheme	Alternative 2
Construction	110.2	82.3
Preparation	10.9	8.2
Supervision	1.3	1.0
Land Cost	15.3	9.7
Total	137.7	101.2

3.12.20 The construction cost estimate has been produced in consultation with the Contractor and reflects Quarter 1 of 2013 prices. The construction cost shown for the Alternative is a very early design estimate, which includes a notional allowance for further design development and risk. The preparation and supervision costs have been estimated pro rata from those for the proposed Scheme.

3.12.21 It is envisaged that there would be an approximate 26% reduction in the land taken compared to the proposed scheme.

3.12.22 As a result of the significantly reduced land take requirement a number of landowners affected by the proposed Scheme would not be affected by this Alternative.

3.12.23 It is assumed that all of the land acquisition would require the exercise of compulsory purchase powers.

Overall Assessment

3.12.24 The table below is an objective assessment of the performance of Alternative 2 against the Scheme objectives.

Table 3.10: Performance of Alternative 2 against Scheme Objectives

Objective	Scoring	Comment
Reduce traffic levels and congestion on the existing road network both within the urban area and beyond to the north	+ +	No relief west of A140
Facilitate journeys that are currently difficult and require traffic to use roads that are unsuitable for the type and volume of traffic that is currently accommodated	+ +	No relief west of A140
Provide access to and help to deliver, planned and potential areas of growth, and enable those areas to be free of the need to incorporate provision for extraneous traffic	+ +	No improved transport connection west of A140
Provide improved transport connectivity, including with the national strategic road network, for existing and future areas of residential and employment development, Norwich International Airport and the wider area of North and North East Norfolk	+ +	No improved transport connection west of A140 and thus reduced level of transport connections to new developments, the Airport and North Norfolk
Increase the opportunities for improving provision for public transport and other sustainable forms of transport and for improving traffic management within the City Centre, thereby encouraging modal shift	+	No improvement west of A140
Improve traffic related environmental conditions for those communities in the northern suburbs of Norwich and outlying villages, whilst minimising the environmental effects of the proposed intervention	+	Will improve noise and air quality in the northwestern suburbs of Norwich

Conclusion

3.12.25 Alternative 2 fails to address problems west of the A140, and this limits its fulfilment of scheme objectives. Its lower cost results in a better assessment for effects on Public Accounts. However, this is outweighed by its assessments for other aspects. It has therefore been assessed as not performing as well as the Scheme, and has not been pursued.

3.13 Alternative 3 - Dual Carriageway from Postwick to the A140 and a Single Carriageway from the A140 to the A1067

Description

3.13.1 Alternative 3 comprises dual carriageways (standard D2AP) as the Scheme from the A47(T) at Postwick to the A140, and then a single carriageway (standard S2) to the A1067 on a similar alignment as the Scheme.

3.13.2 A plan of Alternative 3 is shown in Figure 3.7

Engineering and Buildability

Design and Geometry

3.13.3 Alternative 3 would be a combination of a dual carriageway scheme between the A47 (T) at Postwick and the A140 Cromer Road and a single carriageway road between A140 and the A1067.

3.13.4 The Alternative would be as per the horizontal and vertical alignment proposed for the Scheme along the dual carriage section. Over the single carriageway section, the Alternative would be designed to broadly match the alignment of the preferred Scheme as closely as possible along the single carriageway section taking geometric design criteria into account.

3.13.5 As discussed in section 3.11.7, the principles of horizontal and vertical alignment design for single and dual carriageway roads are fundamentally different. It is likely that optimisation of the single carriageway alignment west of the A140 would be necessary to maximise overtaking opportunities. No detailed assessment of overtaking provision has been undertaken.

3.13.6 The predicted flows for the Scheme are in excess of the economic flow range for the section of single carriageway (S2) road with the exception of the section between the A1067 and Fir Covert Road. Standard S2 is proposed rather than 'Wide Single' WS2 because WS2 roads have a higher than

expected percentage of accidents involving overtaking than S2 roads. This collision type carries a high risk of death or serious injury as the outcome.

- 3.13.7 Alternative 3 would be connected to the same side roads as the Scheme. The junction with the A140 would be an at-grade roundabout (the Scheme has a grade-separated roundabout junction). The other junctions would as per those proposed for the Scheme.

Structures

- 3.13.8 A new three span overbridge to cross the A47 would be required at Postwick similar to the Scheme. Alternative 3 would also cross Plumstead Road and the Sheringham to Norwich railway line on new bridges. All-purpose road bridges would be provided at Middle Road and Buxton Road, which would include facilities for non-motorised users.

- 3.13.9 Bridge crossings for private means of access and non-motorised users would be provided at Newman Road and Bell Farm Track.

- 3.13.10 A bridge for non-motorised users would be provided at Marriotts Way.

Non-motorised Users

- 3.13.11 Alternative 3 would include similar provision to the Scheme.

Drainage

- 3.13.12 Sustainable Drainage Systems (SuDS) would be adopted similar to the Scheme.

Statutory Undertakers' Apparatus

- 3.13.13 Alternative 3 crosses an existing high-pressure gas main close to the A0167, which would need to be diverted. This is similar to the Scheme. There are service diversions detailed for the Scheme, which would also be required for this alternative. These would consist of overhead and underground electric cables, gas mains, overhead and underground telephone cables and water mains.

Private Means of Access

3.13.14 Alternative 3 would include similar provision to the Scheme.

Construction

3.13.15 Construction methodology would be similar to the preferred Scheme with the majority of the scheme constructed on greenfield land.

3.13.16 It is anticipated that these works could be undertaken in 135 weeks.

Economy

3.13.17 The traffic forecasts for the Scheme on the NDR vary between 12,300 AADT between Fakenham Road and Fir Covert Road at the western end of the NDR and 22,300 AADT west of the A140 in the 2017 opening year. The range overall is substantially higher than the upper limit in TA46/97 of 13,000 AADT for a single carriageway. In addition the Alternative requires an at grade roundabout junction on the A140 at the transition between the dual and single carriageway standard which would cause additional delays compared with the proposed Scheme. Whilst Alternative 3 will meet the transport connections objective, the lower standard of the western section and the A140 junction means that there would be a poorer operational performance of Alternative 3 compared with the Scheme due to overcapacity of the single carriageway and thus reduced attractiveness, such that a proportion of traffic will remain on the existing network. Consequently the economic performance of Alternative 3 would be reduced compared with the Scheme, as would the reliability benefits for business users and wider economic impacts.

Environmental

3.13.18 This Alternative would have disbenefits as regards ecology and landscape, although the single carriageway section would have fewer effects on biodiversity than would the dual carriageway section. However the dual carriageway section is situated in an area allocated for development and as a result there would be considerable future habitat loss not associated with the road.

3.13.19 There would be benefits with regard to noise and air quality as this Alternative would reduce the traffic on inappropriate roads in suburban areas.

Social

3.13.20 The performance of Alternative 3 compared with the Scheme for commuters and other users will be similar to that described for business users in the section on economy above. Consequently the travel benefits will be reduced with the Alternative, as will reliability benefits.

3.13.21 Dual carriageways have better safety records than single carriageways. In addition, due to the limited capacity of the single carriageway, there would be higher traffic levels remaining on the existing unimproved network. For these reasons the safety benefits of the single carriageway element of Alternative 3 will be reduced compared with the Scheme.

Public Accounts

3.13.22 The construction costs of the Scheme and of Alternative 3 have been estimated on the same basis to give an overall cost comparison for each of the designs. The results are summarised below:

Value in £m	Scheme	Alternative 3
Construction	110.2	102.8
Preparation	10.9	10.3
Supervision	1.3	1.2
Land Cost	15.3	15.0
Total	137.7	129.3

3.13.23 The construction cost estimate has been produced in consultation with the Contractor and reflect Quarter 1 of 2013 prices. The construction cost shown for the Alternative is a very early design estimate, which includes a notional allowance for further design development and risk. The preparation and supervision costs have been estimated pro rata from those for the proposed Scheme.

3.13.24 It is envisaged that there would be an approximate 2% reduction in the land taken compared to the proposed Scheme.

3.13.25 The small reduction in land take means that it is possible that some landowners affected by the proposed Scheme may not be affected by this Alternative.

3.13.26 It is assumed that all of the land acquisition would require the exercise of compulsory purchase powers.

Overall Assessment

3.13.27 The table below is an objective assessment of the performance of Alternative 3 against the Scheme objectives.

Table 3.11: Performance of Alternative 3 against Scheme Objectives

Objective	Scoring	Comment
Reduce traffic levels and congestion on the existing road network both within the urban area and beyond to the north	+ +	Limited by capacity and attractiveness of single carriageway west of A140
Facilitate journeys that are currently difficult and require traffic to use roads that are unsuitable for the type and volume of traffic that is currently accommodated	+ +	Limited by capacity and attractiveness of single carriageway west of A140
Provide access to and help to deliver, planned and potential areas of growth, and enable those areas to be free of the need to incorporate provision for extraneous traffic	+ +	Limited by capacity and attractiveness of single carriageway west of A140
Provide improved transport connectivity, including with the national strategic road network, for existing and future areas of residential and employment development, Norwich International Airport and the wider area of North and North East Norfolk	+ +	Limited by capacity and attractiveness of single carriageway west of A140
Increase the opportunities for improving provision for public transport and other sustainable forms of transport and for improving traffic management		Limited by capacity and attractiveness of single carriageway

Objective	Scoring	Comment
within the City Centre, thereby encouraging modal shift	+	west of A140
Improve traffic related environmental conditions for those communities in the northern suburbs of Norwich and outlying villages, whilst minimising the environmental effects of the proposed intervention	+	Will improve noise and air quality for suburban areas

Conclusion

3.13.28 Alternative 3’s fulfilment of Scheme objectives is limited by the capacity and attractiveness of its single carriageway west of the A140. This is not outweighed by other aspects. It has therefore been assessed as not performing as well as the Scheme, and has not been pursued.

3.14 Alternative 4 - NDR as Proposed Scheme Except Single Carriageway between Fir Covert Road and A1067

Description

3.14.1 Alternative 4 comprises dual carriageway (standard D2AP) as per the Scheme from the A47(T) at Postwick to Fir Covert Road, and then a single carriageway (standard S2) to the A1067 on a similar alignment as the Scheme.

3.14.2 A plan of Alternative 4 is shown in Figure 3.8.

Engineering and Buildability

Design and Geometry

3.14.3 Alternative 4 would be a combination of a dual carriageway scheme between the A47 (T) at Postwick and Fir Covert Road and a single carriageway road from a roundabout junction at Fir Covert Road to the A1067.

3.14.4 The Alternative would be as per the horizontal and vertical alignment proposed for the Scheme.

3.14.5 Alternative 4 would be connected to the same side roads using the same junction arrangements as those proposed for the Scheme.

Structures

3.14.6 A new three span overbridge to cross the A47 would be required at Postwick similar to the Scheme. Alternative 4 would also cross Plumstead Road and the Sheringham to Norwich railway line on new bridges. All-purpose road bridges would be provided at Middle Road and Buxton Road, which would include facilities for non-motorised users.

3.14.7 Bridge crossings for private means of access and non-motorised users would be provided at Newman Road and Bell Farm Track.

3.14.8 A bridge for non-motorised users would be provided at Marriotts Way.

Non-motorised Users

3.14.9 Alternative 4 would include similar provision to the Scheme.

Drainage

3.14.10 Sustainable Drainage Systems (SuDS) would be adopted similar to the Scheme.

Statutory Undertakers Apparatus

3.14.11 Alternative 4 would require similar diversions to the Scheme.

Private Means of Access

3.14.12 Alternative 4 would include similar provision to the Scheme.

Construction

3.14.13 Construction methodology would be similar to the Scheme with the majority of the scheme constructed on greenfield land.

3.14.14 It is anticipated that these works could be undertaken in 135 weeks.

Economy

- 3.14.15 The traffic forecasts for the Scheme between Fakenham Road and Fir Covert Road is 12300 AADT in the 2017 opening year. This is below the upper limit in TA46/97 of 13000 AADT for a single carriageway. The lower standard on this short section of NDR would not have a significant effect on traffic forecasts and consequently the economic performance of Alternative 4 would be similar to that for the proposed Scheme.

Environmental

- 3.14.16 There are environmental disbenefits associated with ecology and landscape. The western end of the route is particularly sensitive with regards to bat populations, while the eastern section is subject to development unrelated to the Scheme and will experience habitat loss. This is similar to the preferred Scheme.

Social

- 3.14.17 The performance of Alternative 4 compared with the Scheme for commuters and other users will be similar to that described for business users in the section on economy above. Consequently the travel benefits will be similar to the published Scheme, as will reliability benefits.
- 3.14.18 Dual carriageways have a better safety record than single carriageways. For this reason the safety benefits of the single carriageway element of Alternative 4 will be reduced compared with the Scheme.
- 3.14.19 Alternative 4 was included as an alternative to the Scheme within both the Section 47 and Section 42 statutory consultation under the Planning Act 2008. Feedback from the consultation indicated that of those that responded there was a majority support for a dual carriageway between Fir Covert Road and the A1067.

Public Accounts

3.14.20 The construction costs of the Scheme and of Alternative 4 have been estimated on the same basis to give an overall cost comparison for each of the designs. The results are summarised below:

Value in £m	Scheme	Alternative 4
Construction	110.2	109.4
Preparation	10.9	10.9
Supervision	1.3	1.3
Land Cost	15.3	15.3
Total	137.7	136.9

3.14.21 The construction cost estimate has been produced in consultation with the Contractor and reflects Quarter 1 of 2013 prices. The construction cost shown for the alternative is a very early design estimate, which includes a notional allowance for further design development and risk. The preparation and supervision costs have been estimated pro rata from those for the proposed Scheme.

3.14.22 It is envisaged that there would be a negligible reduction in the land taken compared to that required for the proposed Scheme.

3.14.23 It is considered that all landowners affected by the proposed Scheme will still be affected by this Alternative.

3.14.24 It is assumed that all of the land acquisition would require the exercise of compulsory purchase powers.

Overall Assessment

3.14.25 The table below is an objective assessment of the performance of Alternative 4 against the Scheme objectives.

Table 3.12: Performance of Alternative 4 against Scheme Objectives

Objective	Scoring	Comment
Reduce traffic levels and congestion on the existing road network both within the urban area and beyond to the north	+ ++	Similar to Scheme
Facilitate journeys that are currently difficult and require traffic to use roads that are unsuitable for the type and volume of traffic that is currently accommodated	+ ++	Similar to Scheme
Provide access to and help to deliver, planned and potential areas of growth, and enable those areas to be free of the need to incorporate provision for extraneous traffic	+ ++	Similar to Scheme
Provide improved transport connectivity, including with the national strategic road network, for existing and future areas of residential and employment development, Norwich International Airport and the wider area of North and North East Norfolk	+ ++	Similar to Scheme
Increase the opportunities for improving provision for public transport and other sustainable forms of transport and for improving traffic management within the City Centre, thereby encouraging modal shift	+ ++	Similar to Scheme
Improve traffic related environmental conditions for those communities in the northern suburbs of Norwich and outlying villages, whilst minimising the environmental effects of the proposed intervention	+ ++	Will improve noise and air quality for suburban areas

Conclusion

3.14.26 Alternative 4 would not provide a consistent standard for the NDR, it would not provide continuity of road type with the A47 (T) Norwich Southern Bypass for the entire length of the NDR and would provide an inferior performance in terms of link accidents and user costs. Alternative 4 was included as an alternative to the Scheme within both the Section 47 and Section 42 statutory consultation under the Planning Act 2008. Feedback from the consultation indicated that of those that responded there was a majority support for the dual carriageway between Fir Covert Road and the A1067. It has therefore been assessed as not performing as well as the Scheme, and has not been pursued.

3.15 Alternative 5 - Developer Links between Radials (within the Growth Areas)

Description

3.15.1 Alternative 5 comprises a single carriageway link road between St Faith's Road and Broadland Business Park. A plan of Alternative 5 is shown in Figure 3.9.

3.15.2 It has been assumed that:

- the route between St Faiths Road and Wroxham Road would follow the alignment of the Beyond Green development spine road (Planning Application Number 20121516), which has the benefit of a resolution to grant planning permission subject to a planning obligation and various planning conditions;
- between Wroxham Road and Salhouse Road the route would follow the alignment of the Blue Boar Lane development spine road (Planning Application Number 20080367) granted outline planning permission in 2011, and
- between Broadland Business Park and Plumstead Road the route would follow the alignment of the Brook Farm Laurel Farm development spine road (Planning Application Number 20090886 granted outline planning permission in 2013).

3.15.3 It has been assumed there would be some improvement works to widen Wroxham Road between the connections from the Beyond Green and Blue Boar Lane developments.

3.15.4 To facilitate a connection from St Faiths Lane to Meteor Close and Hurricane Way it has been assumed that either St Faith's Road and Repton Avenue

would be improved or that a possible new road could be constructed across the field immediately north of Repton Avenue.

- 3.15.5 There is no published alignment for the missing section of this Alternative between Salhouse Road and Plumstead Road. It is therefore assumed this would take a straight alignment which would pass close to or through an area of ancient replanted woodland just to the north of Plumstead Road.
- 3.15.6 Junction improvements to the A47 interchange (Planning Application Number 20081773) do not form part of this alternative. It should be noted that the Broadland Gate and Brook Farm Laurel Farm development is conditional on the improvement of Postwick Interchange.

Engineering and Buildability

Design and Geometry

- 3.15.7 Between St Faith's Road and Wroxham Road the alignment would mirror that included in the planning application for the Beyond Green development. It has been assumed that this section of the road would comprise a single 6.5m wide carriageway.
- 3.15.8 The section between Salhouse Road and Wroxham Road would mirror that included in the planning permission for the Blue Boar development. As per the planning application, the alignment would include a new roundabout junction with Salhouse Road and would be designed with a 7.3m wide carriageway and subject to a 30mph speed limit.
- 3.15.9 The Alternative would adopt an indicative alignment for a link between Plumstead Road and Salhouse Road. This link is technically feasible and a geometric design solution could be found that follows the suggested alignment (which is shown in green on the plan at Figure 3.9). It has been assumed that it would be a modern single carriageway road comprising a single 7.3m wide carriageway. Without a detailed assessment it is not possible to say if the ancient replanted woodland or County Wildlife Site could be avoided. There are residential curtilages to the east at the southern end between Salhouse and Plumstead Road.
- 3.15.10 Between the Broadland Business Park and Plumstead Road, the proposed alignment follows that proposed as part of the Brook Farm / Laurel Farm development spine road. The route over this section would include a new roundabout junction with Plumstead Road as well as four internal roundabouts within the development. This section of the route would

comprise either a 7.3m or 6.5m wide carriageway and would be subject to a 30mph speed limit.

3.15.11 Between the White House Farm development access point and the Beyond Green development access point, the Alternative includes an allowance for widening works to Wroxham Road.

3.15.12 The Alternative would adopt an indicative alignment either along St Faith's Road and Repton Avenue or constructed across the field immediately north of Repton Avenue to connect with Meteor Close. This link is technically feasible and a geometric design solution could be found that follows the suggested alignment. It has been assumed that it would be a modern single carriageway road comprising a single 7.3m wide carriageway.

Structures

3.15.13 No detailed assessment has been undertaken.

Non-motorised Users

3.15.14 No detailed assessment has been undertaken.

Drainage

3.15.15 No detailed assessment has been undertaken.

Statutory Undertakers Apparatus

3.15.16 No detailed assessment has been undertaken.

Private Means of Access

3.15.17 No detailed assessment has been undertaken.

Construction

3.15.18 No detailed assessment has been undertaken.

Economy

3.15.19 The link roads have been represented in the Do Minimum scenario in the model testing. This shows the following forecasts on the link road sections:

Link	2032 AADT
Buxton Road to North Walsham Road	3700
North Walsham Road to Wroxham Road	13500
Wroxham Road to Salhouse Road	11100
Salhouse Road to Plumstead Road	16700
Plumstead Road to Broadland Business Park	17300

3.15.20 The traffic flows have been taken for 2032 when the developments are assumed to be fully built out.

3.15.21 The Do Minimum scenario does not include a link from Buxton Road via St Faiths Road then to Meteor Close to allow a connection through to the Airport and A140 Holt Road, and this explains the low forecast traffic level between Buxton Road and North Walsham Road. However it serves to show that the traffic flows forecast on the other link roads would be very high and well in excess of their intended function as mixed use urban high street through the Beyond Green development (between North Walsham Road and Wroxham Road). Adding a connection to the Airport and A140 would increase the through traffic movements further, and thus this Alternative would fail in relation to the objective of removing extraneous through traffic from residential development. The operational performance of the link roads would be significantly poorer than with the proposed NDR Scheme and Alternative 5 would therefore have a more limited benefit in removing traffic from existing routes.

3.15.22 The economic benefits for business users would be reduced significantly for the northeast quadrant between the A47(T) and the A140, and there would be no benefits for the northwest segment as the Alternative terminates at the A140. Reliability benefits and wider economic benefits would be considerably reduced with Alternative 5 compared with the Scheme.

Environmental

3.15.23 In terms of landscape and ecology the environmental disbenefits would be associated with the developments and involve habitat loss. Putting roads through areas of housing creates new receptors for noise and air quality disbenefits.

Social

3.15.24 The performance of Alternative 5 compared with the Scheme for commuters and other users would be similar to that described for business users in the section on economy above. Consequently the travel benefits would be substantially reduced with the Alternative, as would reliability benefits.

3.15.25 Due to the limited capacity of the (assumed) single carriageway link roads, there will be higher traffic levels on the existing unimproved network. For these reasons the safety benefits of the single carriageway Alternative 5 will be substantially reduced compared with the Scheme.

Public Accounts

3.15.26 The construction cost of the Scheme and Alternative 5 have been estimated on the same basis to give an overall cost comparison for each of the designs. The results are summarised below:

Value in £m	Scheme	Alternative 5
Construction	110.2	37.7
Preparation	10.9	3.8
Supervision	1.3	0.4
Land Cost	15.3	0.9
Total	137.7	42.8

3.15.27 The construction cost estimate has been produced in consultation with the Contractor and reflects Quarter 1 of 2013 prices. The construction cost shown for the Alternative is a very early design estimate, which includes a notional allowance for further design development and risk. The preparation and supervision costs have been estimated pro rata from those for the proposed Scheme.

3.15.28 The above land cost estimate excludes the existing consented development sites as for the purposes of this assessment it has been assumed that developers would make this land available to NCC at no cost.

3.15.29 It is assumed that land acquisition for the remaining land would require the exercise of powers of compulsory acquisition.

Overall Assessment

3.15.30 The table below is an objective assessment of the performance of Alternative 5 against the scheme objectives.

Table 3.13: Performance of Alternative 5 against Scheme Objectives

Objective	Scoring	Comment
Reduce traffic levels and congestion on the existing road network both within the urban area and beyond to the north	=	Limited due to serving as direct access to developments and catering for large traffic flows; no provision west of A140
Facilitate journeys that are currently difficult and require traffic to use roads that are unsuitable for the type and volume of traffic that is currently accommodated	=	Limited due to serving as direct access to developments and catering for large traffic flows; no provision west of A140
Provide access to and help to deliver, planned and potential areas of growth, and		Limited due to serving as direct access to

Objective	Scoring	Comment
enable those areas to be free of the need to incorporate provision for extraneous traffic	+	developments and catering for large traffic flows; no provision west of A140
Provide improved transport connectivity, including with the national strategic road network, for existing and future areas of residential and employment development, Norwich International Airport and the wider area of North and North East Norfolk	+	Limited due to serving as direct access to developments and catering for large traffic flows; no provision west of A140
Increase the opportunities for improving provision for public transport and other sustainable forms of transport and for improving traffic management within the City Centre, thereby encouraging modal shift	=	Limited due to serving as direct access to developments and catering for large traffic flows; no provision west of A140
Improve traffic related environmental conditions for those communities in the northern suburbs of Norwich and outlying villages, whilst minimising the environmental effects of the proposed intervention	-	The proximity of sensitive receptors associated with the new developments may have noise and air quality disbenefits

Conclusion

3.15.31 Alternative 5's fulfilment of Scheme objectives is very limited as it would serve as a direct access to development, would cater for large traffic flows and due to the lack of provision west of the A140. This is not outweighed by its significantly better assessment for its effects on Public Accounts due to its much lower cost. It has therefore been assessed as not performing as well as the Scheme, and has not been pursued.

3.16 Conclusion on Alternatives

3.16.1 In order to meet the need identified at the beginning of this chapter, a detailed assessment of alternative options has been carried out, covering both the principle of an NDR and its route, standard and design.

3.16.2 In summary, the conclusions of the assessment are:

- improvements to public transport and increased provision for cycling and walking would not by themselves address the fundamental economic and accessibility problems of the area. This is due in part to the difficulty of improving public transport without addressing the problem of traffic congestion. It also reflects the reality that public transport cannot fully address the connectivity problems in the increasingly polycentric City or support its growth as envisaged in planning policy;
- an NDR is essential if the current and future transport and land use problems of the greater Norwich area are to be addressed, the economic and physical expansion of the City facilitated, sensitive urban and rural environments protected from extraneous traffic, connectivity within and around the northern part of the City restored and improved, and improvements to public transport fully implemented;
- a non-road building solution will not meet the need, but an NDR has to be accompanied by parallel improvements in public transport, which the NDR will itself enable and to which NCC is committed;
- improvements to the existing highway network will also not meet the need. The scale of the works that would be required would have unavoidable, significant impacts on the urban environment and it is not feasible to conclude that they could be implemented;
- reliance on the internal link roads to be provided by developers of land to the north east of the City would neither meet the need nor be in the interests of the quality of life and function of these future residential areas, and
- variations to the standard and length of the application proposals would to varying degrees reduce the benefits of the Scheme and its contribution to the need, and would erode its value as a key element of the transport infrastructure of the growing City.

3.16.3 These conclusions derive from studies carried out over a lengthy period as part of the review and implementation of NATS, in parallel with EIA and with public and stakeholder consultation. Other approaches to meeting the need and alternative schemes have been assessed within the process of the review of transport strategy for the greater Norwich area and in the context of the evolution of land use policies in a Joint Core Strategy prepared by all the constituent local planning authorities. The overall conclusion is that the application Scheme proposals for a dual carriageway NDR between the A47(T) at Postwick and the A1067 Fakenham Road represent the most appropriate response to the need identified in the first section of this chapter.

4. Air Quality

4.1 Introduction

4.1.1 The proposed Scheme has the potential to cause air quality effects during the construction and operational phases. The key pollutants for consideration within the assessment of air quality effects are:

- nitrogen oxides (NO_x), particularly nitrogen dioxide (NO₂);
- fine particles (particulate matter defined as those less than 10 and 2.5 microns in diameter; PM₁₀ and PM_{2.5} respectively); and
- dust (defined as particulate matter in the size range 1-75 microns in diameter).

4.1.2 During the construction phase, the proposed Scheme would introduce new emission sources in the form of traffic and plant at some locations, and involve potentially dust generating activities.

4.1.3 During operation the proposed Scheme would add in a new major road and alter parts of the existing road network. It would therefore introduce traffic along a new route and change the characteristics of traffic flows on the wider road network. Changes in traffic flows can impact the location and amount of emissions to air and, subsequently, affect ambient air quality.

4.1.4 Potential changes in air quality at sensitive receptors affected by the proposed Scheme are considered by comparison with air quality standards, as well as with relevant policy and legislation.

4.2 Methodology

Introduction

4.2.1 This Chapter describes the approach that has been taken for the assessment of effects on air quality as a result of the proposed Scheme.

Construction Phase

Dust Generating Activities

4.2.2 Construction activities can result in temporary effects from dust. 'Dust' is a generic term which usually refers to particulate matter in the size range 1-75

microns in diameter; the most common impacts from dust emissions are soiling and increased ambient PM₁₀ concentrations (Building Research Establishment, 2003). Assessment methodologies based on a qualitative approach are advocated in a range of guidance, including that produced by the Mayor of London (Greater London Authority and London Councils Best Practice Guidance, 2006), the Buildings Research Establishment (BRE) (Building Research Establishment, 2003)] and more recently guidance published by the Institute of Air Quality Management (IAQM) (Institute of Air Quality Management, 2011). Therefore, a qualitative approach has been adopted for this assessment based on key issues identified in the guidance described above.

- 4.2.3 The distances from the emission source at which significant construction dust effects are likely to occur are dependent on the extent and nature of mitigation measures, the prevailing wind conditions, rainfall and the presence of natural screening by, for example, vegetation or existing physical screening. However, research indicates that effects from construction activities that generate dust are generally limited to within 150-200m of the construction site boundary (Highways Agency, 2007) although guidance issued by IAQM requires consideration of effects up to 350m from the construction area boundary (Institute of Air Quality Management, 2011) . The construction phase of the assessment is therefore limited to within 350m of the area where construction activities would take place.

Site Plant Emissions

- 4.2.4 Construction work requires the use of a range of site plant, such as excavators, piling equipment, cranes and on site generators. All of these plant have an energy demand and some may result in direct emissions to air from exhausts.
- 4.2.5 Guidance from the IAQM notes that impacts from exhaust emissions from on-site plant are unlikely to be significant. The Scheme Construction Methodology [Volume 2, Chapter 19: CEMP] provides a list of the number of plant likely to be on site at any time. Given the small, local and temporary nature of site plant, effects of emissions on local air quality are considered to be of negligible significance. Construction plant emissions have therefore not been assessed further. Nevertheless, mitigation measures to reduce the effect of site plant on local air quality are discussed in Section 4.6.

Construction Traffic

4.2.6 During the construction phase the proposed Scheme will generate up to 75 Heavy Goods Vehicle (HGV) deliveries (150 movements) per day predominantly in 20 tonne eight wheeled wagons [Volume 2, Chapter 19: CEMP]. EPUK guidance indicates that assessments of construction traffic emissions is only likely to be required for large, long-term construction sites that would generate HGV flows of over 200 movements per day over a period of a year or more. In addition, the Design Manual for Roads and Bridges advises that roads where long term changes in HDV movements are lower than 200 AADT can be screened out from further assessment. On this basis no further consideration has been given to the impacts of construction traffic on ambient air quality.

4.3 Operational Phase

Study Area

4.3.1 Traffic modelling has been undertaken for the Norwich area, and this forms the basis of the overall geographical extent considered in the air quality assessment. However, only areas where changes in traffic flow, and therefore emissions, have the potential to cause significant effects on local air quality have been considered in detail.

4.3.2 Consistent with the (DMRB) (Highways Agency, 2007), the following criteria have been applied to determine which areas require detailed assessment using dispersion modelling:

- new roads (NDR and adjoining junctions); or
- roads where alignment will change by 5m or more; or
- roads with changes in flows of 1,000 annual average daily traffic (AADT) or more; or
- roads with changes in Heavy Duty Vehicle (HDV) flows of 200 AADT or more; or
- roads with changes in daily average traffic speeds of 10 km/h or more; or
- roads with changes in peak hour speed of 20 km/h or more; or
- roads located in areas where existing concentrations are highest within the City Centre, including the Central Norwich Air Quality Management Area (AQMA).

- 4.3.3 Increases in ambient pollutant concentrations as a result of emissions from road vehicles are greatest very near to the road, and reduce rapidly with increasing distance. The DMRB identifies that contributions from a road to ambient pollutant concentrations are generally negligible at a 200m distance from the road and therefore only receptors within 200m of roads meeting the criteria above, have been considered. Based on the criteria outlined above the study area defined for dispersion modelling is presented in Volume 2.
- 4.3.4 Traffic data used within the dispersion model has been provided by Mott MacDonald's traffic consultants and is based on the outputs of a SATURN model developed for the proposed Scheme. Details of the SATURN modelling are provided in DCO Document 5.9: Highway LMVR.
- 4.3.5 The SATURN model has incorporated predicted growth from the Joint Core Strategy (JCS) in both the 'without Scheme' and 'with Scheme' scenarios and therefore any predicted changes in ambient air quality are as a result of the NDR and additional measures associated with the proposed Scheme. Further details of the traffic model and assumptions related to the JCS and measures are presented within the Transport Assessment (DCO Document 5.5: Transport Assessment).

Model Selection

- 4.3.6 The assessment uses a dispersion model called 'ADMS-Roads' (version 3.1); a PC-based model of dispersion in the atmosphere of pollutants released from road traffic sources, produced and validated by Cambridge Environmental Research Consultants (CERC). This model is widely used in the UK, including by Local Authorities for Review and Assessment purposes and to support planning application assessments. The approach used for the modelling is consistent with Technical Guidance produced by the Norfolk Environmental Protection Group (Technical Guidance, Air Quality and Land use Planning, Norfolk Environmental Protection Group (undated)).

Emission Factors

- 4.3.7 Defra's current guidance to Local Authorities recommends the use of the 'Emission Factor Toolkit' (EFT) to calculate road traffic emissions for dispersion modelling. The newest version of the toolkit (Version 5.2c) is available from Defra (<http://laqm.defra.gov.uk/review-and-assessment/tools/emissions.html>). Although the EFT provides predictions of future emissions, there remains some uncertainty over these predictions.

This has been addressed through sensitivity analyses, as detailed below in Sensitivity Analysis for Long Term NO_x and NO₂ Projections

Meteorological Data

4.3.8 The most important meteorological parameters governing the atmospheric dispersion of emissions are wind direction, wind speed and atmospheric stability, as described below:

- wind direction determines the sector of the compass into which the emissions is dispersed;
- wind speed affects the distance, which the emission travels over time and can affect dispersion by increasing the initial dilution of pollutants;
- atmospheric stability determines the dispersion of the emissions as they move away from the source.

4.3.9 For meteorological data to be suitable for dispersion modelling purposes, a number of meteorological parameters need to be measured on an hourly basis. These parameters include wind speed, wind direction, cloud cover and temperature. There are only a limited number of sites where the required meteorological measurements are made.

4.3.10 Data from Norwich weather centre from 2010 to 2012 were used within the assessment. Although the land use within the study area does vary between urban and rural, the meteorological station is considered sufficiently representative for the purposes of the assessment and this is shown through the model verification process (see Model Verification).

4.3.11 Windroses have been produced for each of the three years of meteorological data used in this assessment and are presented in Volume 2, Chapter 4: Air Quality, Section A, Figure 1.1.

Background Pollutant Concentrations

4.3.12 Only road traffic emission sources have been explicitly included within the dispersion model. Non-road traffic related emission sources have been accounted for within the assessment by assigning appropriate 'background' concentrations to modelled receptor locations.

4.3.13 A number of information sources are available on background concentrations and these are presented, along with the choice of background data, within the baseline section (Section 4.5, below).

4.3.14 Assessment of uncertainty with future year background concentrations has been addressed through sensitivity analyses, as detailed in Sensitivity Analysis for Long Term NO_x and NO₂ Projections.

NO_x to NO₂ Relationship

4.3.15 Research undertaken on behalf of Defra has provided a method to determine NO₂ concentrations (<http://uk-air.defra.gov.uk/>). This method has been used within this assessment and its suitability assessed within the model verification process (see below).

Predicted 1 hour and 24 hour pollutant concentrations

4.3.16 The assessment of NO₂ concentrations against the 1 hour air quality objective has only been considered within the assessment if annual mean NO₂ concentrations exceed 60µg/m³. Government guidance (Department for Environment Food and Rural Affairs, 2009) [advises that exceedences of the 1 hour mean objective for NO₂ are only likely to occur where annual mean concentrations are 60µg/m³ or above.

4.3.17 The prediction of daily mean concentrations of PM₁₀ is available as an output option within the ADMS roads dispersion model for comparison against the short term air quality objective. However, as the model output for annual mean concentrations is considered more accurate than the modelling of the daily mean, an empirical relationship has been used to determine daily mean PM₁₀ concentrations. In accordance with Government guidance (Department for Environment, Food and Rural Affairs, 2009). The following formula has been used:

$$\text{No. of 24-hour mean exceedences} = -18.5 + 0.00145 \times \text{annual mean}^3 + (206 / \text{annual mean})$$

Modelled Scenarios

4.3.18 This assessment has modelled the following scenarios

- 'Without Scheme' (WO) scenario 2017 (opening year); and
- 'With Scheme' (W) scenario 2017 (opening year).

4.3.19 An analysis of the predicted future (2032) traffic flows shows that, although an increase is expected, this is outweighed by the improvement in vehicle emissions and background concentrations expected. No additional future years have therefore been considered; the opening year of the proposed Scheme is expected to present the worst case within the first 15 years of opening and therefore, in accordance with DMRB, no other future year has been assessed.

Model Verification

4.3.20 Dispersion modelling has associated with it an inherent level of uncertainty, primarily as a result of:

- uncertainties with traffic flow and emissions data;
- uncertainties with recorded meteorological data; and
- simplifications made in the model algorithms or post processing of the data that describe atmospheric dispersion or chemical reactions.

4.3.21 This uncertainty has been addressed within the assessment by carrying out model verification and sensitivity analyses. Details of the model verification are presented in Volume 2, Chapter 4: Air Quality, Section A.

Ecological Assessment

4.3.22 Elevated NO_x concentrations can adversely affect ecosystems. Assessment of exposure to NO_x has included the following key stages (following the DMRB methodology):

- identification of all Designated Sites within 200m of roads 'affected' by the proposed Scheme which have designated features sensitive to air pollutants directly or indirectly; and
- calculation of annual average NO_x concentrations at the Designated Sites with and without the Scheme.

4.3.23 Elevated nitrogen deposition can also adversely affect ecosystems.

Assessment of nitrogen deposition has included the following key stages (following the DMRB methodology):

- identification of all Designated Sites which 200m of roads 'affected' (see Study Area) by the proposed Scheme which have designated features sensitive to nitrogen deposition;
- obtaining total average nitrogen deposition for all 5km by 5km grid squares for the study area of interest from the Air Pollution Information System (APIS) (www.apis.ac.uk);
- obtaining background NO_x and NO₂ concentrations for the study area;
- calculation of annual average NO₂ concentrations at the Designated Sites with and without the proposals;
- estimation of the dry deposition of NO₂ at the Designated Sites with and without the proposals and the dry deposition of NO₂ in the 5km by 5km APIS square;
- determination of the road contribution to NO₂ dry deposition, and total nitrogen deposition; and
- comparison with the relevant critical load (a description of critical loads is presented in the Summary).

Sensitivity Analysis for Long Term NO_x and NO₂ Projections

4.3.24 Following model verification there is still the potential for uncertainty to remain with respect to NO_x and NO₂ projections. The Highways Agency Interim Advice Note (IAN) 170/12 Rev1 (Highways Agency, 2012) provides guidance on how to address this issue for roads schemes. It includes predicting concentrations at receptors based on different assumptions on long term NO_x and NO₂ projections so that a judgement can be made as to which results should be relied upon to form a concluding view of significance. The approach set out in the IAN has been followed for this assessment.

Receptors

Human Health Receptors

4.3.25 The air quality objectives only apply in locations of relevant exposure. Table 1.1 provides details of where the respective objectives should and should not apply and therefore the types of receptors that are relevant to the assessment.

Table 4.1: Locations where the air quality objectives should and should not apply (Reference Defra 2009)

Averaging period	Objectives should apply at:	Objectives should not apply at:
Annual	<p>All locations where members of the public might be regularly exposed.</p> <p>Building façades of residential properties, schools, hospitals, care homes etc.</p>	<p>Building façades of offices or other places of work where members of the public do not have regular access. Hotels, unless people live there as their permanent residence.</p> <p>Gardens of residential properties.</p> <p>Kerbside sites (as opposed to locations at the building façade), or any other location where public exposure is expected to be short-term.</p>
24 Hour	<p>All locations where the annual mean objective would apply, together with hotels. Gardens of residential properties.</p>	<p>Kerbside sites (as opposed to locations at the building façade), or any other location where public exposure is expected to be short-term.</p>
1 Hour	<p>All locations where the annual mean and 24 and 8-hour mean objectives apply.</p> <p>Kerbside sites (for example, pavements of busy shopping streets).</p> <p>Those parts of car parks, bus stations and railway stations etc. which are not</p>	<p>Kerbside sites where the public would not be expected to have regular access.</p>

Averaging period	Objectives should apply at:	Objectives should not apply at:
	fully enclosed, where members of the public might reasonably be expected to spend one hour or more. Any outdoor locations where members of the public might reasonably be expected to spend one hour or longer.	

4.3.26 On the basis of Table 4.1, and the road selection criteria described in the Study Area, discrete human health receptors have been selected and are presented in Volume 2, Chapter 4: Air Quality, Section A.

4.3.27 These receptors have been chosen as they represent locations where changes in ambient concentrations as a result of the Scheme are likely to be greatest or where the existing concentrations are highest.

Ecological Receptors

4.3.28 The DMRB (Highways Agency, 2007) provides a methodology for assessing air quality effects on SACs, SPAs, SSSIs and Ramsar sites (hereafter referred to as 'Designated Sites'). This is discussed further within the Ecological Assessment Section.

4.3.29 Discrete receptors have been included within the dispersion modelling to predict potential effects at ecological sites. Receptors have been placed in a transect across the Designated Sites at increasing distances from the affected roads at a height of zero metres.

4.3.30 Volume 2, Chapter 4: Air Quality, Section A presents the ecological Designated Sites potentially affected by the proposed Scheme (i.e. those within 200m of roads meeting the criteria described in the Study Area Section). Table 4.2 presents the modelled ecological discrete receptors (which are located as 'transects' across the designated sites) included within the dispersion modelling.

Table 4.2: Modelled Discrete Ecological Receptors

Designated Site	Distance from 'Affected' Road	Coordinates	
		X	Y
River Wensum 1 (SAC)	0 ^(a)	625935	316535
	70	626003	316517
	115	626046	316504
	175	626105	316488
Broadland (SPA, RAMSAR), The Broads (SAC)	0 ^(a)	612818	316746
	70	612800	316820
	115	612777	316875
	175	612752	316941

Notes: (a) Represents closest point of the designated site adjacent to the road

Site survey

4.3.31 As part of the Assessment an air quality monitoring survey was undertaken along the route of the NDR.

4.3.32 A summary of the method and results is presented in Volume 2, Chapter 4: Air Quality, Section A.

Assessment Criteria

Construction Phase

4.3.33 Guidance from the IAQM recommends splitting the construction phase into four separate source categories and determining the dust risk associated with each of those sources individually. This assessment has determined the risk of each of the following source categories;

- Demolition;
- Earthworks;

- Construction; and
- Track out.

4.3.34 The risk of each source for dust effects is described as 'negligible', 'low risk', 'medium risk' or 'high risk' depending up the nature and scale of the construction activities and the proximity of sensitive receptors to the construction site boundary.

4.3.35 The assessment considers three separate effects from dust:

- annoyance due to dust soiling;
- harm to ecological receptors (including internationally and nationally designated sites and County Wildlife Sites (CWS); and
- the risk of health effects due to significant increase in exposure to PM₁₀.

4.3.36 The first stage of the assessment is to determine the overall dust raising magnitude from each of the dust sources identified (demolition, earthworks, construction and trackout) in accordance with the criteria outlined in Volume 2, Chapter 4: Air Quality, Section A, Table 1.3.

4.3.37 The second stage of the assessment is to determine the overall risk of each of the dust sources in relation to dust soiling, ecological receptors and PM₁₀ concentrations during the construction phase. This is based on the distance of the construction boundary to the closest receptors and the magnitude of dust raising activities for each source. Volume 2, Chapter 4: Air Quality, Section A, Table 1.4 to 1.7 present the criteria used for determining overall dust risk from each dust raising source.

4.3.38 In the third stage of the assessment the sensitivity of the receptors located within 350 m of the construction boundary is determined based on the criteria outlined within Volume 2, Chapter 4: Air Quality, Section A, Table 1. Receptors include residential areas and relevant features of cultural heritage interest. The sensitivity of receptors has been based on the highest of any of the criteria being met and therefore the assessment is considered conservative.

4.3.39 The final stage of the assessment takes the risk category identified for each of the dust sources identified and the sensitivity of receptors, to determine the overall significance of effects on annoyance due to dust soiling, harm to ecological receptors and the risk of health effects due to an increase in exposure to PM₁₀. The significance criteria are outlined within Volume 2,

Chapter 4: Air Quality, Section A, Table 1 and assume that mitigation measures appropriate for construction sites with the dust raising potential identified within the assessment will be applied.

Operational phase – Human Health Receptors

4.3.40 A number of approaches can be used to determine whether the potential air quality effects of a Scheme are significant. However, there remains no universally recognised definition of what constitutes ‘significance’ for air quality effects.

4.3.41 Guidance is available from a range of regulatory authorities and advisory bodies on how best to determine and present the significance of effects within an air quality assessment. It is generally considered good practice that, where possible, an assessment should communicate effects both numerically and descriptively.

4.3.42 Any description of an effect of a Scheme is informed by numerical results. However, an element of professional judgement must also be involved. To ensure that the descriptions of effects used within the assessment are clear, consistent and in accordance with recent guidance, definitions for the assessment of changes in ambient air quality at discrete human health receptors have been adapted from the Environmental Protection UK (EPUK) Development Control: Planning for Air Quality 2010 guidance (Environmental Protection UK, 2010). Table 4.3 to Table 4.4 provide descriptors for changes in NO₂, PM₁₀ and PM_{2.5} concentrations as a result of the proposed Scheme.

Table 4.3: Magnitude descriptors for predicted change in annual mean concentrations (Source: Ref 22)

Magnitude	NO ₂ /PM ₁₀ Concentrations	PM _{2.5} Concentrations
Large	Increase / decrease >4µg/m ³	Increase / decrease >2.5 µg/m ³
Medium	Increase / decrease 2 - 4µg/m ³	Increase / decrease 1.25 – 2.5 µg/m ³
Small	Increase / decrease 0.4 -2 µg/m ³	Increase / decrease 0.25 -1.25 µg/m ³
Imperceptible	Increase / decrease <0.4 µg/m ³	Increase / decrease <0.25 µg/m ³

Table 4.4: Magnitude descriptors for predicted change in number of days with PM₁₀ Greater than 50 µg/m³ (Source: Ref 22)

Magnitude	Number of Days with PM ₁₀ Greater than 50 µg/m ³
Large	Increase / decrease >4 days
Medium	Increase / decrease 2 – 4 days
Small	Increase / decrease 1 – 2 days
Imperceptible	Increase / decrease < 1 day

4.3.43 The magnitude of any change identified must be considered in the context of existing air quality conditions within the study area to determine the significance of that magnitude.

4.3.44 Table 4.5 provides descriptors for the significance of air quality effects based on the magnitude of change in the context of existing conditions. EPUK recognise that professional judgement is required in the interpretation of air quality assessment significance. Table 4.5 is intended as a tool to help interpret the results to the air quality assessment and will therefore be employed in conjunction with professional judgement. It should be noted only 'moderate' effects or above are considered to be significant for the purposes of this assessment.

Table 4.5: Descriptors of significance of effect (Source: Environmental Protection UK, 201).

Absolute Concentrations in Relation to Objective	Change in Concentration ^(a)		
	Small	Medium	Large
<u>Increase with proposed Scheme</u>			
Above objective value with Scheme (> Objective)	Minor adverse	Moderate adverse	Major adverse
Just below objective value with Scheme (>90% of the Objective)	Minor adverse	Moderate adverse	Moderate adverse
Below objective value with Scheme (>75% of the Objective)	Negligible	Minor adverse	Minor adverse
Well below objective value with Scheme (<75% of the Objective)	Negligible	Negligible	Minor adverse
<u>Decrease with proposed Scheme</u>			
Above objective value with Scheme (>Objective)	Minor beneficial	Moderate beneficial	Major beneficial
Just below objective value with Scheme (>90% of the Objective)	Minor beneficial	Moderate beneficial	Moderate beneficial
Below objective value with Scheme (>75% of the Objective)	Negligible	Minor beneficial	Minor beneficial
Well below objective value with Scheme (<75% of the Objective)	Negligible	Negligible	Minor beneficial

Note: (a) 'Moderate' effects or above are considered to be significant within this assessment.

'Objective' refers to national air quality objective. See below for assessment of compliance with EU limit values

4.3.45 EPUK recognises that, as well as assessing effects at discrete receptors, consideration of a scheme's overall effect on air quality must be made using professional judgement of a suitably qualified person, whilst taking account of the following key factors:

- number of properties affected by air quality effects and a judgement on the overall balance;
- the magnitude of the changes and the descriptions of the effects at the receptors (as per the tables above);
- whether or not an exceedence of an objective is predicted to arise in the study area where none existed before or an exceedence area is substantially increased;
- whether or not the study area exceeds an objectives and whether this exceedence is removed or the exceedence area is reduced;
- uncertainty, including the extent to which worst-case assumptions have been made; and
- the extent to which an objective or limit value is exceeded, e.g. an annual mean NO₂ of 41µg/m³ should attract less significance than an annual mean of 51µg/m³.

4.3.46 The factors set out above have been taken into account when assessing the overall significance of the changes in air quality.

Operational Phase - Compliance with EU Limit Values

4.3.47 The EU Directive on ambient air quality (2008/50/EC) sets a range of 'limit values' for pollutants including NO₂ and PM₁₀ (further details are presented in Section 4.4). Defra assesses and reports on the status of the UK's compliance with the limit values to the European Commission annually.

4.3.48 The evidence base for the annual assessment of compliance is based on a combination of information from the UK national monitoring networks and the results of modelling assessments. Modelling is undertaken using a national model known as the Pollution Climate Mapping (PCM) model. The PCM model has been designed to assess compliance with the limit values at locations defined within the Directive.

4.3.49 In June 2013 the Highways Agency (HA) published an Interim Advice Note (IAN 175/13) which described a method for using outputs from the dispersion modelling for a road scheme assessment with those from Defra's PCM model in order to identify the risk of a scheme causing non-compliance with an EU limit value. IAN 175/13 has recently been withdrawn, pending an update. However, in the absence of an updated version, IAN 175/13 has been followed for this assessment to assess the Scheme's potential effect on compliance with the EU limit values. Key elements of the IAN 175/13 approach are summarised below:

- Obtain outputs from Defra's PCM model for road links being assessed that are included within the Compliance Risk Road Network (CRRN);
- Calculate the Scheme contribution to annual mean NO₂ concentrations at a worst case receptor location near to the CRRN links;
- Identify those road links where the PCM modelled total NO₂ concentrations, or Scheme modelled total NO₂ concentrations are greater than 40 µg/m³;
- Identify those road links where the Scheme is at risk of causing a new exceedence of the annual mean NO₂ EU limit value.

Operational Phase – Ecological Receptors

4.3.50 In accordance with the DMRB, assessment has been made of potential impacts on Special Areas of Conservation (SAC), Special Protection Areas (SPA) and Sites of Special Scientific Interest (SSSI). Increases in NO_x concentrations at Designated Sites as a result of the scheme would be potentially significant if:

- the Scheme is predicted to cause an increase in annual mean NO_x concentrations of at least 2 µg/m³; and
- predicted concentrations (including background) are very close to or exceed the criterion.

4.3.51 Results from the dispersion modelling have been used to compare concentrations at the Designated Sites with and without the proposals and to identify potentially significant effects in accordance with the above. In the absence of a more specific definition within DRMB, 'very close to the criterion' is assumed to be above 29µg/m³ for the purposes of this assessment (the criterion being 30µg/m³).

4.3.52 Increases in nitrogen deposition at Designated Sites as a result of the Scheme would be potentially significant if the critical load for the site is exceeded as a result of the proposed Scheme.

Assumptions and Limitations

4.3.53 As mentioned in Sensitivity Analysis for Long Term NO_x and NO₂ Projections the primary assumptions and limitations to the study are associated with the uncertainty related to emission factors and the background concentrations assumed within the assessment. These have been addressed through model verification and a sensitivity analysis, the results of which are presented in Volume 2, Chapter 4: Air Quality, Section 1.3 and 1.6 respectively. The assessment is based on the current scheme design. DCO permitted deviations have to be reviewed and are considered to be too small to require explicit consideration within the assessment.

4.4 Context

Legislation

European Union Legislation

4.4.1 EU Framework Directive 96/62/EEC on ambient air quality assessment and management came into force in November 1996 and had to be implemented by Member States by May 1998. This Directive aimed to protect human health and the environment by avoiding, reducing or preventing harmful concentrations of air pollutants. As a Framework Directive, it required the European Commission to propose 'Daughter' Directives which set air quality limit and target values, alert thresholds and guidance on monitoring and measurement for individual pollutants. The four Daughter Directives are as follows:

- Council Directive 1999/30/EC (the first Daughter Directive) relating to limit values for sulphur dioxide (SO₂), nitrogen dioxide (NO₂) and oxides of nitrogen (NO_x), particulate matter (PM₁₀) and lead in ambient air;
- Directive 2000/69/EC (the second Daughter Directive) relating to limit values for benzene and carbon monoxide (CO) in ambient air;
- Directive 2002/3/EC (the third Daughter Directive) relating to ozone (O₃) in ambient air; and
- Directive 2004/107/EC (the fourth Daughter Directive) relating to arsenic, cadmium, mercury, nickel and polycyclic aromatic hydrocarbons in ambient air.

4.4.2 Directive 2008/50/EC on ambient air quality and cleaner air for Europe was adopted in May 2008. This Directive merges the first three existing Daughter Directives and one Council Decision into a single Directive on air quality (it is anticipated that the fourth Daughter Directive will be brought within the new Directive at a later date). It also sets new standards and target dates for reducing concentrations of fine particles.

English legislation

Air quality – Human Health

4.4.3 The Air Quality Standards Regulations 2010 came into force in June 2010; they implement the EU's Directive 2008/50/EC on ambient air quality.

4.4.4 Part IV of the Environment Act 1995 requires that every Local Authority shall periodically carry out a review of air quality within its area, including likely future air quality. As part of this review, the Authority must assess whether air quality objectives are being achieved, or likely to be achieved within the relevant periods. Any parts of an Authority's area where the objectives are not being achieved, or are not likely to be achieved within the relevant period must be identified and declared as an Air Quality Management Area (AQMA). Once such a declaration has been made, Authorities are under a duty to prepare an Action Plan which sets out measures to pursue the achievement of the air quality objectives within the AQMA.

4.4.5 The air quality objectives specifically for use by Local Authorities in carrying out their air quality management duties are set out in the Air Quality (England) Regulations 2000 and the Air Quality (England) (Amendment) Regulations 2002.

4.4.6 The Environment Act also requires that the UK Government produces a national 'Air Quality Strategy' (AQS) containing standards, objectives and measures for improving ambient air quality and to keep these policies under review. Further details of the AQS are presented below.

Air Quality – Ecological Receptors

4.4.7 The Air Quality Standards Regulations relevant to the protection of vegetation specifically transpose the limit value contained within EU's Directive 2008/50/EC on ambient air quality. The Directive contains guidance on the locations where the limit values apply.

4.4.8 The areas where the Air Quality Standards Regulations annual limit for the protection of vegetation applies are:

- more than 20km from an agglomeration (i.e. an area with a population of more than 250,000);
- more than 5km away from industrial sources regulated under Part A of the Environment Act 1990 (and/or Part A1 sites under the Pollution Prevention and Control (PPC) regulations);
- more than 5km away from motorways; or
- more than 5km away from built up areas of more than 5,000 people .

4.4.9 Designated ecological sites within these areas do not have the benefit of protection from statutory air quality limit values. However, there are a number of international and national agreements which identify and seek to protect ecosystems of high conservation value.

4.4.10 These include Special Protection Areas (SPAs) and Special Areas of Conservation (SACs) established under the EC Habitats and Birds Directive (jointly included in a European Union wide network of protected areas called Natura 2000 sites).

4.4.11 The UK conservation agencies' (Natural England, the Countryside Agency for Wales and Scottish Natural Heritage) policy to apply the Air Quality Regulations limit value to all sensitive ecological sites when considering the potential effects of oxides of nitrogen (NO_x) (Environment Agency, 2010).

Statutory Nuisance

4.4.12 Section 79(1)(d) of the Environmental Protection Act 1990 defines one type of 'statutory nuisance' as "any dust, steam, smell or other effluvia arising on industrial, trade or business premises and being prejudicial to health or a nuisance". Where a Local Authority is satisfied that a statutory nuisance exists, or is likely to occur or recur, it must serve an abatement notice. Failure to comply with an abatement notice is an offence. However, it is a defence if an operator employs the best practicable means to prevent or to counteract the effects of the nuisance.

Policy

UK Air Quality Strategy

4.4.13 The Environment Act 1995 requires the UK Government to produce a national AQS. The AQS establishes the UK framework for air quality improvements. Measures agreed at the national and international level are the foundations on which the strategy is based. The first Air Quality Strategy was adopted in 1997 [Ref 10] and replaced by the Air Quality Strategy for England, Scotland, Wales and Northern Ireland published in January 2000. The 2000 Strategy has subsequently been replaced by the Air Quality Strategy for England, Scotland, Wales and Northern Ireland 2007.

4.4.14 The air quality objectives in the AQS are a statement of policy intentions and policy targets. As such, there is no legal requirement to meet these objectives except in as far as they mirror any equivalent legally binding limit values in EU Directives and English Regulations.

National Planning Policy Framework

4.4.15 The National Planning Policy Framework sets out the government's planning policies for England.

4.4.16 With regard to air quality the policy states at paragraph 109 that:

"The planning system should contribute to and enhance the natural and local environment by:... preventing both new and existing development from contributing to or being put at unacceptable risk from, or being adversely affected by unacceptable levels of soil, air, water or noise pollution or land instability..."

4.4.17 And at paragraph 124 that:

"Planning decisions should ensure that any new development in Air Quality Management Areas is consistent with the local air quality action plan."

National Planning Policy Guidance

4.4.18 The Department for Communities and Local Government (DCLG) launched national planning practice guidance as a web-based resource for testing and comment on 28 August 2013. The planning practice guidance is in draft form

and has not been formally issued by the Secretary of State (at the time the assessment was carried out).

4.4.19 Regarding the status of the guidance in decision taking, it notes that:

“The Government considers that where the planning practice guidance published in draft during Beta is a material consideration, it is likely to have limited weight. However, it is for the decision taker to determine the weight of this guidance in any individual decisions.” The National Planning Guidance includes a dedicated section on ‘Air Quality,’ It notes that, for new planning applications, the Local Planning Authority may want to know about:

- “the ‘baseline’ local air quality;
- whether the proposed development could significantly change air quality during the construction and operational phases; and/or
- whether there is likely to be a significant increase in the number of people exposed to a problem with air quality, such as when new residential properties are proposed in an area known to experience poor air quality.”

4.4.20 It also states the following in relation to determining whether air quality is relevant to a planning decision:

“Concerns could arise if the development is likely to generate air quality impact in an area where air quality is known to be poor. They could also arise where the development is likely to adversely impact upon the implementation of air quality strategies and action plans and/or, in particular, lead to a breach of EU legislation (including that applicable to wildlife).”

Local Planning Policy

4.4.21 In 2006, Broadland District Council, Norwich City Council and South Norfolk District Council established the Greater Norwich Development Partnership (GNDP). The GNDP’s role is to develop and deliver the area’s growth strategy through the implementation of the strategic planning policy. As part of each council’s Local Development Framework (LDF), the NPPF requires that Local Authorities prepare a ‘Core Strategy’, which should outline policies for local development up to the year 2026. In 2011, the GNDP produced its first Joint Core Strategy (JCS) which was adopted in March 2011. Following a legal challenge, the JCS was amended and the latest JCS was submitted by GNDP to the Secretary of State in February 2013. The inspector issued his final report on 13th November 2013, stating that, subject to a number of Main

Modifications, the Joint Core Strategy is appropriate. It is expected that each Local Authority will formally adopt the Core Strategy in early 2014.

4.4.22 Spatial planning objective 9 of the JCS is “to protect, manage and enhance the natural, built and historic environment including key landscapes, natural resources and areas of natural habitat or nature conservation value.” This encompasses thirteen separate policies. None of these policies makes specific reference to air quality, although a number of them are expected to lead to improvements in traffic and subsequently may improve air quality. Objective 9 also sets a target of having no AQMAs, although a timescale to achieve this is not provided. The JCS refers to the Norwich Area Transport Strategy (NATS) and describes the need for, and benefits associated with, the proposed NDR. It suggests that the NDR may reduce cross-city vehicle trips and thus may lead to improvements in air quality within Norwich.

4.4.23 On 30 March 2010 Norwich City Council adopted *the Northern city centre area action plan*. This document now forms part of the planning policy framework for the council and will be used when determining planning applications in this part of the city. The plan contains policies and proposals for the regeneration of the area and redevelopment of specific sites over the period 2008-16. The plan area is that bounded by the River Wensum, Bakers Road, Magpie Road, Bull Close Road, and Whitefriars. One of the Area Action Plan Objectives is:

“to improve traffic circulation in the area with reductions in congestion and air pollution, particularly (but not only) within the air quality management area on St Augustines Street, while allowing for traffic generated by redevelopment to be accommodated.” (paragraph 3.3.2)

4.4.24 In addition, paragraph 4.4.2 notes: “A key issue for the plan is to address pollution and air quality problems by providing for improvements to traffic circulation, if possible with reduced movement by vehicles through the area.” (paragraph 3.3.2)]

Summary

4.4.25 This Chapter has identified the legislation and policy framework relevant to the assessment. On the basis of the above, relevant numerical environmental quality standards are summarised in Table 4.6.

4.4.26 Within this assessment, the word ‘objective’ has been used to refer to environmental quality standards provided within the Air Quality (England)

Regulations 2000 (as amended) or the UK Air Quality Strategy 2007. The phrase 'limit value' has been used to refer to the environmental quality standards provided within EU Directive 2008/50/EEC.

4.4.27 Non-statutory environmental quality standards are available for nitrogen deposition; referred to as 'critical; loads'. They are usually defined as 'a quantitative estimate of an exposure to one or more pollutants below which significant effects on specific sensitive elements of the environment do not occur according to present knowledge' (Environment Agency, 2010) [. Relevant critical loads are presented in Volume 2, Chapter 4: Air Quality, Section 1.9.

Table 4.6: Relevant Air Quality Objectives and Limit Values

Pollutant	Averaging Period	Standard	
		Concentration	Allowance
Nitrogen Dioxide (NO ₂)	1-hour	200 µg/m ³	18 per calendar year
	Annual	40 µg/m ³	-
Nitrogen Oxides (NO _x)	Annual	30 µg/m ³	-
Particulates (PM ₁₀)	24-hour	50 µg/m ³	35 per calendar year
	Annual	40 µg/m ³	-
Particulates (PM _{2.5})	Annual	25 µg/m ³	-

4.5 Baseline

Introduction

4.5.1 The study area for the air quality assessment covers three Local Authorities' administrative areas: Norwich City Council (NCC), Broadland District Council (BDC) and South Norfolk District Council (SNDC). Data from all of these Local Authorities and Defra's Air Information Resource 'AIR' website have been reviewed.

4.5.2 The first part of the baseline analysis characterises the existing conditions based on current monitoring data and background pollutant concentration

data. The second part determines the background concentrations to be used within the assessment.

Local Authority Data

Overview

- 4.5.3 On 1 June 2003, NCC declared three AQMAs (Grapes Hill St, Augustines Street and the Castle area) due to exceedences of the annual mean NO₂ objective. The results of a diffusion tube survey in 2007 confirmed that the annual mean objective for NO₂ was not met at several additional locations within Norwich, and so a Detailed Assessment (DA) was undertaken in 2008. The DA concluded that a further AQMA (Riverside) was required, and this was declared in 2009.
- 4.5.4 The 2010 Annual Progress Report revealed exceedences of annual mean NO₂ at a further two locations. Following this, the exceedence at King Street resulted in the recommendation of a further AQMA, whereas the exceedence on Bull Close Road was very marginal, so a DA was carried out and additional monitoring recommended. The most recent review and assessment report (the 2012 Updating and Screening Assessment) recommended that the four existing AQMAs should be revoked and replaced with one larger area encompassing all four. The Central Norwich AQMA was subsequently declared on 1 November 2012 (shown in Volume 2, Chapter 4: Air Quality Section 1.6.1). The AQMA is approximately 3.8 kilometres from the proposed Scheme at its closest point.
- 4.5.5 NCC produced an Air Quality Action Plan in 2004 after the initial designations were made. It includes 16 measures to improve air quality, including park and ride schemes, car sharing, travel plans, a cycle network and use of alternative fuels.
- 4.5.6 BDC declared an AQMA in Upper Hellsdon in 2008 due to exceedences of the annual mean NO₂ objective. The 2009 Updating and Screening Assessment (USA) concluded that the concentrations at all diffusion tube locations within the District met the NO₂ annual mean objective both inside and outside the AQMA and in 2010 the AQMA was revoked. The 2012 Updating and Screening Assessment (the latest Review and Assessment document) concluded no exceedences of the objectives have been identified in Broadland District. The USA notes that a Detailed Assessment for PM₁₀ is still required at Haveringland Farm although this has been put on hold while further guidance is sought (this is for PM₁₀ from a poultry farm).

- 4.5.7 SNDC completed its most recent Review and Assessment report in 2012. This Updating and Screening Assessment indicated that there were no exceedences of objectives at any of the monitoring locations. SNDC has therefore not declared any AQMAs.
- 4.5.8 BDC, SNDC and NCC carry out air quality monitoring at a variety of locations and using a variety of methods. The following sections provide an overview of the monitoring locations and present a summary of key monitoring data.

Roadside and Kerbside Monitoring

- 4.5.9 The majority of monitoring in the three Local Authorities concerned is focussed at 'roadside' or 'kerbside' locations in order to provide the Authorities with data on sites affected by road traffic emissions, which is generally their primary concern. The following sub-sections provide a brief summary of this monitoring data; a full description of the roadside and kerbside monitoring results for each of the three Local Authorities is provided in Volume 2, Chapter 4: Air Quality, Section 1.6.

Automatic Analysers

- 4.5.10 NCC carries out roadside monitoring at one roadside site located at Castle Meadow; this site is located within a bus station and monitors NO₂, PM₁₀ and PM_{2.5}. NO₂ concentrations from 2010 to 2012 at Castle Meadow exceeded the annual mean objective, although it should be noted that monitored concentrations at this location are significantly influenced by bus emissions and this site does not represent relevant exposure for the annual mean. The hourly objective was exceeded for the first time in 2011, although only four of the allowed 18 hours exceeded the hourly objective of 200µg/m³ in 2012. No exceedences of PM₁₀ or PM_{2.5} objectives have been recorded.
- 4.5.11 SNDC previously undertook continuous monitoring of NO₂ and PM₁₀ at one roadside site positioned at Long Stratton Library, however monitoring at this site ceased in early 2012. The results of this monitoring indicated that annual mean NO₂ and PM₁₀ concentrations were below the objective in both 2010 and 2011 and no exceedences of the short-term objective have been recorded.
- 4.5.12 BDC do not undertake any automatic monitoring at roadside or kerbside locations.

NO₂ Passive Diffusion Tubes

- 4.5.13 NCC carried out diffusion tube monitoring at 28 sites in 2012; eighteen of these were roadside sites, nine were kerbside sites and one was a background site. The results of this monitoring show a number of exceedences of the annual mean NO₂ objective over the last three years at roadside and kerbside sites. This is reflected in the declaration of the city-wide AQMA for NO₂ in November 2012, which covers all of the kerbside and roadside diffusion tube monitoring locations. Volume 2, Chapter 4: Air Quality, Section 1.6.1 presents the extent of the city-wide AQMA.
- 4.5.14 BDC undertook diffusion tube monitoring at sixteen sites in 2012; all of which were either roadside or kerbside locations. The results of this monitoring indicated that there were no exceedences of the annual mean NO₂ objective at any monitored sites.
- 4.5.15 SNDC carried out diffusion tube monitoring at twenty-nine sites in 2012; the number and locations of diffusion tubes has been reduced district wide over recent years. Following application of a bias adjustment factor, no tubes recorded exceedences of the annual mean objective. However tubes at Long Stratton and Ditchingham recorded NO₂ levels close to the objective. SNDC has confirmed that these trends are being monitored, although there are currently no plans to declare an AQMA.

Background Monitoring

Automatic Analysers

- 4.5.16 NCC undertakes continuous monitoring of background concentrations of nitrogen oxides (NO_x), NO₂ and particulate matter (as PM₁₀ and PM_{2.5}) at one location. The Norwich Lakenfields site is classified as an urban background site and is part of Defra's Automatic Urban and Rural Network (AURN). It is located approximately 500m south of the city-wide AQMA. Monitoring data for the three most recent years is presented in Table 4.7 and Table 4.8 and shows that monitored concentrations of each pollutant are generally low and, where applicable, are well below the relevant air quality objectives.

Table 4.7: Annual mean pollutant concentrations at the Norwich Lakenfields urban background AURN site (Source: Defra AURN website)

Pollutant	Data capture for 2012 monitoring period (%)	Annual Mean Concentration ($\mu\text{g}/\text{m}^3$)		
		2010	2011	2012
NO _x	98	23	20	19
NO ₂	98	13	13	14
PM ₁₀	87	18	20	14
PM _{2.5}	95	13	14	14

(a) Hourly mean (of which 18 exceedences allowed per year)

(b) Daily (24 hour) mean (of which 35 exceedences allowed per year)

4.5.17 BDC and SNDC do not currently undertake any automatic monitoring and there are no AURN sites located within either District.

NO₂ Passive Diffusion Tubes

4.5.18 NCC carried out diffusion tube monitoring of NO₂ at 28 locations in 2012; one of these is the Lakenfields urban background site, where three diffusion tubes are collocated with the continuous analyser. SNDC carried out diffusion tube monitoring at one Rural Background site (Cringleford Park and Ride) in 2010, although this was moved to a nearby 'Roadside' location in 2011; no new background monitoring sites were introduced to replace it. BDC does not undertake diffusion tube monitoring at any background locations. Passive background monitoring data for the NCC site is presented in Table 4.9 below.

Table 4.9: Annual mean NO₂ concentrations at background locations

Site Name	Local Authority	Within AQMA?	Distance to kerb (m)	Annual Mean Concentration ($\mu\text{g}/\text{m}^3$)		
				2010	2011	2012
Lakenfields	Norwich City Council	N	N/A	15 ^(b)	13 ^(b)	14 ^(a)

All results bias adjusted

Source: (a) NCC Diffusion Tube data (obtained through consultation with EHO)

(b) NCC 2012 Updating and Screening Assessment

4.5.19 Volume 2, Chapter 4: Air Quality, Section 1.6.1 presents the location of this background monitoring site and the Norwich city-wide AQMA.

Defra Estimated and Projected Background Pollutant Concentrations

4.5.20 Defra (Department for Environment Food and Rural Affairs, 2012) provides estimates of background pollution concentrations for NO_x, NO₂, PM₁₀ and PM_{2.5} across the UK for each one kilometre grid square for every year from 2010 to 2030. Future year projections have been developed on the base year for the background maps which is currently 2010. The maps include a breakdown of background concentrations by emission source, including road and industrial sources which have been calibrated against 2010 UK monitoring data. Volume 2, Chapter 4: Air Quality, Section 1.8 presents background concentrations for each receptor within the assessment.

Scheme Monitoring Survey

4.5.21 As part of the Assessment an NO₂ diffusion tube monitoring survey was undertaken from April 2012 until July 2013 at twelve locations along the proposed Scheme route. Results from the nine months of monitoring carried out in the year 2012 have been adjusted to represent an annual mean concentration following Government guidance (Department for Environment, Food and Rural Affairs, 2009). The results of the monitoring indicate that annual mean NO₂ concentrations are well below the air quality objective at locations of representative exposure along the route of the proposed Scheme.

4.5.22 Further details on this survey are provided in Volume 2, Chapter 4: Air Quality, Section 1.7.

Background Pollutant Concentrations Assumed within the Assessment

4.5.23 The background concentrations from the Defra AIR website have been used within this assessment. In accordance with Defra guidance (Department for Environment, Food and Rural Affairs, 2009), background concentrations presented within the results section have had contributions from road sources

included within the dispersion modelling removed, to avoid double counting of emissions. Background concentrations for the base year (2012) and opening year (2017) have been presented Volume 2, Chapter 4: Air Quality, Section 1.8. Sensitivity Analysis for Long Term NO_x and NO₂ Projections provides a description of long-term projections of NO_x and NO₂ concentrations.

4.6 Mitigation

Construction Phase

- 4.6.1 The key effects during the construction phase are associated with dust-raising activities associated with earthworks, construction and trackout. This includes the handling of spoil, loading and unloading of trucks and the movement of the trucks around the construction sites and onto the local road network.
- 4.6.2 The proposed Scheme has a number of incorporated mitigations for the construction phase which are principally aimed at reducing dust effects from the construction activities and will be included within the Construction Environmental Management Plan (CEMP) (Volume 2, Chapter 19: CEMP). The construction phase will include the mitigation measures presented in
- 4.6.3 Table 4.10 and will reduce the dust risk from each of the sources assessed. The overall significance for effects from construction dust has been determined taking this mitigation into account.

Table 4.10: Mitigation Measures

Mitigation	Actioned by Whom	Compliance Route
Site Planning	Contractor	CEMP
Plan site layout – machinery and dust causing activities should be located away from sensitive receptors	Contractor	CEMP
All site personnel to be fully trained	Contractor	CEMP
Trained and responsible manager on site during working times to maintain and carry out site inspections	Contractor	CEMP
Construction Traffic	Contractor	CEMP

Mitigation	Actioned by Whom	Compliance Route
	Contractor	CEMP
All loads entering and leaving site to be covered	Contractor	CEMP
All vehicles switch off engines when stationary – no idling vehicles	Contractor	CEMP
Effective vehicle cleaning and specific fixed wheel washing on leaving site and damping down of haul routes	Contractor	CEMP
No site runoff of water or mud	Contractor	CEMP
On-road vehicles to comply to set emission standards	Contractor	CEMP
All non road mobile machinery (NRMM) to use ultra low sulphur taxexempt diesel (ULSD) where available and be fitted with appropriate exhaust after-treatment from the approved list	Contractor	CEMP
Minimise movement of construction traffic around site	Contractor	CEMP
Hard surfacing and effective cleaning of haul routes and appropriate speed limit around site	Contractor	CEMP
Site Activities	Contractor	CEMP
Minimise dust generating activities	Contractor	CEMP
Use water as dust suppressant where applicable	Contractor	CEMP
Cover, seed or fence stockpiles to prevent	Contractor	CEMP

Mitigation	Actioned by Whom	Compliance Route
wind whipping		
Re-vegetate earthworks and exposed areas	Contractor	CEMP
ensure concrete crusher or concrete batcher has permit to operate	Contractor	CEMP

Operational Phase

4.6.4 No specific incorporated mitigation measures are included for the operational phase of the proposed Scheme. However, the route of the Scheme means that increases in traffic flows (and therefore emissions) generally occur in areas where existing pollutant concentrations are lower and therefore the significance of effects is lower. This is included within the assessment of effects presented below.

4.7 Assessment of Effects

Construction Phase Effects

Construction Activities

4.7.1 The main construction phase of the proposed Scheme is anticipated to begin in January 2015 and be completed by January 2018. Construction will be divided into sections along the route. Each of these sections will contain similar activities including earthworks and construction. The duration of these activities will vary depending on the individual task being carried out [Volume 2, Chapter 19: CEMP]. In order to assess the worst case scenario it has been assumed that earthworks, construction and trackout will occur along the length of the NDR route for the duration of the construction period.

4.7.2 The main construction compound will be located at the airport to the north of the NDR and will be accessed via the Cromer Road. Here the main site office, welfare facilities, materials and plant storage and maintenance facilities will be located. In addition to the main site there will satellite construction compounds to provide offices, parking and plant storage. These will be located at Drayton Lane, Buxton Road, Plumstead Road and Postwick. Batching plants will also be located at three of the compounds located at Drayton Lane, Buxton Road and Plumstead Road. Smaller compounds will be located at each of the bridge sites and these will be reinstated after the

bridge construction is complete. Each of the compounds are located within the DCO boundary of the Scheme and therefore have not been included separately within the construction phase assessment.

4.7.3 The number of receptors located within 350 m of the DCO boundary are presented within Table 4.11.

Table 4.11: Receptors Located within 350 metres of DCO Boundary

Distance from DCO Boundary	Number of Receptors
< 20 m	63
20 – 50 m	112
50- 100 m	149
100 – 350 m	1,763
Total	2,087

4.7.4 In accordance with the assessment criteria outlined in Assessment Criteria, Construction Phase. Table 4.12 presents the risk of dust nuisance effects for each of the sources of construction dust after mitigation.

Table 4.12: Summary of the Risk of Dust Soiling Effects

Source	Dust Soiling Effects	Ecological Effects	PM ₁₀ Effects
Demolition	None - No Demolition Required		
Earthworks	High Risk Site	Medium Risk Site	High Risk Site
Construction	High Risk Site	Medium Risk Site	High Risk Site
Track Out	High Risk Site	Medium Risk Site	High Risk Site
Overall Significance	High	Medium	High

4.7.5 The sensitivity of receptors to dust soiling effects, ecological effects and PM₁₀ effects is presented in

4.7.6 Table 4.13. As the Table shows, the significance of dust soiling effects is slight adverse because receptor sensitivity is high and risk category is high. The significance of ecological effects is slight adverse because receptors sensitivity is very high and risk category is medium. The significance of PM₁₀ effects is negligible because receptor sensitivity is low and risk category is high.

Table 4.13: Receptor Sensitivity

Effect	Sensitivity of Receptor	Comment
Dust Soiling effects	High	Between 10-100 sensitive receptors within 20 m of the DCO boundary
Ecological Effects	Very High	The River Wensum SAC lies approximately 220 m from the DCO boundary
	Medium	Locally designated sites <20m
PM ₁₀ Effects	Low	PM ₁₀ background concentrations are below 75% of the objective

4.7.7 Based on the above, the overall significance of effects of dust nuisance from the construction phase is described as Slight Adverse at worst. Table 4.14 presents a summary of the significance of effects for each dust source and each type of effect.

Table 4.14: Summary of Significance where Mitigation has been Applied

Source	Dust Soiling Effects	Ecological Effects	PM ₁₀ Effects
Demolition	-	-	-
Earthworks	Slight Adverse	Slight Adverse	Negligible
Construction	Slight Adverse	Slight Adverse	Negligible
Trackout	Slight Adverse	Slight Adverse	Negligible
Overall Significance			Slight Adverse

Potential Effects from Climate Change

4.7.8 Windy and warm, dry conditions can combine to generate dust temporarily affecting local air quality. These conditions can exacerbate dust generated during construction, causing issues for the wider environment. However, as the construction phase is anticipated to be completed by around 2018 (and therefore well within any time period within which notable changes in the UK's climate could occur), the potential for effects from climate change to exacerbate dust effects is concluded to be Negligible.

Operational

Human Health Receptors

Nitrogen Dioxide (NO₂)

4.7.9 The modelled annual mean NO₂ concentrations at discrete receptors for the opening year with and without the proposed Scheme are presented in Volume 2, Chapter 4: Air Quality, Table 1.23 and Table 1.26.

4.7.10 As noted in Sensitivity Analysis for Long Term NO_x and NO₂ Projections, sensitivity analysis has been undertaken with respect to long term NO_x and NO₂ projections. Therefore, the significance of effects at discrete receptors is presented in Volume 2, Chapter 4: Air Quality, Section A, Table 1.23 and Table 1.26 on the basis of two different long term projections; one that assumes a reduction in road traffic and background emissions (hereafter referred to as the 'LAQM' method) and one that does not (hereafter referred to

as the 'HA IAN' method). The results of both methods indicate that, at the majority of discrete receptors modelled, effects are concluded to be 'negligible' in accordance with the significance criteria presented in the Operational phase – Human Health Receptors Section.

- 4.7.11 Volume 2, Chapter 4: Air Quality, Table 1.23 shows that beneficial effects generally occur within the Central Norwich AQMA or Norwich urban area, where total concentrations are higher. Adverse effects generally occur in the rural areas near to the NDR route where total concentrations are lower. All discrete receptors where an exceedence of the annual mean objective is predicted in the without Scheme scenario, the proposed Scheme is predicted to cause a beneficial effect. The majority of these are within the Central Norwich AQMA. This is due to the Scheme's general impact of reducing traffic flows through urban areas where concentrations are higher, and introducing new flows through more rural areas where concentrations are lower.
- 4.7.12 As the results in Volume 2, Chapter 4: Air Quality, Section A, Table 1.23 and Table 1.26 show, the proposed Scheme is not predicted to cause any exceedences of the NO₂ air quality objectives.
- 4.7.13 Using the 'LAQM' method, a small number of receptors are concluded to experience 'slight adverse' and 'slight beneficial' effects; no 'moderate adverse' or 'moderate beneficial' effects are predicted. Using the 'HA IAN' method, more 'slight adverse' and 'slight beneficial' effects are predicted. In addition, 'moderate beneficial' effects are predicted to the north of the City centre. Because the LAQM method is considered to provide a more realistic representation of likely future conditions, and is more conservative, it has been used as the basis upon which to judge the significance of impacts.
- 4.7.14 In order to provide an analysis of the number of properties affected by air quality effects overall, Table 4.15 presents the number of properties within 25 m of modelled roads that experience any improvement or deterioration in annual mean NO₂ concentrations as a result of the proposed Scheme. Table 4.16 presents the same information, but for changes of greater than 1 µg/m³ only.

Table 4.15: Number of residential receptors experiencing an improvement or deterioration in annual mean NO₂ concentrations

	Number of Properties
Properties with an improvement in air quality	1194
Properties with a deterioration in air quality	726

Table 4.16: Number of residential receptors experiencing an improvement or deterioration in annual mean NO₂ concentrations greater than 1 µg/m³

	Number of Properties
Properties with an improvement in air quality >1 µg/m ³	79
Properties with a deterioration in air quality >1 µg/m ³	21

4.7.15 As described within the Operational phase – Human Health Receptors Section, judging a Scheme’s overall effect on NO₂ concentrations should consider a range of factors. Taking account of the predicted effects at discrete receptors (including consideration of long-term trends in NO_x and NO₂ concentrations), effects on receptors experiencing concentrations above the air quality objective, and the general change in concentrations at residential properties, the proposed Scheme is concluded to have a Slight Beneficial effect on NO₂ concentrations overall.

4.7.16 The proposed Scheme does not conflict with NCC’s AQAP; the overall improvement in NO₂ is consistent with the aims of the Plan.

Fine Particulates (PM₁₀ and PM_{2.5})

4.7.17 The modelled annual mean concentrations at discrete receptors for the opening year with and without the proposed Scheme are presented in Volume 2, Chapter 4: Air Quality, Section A, Table 1.24. At all receptors, concentrations are predicted to be below the air quality objective and the changes in concentrations caused by the proposed Scheme are concluded to be negligible. Daily mean PM₁₀ concentrations are predicted to be below the objective in all scenarios and the number days when concentrations are above 50 µg/m³ are unchanged by the Scheme.

4.7.18 The modelled annual mean PM_{2.5} concentrations at discrete receptors for the opening year with and without the proposed Scheme are presented in Volume 2, Chapter 4: Air Quality, Section A, Table 1.25. At all receptors, concentrations are predicted to be below the air quality objective and the changes in concentrations caused by the proposed Scheme are concluded to be negligible.

Overall fine particulate effects are concluded to be Negligible.

Ecological Receptors

4.7.19 Predictions of atmospheric NO_x concentrations, and nitrogen deposition at Designated Sites are presented in Volume 2.

4.7.20 As noted within the Operational Phase – Ecological Receptors Section, increases in NO_x concentrations at Designated Sites as a result of the proposals would be potentially significant if:

- the proposed link road is predicted to cause an increase in annual mean NO_x concentrations of at least 2 µg/m³; and
- predicted concentrations (including background) are very close to or exceed the criterion

4.7.21 As shown in Volume 2, the above criteria are not met at any designated sites.

4.7.22 Effects on Designated Sites due to nitrogen deposition are concluded to be Negligible as the proposed Scheme does not cause critical loads to be exceeded.

Compliance with EU Limit Values

4.7.23 Volume 2, Chapter 4: Air Quality, Section 1.95 presents the results of the assessment of the Scheme's potential effects on compliance with EU limit values.

4.7.24 There are 26 CRRN links within the study area. The Scheme is predicted to cause increases in AADT flows along 4 of these links and therefore these are the focus of the assessment.

4.7.25 Volume 2, Chapter 4: Air Quality, Table 1.35 shows, increases in annual mean NO₂ concentrations along these links are small. There are no

exceedences of the limit value predicted by the PCM model and the increases in NO₂ predicted to be caused by the Scheme do not result in a risk of a new exceedence of the EU limit value as total concentrations are below 40 µg/m³.

Potential Effects from Climate Change

4.7.26 Although meteorological conditions can affect ambient pollutant concentrations, future climate change is not considered to have the potential to change the conclusions of the assessment presented above. This is because predicted results are not sensitive to the likely degree of change in conditions expected.

4.8 Conclusions

4.8.1 A qualitative assessment of potential construction phase effects has been undertaken. Mitigation measures have been identified for incorporation within the CEMP commensurate with the risk of dust effects identified and in line with best practice. Potential impacts are concluded to be Negligible to Slight Adverse, at worst and therefore not significant.

4.8.2 Operation phase effects have been assessed using an advanced dispersion model. Concentrations of key traffic related pollutants have been predicted at sensitive human health and ecological receptors and the change as a result of the Scheme has been quantified. Existing concentrations of nitrogen dioxide (NO₂) are of concern in Norwich, particularly in the city where an 'Air Quality Management Area' (AQMA) has been declared, The Scheme is predicted to cause a Slight Beneficial effect on NO₂ concentrations, including within the AQMA, and negligible effects on fine particulate concentrations. Overall, operational phase air quality effects are concluded to be not significant.

Potential impacts	Description for the impact	Description of mitigation measures	How the measures will be implemented, measured and monitored
Construction Phase	Negligible to Slight Adverse	Best practice measures for construction activities (see Section 4.6 Mitigation, Construction Phase)	CEMP

Operation Phase – NO ₂	Slight beneficial	N/A	N/A
Operation Phase – Fine particulates	Negligible	N/A	N/A

5. Carbon

5.1 Introduction

- 5.1.1 The Secretary of State for Communities and Local Government has requested that carbon dioxide emissions specifically be addressed within the Environmental Statement (paragraph 3.77 of the Scoping Opinion -see Volume 1, Appendix 5 of the ES). These emissions contribute to climate change, which is a global issue. The emissions of carbon dioxide, the principal climate change gas, are often referred to by the short-hand “carbon”. In this assessment, any reference to ‘carbon’ is to emissions expressed as carbon dioxide (CO₂).
- 5.1.2 The assessment presents emissions of carbon dioxide associated with the construction of the Scheme and the subsequent changes in emissions during the operation of the Scheme. The results are discussed in relation to national and regional emissions and in relation to relevant legislation and policies.
- 5.1.3 This carbon assessment has been carried out using the reference dates of 2012(baseline), 2017 (scheme opening), 2032 (scheme opening + 15 years) and 2077 (sixty years from Scheme opening).
- 5.1.4 A Climate Change Risk Assessment (Volume 2, Chapter 16: Climate Change Risk Assessment) has also been undertaken. This considers the issues associated with resilience of the Scheme to climate change risks.

5.2 Scheme Design in Context of Carbon Dioxide Effects

- 5.2.1 The Scheme has the potential to lead to changes in emissions of carbon dioxide from:
- Activities related to construction of the Scheme.
 - Changes to emissions from use of the road network.
- 5.2.2 Construction activities require resources that have associated carbon dioxide emissions. The use of materials, construction plant and construction vehicles all lead to varying levels of energy and other resource use which lead to carbon emissions. The Scheme will require the installation of new infrastructure including a dual carriageway road, under bridges and over bridges, at-grade and grade-separated junctions, as well as the re-routing of private and public rights-of-way and utilities. The works undertaken on all of these elements will contribute to emissions of carbon from the manufacture of

the materials used (commonly referred to as 'embodied carbon'). Construction processes also require the use of plant which commonly operate on diesel and lead to further emissions.

- 5.2.3 All modes of transport lead to emissions of carbon due to their consumption of energy. Typical road transport modes use internal combustion engines which lead to carbon emissions from their use of fossil fuels. Since the Scheme will also change the configuration of the road network, there will be changes in emissions due to factors including vehicle speed, network capacity, and patterns of travel. These changes can affect the amount of carbon emitted by users of the network.

5.3 Methodology

Introduction

- 5.3.1 This section summarises the overall approach and methodology used for the assessment of carbon dioxide emissions.
- 5.3.2 The methodology used in this assessment follows the main principles prescribed in Design Manual for Roads and Bridges (DMRB) HA/207/07, "Air Quality". An assessment of long-term emissions has also been undertaken following the approach outlined in WebTAG 3.3.5, "The Greenhouse Gases Sub-Objective". Details of the approach are set out below.

Spatial Scope

- 5.3.3 For the construction phase assessment, the spatial scope has been determined by the main construction route, the construction compounds used to store materials and topsoil, and the construction of new structures, such as bridges.
- 5.3.4 The proposed Scheme has the potential to change traffic flows on the wider road network of Norwich and Norfolk. Emissions of greenhouse gases from road vehicles are a function of the engine size, speed and fuel type. At a network level, emissions are dependent on overall traffic flows and the relative mix of different vehicle classes. The Scheme has the potential to affect a combination of these functions, leading to a change in overall emissions.
- 5.3.5 In assessing the operational phase emissions, two spatial scopes have been included. The first study area has been determined from the Fully Modelled Area referenced in the Transport Assessment for the Scheme. The Fully Modelled Area represents the extent of the traffic model which is validated

through traffic counts (see Volume 2, Chapter 5: Carbon). A second, wider, study area has also been assessed. This includes those roads on the 'wider network' which connect to other population centres, including, for example, Great Yarmouth, has been referred to as 'the Wider Network' in this assessment. Flows on the links in the Wider Network have not been validated and therefore may be subject to greater modelling uncertainty. For clarity, the Wider Network also includes all of the links contained in the Fully Modelled Area. In assessing carbon emissions, both study areas have been considered to provide relevant local and regional context to any changes that occur.

Temporal Scope

- 5.3.6 Construction phase carbon emissions will be confined to the construction period only. Construction of the main NDR works is planned for a two year period between 2015 and 2017.
- 5.3.7 In relation to the operational phase, the assessment calculates emissions for the assessment years of 2017 and 2032, which are the years considered in the transport modelling. This follows the guidance presented in DMRB Regional Assessment. The WebTAG methodology sets out that carbon emissions should be calculated over a 60 year period from construction which represents 2017-2077 and this has been done based on the modelled traffic data years. Limitations associated with the traffic data are discussed in Section 5.3.15.

Sensitive Receptors

- 5.3.8 No specific resources or receptors have been focussed upon during the assessment, as the changes in carbon emissions caused by the Scheme cannot be linked to specific climate impacts or specific locations where any impact may occur.

Consultation

- 5.3.9 Formal consultation was undertaken as part of the EIA process through submission of an EIA Scoping Report to the Secretary of State for Communities and Local Government. The Secretary of State requested at paragraph 3.77 of his Scoping Opinion that carbon be considered within the Environmental Statement (see Volume 1, Appendix 5 of the ES).

Desk study

Overview

5.3.10 This assessment calculates carbon emissions based on the available Scheme information. The key sources of information used in this assessment are:

- the development description (see Volume 1, Chapter 2: The Scheme);
- the transport model outputs (see DCO Document 5.6: Forecasting Report);
- the construction bill of quantities (provided by Birse Civils);
- the contractor's construction methodology (see Volume 2, Chapter 24: CEMP);
- Department of Energy and Climate Change (DECC) official statistics: Local Authority carbon dioxide emissions;
- Department for Transport WebTAG guidance 3.3.5 and 3.5.6; and
- The Emission Factor Toolkit published by Defra.

Construction Phase

5.3.11 Carbon emissions due to embodied carbon in construction materials have been estimated using the Mott MacDonald CapIT estimation tool (<http://www.eru.mottmac.com/registrationsubscription/capit/>). This tool estimates the embodied emissions in range of construction products relating to the construction of highways and follows the Highways Agency schedule of items. The methodology includes the embodied emission in the products as well as the construction plant typically required to build the Scheme.

5.3.12 Quantities of construction materials and activities were provided for the Scheme by Birse Civils, the main contractor for the NDR.

5.3.13 No detailed description of construction traffic was available for this assessment. However the Birse Civils Construction Methodology has indicated that peak flows of up to 75 vehicles per day can be expected, with additional movements for the approximately 120 workers that will be on site. Therefore an estimate of the potential emissions has been made based on the following assumptions about the potential construction flows based on worst-case assumptions:

- 75 Heavy Duty Vehicles, travelling an average of 40km per day at 25km/h;
- 30 movements associated with staff which are a mixture of HDVs and Light Duty Vehicles (LDVs) travelling an average of 25km per day at 30km/h;
- 5.5 working days per week; and
- 161 weeks of construction.

5.3.14 Emissions from construction traffic have been calculated using the Emission Factors Toolkit, which is described further in Section 5.3.15.

Operational Phase

5.3.15 The assessment of carbon emissions follows guidance set out in the DMRB regional impacts assessment and the WebTAG guidance (section 3.3.5). For operational phase effects, both guidance documents set out that emissions from the Scheme (the 'With Scheme scenario') should be compared to the baseline (the 'Without Scheme' scenario) for each assessment year. The method adopted is based on calculating the emissions for each link in the traffic model based on its length and its vehicle flow characteristics.

5.3.16 A single development scenario has been considered in the creation of the traffic model. This scenario is based on the Greater Norwich Development Partnership's Joint Core Strategy (JCS). This means the same regional growth assumptions exist in the "With" and "Without" Scheme scenarios and the only difference is in the road network layout.

5.3.17 Traffic model data has been used to estimate emissions in each scenario. For each road link in the study area the following characteristics are determined: link length, number of vehicles, average speed of vehicles, and percentage of vehicles that are heavy duty (HDV). As noted above, two spatial scopes have been included in the assessment, the Fully Modelled Area' and the Wider Network.

5.3.18 The emissions have been calculated separately for each link for each period of the day and then summed. These calculations are based on four traffic characteristics as follows:

for weekday flows

- Weekday Off-Peak flows have been used for 19:00 to 07:00,
- Weekday AM-Peak flows for 08:00 to 09:00

- Weekday Inter-Peak flows for 07:00 to 08:00, 09:00 to 16:00 and 18:00 to 19:00, and
- Weekday PM-Peak flows 16:00 to 18:00;
for Saturday flows
- Weekday Off-Peak flows multiplied by 1.426 have been used for 0:00 to 10:00 and 18:00 to 24:00 and
- Weekday Inter-Peak flows for 10:00 to 18:00;
for Sunday flows
- Weekday Off-Peak flows multiplied by 1.426 have been used for 0:00 to 11:00 and 16:00 to 24:00 and
- Weekday Inter-Peak flows for 11:00 to 16:00.

5.3.19 For each time period, the traffic estimates have been categorised into LDVs, HDVs and buses. Emissions are calculated for each link and for each time period, before being combined into a total. This means that diurnal variations in traffic flows are accounted for, which is particularly relevant to the parameter of speed.

5.3.20 Based on the traffic flow data, emissions have been estimated using the Defra Emissions Factor Toolkit v5.2c (EFT). Emissions have been calculated for each modelled link in the network based on vehicle flow, vehicle-type composition and vehicle average speed for the period. Where speeds were less than 5km/h, these have been set at 5km/h as the EFT does not provide factors for less than this speed. Individual link emissions have then been summed to calculate total network emissions. A vehicle emissions profile was selected within the EFT that represented the year being assessed. For 2012 and 2017, their corresponding years were selected, however, for 2032, the profile for 2030 was selected as this is the latest year available in the current version of the EFT.

5.3.21 Emission factors change from year to year. Government policy suggests that emissions from transport will decrease in the future in order to meet targets set out in the Climate Change Act. This implicitly means that emission factors would be lower than those of present activities. The current version of the EFT does not account for projected changes in the vehicle fleet relating to the introduction of electric vehicles and other alternative ultra-low emission vehicles as set out in the Government's low carbon vehicle strategy, 'Driving the Future Today'. Accordingly, the benefits in terms of reduced emissions

that are expected to be achieved through such technologies are not accounted for in this assessment and the total calculated emissions, particularly for years after 2025. An adjustment to the calculated emissions has been made to include the expected use of electric vehicles. This is based on the DfT expected uptake rate for electric vehicles and the electricity use per kilometre for electric vehicles set out in WebTAG guidance (3.5.6) and the grid electricity rates set out in the WebTAG guidance (3.3.5). These assumptions are set out in Volume 2, Chapter 5: Carbon). The uptake rate for electric vehicles is expressed in WebTAG as a proportion of vehicle kilometres therefore the emissions associated with these vehicles are calculated on the share of vehicle kilometres travelled in each scenario. These rates only apply up to 2035 and in subsequent years the rate is fixed. This means that the emissions in years after 2035 are over-estimates based on the policy expectations that electric vehicle use will increase over time.

Assessment Criteria

- 5.3.22 There are currently no statutory criteria for assessing the relative effects of projects in relation to emissions of carbon. Although the Climate Change Act prescribes a national target for reduction, this has not been transposed into regional, sector or project level targets. In addition, current planning guidance does not give specific guidance in how to appraise the impacts of developments in terms of carbon emissions.
- 5.3.23 The European Commission’s “Guidance on Integrating Climate Change and Biodiversity into Environmental Impact Assessment” (2013) provides a steer on what an assessment of carbon emissions should take into account. There is guidance on what to cover when addressing impacts (although this guidance is provided in general, and not specific to certain types of development), but no guidance is provided on how to determine the significance of changes in carbon emissions. It notes that: “Judging an impact’s magnitude and significance must be context-specific. For an individual project — e.g. a road project — the contribution to GHGs may be insignificant on the global scale, but may well be significant on the local/regional scale, in terms of its contribution to set GHG-reduction targets.” (section 4.4.2).
- 5.3.24 In the absence of accepted EIA criteria, carbon emissions arising from the Scheme have been presented and compared to those from all sources across the region taking account of the trends in baseline emissions.

5.3.25 The significance of the changes in emissions has been assessed qualitatively by presenting them in the context of total emissions from the study area, as well as national, regional and local policies and targets.

Site survey

5.3.26 No baseline site surveys have been required for this assessment.

5.4 Context

Overview

- 5.4.1 Carbon dioxide is a greenhouse gas (GHG) that causes the trapping and absorption of energy in the atmosphere. This leads to warmer atmospheric temperatures and associated climate changes.
- 5.4.2 There are natural variations in carbon emissions; however, atmospheric concentrations of CO₂ have increased by 40% since pre-industrial times due to fossil fuel emissions and land-use change. In the Intergovernmental Panel on Climate Change's 5th Assessment Report, 2013, it is stated with very high confidence, that the recent rates of increase of CO₂ concentrations in the atmosphere are unprecedented in the last 22,000 years. It is considered extremely likely that more than half of the observed increase in global average surface temperature since 1951 has been caused by anthropogenic greenhouse gas emissions.
- 5.4.3 CO₂ is one of several GHGs, but it is responsible for the largest contribution to the net uptake of energy in the climate system. It is also the most significant GHG in relation to emissions from motor vehicles.
- 5.4.4 The European Commission's "Guidance on Integrating Climate Change and Biodiversity into Environmental Impact Assessment" (2013) recognises that climate change is not yet being systematically integrated into EIA, and the "main reason for this is that climate change ... (is) not yet explicitly included in the formal requirements of EIA procedures". (section 1.1). In addition, it is noted that climate change is a multi-faceted issue that does not lend itself to simple or quick analysis. The focus for EIA is on quantifying the emissions and placing them in the context of baseline changes.

Planning and legislative

European Union Policy

- 5.4.5 The European Commission White Paper “Roadmap to a Single European Transport Area – Towards a competitive and resource efficient transport system” (2011) outlines the long-term strategy being pursued to achieve a sustainable transport system across the EU by 2050.
- 5.4.6 The White Paper recognises that “Transport is fundamental to our economy and society.” but also recognises that transport “must be sustainable”. In order to limit climate change “... a reduction of at least 60% of GHGs by 2050 with respect to 1990 is required from the transport sector” and that “By 2030, the goal for transport will be to reduce GHG emissions to around 20% below their 2008 level.” (paragraph 6).
- 5.4.7 To achieve the changes the White Paper recognises that “New technologies for vehicles and traffic management will be key to lower transport emissions ...” (paragraph 8) and “The challenge is to break the transport system’s dependence on oil without sacrificing its efficiency and compromising mobility.” (paragraph 17). It emphasises that “Curbing mobility is not an option.” (paragraph 18).
- 5.4.8 Three strands for future development are set out as follows:
- “Improving the energy efficiency performance of vehicles across all modes. Developing and deploying sustainable fuels and propulsion systems.
 - Optimising the performance of multimodal logistic chains, ...
 - Using transport and infrastructure more efficiently through the use of improved traffic management and information systems ...” (paragraph 19).

National Legislation

- 5.4.9 The UK Climate Change Act (2008) has two key aims:
- to improve carbon management and help the transition towards a low carbon economy in the UK; and
 - to demonstrate strong UK leadership internationally, signalling the UK is committed to reducing global GHG emissions.
- 5.4.10 The Act introduces legally binding net UK GHG emission reduction targets, which are applicable at the national level. The Act specifies a long-term GHG emission reduction target of at least 80% by 2050 and reductions in CO₂ emissions of at least 26% by 2020 (changed to 34% by subsequent legislation

in 2009), both against a 1990 baseline. This will be done through five-year “carbon budgets”. Budgets have currently been set covering the periods 2008-2012, 2013-2017, 2018-2022, and 2023-2027. These targets are reviewed regularly according to the advice of the Committee on Climate Change in line with new evidence and data.

5.4.11 Furthermore, the Act requires all departments of the UK Government, including the Department for Transport (DfT), to develop strategies to reduce GHG emissions.

5.4.12 Carbon budgets cap the total national emissions over the budget period. They do not require emissions from specific locations, or even specific sectors, to reduce; so long as total emissions from the UK as a whole meet the budget limits. The GOV.UK website explains that: *“Where emissions rise in one sector, the UK will have to achieve corresponding falls in another”*.

National Policy

5.4.13 The Planning Act 2008 was introduced to simplify consent for major infrastructure schemes, including those in the transport sector. On 9 August 2013, the Secretary of State decided that the NDR is nationally significant and directed that it be treated as development for which development consent is required. The Planning Act 2008 empowers the Secretary of State to designate a statement as a National Policy Statement, which may set out criteria relating to development that is subject to development control. In designating National Policy Statements, the Secretary of State is required to have regard to the desirability of mitigating, and adapting to, climate change. When National Policy Statements are designated, they are required to include an explanation of how the policy set out in the statement takes account of Government policy relating to the mitigation of, and adaptation to, climate change.

5.4.14 At the time of this assessment, a draft National Policy Statement for Transport Networks had not been published for consultation. In its absence, other policy and guidance has been reviewed to set the policy context. Mention scoping reason

5.4.15 In 2013, the Department for Transport published the policy paper ‘Action for Roads’. Action for Roads sets out the challenges facing the transport network, together with proposals to meet these challenges. One section of the paper deals with delivering ‘a greener, better network’. Proposals to meet these goals include continuing to fund the development and uptake of ultra-

low emission vehicles, further investment in the quality and provision of walking and cycling networks, developing and embracing new technologies to optimise traffic flows across networks. These proposals are designed to help to meet the obligations set out in the Climate Change Act 2008 for reducing carbon emissions.

5.4.16 In December 2013, the Department for Transport published a consultation version of 'National road and rail networks: draft national policy statement'. Although National Policy Statements are specifically for development classed as 'Nationally Significant Infrastructure Projects', it provides a some guidance on the important considerations that can be applied to all road schemes. Chapter 3 of the draft sets out 'Wider Government policy on the national network'. The section recognises that there are a number of national level policies which will reduce carbon emissions in order to meet national targets. Paragraph 3.4 notes that "While, considered in isolation, individual schemes may result in an increase in CO₂ emissions, the Government's overarching plan for reducing carbon emissions will ensure that any such increases do not compromise its overall CO₂ reduction commitments. Increases in carbon emissions from a development should not therefore need to be considered by the Examining Authority and the Secretary of State". This emphasises the importance placed by Government on national level policies in meeting the national carbon targets.

5.4.17 In December 2011, the UK Government published the Carbon Plan which updates and supersedes the 2009 Low Carbon Transition Plan and sets out the Government's strategy for meeting the interim carbon budgets. The Carbon Plan identifies that transport has an important role in meeting the Climate Change Act 2008 obligations and includes the following high-profile policies and proposals for this sector:

- supporting local authorities in enabling people to make lower carbon travel choices, such as walking, cycling or using public transport, by providing a Local Sustainable Transport Fund;
- incentivising more efficient combustion engines and the use of sustainable biofuels;
- moving towards ultra-low carbon vehicles, such as electric vehicles;
- further electrification of the rail network; and
- capping of emissions from domestic aviation as part of the EU Emissions Trading Scheme (ETS).

5.4.18 The DfT White Paper “Creating Growth, Cutting Carbon: Making Sustainable Local Transport Happen” (2011) sets out the government’s vision for a sustainable local transport system that supports the economy and reduces carbon emissions. The White Paper forms part of the Government’s

- “overall strategy to tackle carbon emissions from transport. It sets out what Government believes is the best way in the short term to reduce emissions at the local level, ... principally by encouraging people to make more sustainable travel choices for shorter journeys. This White Paper is about providing the early reduction in carbon emissions that local action is best placed to deliver, while facilitating the access to local jobs that will boost economic growth.” (paragraph 1.4, page 11)
- “The Government is convinced that in the longer term, progressive electrification of the passenger car fleet will play an important role in decarbonising transport, ... Eliminating the use of passenger cars altogether would be the wrong approach given that for many people, particularly in rural areas and for medium-distance or multi-leg trips, the car is the only practical choice and will remain so.” (paragraph 1.5, page 11)
- “... alongside technological change to address carbon output, we will need to take measures to tackle the problem of congestion.”. (paragraph 1.8, page 12)

5.4.19 The National Planning Policy Framework (NPPF) was published on 27th March 2012 and supersedes previous national Planning Policy Statements (PPS) and Planning Policy Guidance, including Planning Policy Statement 1 on delivering sustainable development. Paragraph 94 of the NPPF requires Local Authorities to adopt pro-active strategies to mitigate and adapt to climate change, in line with the objectives and provisions of the Climate Change Act 2008.

5.4.20 At the national level, the following key policy areas of the NPPF are relevant:

- plan for development in locations which reduce greenhouse gas emissions;
- support energy efficiency improvements in existing buildings;
- including low-carbon and renewable energy strategies in new development;
- promoting sustainable transport; and
- meeting the challenge of climate change, flooding and coastal change.

5.4.21 Paragraph 30 of the NPPF notes with regards to sustainable transport that “[e]ncouragement should be given to solutions which support reductions in greenhouse gas emissions and reduce congestion”.

Regional Policy Local and Transport Policy

5.4.22 The Norfolk Climate Change Strategy, ‘Tomorrow’s Norfolk, Today’s Challenge’, identified that 31.4% of Norfolk’s GHG emissions were from road transport in 2006. This is higher than the national average of 22.8% and is attributed to the county’s rural nature. The Strategy acknowledged that transport is the only sector where GHG emissions are expected to increase between 1990 and 2020, due to the projected growth in road travel. It accepted that car travel will always remain necessary for some to access essential services, particularly in rural areas, due to the distances involved or limitations in public transport. Therefore, to achieve reductions in emissions, the Strategy posits a reduction in the overall need to travel. This could include improved accessibility planning, pragmatic siting of developments, energy efficient vehicles, increased availability of sustainable transport options and through reducing the long-term impact of road development through scheme design.

5.4.23 The Norfolk Joint Core Strategy (JCS) is a strategic vision for shaping development across Broadland, Norfolk Norwich and South Norfolk council areas. The Strategy draws attention to the fact that much of Norwich’s current road network is operating at 90% capacity. As a result, traffic delays in the area can be significant. Much of this congestion is caused by significant through-traffic in Norwich. The NDR project is specifically identified in paragraph 3.13 of the JCS as a solution which “would remove some 19,000 cross city trips daily”. The first area-wide objective established by the JCS is “addressing climate change and protecting environmental assets”. To do this, the JCS indicates that future development will need to minimise the need to travel and give priority to low impact modes of travel.

5.4.24 The Norfolk 3rd Local Transport Plan (LTP3), ‘Connecting Norfolk’ (2011), sets out transport strategy and policy for the County to 2026. The Plan has six strategic aims: maintaining the highway network; delivering sustainable growth; enhancing strategic connections; reducing emissions; improving road safety; and improving accessibility. This demonstrates that reducing carbon emissions is one of several competing aims to any transport infrastructure project. Short to medium term priorities highlighted in the LTP3 for reducing emissions are: complementary infrastructure such as electric vehicle charging

points; and promotion of walking and cycling for short journeys. Longer term priorities include: a more efficient vehicle fleet, a significant change in travel behaviour for short journeys, high quality interchange facilities in key urban areas. The NDR project will not affect these priorities for reducing emissions. Instead, the LTP3 specifically mentions the NDR as a facilitator of economic growth in the Greater Norwich area and provider of strategic access to Norwich airport (paragraph 4.11 of LTP3).

5.4.25 Norfolk County Council has an environment policy, approved in 2001, which aims to enable people in Norfolk to benefit from an enhanced environment and consequently an improved quality of life. The Policy asserts that its principles will be integrated into the decisions of all its services. Relevant to this project is the principle of taking measures to reduce greenhouse gas emissions through the adoption of energy and transport initiatives (paragraph 7). It states the Council will also encourage a shift towards more sustainable transport, such as appropriate public transport, cycling and walking (paragraph 8).

Local Policy

5.4.26 The Norwich Area Transportation Strategy (NATS), (2006 and updated in 2010), was created with the intention of ensuring Norwich's transport system meets the needs of the city's planned growth. It addresses transport issues such as congestion, and the NDR is specifically included to address this. Policy 57 of the Strategy addresses the adverse environmental impacts of traffic, including greenhouse gas emissions. NATS also encourages sustainable modes of travel and the use of alternative fuels in vehicles. To preserve growth, NATS does not plan to place major restrictions on car movements in the area. The updates in 2010 modified some of the policies. The first relevant policy is Policy 52: Smarter Choices, which states "In the Norwich area measures that encourage a modal shift to sustainable modes of transport will be investigated before road capacity improvements. ...". *This is a changed policy, included, in part, "... to better reflect the Climate Change Act 2008 and associated carbon reduction targets."* (paragraph 3.113, page 46).

5.4.27 The second relevant policy is Policy 57: Tackling Climate Change and Pollution, which states "We will seek to reduce emissions from road transport, including carbon emissions and to improve air quality in the Norwich area by:

- Encouraging a modal shift to less polluting modes of travel

- Reducing emission from vehicles that emit the most
- Ensuring that new development is planned and located to reduce the need to travel and maximise the opportunities for the most sustainable modes of travel.”

5.4.28 As with Policy 52, this is a changed policy, included, in part, “... to better reflect the Climate Change Act 2008 and associated carbon reduction targets.” (paragraph 3.123, page 49).

5.4.29 The City of Norwich Replacement Local Plan provides guidance for developers and the Council on what development is permitted in the city. It is a collection of policies and has been partially replaced by the JCS and the Northern City Centre Area Action Plan (see below). Carbon dioxide emissions, along with noise and land use, are identified as continuing problems for development in the city. There are no policies specific to road building; however there are a number of sustainability objectives to the Plan. These include promoting a well-connected city which uses resources in a sustainable manner.

5.4.30 The Northern City Centre Area Action Plan (NCCAAP) (2010) establishes the vision and objectives for regenerating the area north of Norwich city centre. It identifies that this area experiences significant congestion, road safety and environmental problems for the local community as main transport routes pass through the area. Consequently, an aim of the NCCAAP is to improve traffic circulation in the area (paragraph 3.2.2, objective 6). It proposes a policy to promote sustainable transport, citing a reduction in vehicular emissions as motivation (Table 6 and Appendix 5). Further to this, a sustainability goal of the NCCAAP is to reduce contributions to climate change (Policy ENV1 and paragraph 4.6.7). The main transport-related activity in the NCCAAP intended to achieve this is the reduction in the need to travel (Appendix 1 paragraphs 12 and 16).

5.5 Baseline

Overview

5.5.1 This chapter presents the existing emission levels, using a 2012 baseline, in order to assist in contextualising the emissions associated with the Scheme.

National and Local Data

5.5.2 For the latest year in which data is available, 2012, UK total GHG emissions were 571.6 MtCO₂e (million tonnes of emissions of all greenhouse gases, expressed as equivalent CO₂ emissions) (Table 4.1). Of this, transport emissions were 116.0MtCO₂e, equivalent to 24% of the national total CO₂ emissions. These are total emissions for all the activities in the UK.

Table 4.1: UK total MtCO₂e emissions 2008-2012 (Source: DECC Statistics - 2012 provisional UK figures: data tables (March 2013))

	2008	2009	2010	2011	2012	Trend 2008-12
Energy supply	212.5	189.5	195.3	182.2	192.1	-10%
from power stations	172.7	151.1	156.6	144.2	156.1	-10%
other Energy supply	39.8	38.4	38.7	37.9	36.0	-10%
Business	90.1	78.5	78.5	75.6	79.2	-12%
Transport	125.5	120.7	119.1	117.4	116.0	-8%
Public	9.3	8.2	8.4	7.1	7.4	-20%
Residential	79.9	74.7	86.5	66.4	74.2	-7%
Agriculture	4.1	4.1	4.1	4.2	4.2	2%
Industrial process	14.0	9.2	9.9	9.5	9.8	-30%
Waste Management	0.3	0.3	0.3	0.3	0.3	0%
LULUCF	-4.5	-4.5	-4.3	-3.9	-3.9	13%
Total CO ₂	531.2	480.7	497.8	458.6	479.1	-10%
Non-CO ₂ emissions	96.7	93.6	93.9	92.1	90.7	-6%
Total GHG	630.5	576.8	594.0	552.6	571.6	-9%

5.5.3 The national figures show a downward trend in total emissions over the last five years for which data is available. The trend for the transport sector as a whole is also downward, although at a slightly slower rate of change than overall emissions (Table 4.1).

5.5.4 Estimates of emissions of greenhouse gases, by Local Authority area, are provided by DECC on an annual basis. This exercise is undertaken to provide consistent information across all local authorities in the UK. Table 4.2 to Table 4.4 present the latest statistics published by DECC, for the period 2007 to 2011. The dataset covers emissions by end-user (rather than source) and compares road transport emissions with the total emissions in the areas where traffic flows are most affected. Population figures have been used to present a per capita carbon emissions figure for comparison over time and between areas (these are the total emissions for the area, divided by the population of that area to give an equivalent per-person value).

Table 4.2: CO2 emissions in Broadland LA (ktCO2)(Source: DECC Statistics: Local and regional CO2 emissions estimates for 2005-2011: full dataset (July 2013))

	2007	2008	2009	2010	2011	% change 2007-2011
Road transport emissions	231.9	228.5	221.2	216.3	211.1	-9%
Grand total emissions	920.1	926.3	909.0	998.7	890.4	-3%
Percentage road transport	25.2	24.7	24.3	21.7	23.7	-6%
Population ('000)	123.2	123.4	123.8	124.5	124.7	1%
Per capita total emissions	7.5	7.5	7.3	8.0	7.1	-5%

Table 4.3: CO2 emissions in Norwich LA (ktCO2) (Source: DECC Statistics: Local and regional CO2 emissions estimates for 2005-2011: full dataset (July 2013))

	2007	2008	2009	2010	2011	% change 2007-2011
Road transport emissions	142.6	137.9	134.2	131.9	128.3	-10%

Grand total emissions	835.5	807.6	730.0	755.4	675.4	-19%
Percentage road transport	17.1	17.1	18.4	17.5	19.0	11%
Population ('000)	126.9	128.0	129.2	130.9	132.2	4%
Per capita total emissions	6.6	6.3	5.7	5.8	5.1	-23%

Table 4.4: CO2 emissions in North South Norfolk LA (ktCO2)(Source: DECC Statistics: Local and regional CO2 emissions estimates for 2005-2011: full dataset (July 2013))

	2007	2008	2009	2010	2011	% change 2007-2011
Road transport emissions	393.1	386.2	373.4	367.2	361.6	-8%
Grand total emissions	1004.8	1009.8	932.7	965.0	907.4	-10%
Percentage road transport	39.1	38.2	40.0	38.0	39.9	2%
Population ('000)	117.1	118.8	120.5	122.6	124.5	6%
Per capita total emissions	8.6	8.5	7.7	7.9	7.3	-15%

5.5.5 In Broadland and North South Norfolk the percentages of emissions from road transport in 2011 were 23.7% and 2939.49% respectively. In Norwich, the percentage from road transport was lower, at 19% in 2011. Road transport emissions have declined consistently across all three relevant Local Authority areas by 98-10% over six five years. This is consistent with national level trends. Grand total emissions were much more variable in their decline, ranging from 3% to 19% decline over five years. These reductions in emissions are despite a small increase in populations in all three areas.

5.5.6 These regional traffic emissions are not directly comparable with those derived for this assessment, due to differences in the methodologies used to

estimate traffic flows in the area, however, they do provide an indication of the relative importance of road transport compared to overall emissions.

Modelled Data

Overview

5.5.7 This section sets out calculated baseline carbon emissions from road transport sources. The calculations are based on the traffic flow data for the Base Year and Without Scheme modelling scenarios outlined in Section 2.6.3. The totals presented in this section are the aggregated carbon emissions for the road links contained in the model in each of the scenarios for the two study areas: the smaller, Fully Modelled Area, and the Wider Network to provide a local and regional context.

Base Year 2012

5.5.8 Carbon emissions have been calculated for the base year of 2012 and are presented in Table 4.5

Table 4.5: Total emissions from Road Network, 2012 (ktCO₂)

	2012
Fully Modelled Area	345.1
Wider Network	1,092

5.5.9 The proportion of emissions from road links that lie within the Norwich Local Authority area has been calculated (as a subset of the Fully Modelled Area). This is 126ktCO₂ in 2012 which is a value similar to the emissions from road transport sources within Norwich in 2011 (128.3ktCO₂ – see Table 4.3), demonstrating that the model is providing a good comparative representation of carbon emissions in the study area.

Without Scheme 2017 and 2032

5.5.10 The baseline (Without Scheme) carbon emissions from the road network in the future years 2017 and 2032 are presented in Table 4.6 for the two study areas considered in the assessment.

Table 4.6: Total emissions from Without Scheme Road Network, 2017 and 2032 (ktCO2)

	2017	2032
Fully Modelled Area	351.4	379.1
Wider Network	1,103	1,246

Without Scheme 2017 and 2077

5.5.11 The total carbon emissions for the Without Scheme scenario over the 60 years between 2017 and 2077 are presented in Table 4.7 for the two modelled study areas.

Table 4.7: Total emissions from Road Network 2017-77 (ktCO2)

	Emissions 2017-77
Fully Modelled Area	22,423
Wider Network	73,409

5.5.12 These values are considered conservative as there is no allowance for the introduction of ultra-low emissions vehicles beyond 2035, which form a cornerstone of current policy.

5.6 Mitigation

Introduction

5.6.1 This chapter describes the mitigation measures that have been considered to address the carbon emissions from the construction and operational phases of the Scheme.

Construction Phase

5.6.2 In the construction phase, a number of design decisions have been taken and incorporated in to design to minimise the impact as far as possible. The overall Scheme design is described in Volume 1, Chapter 2: The Scheme, Section 2. These design decisions include:

- achieving a neutral cut and fill balance, removing the need for transporting bulk fill materials from or to site - all excavated materials will be utilised within the site;
- once the volume of contaminated materials is known there will be remediation and burial under landscape areas;
- cement stabilised granular material will be used to reduce the import of quarried materials; and
- recycled crushed glass filter material as an alternative to sand.

5.6.3 Of these measures, the benefits from the neutral cut and fill balance have been included in the construction assessment. The potential benefits of the other measures have not been quantified at this stage, as the specific amounts of the materials involved have not been established. These other measures will, however, help to reduce further the amount of carbon embodied in the construction of the road by reducing the overall demand for virgin materials, particularly primary materials. Therefore the assessment of construction carbon emissions presented represents a worst-case.

5.6.4 Measures to reduce the impact of construction works will also be implemented through the Construction Environmental Management Plan (CEMP) (see Volume 2, Chapter 24: CEMP). These will include the following typical measures relating to construction plant and construction traffic:

- ensuring that the engines of all vehicles and plant on site are not left running unnecessarily;
- requiring that plant will be well maintained, with routine servicing of plant and vehicles to be completed in accordance with the manufacturers recommendations and records maintained for the work undertaken;
- avoiding the use of diesel or petrol powered generators and using mains electricity or battery powered equipment;
- maximising energy efficiency (this may include maximising vehicle utilisation by ensuring full loading and efficient routing);

- drivers of vehicles, while on the public highway, will be required to switch off their vehicle's engines when stationary to prevent exhaust emissions.
 - development of a Site Waste Management Plan which will identify materials that can be reused and recycled:
- 5.6.5 These measures aim to make the construction process as efficient as possible, reducing the amount of energy and transport movements associated with construction and thereby reducing the carbon emissions.

Operational Phase

- 5.6.6 The NDR is part of a wider package of works to be delivered as part of the Norwich Areas Transport Strategy. The increased capacity that the road will deliver will help to enable development of public transport and park and ride facilities in the area. This will encourage modal shift in the area. Part of the Scheme will include 9km of cycle lanes, and the reduced congestion in the centre of Norwich means that additional bus services can be facilitated. The potential benefits of these measures have not been quantified as part of this assessment.
- 5.6.7 The Scheme will not be lit with the exception of the Postwick Hub which avoids any potential carbon emissions associated with energy use from lighting during the operation of the road.
- 5.6.8 The Scheme will include extensive tree and shrub planting to mitigate for the loss of trees to accommodate the route. The potential benefit to carbon emissions from sequestration has been assessed as part of the Ecosystems Assessment (see Volume 2, Chapter 5). There is a net benefit to overall emissions over the lifetime of the Scheme. The changes in overall carbon stocks within the Development Consent Order area are presented in Table 4.8.

Table 4.8: Carbon stock associated with sequestration from planting (as equivalent ktCO₂) (Source: Ecosystem Goods and Services Assessment for NDR Development – InVest Carbon Storage and Sequestration Model)

Year	Without Scheme	With Scheme
2017	177.3	157.1

2032	181.4	172.8
2077	200.5	215.5

5.6.9 There is a reduction in total carbon stock during the early years, due to the felling of trees during construction. In the longer term, the planting of trees increases the carbon stock, such that over the full 60 year period there will be a net benefit of the Scheme, of 15 ktCO₂, i.e. there will be a greater sequestration of carbon. This is considered further in para' 5.7.7.

5.7 Assessment of changes in carbon emissions

Overview

5.7.1 This section presents the assessment of the potential changes in carbon emission due to the Scheme in both the construction and operational phases.

Construction Phase

5.7.2 Carbon emissions associated with the construction phase of the Scheme derive from embedded carbon in the materials used and the carbon in the fuel used by the construction plant and vehicles. These emissions are summarised in Table 6.1 for the different elements of the construction programme (further details are provided in Volume 2, Chapter 5: Carbon).

Table 4.9: Carbon emissions associated with each part of the Bill of Quantities (Notes: Based on the Bill of Quantities provided by Birse Civils (September 2013). The figures in this table account for quantified mitigation measures.)

Element	Total Carbon (ktCO ₂)
NDR Road	40.4
Buxton Rd Overbridge	1.1
Newman Rd Overbridge	1.0
Middle Rd Overbridge	1.4
Rackheath Bat Underpass	0.1
Marriots Way Overbridge	0.6

Cromer Rd Overbridge	1.0
Bell Farm Overbridge	0.4
Rackheath Rail Bridge	3.3
Rackheath Rd Bridge including Retaining Wall	3.2
All Bat Gantries	0.1
Total	52.4

5.7.3 The emissions for the NDR road allow for the reduction in carbon emissions of 13.8ktCO₂ associated with the mitigation measure of balancing cut and fill in the scheme design (see para' 5.6.2).

5.7.4 Carbon emissions from construction traffic have had to be estimated, as detailed data on construction traffic was not available. The estimate is presented in Table 4.10 and is based on the conservative assumptions outlined in para' 5.3.11.

Table 4.10: Carbon emissions associated with construction traffic

Element	Total Carbon (ktCO ₂)
Construction traffic	5.4

5.7.5 The total quantified carbon emission associated with construction of the Scheme is therefore 57.8 ktCO₂.

5.7.6 The felling of trees in the construction phase leads to a temporary lowering in the carbon stock within the Development Consent Order area (see Section 5.3). This is quantified in the Ecosystem Goods and Services Assessment to be 20.2ktCO₂. However, over the life of the Scheme, this carbon is sequestered by the new trees and vegetation and overall the carbon stock is increased in comparison to the without Scheme scenario.

Operational Phase

5.7.7 This section sets out the carbon emissions associated with the operational phase of the Scheme. Table 4.11 presents the change in total carbon emissions associated with the Scheme for each identified assessment year.

Table 4.11: Total carbon emissions (ktCO₂) from With Scheme road network and change compared to Without Scheme network (Source: Total emissions calculated from traffic model produced for the Scheme)

	2017 (With Scheme)	2017 Change compared to Without Scheme	2032 (With Scheme)	2032 Change compared to Without Scheme
Fully Modelled Area	364.8	+13.4	397.1	+18.0
Wider Network	1,117	+13.2	1,264	+18.0

5.7.8 Compared to the Without Scheme scenario, carbon emissions from the road network within the Fully Modelled Area increase by 13.4ktCO₂ in the opening year (2017). This represents a 3.8% increase in emissions from traffic within the Fully Modelled Area. The increase across the Wider Network is similar, at 13.2ktCO₂, representing a 1.2% increase across this area. In 2032 the projected increase is 18.0 ktCO₂ for both areas, representing a 4.7% increase in emissions from traffic in the Fully Modelled Area and a 1.4% increase across the Wider Network. It is clear that most of the change in emissions occurs within the Fully Modelled Area that represents the road network closer to the scheme. As stated in Section 5.3, the calculations of road transport emissions do not account for other aspects of NATS.

5.7.9 The increase in emissions is due primarily to the increase in vehicle kilometres (a measure of the cumulative distance travelled by all vehicles) across the study area, which is predicted to increase by 3.9% in 2017 and 4.9% in 2032 within the Fully Modelled Area (see DCO Document 5.5: Transport Assessment).

5.7.10 An assessment of the change in emissions over a 60 year period is presented in Table 4.12. The Scheme is predicted to increase emissions from road traffic by 4.6% within the Fully Modelled Area, and by 1.4% across the Wider Network over the period of 2017 to 2077. Emissions for each year are set out in Volume 2, Chapter 5: Carbon. As noted above, there are significant uncertainties associated with the absolute emissions, since the emission

factors are likely to be significantly overestimating emissions in future years, based on the intent stated in current policy in relation to uptake of lower emission vehicles.

Table 4.12: Change in carbon emissions (ktCO₂) compared to the Without Scheme road network, over the period 2017-77 (Source: Total emissions calculated from traffic model produced for the Scheme)

	Change in Emissions 2017-77 (With Scheme)	Percentage change compared to Without Scheme
Fully Modelled Area	+1,104	4.7%
Wider Network	+1,104	1.4%

5.7.11 The changes in emissions can also be compared with the total GHG emissions from the Norfolk area. The total emissions from the Broadland, Norwich, and North South Norfolk Local Authority areas were 2,4732,237.3ktCO₂ in 2011 (summed from Table 4.2, Table 4.3 and Table 4.4). By 2017, this would become 1,8942,094 ktCO₂ if national projections of reductions apply to this area, and by 2032, 1,4971,654 ktCO₂ (see Volume 2, Chapter 5: Carbon). The increases due to the Scheme across the Wider Network in 2017 and 2032 would be 13.2 and 18.0 ktCO₂ respectively, representing 0.763% and 1.21% of the totals in these two years.

5.7.12 The Ecosystem Goods and Services Assessment provides a quantification of the changes in carbon stock in the Development Consent Order area over the 60 year assessment period. The assessment has determined that carbon stocks (as CO₂) would be increased by 15ktCO₂ by 2077 compared to the Without Scheme scenario. This will off-set some of the increase during the construction and operational phases.

5.7.13 As noted in the Assessment Criteria Section, there are no statutory criteria for assessing the impact of carbon emissions. There are also no local or regional targets for reducing emissions. The Scheme is a part of the wider Norwich Area Transport Strategy and will help to enable other sustainable transport measures which are not assessed here, as well as delivering economic benefits. As such the Scheme is currently part of the local and regional planning policy.

5.7.14 The changes in emissions predicted represent a small fraction of the total emissions of the three Local Authorities in which the changes in traffic flows occur. In addition, policies at the national level relating to the expected increased use of hybrid-electric and electric vehicles after 2035 are not accounted for in the calculations presented in this assessment. Such policies are likely to considerably outweigh any changes in emissions presented in this assessment. Since the national reduction targets are based on absolute emissions, the total change in emissions that would result from this Scheme is likely to be less than presented in this assessment in the long term. While national reduction targets do not apply directly to Local Authorities, the predicted changes in emissions on the transport network are unlikely to materially affect the ability of the Local Authorities to contribute to these targets. This is consistent with the draft Government policy statement issued in December 2013.

5.8 Conclusion

Summary of Assessment

5.8.1 This assessment has considered the impact of the Scheme on carbon emissions. This has involved consideration of emissions in the construction phase and operational phase, including the effects on the wider transport network of which the Scheme is part.

Table 5.1: Assessment summary

Potential impacts	Description for the impact	Description of mitigation measures	How the measures will be implemented, measured and monitored
Construction Phase	The construction phase will lead to a one-off emission from the use of construction materials, plant and transport. Mitigation measures have been included in the Scheme design, which reduce emissions by 13.8ktCO ₂	Design decisions. Reuse of site won materials	Scheme design, CEMP
Operation	Increase in carbon emissions with	Scheme is	None – this will

Potential impacts	Description for the impact	Description of mitigation measures	How the measures will be implemented, measured and monitored
Phase	<p>the Scheme due to increase in vehicle kilometres. Changes in absolute emissions represent around 1% of the total emissions from all sources within the relevant Local Authorities in the assessment years. There are no targets in place to reduce emissions at the local or regional level. National policies are likely to reduce the absolute amount of emissions.</p>	<p>part of NATS which will enable other sustainable travel modes to be introduced in the area. 6. Cultural Heritage

6.1 Introduction

6.1.1 This chapter provides an assessment of the potential impacts of the NDR on heritage assets. It draws on information gained from desk-based sources, site inspections and specialist field surveys commissioned for the proposed scheme. The assessment seeks to identify heritage assets within a defined study area around along the route and assess the potential for previously unknown assets to be present. The value of the heritage assets and the significance of effect of the development have been addressed, and mitigation proposed where appropriate. All the significant features identified in this chapter are addressed in further detail in the supporting documents. Supporting documents for this chapter are provided in Volume 2: Section 6: Cultural Heritage.

6.1.2 The heritage assets have been ranked in terms of their relative value in accordance with DMRB guidance (Highways Agency 2007). The scale of impact of the scheme on each of these assets has been considered.

6.2 Methodology

Guidance

6.2.1 The assessment of the likely significance impacts of the proposed development on heritage assets has been undertaken using the policy, guidance and methodology set out in:

- National Planning Policy Framework (2012); all relevant chapters;
- All relevant local plan policies;
- The Design Manual for Roads and Bridges, Vol 11, Section 3, Part 2 (Highways Agency 2007);
- English Heritage's Setting of Heritage Assets (2013);
- Institute of Field Archaeologists Standards and Guidance for Desk-Based Assessment (2012);
- The Norwich NDR Scoping Report (Mott MacDonald 2013); and
- The Norwich NDR Scoping Opinion (Planning Inspectorate 2013)

Study Area

- 6.2.2 DMRB specifies that, when preparing an Environmental Statement, the study area for impacts on heritage assets should be assessed for an area extending for at least 200m in all directions from the proposed scheme. Norfolk HER data was gathered for a wider area, extending 300m in all direction from the DCO boundary, and national designation data gathered over a 1km radius from the centreline of the scheme.
- 6.2.3 The 300m study area encompasses all proposed site compounds and lagoon locations included on the most recent scheme design to date (Revision F). An area of historic parkland identified extends outside the study corridor. This has been considered in its entirety, but with greater attention given to those assets directly affected by the scheme. Consideration has also been given to the impact on Catton Hall Grade II* Registered Park and Garden, which although lying over 1km from the scheme, was included in the scoping opinion from the Planning Inspectorate (2013).

Methodology for assessing setting

- 6.2.4 The assessment of historic buildings and historic landscapes has been carried out in accordance with the Department for Transport's Design Manual for Roads and Bridges (DMRB) Volume 11 Section 3 Part 2 and their publication (with English Heritage) Assessing the Effect of Road Schemes on Historic Landscape Character, published in March 2007. It states that any design mitigation approaches would be scheme-specific and a matter of professional judgement. When assessing the effect of a proposed development on the setting of a heritage asset, English Heritage's The Setting of Heritage Assets (English Heritage 2011) recommends using the following criteria for comprehensive assessment:
- Location and siting of development;
 - The form and appearance of the development;
 - Other effects of the development;
 - Permanence of the development; and
 - Longer term or consequential effects of the development

Significance of Impacts

6.2.5 The assessment of the significance of impact (Table 5.3), before mitigation, is determined by cross referencing the value of the asset (Table 5.1) and the magnitude of impact (Table 5.2). Major and moderate impacts are considered to be significant effects.

6.2.6 The setting of a designated heritage asset embraces other forms of experience and associative relationships, but its extent and importance is often expressed by reference to visual considerations, including views. Any development affecting the setting of a heritage asset is a direct impact in terms of EIA definitions.

Methodology for Evaluation of Impact and Assessment of Significance

6.2.7 The methodology used to assess the significance of effects is based on that provided in the Design Manual for Roads and Bridges (DMRB 2007). Each heritage asset has been assigned a value in accordance with the guidance provided in DMRB as shown in Table 6.1.

Table 6.1: Heritage asset value levels and criteria

Value of Asset	Criteria
Very High	The asset is of international significance - . This will include World Heritage Sites and some Scheduled Monuments, Grade I Listed Buildings, Grade I Registered Parks and Gardens and Registered Battlefields.
High	The asset is of national significance - . This will consider: Scheduled Monuments, Grade I and Grade II* Listed Buildings, Grade I and II* Registered Parks and Gardens, Registered Battlefields, undesignated assets of schedulable quality, undesignated buildings, sites, monuments and landscapes that can be shown to have specific nationally important qualities, areas of ancient woodland.
Medium	The heritage asset is of regional importance: Grade II Listed Buildings, Grade II Registered Parks and Gardens, Conservation Areas, Sites of high value identified through consultation, locally listed buildings,

Value of Asset	Criteria
	locally listed parks and gardens, undesignated buildings, monuments, sites or landscapes that can be shown to have important qualities in their fabric or historical association, Historic Townscapes with historic integrity in that the assets that constitute their make-up are clearly legible.
Low	The heritage asset is of local importance, including: undesignated assets – buildings, monuments, landscapes, Archaeological sites with a local value for education or cultural appreciation and which add to local archaeological and historical research, very badly damaged assets that are of such poor quality that they cannot be classed as high or medium, parks and gardens of local interest
Negligible	Assets identified as being of no historic, evidential, aesthetic or communal interest and Assets whose values are compromised by poor preservation or survival or of contextual associations to justify inclusion into a higher grade

6.2.8 For each asset the magnitude of impact of the scheme has then been assessed – as shown in Table 6.2. The magnitude of impact is the level of change that a site would experience as a result of the construction and operation of the scheme. The scheme also has the potential to impact beneficially on heritage assets through increased protection to the cultural heritage resource and its setting, or removal of objects or features currently harming the asset and/or its setting. This has been assigned as being of positive magnitude in the same way as the adverse ratings.

Table 6.2: Magnitude of impact and criteria

Magnitude of Impact	Criteria
Major	The development would completely destroy the heritage asset and its context, or the asset is separated from its setting thereby destroying the value of the asset.
Moderate	The development would damage the heritage asset and its context or the development would impact the setting of the asset to such an extent that its value is decreased.
Minor	The development would cause minimal damage to the heritage asset and/or its context, and/or the setting of the heritage asset is slightly impacted, but the value of the resource is not lost.
Negligible	The development would have little impact on the heritage asset or its setting.
No change	The development would have no impact on the heritage asset or its setting.

6.2.9 The likely significance of the effect of the scheme on each heritage asset has been determined by considering the relevant value of the asset and the magnitude of the impact, using the matrix shown in Table 6.3 below. Moderate effects and above are considered to be significant.

Table 6.3: Significance of effect

Value of Asset	Magnitude of Impact				
	Major	Moderate	Minor	Negligible	No change
Very High	Very Large	Large/Very Large	Moderate/Large	Slight	Neutral
High	Large/Very Large	Moderate/Large	Moderate/Slight	Slight	Neutral

Value of Asset	Magnitude of Impact				
	Major	Moderate	Minor	Negligible	No change
Medium	Moderate/Large	Moderate	Slight	Neutral/Slight	Neutral
Low	Moderate/Slight	Slight	Neutral/Slight	Neutral/Slight	Neutral
Negligible	Slight	Neutral/Slight	Neutral/Slight	Neutral	Neutral

Assumptions and limitations

6.2.10 The current understanding of the extent and survival of archaeological remains within the study area is well informed by the fieldwork investigations along the route. Further archaeological evaluation will be required in advance of construction to inform a detailed archaeological mitigation strategy to be formulated. Further information on assumptions and limitations of this assessment are provided in Volume 2, Chapter 6: Cultural Heritage, Section A.

6.2.11 Wider vantage issues are addressed in Chapter 7 – Landscape

6.3 Context

Technical context

6.3.1 In this assessment, the term cultural heritage is synonymous with ‘historic environment’ and divided into three sub-topics: Archaeological Remains, Historic Buildings and Historic Landscapes.

- Archaeological Remains – are the materials created or modified by past human activities that contribute to the study and understanding of past human societies and behaviour.
- Historic Buildings – are architectural or designed structures with a significant historic value. These may include country houses, churches, vernacular buildings, industrial and military buildings, as well as other structures not usually thought of as buildings, such as bridges and milestones.
- Historic Landscapes – all landscapes of the UK have, to some extent, been shaped by past human activity and, therefore, have some historic character.

However, not all landscapes are historically significant. This sub-topic is mainly concerned with the evidence of the past shaping the present landscape. Historic landscapes can be rural or urban and include designed landscapes, such as parkland.

6.3.2 The baseline was established in order to undertake the assessment of the historic environment potential in the study area. In order to establish the baseline, information was collected on the known cultural heritage within the vicinity of the proposed new road. The existing cultural heritage assets surviving within the study area (a buffer zone 300m from the DCO boundary) are presented in Volume 2, Chapter 6: Cultural Heritage, Section B with further information on the key receptors provided in 1.4.4 below. The location and extent of these sites are illustrated in Volume 2, Chapter 6: Cultural Heritage, Section C (Drawings MMD-233906-DT-0887 to 0889). The baseline conditions and criteria for evaluation are described below. The following designated and undesignated historic environment data has been collated as part of the baseline data gathering process.

6.3.3 Information was gathered from the following sources:

- Norfolk HER data;
- Undesignated historic buildings, structures and built monuments including: Locally listed buildings, buildings of local merit; and buildings, structures and monuments included in the Norfolk HER;
- Archaeological or historic landscape sites including sites listed in the Norfolk HER;
- Archaeological assets of schedulable quality as identified in the NPPF paragraph 139;
- Sites or areas predicted or known from desk based or fieldwork study;
- Known historic settlements including those identified as being of archaeological interest in local planning authority documents;
- Locally listed historic parks, gardens and battlefields;
- Historic maps;
- Published literature about known archaeology;
- Previous cultural heritage reports prepared for this scheme;

- Site Walkover Survey;
- Archaeological surveys carried out along the route corridor using fieldwalking, metal detecting, geophysics and trial trenching techniques;
- Details of designated sites held by English Heritage;
- Local authority conservation area appraisal documents and statements (where available) and their mapping;
- Historic landscape character mapping;
- Aerial photographs held by Norfolk HER; and
- Documentary, cartographic and other resources as deposited within local studies libraries and county and national records libraries and archives.

6.3.4 In order to ensure that all possible impacts on the setting of sensitive heritage assets were assessed, information on protected heritage features was gathered for a wider study area extending 1km from the scheme. These comprised a search of the following;

- Scheduled Monuments;
- Listed Buildings, Grade I, II* and Grade II;
- Conservation Areas;
- Registered Parks and Gardens;
- Registered Battlefields; and
- Ancient Woodlands.

6.3.5 The baseline study has considered all fieldwork reports comprising:

- Geophysical survey undertaken with a magnetometer 2006/2007 (Donaldson and Sabin 2007);
- A field-walking and metal detecting survey 2006/2007 (Hoggett and Morgan 2008);
- Trial trenching undertaken along the route corridor 2008 (Trimble and Watkins 2008);

- An archaeological desk-based assessment of proposed borrow pits 2008 (Penn 2008);
- A geophysical survey undertaken with a magnetometer 2009 (Railton 2009);
- Trial trenching undertaken along the route corridor 2009/2010 (Amis and Silwood 2012, Trimble 2006);
- An archaeological evaluation at the site of the Broadland Gate constructors compound 2010 (Ames and Sillwood 2010);
- An environmental statement including assessment on archaeology, historic buildings and historic landscapes 2008 (Mott MacDonald Ltd 2008 (a and b); and
- Geophysical Survey of the route (ASWYAS 2013).

Environmental Surveys

6.3.6 Site visits have been undertaken on numerous occasions in order to establish the setting of the development as well as to assess the setting of heritage assets (Listed Buildings, historic landscapes or structural remains), and identify any potential areas where sub-surface remains may be likely to be encountered. Archaeological fieldwalking, metal detecting, geophysical survey and trial trenching has also been undertaken in numerous locations across the scheme. The results of these surveys are summarised in the baseline section and detailed in Volume 2 6.D-6.I

Cultural Heritage Scheme Objectives

- 6.3.7 The main objectives of the scheme in relation to cultural heritage have been, as far as practicable, to:
- Design the scheme to avoid adverse impacts on the environment and, where appropriate, take opportunities to create beneficial environmental impacts.
 - Design the scheme to minimise any negative impacts on local landscape and historic landscape character.
 - Mitigate for any potential loss of archaeological remains by preservation in situ through designing appropriate construction methods or preservation by

record, as specified in Design Manual for Roads and Bridges (DMRB) Volume 11 Section 3 Part 2 Cultural Heritage

- Design and implement an archaeological mitigation strategy that will allow remains impacted by the scheme to be preserved by record under controlled and appropriate conditions.

Scoping and Consultation

6.3.8 A scoping report (Mott MacDonald 2013) set out the proposed methodology for the Environmental Impact Assessment. A scoping opinion (Planning Inspectorate 2013) was issued on behalf of the Secretary of State with regard to proposals set out in the scoping report (Mott MacDonald 2013). With regard to Cultural Heritage, the Scoping Opinion reaffirmed that the character or setting of cultural heritage resources are important, especially those which may be directly affected by the scheme, including historic buildings, historic landscapes and archaeological sites. The opinion notes from the scoping report the intention to address impacts on character and setting in the ES and welcomed this approach. The following issues were specifically mentioned and are therefore addressed in this assessment:

- The EIA should assess the proposed development in relation to all existing listed buildings, conservation areas, registered parks and gardens, scheduled monuments within the site and the wider area.
- The heritage assets, their setting and significance must be assessed in accordance with the requirements of NPPF and the scoping report.
- The effect of the development on the asset, its setting and its significance must be assessed.
- Mitigation measures must also be suggested where harm is identified.

6.4 Planning and Legislative context

Overarching Legislation

6.4.1 The overarching legislation in relation to Heritage Management in Britain is provided by:

- The Ancient Monuments and Archaeological Areas Act 1979; and
- The Planning (Listed Buildings and Conservation Areas) Act 1990.

6.4.2 There are three main categories regarding Listed Buildings within England.

- Grade I buildings are of exceptional interest. Just 2.5% of listed buildings within England are Grade I.
- Grade II* buildings are particularly important buildings of more than special interest. 5.5% of listed buildings are Grade II* within England.
- Grade II buildings are of special interest warranting every effort to preserve them. 92% of all listed buildings are in this class within England.

National Policy

6.4.3 The National Planning Policy Framework (NPPF) was published on 27th March 2012 and replaces all previous national planning policy documents, including Planning Policy Statement 5: Planning for the Historic Environment (2010). The NPPF seeks to streamline the national planning policy, simplify the planning process and introduce the concept of presumption of approval for sustainable development. The NPPF sets out guidelines for Local Planning Authorities and developers alike.

6.4.4 Although consent for the NDR scheme is being sought via a DCO from the Secretary of State and not a planning permission from the local planning authority, regard has been had to the elements of the document:

6.4.5 Policy 132 sets out what constitutes harm to heritage assets and the requirements for justifying harm to assets, stating. Significance can be harmed or lost through alteration or destruction of the heritage asset or development within its setting. As heritage assets are irreplaceable, any harm or loss should require clear and convincing justification.

6.4.6 Policy 133 sets out the circumstances when consent should be refused because of harm to a designated heritage asset - Where a proposed development will lead to substantial harm to or total loss of significance of a designated heritage asset, local planning authorities should refuse consent, unless it can be demonstrated that the substantial harm or loss is necessary to achieve substantial public benefits that outweigh that harm or loss, whilst Policy 134 explains that where a development proposal will lead to less than substantial harm to the significance of a designated heritage asset, this harm should be weighed against the public benefits of the proposal.

6.4.7 In policy 135 the assessment of an applications effect on non-designated assets is explained - the effect of an application on the significance of a non-

designated heritage asset should be taken into account in determining the application. In weighing applications that affect directly or indirectly non designated heritage assets, a balanced judgement will be required having regard to the scale of any harm or loss and the significance of the heritage asset. Policy 139 further explains that non-designated archaeological assets of equivalent significance to scheduled monuments, should be considered subject to the policies for designated heritage assets.

- 6.4.8 The requirement for recording heritage assets prior to their loss is explained in Policy 141. Local planning authorities should ... require developers to record and advance understanding of the significance of any heritage assets to be lost (wholly or in part) in a manner proportionate to their importance and the impact, and to make this evidence (and any archive generated) publicly accessible. However, the ability to record evidence of our past should not be a factor in deciding whether such loss should be permitted.

Local Planning Policy

- 6.4.9 The Joint Core Strategy (JCS) covering the authority areas of Broadland District, Norwich City and South Norfolk was adopted in 2011 and forms part of the Local Development Framework. The element of the development plan relevant to the proposed development contains one policy of relevance to cultural heritage matters (Policy 8), however this does not cover the assessment of impact on heritage assets.. There are saved relevant policies regarding cultural heritage in the Broadland District Council Local Plan (Policies ENV10, ENV17, ENV18 & ENV20). There are 12 policies relating to Cultural Heritage presented in the City of Norwich replacement local plan (adopted 2004) the five most pertinent to the NDR are presented in section 5.4.3.3.

The Broadland District Local Plan Policies

- 6.4.10 Policy ENV10 relates to historic parkland and includes the statement Development which would adversely affect their character and setting will not be permitted.
- 6.4.11 Policies ENV17, 18 and 19 address ancient monuments and archaeological sites. These state that the Development which would adversely affect a scheduled ancient monument or other nationally important archaeological sites and monuments, or their settings, will not be permitted...

6.4.12 However for archaeological remains of less importance the following applies - Where there is no overriding case for preservation of a site of archaeological importance, development which affects the site will only be permitted when an agreement has been reached to provide for the evaluation, recording and where desirable, the excavation of the site. To enable a decision to be made by the Local Authority regarding archaeological issues, sites will be subject to an evaluation of their archaeological significance. Any planning permissions granted will be subject to appropriate conditions.

City of Norwich replacement local plan (adopted 2004) (www.norwich.gov.uk)

6.4.13 Policies HBE1-12 relate to cultural heritage. With regard to archaeology the plan sets out that development detrimentally affecting scheduled ancient monuments, or their settings will not be allowed. For other sites of archaeological interest, there will be a presumption in favour of preserving remains in situ. Where this is not appropriate agreements to investigate, excavate and interpret the findings will be secured through planning obligations.

6.4.14 Regarding historic buildings, Policy HBE7 states development affecting significant historical structures or buildings within the development site should take account of the chronology of their development and their physical and historical significance. Proposals in conservation areas will be considered with relation to the following (Policy HBE8):

- demolition of buildings or structures, including ancient walls, will only be permitted if they make little or no contribution to the area's character and appearance, and are accompanied by acceptable and detailed plans of appropriate new development, contributing to the enhancement of the conservation area;
- every effort to conserve and retain the features which contribute to the area's character can be demonstrated. Where historic features cannot be maintained in situ, arrangements should be made, for their salvage and reuse or transfer to a suitable location
- its design respects and is sympathetic to the form and character of the area's development including any extant historic plot boundaries and in particular takes account of the Conservation Area Appraisal for the area in terms of the built form elements and materials which are of significance for its character;

- sufficient detail is provided to demonstrate the townscape implications in relation to neighbouring buildings.

6.5 Baseline

- 6.5.1 Conclusions are provided below about the nature of the historic environment resource across the NDR route from the surveys to date. This section forms the baseline study presented in date order (generally described from east to west). The Norfolk Historic Environment Record (NHER) data and survey results are illustrated in Volume 2, Chapter 6: Cultural Heritage, Section C (Drawings MMD-233906-DT-0887 to 0908).
- 6.5.2 Previously known archaeological sites that lie within or near the route corridor are recorded in the NHER. The available dataset has been augmented by finds recovered during fieldwalking with metal-detector survey, geophysical survey and archaeological evaluation undertaken over specifically targeted areas along the route (where access was possible).
- 6.5.3 The Norfolk National Mapping Programme (NMP) aerial photographic survey has identified and mapped a large number of archaeologically significant cropmarks and earthwork sites along the NDR corridor (Drawings MMD-233906-DT-0896 to 0908). The full NHER dataset (300m buffer zone of the route), updated in August 2013, is tabulated in Volume 2, Chapter 6: Cultural Heritage, Section B.

Geology and Topography

- 6.5.4 The route is located on gently undulating land to the north of Norwich. At the western end of the route, around Taverham, the geological deposit is the Wroxham Crag Formation sand and gravel overlain by mid-Pleistocene glaciofluvial deposits of sand and gravels. Large deposits of brickearth are recorded further to the east, around Spixworth and Horsham St Faith and at Rackheath the route runs over alluvium deposited along the floodplain of the tributary stream of the River Bure. The route then runs through a large area of Happisburgh Glacigenic Formation Diamicton deposited up to 2 million years ago over Crag Group sand and gravel. The eastern end of the route, at the Broadlands Industrial Estate, is situated on bedrock comprising Crag Group sand and gravel.

Known archaeological sites

Scheduled Monuments

- 6.5.5 There are two Scheduled Monuments within a 1km buffer of the route. Horsford Castle (1003998) had a motte which was 77 metres by 85 metres wide, and around 2.3m high, with a single bailey 72 metres by 32 metres wide. The remains of the castle are on the edge of the study area. St Faith Priory (1003933) was founded by Robert Fitz Walter, the son of Walter de Caen who built Horsford Castle and also lies on the edge of the study area.

Prehistoric

- 6.5.6 The entire route is in a landscape that appears to have been utilised from the prehistoric period with background material including prehistoric flint artefacts from the Upper Palaeolithic through to the Iron Age. Trial trenches have in some cases been able to confirm the presence of geophysical anomalies and cropmarks, although evidence to securely date features has been sparse. There are a number of important prehistoric funerary monuments either evaluated as part of the archaeological work for NDR or seen within the vicinity of the route on aerial photographs.
- 6.5.7 Geophysical survey during 2012 and 2013 (ASYWAS 2013) revealed three linear features forming what appears to be an inverted D-shaped enclosure surrounding several possible pits or postholes between chainage 2300 and 2400. The site is located within the construction corridor, on the western side of the railway from Norwich to King's Lynn, adjacent to site 30315, within the parish of Taverham (Volume 2, Chapter 6: Cultural Heritage, Section C, MMD-233906-DT-0889).

Site 30315

- 6.5.8 A programme of evaluation trenching was undertaken to determine the nature of the cropmarks visible on aerial photographs within area 30315 (Volume 2, Chapter 6: Cultural Heritage, Section C – MMD-233906-DT-0889) between chainage 2400 and 2500. A linear earthwork uncovered during the course of evaluation work in Taverham (site 30315) is an important discovery. Although it was visible as a cropmark, its true significance was not understood until identified through trial trenching as a large ditch. Subsequent research shows its line to continue in a north-easterly direction, where it forms the boundary between Drayton and Felthorpe parishes. It also forms part of the boundary between Taverham and South Erpingham hundreds. Along part of its length it is visible as a low upstanding bank and shallow ditch, but not within the

immediate vicinity of the proposed scheme where it survives below ground only. Parish boundaries are some of the oldest surviving features in the modern landscape. Most were in the process of being ‘formalised’ between 900 and 1150 AD and were, in most cases, fixed by 1200 AD. Parish boundaries often perpetuate older boundaries, or ‘marginal zones’ in the historic landscape. In many cases parish boundaries follow ancient physical features in the landscape like rivers, streams, valleys, watersheds, or roads. In Norfolk, five other major linear earthworks of this type are known; the Fossditch, the Bichamditch the Panworth Ditch, the Launditch and the Devil’s Ditch. . Despite the investigations, the date of the feature is uncertain, but Saxon or Iron Age origin is most likely, with the presence of disarticulated human remains found nearby perhaps indicative of more Iron Age origin.

Site 124468

6.5.9 Archaeological trial trenching further to the east revealed postholes containing Bronze Age pottery and worked flint between chainage 2500 and 2900 (Ames and Sillwood 2012; (Volume 2, Chapter 6: Cultural Heritage, Section C – MMD-233906-DT-0889)). A small number of undated features, including a north-east to south-west aligned ditch and small pits/postholes were also recorded.

Site 18131

6.5.10 Two archaeological trenches were excavated across a large rectilinear enclosure cropmark, within the construction corridor, at Bell Farm, Reepham Road between chainage 3900 and 4300 (Site 18131; Volume 2, Chapter 6: Cultural Heritage, Section C – MMD-233906-DT-0890), initially considered to be an early Neolithic mortuary enclosure (Trimble and Watkins 2008). The trenching produced evidence which suggests the enclosure probably dates from the Bronze Age. However, a series of large pits, thought to be from an earlier, perhaps Neolithic, phase of activity were recorded within the enclosure. The excavated ditch sections were of a considerable depth (1.20m) suggesting that the site is relatively well preserved. This is supported by the discovery of undisturbed remnants of a burnt mound (a dump of burnt flints used to heat water). Usually, on arable land, these features only survive as scatters of burnt flint within the ploughsoil. Preservation is no doubt helped by the fact the land here has been set to pasture in recent years. A geophysical survey in 2012 across this area revealed a concentration of small

pit and ditch-like features indicating that the features revealed through cropmarks and the previous trenching exercise extend some distance.

Site 124223

6.5.11 A small number of ditches and pits were identified during trenching in the field to the east of site 18131 (Volume 2, Chapter 6: Cultural Heritage, Section C – MMD-233906-DT-0890), between chainage 4000 and 4400, but none of these could be firmly linked to the features identified to the west (Ames and Sillwood 2012), although they may be associated

Sites 124224

6.5.12 Further positive anomalies were confirmed as ditches and pits although generally undated at sites 124224 & 124225 (Volume 2, Chapter 6: Cultural Heritage, Section C – MMD-233906-DT-0890), they are considered to be prehistoric in date.

Site 35668

6.5.13 A total of 15 trenches were excavated at Site 35668 (Volume 2, Chapter 6: Cultural Heritage, Section C – MMD-233906-DT-0891) between chainage 9100 and 9800 (Ames and Sillwood 2012) which aimed to provide context data for finds recovered during the fieldwalking and metal detecting survey (Morgan and Hoggett 2008). To the south-east of the site, a pit containing four sherds of late Bronze Age pottery was revealed, alongside evidence of fish bone, wheat and oat (Ames and Sillwood 2012) at chainage 9500. A second but undated ditch was also present at chainage 9700. This archaeological evaluation indicated sparse evidence of archaeological activity in this area. The location of Bronze Age activity within this region is not unusual as numerous Bronze Age sites are recorded to the west at Horsford.

Site 35669

6.5.14 Ten trenches were excavated at site 35669 (Ames and Sillwood 2012; Volume 2, Chapter 6: Cultural Heritage, Section C – MMD-233906-DT-0891) targeting possible features identified during a geophysical survey (Railton 2009), within the Parish of Spixworth between chainage 10200 and 10600. Four thin linear cropmarks have also been identified within this area (NMP). A

small number of ditches and pits contained prehistoric pottery and worked flint.

Site 123748

6.5.15 Six trenches were excavated within site 123748 between chainage 10900 and 11000 (Ames and Sillwood 2012; Volume 2, Chapter 6: Cultural Heritage, Section C – MMD-233906-DT-0892), two of which targeted a large earthwork identified through the National Mapping Programme, the postulated Roman road between Brampton and Thorpe St Andrew. No absolute evidence of the road was identified but a compact layer containing Iron Age pottery was present, and might indicate an earlier origin for the track than previously considered. A small number of undated pits and ditches were also identified in these trenches, along with a post-medieval/modern posthole.

Site 49748

6.5.16 Site 49748 (Volume 2, Chapter 6: Cultural Heritage, Section C – MMD-233906-DT-0892) within the Parish of Sprowston, was evaluated with 20 trenches of which 14 contained archaeological features. The majority were undated ditches showing that earlier land divisions had occurred prior to the open field system that presently exist. Ditches were located in Trenches 1, 2, 5, 7, 8, 9, 12, 13, 14 and 18 with the most significant being a ditch located within Trench 2 containing early Neolithic pottery. To the west of site 49748 geophysical results undertaken in 2013 have revealed a series of anomalies which may be archaeological in nature.

6.5.17 In the parish of Beeston St Andrew ring ditches have been recorded on the NHER at various locations (NHER 21124, 50883 & 50804) which lie outside of the construction corridor. Other prehistoric monuments are within the parish of Horsford at Drayton and Felthorpe, where two Neolithic barrows are recorded (NHER 7763 & 52401), which may be the same feature.

Site 123960

6.5.18 Archaeological trial trenching across the area known as Broadland Gate, Site 123960 (Silwood & Ames 2010) revealed features within 17 of the 33 trenches (Volume 2, Chapter 6: Cultural Heritage, Section C– MMD-233906-DT-0894). Ditches mostly aligned north-south and east-west were revealed. Only flint artefacts were recovered from the ditches, with a few fragments of prehistoric

pottery indicating an early date for the site. To the north of this area, adjacent to a balancing pond, geophysics in 2012 uncovered further positive anomalies, close to rectangular shaped cropmarks.

6.5.19 Further to the south, in the Postwick Hub area of the scheme, a series of archaeological investigations including geophysical survey (Sabin and Donaldson 2007) and trial trenching (Trimble and Watkins 2008) revealed prehistoric remains including a ring ditch, possibly a Bronze Age barrow or henge monument.

Site 123955

6.5.20 The evaluation of Site 123955 Postwick Hub confirmed the survival of a large enclosure and other cropmark features (HER 124995) dated from the Neolithic through to the Bronze Age. Of the 14 trenches opened, seven were placed to target known cropmarks and of these, six located features which appear to correspond with the cropmarks. Additional ditches were discovered which had not appeared as cropmarks.

6.5.21 The most significant of the features were in Trenches 10 and 11, where the trenches had been placed to sample the northern and western elements of a rectilinear enclosure identified from cropmarks. In Trench 10 east–west ditch [15] contained finds of prehistoric date in its primary and upper fills. The north–south aligned ditch [19] on the western side of the enclosure contained middle Bronze Age pottery and struck flint. This enclosure is clearly of a prehistoric date and the ditch was still open to a certain depth during the Bronze Age. It may be that the enclosure had its origins as early as the Neolithic period and was being slowly backfilled, but still a feature in the landscape in the Bronze Age. The presence of a pit in the vicinity also containing Bronze Age pottery (Trench 12, pit [28]) is also significant, hinting at the presence of a prehistoric landscape, rather than features in isolation.

Site 49758

6.5.22 A probable Bronze Age barrow or hengiform monument (NHER 52036) was excavated as part of previous evaluation work along the route of the NDR (NHER 49758; Volume 2, Chapter 6: Cultural Heritage, Section C – MMD-233906-DT-0894) in the parish of Postwick with Witton. This feature was recognised during the evaluation trenching although it could not be precisely dated with only medieval pottery recovered from the upper fills. The proposed slip road where the ring ditch was located no longer forms part of the road

design and it will therefore be left undisturbed. A variety of prehistoric hengiform monuments or Bronze Age ring ditches are known in the wider landscape (NHER 52041; 21766; 51972 & 21766), but lie outside of the study area.

Roman

6.5.23 The Roman period appears to be characterised by land management ditches which are rare along the line of the proposed route. Within the parish of Great and Little Plumstead during excavations at Laurel Farm in 2006 a possible Roman roadside cremation cemetery was recorded (NHER 51007). This consisted of an eroded layer containing a quantity of Roman jars, and the lack of any building material suggests that there were no structures, certainly within the excavation area. It may be that this site is related to the Roman pottery kiln to the south, and may, in fact, be a dumping area for pottery.

6.5.24 A Roman road (NHER 7598) runs north-west to south-east crossing several parishes and coincides with part of the route of the NDR. The road is believed to run from Brampton (NHER 1124) to the riverside at Thorpe St Andrew and was investigated during an earlier evaluation of the NDR route (NPS 2008). This site (NHER 41874) did not uncover any evidence for the road, although the excavator noted that there is the possibility that it had been ploughed out.

6.5.25 Excavations by NAU in 1997 ahead of the development of a business park located Roman pottery kilns (NHER 31108), three in total, dated to the 2nd century. This industry is only thought to have been a small scale local enterprise.

6.5.26 The cropmarks of a possible Roman marching camp (NHER 16451) were noted on aerial photographs within Spixworth; metal-detecting and fieldwalking have produced Roman finds which make this camp locally important. This site is not within the construction corridor. Evidence of another square enclosure (NHER 13224) was seen to the north-west of this marching camp, within Horsham and Newton St Faith parish. This enclosure is undated, although a Roman coin found nearby (NHER 19644) may suggest a Roman date for the cropmark.

6.5.27 In the parish of Postwick, a Roman site containing cropmarks of a rectangular enclosure, field boundaries and a trackway (NHER 36341) is located in the most southerly portion of the search area. The enclosure measures 36m by 20m and to its immediate south there is an enclosed area measuring 140m by 130m, with internal subdividing ditches. A trackway and associated ditches

can be seen 250m to the east. Also further, multi-period cropmarks have been found at NHER 49560, and may represent phases of activity from late prehistoric through to post-medieval, the main phase of activity is probably Roman.

Saxon

6.5.28 There have been Saxon features and find spots within the vicinity of the proposed NDR. In the parish of Postwick (NHER 10219) a grubenhaus or sunken-featured building was discovered, previously interpreted as an Iron Age feature. The Laurel Farm excavations in Great and Little Plumstead uncovered Saxon activity (NHER 51008), which included several large fire pits and several more refuse pits. Iron slag was recovered from the fire pits, and the site is interpreted as a small scale industrial site with some evidence for occupation during the period.

6.5.29 In Thorpe St Andrew parish, the cropmarks of a pit-like feature, interpreted as a possible Saxon grubenhaus (NHER 52046), have been recorded. The field that contains this cropmark and cropmarks of other pit-like features (NHER 52045) is recorded as being covered with features of a probable geological nature and hence should be viewed with caution.

Site 124298

6.5.30 Trenching at area ENF124298 (Volume 2, Chapter 6: Cultural Heritage, Section C – MMD-233906-DT-0891) which had previously produced medieval and post-medieval finds during fieldwalking and metal detecting (Morgan and Hoggett 2008) revealed two small early Saxon pits and a ditch (Ames and Sillwood 2012; Trench 2) chainage 6900 and 7200. It lies within the area of St Faith's Fairstead from which numerous metal detected finds have been recovered. One of these finds was an early Saxon copper alloy wrist clasp from site (HER 18126) which is of interest because it places what was found during the evaluation into the context of wider early Saxon activity (Ames & Silwood 2012).

Medieval

Site 41884

6.5.31 Site 41884 lies to the north of Beeston St Andrew Hall and to the west of the B1150 North Walsham Road between chainage 2200 and 2300. Fieldwalking in 2005 recovered medieval and post-medieval pottery fragment with iron slag in the ploughsoil. No features or finds were seen in the one trial trench placed here.

Site 124298

6.5.32 At site 124298 rectilinear system of field boundaries visible as cropmarks were confirmed as being medieval during evaluation (Ames and Sillwood 2012; Volume 2, Chapter 6: Cultural Heritage, Section C – MMD-233906-DT-0891) between chainage 6900 and 7200. There was no clear evidence for associated areas of habitation on the site, although several medieval pits were identified. Two further ditches not visible as cropmarks appeared to represent an earlier, perhaps Roman phase of activity.

Sites 51049 & 50501

6.5.33 Sites 51049 and 50501, located between chainage 14900 and 15300, revealed features that could have been associated with the deserted medieval village at Rackheath; linear ditches are thought to represent former field boundaries, and possible extraction pits date to the 13th to 14th centuries (Ames and Sillwood 2012; Volume 2, Chapter 6: Cultural Heritage, Section C – MMD-233906-DT-0893)

Post-medieval

Site 124299

6.5.34 Site 124299 (Volume 2, Chapter 6: Cultural Heritage, Section C – MMD-233906-DT-0890) was first investigated by field walking which uncovered a selection of post-medieval finds. The area was subsequently subject to geophysical survey which produced a large number of bipolar magnetic anomalies. As a result of the trial trenching two ditches and one pit were recorded within this field. The finds from the ditch indicate a medieval to post-medieval date range.

6.5.35 The only post-medieval archaeological evidence recovered from field 35668 (Volume 2, Chapter 6: Cultural Heritage, Section C – MMD-233906-DT-

0891) were two ditches (Trenches 6 and 15) and two pits (Trenches 9 and 11). The ditch from Trench 6 produced 16th – 17th century pottery.

Undated/ambiguous

Site 50493

6.5.36 In Attlebridge, the field survey identified an aircraft crash site (Site F2- 50493; Volume 2, Chapter 6: Cultural Heritage, Section C – MMD-233906-DT-0889). The site is marked by a spread of aluminium airframe and twisted iron fragments which were situated within a dish-shaped depression. The depression is most likely to have been caused by the impact of the crash. The crash site is not recorded on the NHER and the date of the crash remains uncertain. However, it is likely to be a WW2 crash, possibly of an aircraft from the nearby USAAF airbase at Attlebridge. Ten trial trenches were excavated across the general area of the suspected WW2 crash site in 2010 between chainage 800 & 1100 (Ames & Silwood 2012). None of the trenches revealed any archaeological features or remains of the wreckage within this section of the proposed route. A c. 0.90m thick colluvial layer was revealed across this area.

Site 18126

6.5.37 At site 18126 (Volume 2, Chapter 6: Cultural Heritage, Section C – MMD-233906-DT-0891) two enclosures were noted, and were investigated by NPS Archaeology for the NDR project between chainage 5100 and 5300. The results of the evaluation were negative, with no features found in any of the trenches, although several fragments of possible Bronze Age flint were recovered. Geophysical survey in 2012 has revealed further possible enclosures to the west of this area (Between sites 124255 & 18126)

Site 49745

6.5.38 In Horsham St Faith parish (Site 49745) a medieval fair site (NHER 8126) known as St Faith's Fairstead is recorded between chainage 8400 and 8700. The fair was granted a charter in 1100 and continued to hold annual fairs until the mid-19th century. The fair was predominantly for the trading of cattle, and the site has yielded a great variety of metal-detected finds over many years. Evaluation by NAU in 2006 in preparation for the NDR (NHER 49745; Volume 2, Chapter 6: Cultural Heritage, Section C – MMD-233906-DT-0891)

produced no evidence for the fair even though the trench was placed to sample the densest scatter of artefacts.

Site 41874

6.5.39 Site 41874, (Volume 2, Chapter 6: Cultural Heritage, Section C – MMD-233906-DT-0892) within the parish of Beeston St Andrew, was to the east of the B1150 & area 41884. The proposed route of the NDR crosses the postulated line of a Roman road within this field (NHER 7598) between chainage 2300 and 2700. The road is marked on Fadens map of 1797 and is thought to have run between Brampton and Thorpe St Andrew. At this point the line of the road is marked by the thin north-west south-east 'Broadway'. A trench was placed across the postulated line of the Roman road but no trace of it was revealed. This is consistent with the other trenches designed to prove the existence of the Roman road, which have all been negative. The road may have been ploughed away in recent years. Other trenches to test anomalies in this area proved largely negative.

Site 124225

6.5.40 Four trenches helped to ascertain weak geological anomalies as modern in date between chainage 4600 and 4800.

Site 49757

6.5.41 Site 49757 (Volume 2, Chapter 6: Cultural Heritage, Section C – MMD-233906-DT-0894) lies to the north of Postwick where a proposed link road will connect the NDR to the Broadland Way industrial estate. Two targeted trenches revealed only geological features.

Historic Buildings

6.5.42 Historic buildings include statutory Listed Buildings (Grade I, II* and II), locally listed buildings and other features identified by local authorities as being of historical interest. This definition also encompasses structures of historic merit, for example railway bridges, boundary stones and statues. Designated and undesignated buildings and Conservation Areas are displayed in in Volume 2, Chapter 6: Cultural Heritage, Section C MMD-233906-DT-0886 to 0888.

6.5.43 At the western end of the route there are relatively few historic buildings in the study area. Moving eastwards, the route skirts around the south of the historic settlement areas of Horsham St Faith, which include a number of listed buildings. From Spixworth eastwards there are various historic buildings associated with the historic parklands, including gates, bridges and lodges, as well as the various home farms of the parks/estates. To the south of Rackheath Park, the route skirts around a historic former green in Plumstead, through a number of historic farmsteads towards more modern development in Postwick.

6.5.44 There are 52 Listed Buildings within the defined 1km study area of the proposed development (Table 6.4 and Volume 2 6.B). This includes four Grade I and two Grade II* Listed churches, whilst the remaining listed buildings are all Grade II listed.

Table 6.4: Historic Buildings (Listed)

NHER	Listed Building Ref	Value of Asset	Description
	228423	Medium	Poplars Farm house. 17th Century wing of larger house, with 19th Century additions, of rendered and rough cast brick, with red and black pantiled roofs. L-shaped plan of 2 storeys (Grade II).
48709	228418	Medium	The Lindens, Horsford (Grade II) House early 18th C with early 16th-C core
7795	228419	High	Parish Church, Horsford (Grade II*) Medieval parish church
17520	228420	Medium	Horsford Hall, Horsford (Grade II) Former 18th-C manor house
20966	228421	Medium	Little Orchard, Horsford (Grade II) House 18th C with 17th-C core (Not on plan)
43951	228099	Medium	The Kennels, Horsham & Newton St Faith early 18th century and later, of several builds. Brick, partly rendered and whitewashed, thatched roof. Two storeys and attics, L-shaped (Grade II).

NHER	Listed Building Ref	Value of Asset	Description
48738	228098	Medium	The White House, Horsham & Newton St Faith (Grade II) 17th-C house (BAR)
12250	228092	Medium	The Lilacs Horsham St Faith. House, early 17th century and later; much restored. Red brick, partly colour washed and rendered. Steeply-pitched pantile roof. Two storeys and attics, T-shaped.
11826	228486	Medium	The Smee Farmhouse. Farmhouse, early C18 and later, of brick and thatch
51101	359869	Medium	2 pairs gate piers & att. railings & terminal piers (Grade II) SE entrance to Spixworth Hall
8173	228195	Low	Gateway to Rackheath Park (Grade II) Cast and wrought iron gate piers and screen (gates missing)
8174	228069	Medium	Beeston St Andrew Hall. Walls to south Beeston St Andrew Hall (Grade II) 18th-C curved blind arcaded walls. (The walls to the north of the hall are earlier).
8172	228196	Medium	Rackheath Hall (Grade II) An 18th century Country House remodelled in the mid-19th-C by the Stracey family.
20138	228197	Medium	Bridge 100m NE of Rackheath Hall (Grade II) Early to mid-19th-C bridge linking to kitchen garden
41948	228088	Medium	Methodist Chapel on Church Street (Grade II Listed)
21666	228095	Low	The Clink (Grade II). An 18th century village prison or lock up, attached to a medieval and post medieval boundary wall.
8005	228083	High	Benedictine Priory of St Faith (Grade I Listed)

NHER	Listed Building Ref	Value of Asset	Description
21982	228483	Medium	South Lodge Cottage, Low Road, Little Plumstead. 16th century (Grade II Listed) (Not on plan).
48728	359870	Low	A type K6 telephone kiosk, designed by Sir Giles Gilbert Scott (1935) (Grade II Listed)
48737	228097	Medium	The Old Posthouse, 94 Norwich Rd 18th Century (Grade II Listed)
11528	228424	Medium	The Dog Public House. Early 17th century T-shape in plan (Grade II Listed)
	228082	High	The Parish Church of the Blessed Virgin & St Andrew (Grade I Listed)
	228070	High	The Parish Church of St Peter (Grade I Listed)
	228194	High	The Church of All Saints in Rackheath (Grade I Listed)
	228419	High	Parish Church of All Saints in Postwick & Witton (Grade II* Listed)
	468956	Medium	Church at St Andrew's Hospital (Grade II Listed)
	1050874	Medium	Barn at the site of Spixworth Hall (Grade II Listed)
	1050875	Medium	Garden wall at gatepiers south of barn and Gaffers cottage (Grade II Listed)
	1050876	Medium	Granary to west of barn (Grade II Listed)
	1050876	Medium	2-5, Church Street (Grade II Listed)
	1050901	Medium	The King's Head Public House (Grade II Listed)
	1050902	Medium	Meadow Farm House (Grade II Listed)
	1050904	Medium	The Gildencroft (Grade II Listed)

NHER	Listed Building Ref	Value of Asset	Description
	1051488	Medium	Grove Farm House (Grade II Listed)
	1051489	Medium	Corn Barn and Cart Shed at the Grove(Grade II Listed)
	1051545	Medium	Little Orchard (Grade II Listed)
	1051550	Medium	Barn 50m north west of Low Farm House(Grade II Listed)
	1152491	Medium	Waytes House (Grade II Listed)
	1152508	Medium	Mill Farm House (Grade II Listed)
	1152889	Medium	Church of St Mary the Virgin (Grade II Listed)
	1170605	Medium	Manor Farm Cottages (Grade II Listed)
	1170619	Medium	The Stower Grange (Grade II Listed)
	1170828	Medium	Lower Farm House and attached barn (Grade II Listed)
	1263402	Medium	Boatman's Foremans' Cottage (Grade II Listed)
	1372664	Medium	Manor Farm House (Grade II Listed)
	1372677	Medium	Barn and Byre at the Grove (Grade II Listed)
	1372678	Medium	The Old Lodge (Grade II Listed)
	1372681	Medium	The Church of All Saints (Grade II Listed)
	1372707	Medium	St Andrew's Hospital (Grade II Listed)
	1372960	Medium	Village Hall (Grade II Listed)
	1372961	Medium	The Oaks (Grade II Listed)
	1372985	Medium	Gaffers Cottage (Grade II Listed)

6.5.45 6.5.45 Other Historic Buildings (not statutory listed) that have also been noted within the vicinity of the route corridor are described in Table 6.5 below.

Table 6.5: Selected non-designated historic buildings

NHER	Value of Asset	Description
-	Low	West Farm, Horsham St Faith
12258	Low	Red Hall farm complex.
8176	Low	Late 19th-C Hydraulic Ram (connected to Rackheath Hall by over 1 mile of cast-iron piping)
55989	Low	WWII accommodation sites (Gazebo Farm) associated with Rackheath Airfield
47126	Low	Hall Farm, Rackheath Park, c.1820
50041	Low	Laurel Farm, Gt & Lt Plumstead
12637	Low	Great Plumstead Hall
8142	Low	Possible site of St Andrew's church, Beeston St Andrew, ruins by the mid 16th Century
8022	Low	Spixworth Hall/Spixworth cottages

Conservation Areas

6.5.46 There are two conservation areas within 1km of the DCO boundary. This include the Thorpe End Garden Village Conservation Area, which lies c. 300m to the east of the new road, but off-line improvements will be required within the conservation area. Thorpe End Garden Village was a planned development by Percy Howes and Co in the 1930s, following the model of garden cities such as Letchworth and Welwyn. The development was deliberately separated from Norwich and characterised by wide verges, chestnut trees and the village green (Broadland District Council 2010).

6.5.47 The Horsham St Faith Conservation Area lies c.400m away from the DCO boundary. The conservation areas significance lies in its historical associations with a Benedictine priory (scheduled monument and grade I

listed building) which was the precursor to the village (hence St Faith) and still stands on the west side.

Historic Landscapes

6.5.48 Historic landscapes comprise visible elements of the landscape fashioned by human occupation such as, for example, field patterns, walls and hedgerows, drainage systems, lime kilns, barns, historic woodlands, village greens and historic parks. They also include sites of historical events such as battlefields.

6.5.49 The route travels through a particularly distinctive area of historic landscape to the north-east of Norwich. This area can be characterised by the 8 separate historic landscape character areas recorded in the HER (Table 6.6). Parks of varying size are loosely clustered along with a series of small blocks of ancient woodland. These are predominantly private landscapes although Beeston and Red Hall have minor public roads crossing them. The overall perception is one of a well-wooded landscape with some visible parkland features.

Table 6.6: Historic Landscapes and parklands

NHER	Landscape Ref:	Description
61679	HNF55372	Spixworth Park. Landscape park visible on OS survey 1883 6 inch map
62644	HNF56247	Beeston Old Hall/Red Hall Park. Minor park associated with Beeston Old Hall (HER relates to Hall) (not illustrated)
30495	HNF40903	Beeston St Andrew Hall Park
56245	HNF 62642	Sprowston Lodge Park. Small rectangular park adjacent to Beeston St Andrew Park. Once occupied by a branch of the Stracey family. Described in White's 1845 directory as a 'neat white brick mansion' with 'pleasure grounds' (not illustrated)
30522		Sprowston Hall Park. First Sprowston Hall built c.1560 for Corbett family. Later associated with Gurney family who rebuilt the Hall in neo-Elizabethan style 1872–6. Additions 1905 and more recently in association with its use as a

NHER	Landscape Ref:	Description
		hotel and golf club. Parkland remodelled through use as golf course though a number of mature trees survive. Surveyed by NCC/UEA in 1989–91 (not illustrated)
30518	HNF40826	Rackheath Park and WWII airfield accommodation sites
21637		Gt Plumstead Hall Park, Gt & Little Plumstead (not illustrated)
8137	HNF46673	Horsham St Faith WWII Airfield – A few WWII buildings extant. Site includes aircraft museum with relocated WWII building (not illustrated)

6.5.50 The historic landscape across the route includes eight locally listed historic landscapes. There are two locally listed parklands which will be directly impacted by the NDR route; Beeston St Andrew Park and Rackheath Park (section 5.7.9).

6.5.51 In addition to the above, the Historic Landscape Character data provided by Norfolk HER indicates that the proposed route passes between (not through) two areas of ancient woodland.

6.5.52 The route runs through Beeston St Andrew Park, a locally listed parkland classified as informal parkland of unknown to post-medieval date.

6.5.53 The south-eastern edge of 18th – 20th century woodland, which is a plantation on the western side of the road A1151 will be cut by a proposed roundabout and will also cut into the north-western edge of 18th-20th century woodland plantation on the east side of the road.

6.5.54 The route is planned to cut through a further section of 18th – 20th century woodland plantation to the west of New Rackheath. This section of the route also passes through and to the east of Rackheath Park, a locally listed parkland classified as informal parkland of unknown to post-medieval origin.

Historic Landscapes

6.5.55 Historic landscapes comprise visible elements of the landscape fashioned by human occupation such as, for example, field patterns, walls and hedgerows,

drainage systems, lime kilns, barns, historic woodlands, village greens and historic parks. They also include sites of historical events such as battlefields.

6.5.56 The route travels through a particularly distinctive area of historic landscape to the north-east of Norwich. This area can be characterised by the 8 separate historic landscape character areas recorded in the HER (Table 6.6). Parks of varying size are loosely clustered along with a series of small blocks of ancient woodland. These are predominantly private landscapes although Beeston and Red Hall have minor public roads crossing them. The overall perception is one of a well-wooded landscape with some visible parkland features.

8137	HNF46673	Horsham St Faith WWII Airfield – A few WWII buildings extant. Site includes aircraft museum with relocated WWII building (not illustrated)

6.5.57 The historic landscape across the route includes eight locally listed historic landscapes. There are two locally listed parklands which will be directly impacted by the NDR route; Beeston St Andrew Park and Rackheath Park (section 5.7.9).

6.5.58 In addition to the above, the Historic Landscape Character data provided by Norfolk HER indicates that the proposed route passes between (not through) two areas of ancient woodland.

6.5.59 The route runs through Beeston St Andrew Park, a locally listed parkland classified as informal parkland of unknown to post-medieval date.

6.5.60 The south-eastern edge of 18th – 20th century woodland, which is a plantation on the western side of the road A1151 will be cut by a proposed roundabout and will also cut into the north-western edge of 18th-20th century woodland plantation on the east side of the road.

6.5.61 The route is planned to cut through a further section of 18th – 20th century woodland plantation to the west of New Rackheath. This section of the route also passes through and to the east of Rackheath Park, a locally listed parkland classified as informal parkland of unknown to post-medieval origin.

Historic Parkland

6.5.62 Beeston St Andrew and Rackheath Parks are both directly affected by the proposed route and have therefore been considered more fully. They are shown in Volume 2, Chapter 6: Cultural Heritage, Section C MMD-233906-DT-0886 to 0888.

Beeston St Andrew Park

- 6.5.63 The park at Beeston St Andrew probably dates from the 17th century, when the land was owned by the Corbett family who also owned Sprowston Manor. The curtain walls to the north of the present house are considered to date from this period.
- 6.5.64 An estate map of 1722 depicts an earlier house and park of geometric design. By the early 19th century the park had been radically remodelled and the straight lines replaced by rounded clumps and curving paths. The only element of the earlier scheme that appeared to survive was the line of the former avenue from the present-day North Walsham road. This avenue also forms part of a projected Roman Road (HER 7598).
- 6.5.65 The park is unusually long and rectangular. The current Beeston Hall, a later replacement, was designed by local architect Edward Boardman in 1897. The various estate lodges and cottages all appear to be of late 19th- and early 20th-century date, although the Park Farm complex is earlier.
- 6.5.66 In general, the park has not altered in its basic form since the early 19th century. Significant plantation belts survive to contribute to the well-wooded appearance of this area. The parkland to the south of the Hall is in better condition, with part used for grazing and better survival of mature standard trees. The northern half of the park has lost its standard trees and clumps of trees, along with part of the north-eastern boundary, and is partially under the plough.
- 6.5.67 A minor public road crosses the park to the south of the hall, although the lodges at either end create a private feel. There is no formal public access within the park.
- 6.5.68 This parkland is undesignated but is covered by Broadland District Council Local Plan policy ENV10 'Historic Parklands'. The Hall itself is unlisted but the curtain walls flanking the southern facade of the hall are Grade II listed.

Rackheath Park

- 6.5.69 Rackheath Park is a notably large park, around a square plastered brick Italianate Hall. The parkland is incised by a minor tributary of the River Bure, which creates areas of striking landform. A deer park existed here on a 1588 map of Mousehold Heath. A landscape park was in existence by the later 18th century and was associated with the Stracey family from 1773 onwards. The

parkland was extended over heathland to the south in the early 1800s. The Hall was remodelled in the mid-19th century.

- 6.5.70 Rackheath WWII airfield was established in 1943/4 on a site adjacent to the park. Accommodation blocks for 2400 USAAF personnel were built in the park woodland. The Hall was requisitioned for use by the officers and the main routeways were overlaid with concrete.
- 6.5.71 The park survives in better condition to the west, where the main approach to the hall is located. This area is mainly in (horse) grazing use and a number of mature parkland trees have survived here. The plantation woodland has also survived well.
- 6.5.72 The eastern boundary of the park is not well defined and appears to have moved over time. Changes in use and fragmentation of ownership since the sale of the park in 1949 have impacted on condition. The eastern side towards Green Lane is today in mixed use and multiple ownership. The Hall has been sub-divided into apartments along with adjacent new building. There are a variety of business and amenity uses in the area parallel with Green Lane. These include scaffold storage, plant nursery and car repairs. Several detached bungalows have also been built here.
- 6.5.73 WWII Accommodation clusters, bomb shelters and other unidentified ancillary buildings survive within the park (NHER 50740), albeit in poor condition. The main concreted routes through the park also remain.
- 6.5.74 The parkland is undesignated, but is covered by Broadland District Council Local Plan policy ENV 10 'Historic Parklands'. The Hall, entrance gates and a bridge are all individually grade II listed.

Catton Hall

- 6.5.75 The Catton Hall Grade II* registered park and garden (list number 1000269) is located approximately 2km to the south of the proposed development. The park is located on the north side of Norwich, completely surrounded by urban development including the Norwich inner ring road on its southern side. The significance of the park lies with its design by Humphrey Repton (his first commission); its association with Catton Hall (the principle, u-shaped building) and associated orangery, South Lodge and south entrance piers (all Grade II listed); and historic association with the City of Norwich. The main views out of the site are from the south front of the Hall looking south over the park to

the rooftops of the city in the distance, a gap in the tree line focusing the eye on the spire of Norwich Cathedral.

Ancient Woodland

6.5.76 Ancient woodland is defined as sites that have been woodland continuously from AD 1600 or earlier. The proposed route passes through an area containing a series of blocks of ancient woodland although it does not directly impact upon them. These areas are currently identified and mapped under Broadland District Council policy ENV 7 'Ancient Woodlands'. A number of Ancient Woodlands are located within the surrounding area of the site: Spowston Wood lies adjacent to the site; Ladies Wood, Church Carr, Beeston St Andrew; Church Wood, Rackheath and Tolshill Wood at Spowston.

6.6 Mitigation

6.6.1 The identification of potential impacts to heritage assets is an important part of the iterative design process because it can help avoid or minimise potential negative effects of the proposed development by avoiding physical damage or changes to setting

Approach to Mitigation

6.6.2 Mitigation by design is the preferred option, and for the NDR has included: works to reduce potential impacts on the settings of heritage assets such as planting trees or shrubs, creation of bunds to reduce road noise and block views, and/or grading the back of bunds for return to agriculture and integration with the local topography. These measures can, however, also themselves have an impact on archaeological remains.

6.6.3 Impacts of the proposed scheme on the setting of heritage assets can be mitigated by the use of appropriate landscaping. Mature landscape planting can reduce the visual impact by integrating the new road with its surroundings. Landscape mitigation proposed for the scheme includes native hedgerow and tree planting along the new road, earth bunds and areas of woodland planting to screen views (see Chapter 7: Landscape).

6.6.4 Where effects on identified archaeological assets are unavoidable appropriate mitigation measures are proposed to offset the loss of the resource.

Archaeological mitigation

- 6.6.5 The preferred mitigation option for archaeological sites is to preserve them in situ. Where this is not possible, the alternative is to make a detailed record of the archaeological remains that would be lost in accordance with professional standards and guidance. This is referred to as 'preservation by record'. Due to the general nature of the construction, preservation in situ will be difficult to achieve (through avoiding impacts on archaeological remains) in many areas, although there may be opportunities, for example under landscape bunds or construction compounds, where construction activities can be controlled to prevent damage. Additional strategies (fieldwalking, geophysical survey & targeted trial trenching) employed to inform the baseline study will form part of the overall preservation by record mitigation strategy.
- 6.6.6 As described above, not all areas of the route have been archaeologically surveyed and therefore, an additional programme of survey will be required to finalise the mitigation strategy.

Fieldwalking and Geophysical Survey

- 6.6.7 Fieldwalking and geophysical survey, along with cropmark analysis from the National Mapping Programme has been undertaken along the majority of the proposed route. Due to alterations in the design of the new road some areas such as roundabout and the edges of the road have not been subject to geophysical survey, where access has not been possible. These areas will be surveyed, where possible, to inform the archaeological mitigation strategy.

Targeted Trial Trenching

- 6.6.8 Following completion of the geophysical survey, additional targeted trial trenching will be undertaken in areas of archaeological significance, identified by the surveys and the assessment report. The trial trenching program will be used to identify the type, quality, extent and depth of archaeology within the footprint of the new road and within any associated features such as lagoons and bunds. This data will inform the archaeological mitigation strategy.

Preservation by Record

- 6.6.9 A programme of archaeological mitigation in defined and specific areas of archaeological importance identified in this assessment and through further

surveys will need to be undertaken. This is likely to involve excavation of remains in advance of, and during the construction of the new road. A mitigation strategy will be produced, and agreed with Norfolk Landscape Archaeology following completion of the above surveys.

6.6.10 The time required for this mitigation will have to be factored into the scheme’s construction programme. The requirements for archaeological mitigation will be set out in an overarching archaeological Written Scheme of Investigation, and will also need to be incorporated into the Construction Environmental Management Plan (CEMP) and their implementation facilitated and monitored by an Archaeological Manager and/or an Archaeological Clerk of Works.

6.6.11 The archaeological work is likely to involve excavation of remains in advance of, and during the construction of the proposed scheme. A mitigation strategy will be produced, and agreed with Norfolk Landscape Archaeology. The sites identified to date which will require archaeological mitigation are listed in Table 6.7. Further areas of mitigation are likely to be needed following further surveys and consultation.

Table 6.7: Archaeological Mitigation areas identified to date

NHER/Site	Archaeological Resource	Implementati on	Action	Compliance mechanism
30315	Possible Iron Age Ditch and bank-on line of parish boundary	Archaeologic al Investigation	Contract or	WSI, CEMP
30315	Field systems of possible IA date evaluated by trial trenches and further associated features seen in 2012 geophysics to the west	Archaeologic al Investigation	Contract or	WSI, CEMP
124468	Prehistoric discrete features	Archaeologic al Investigation	Contract or	WSI, CEMP
49748	Ditch or pit with early Neolithic pottery (NPS 2012)	Archaeologic al Investigation	Contract or	WSI, CEMP

NHER/Site	Archaeological Resource	Implementation	Action	Compliance mechanism
49758 (T1 & T3)	Rectilinear enclosure and possible ring ditches	Archaeological Investigation	Contractor	WSI, CEMP
123955	Large prehistoric enclosure and cropmarks (NPS 2012)	Archaeological Investigation	Contractor	WSI, CEMP
124298	Early Saxon pits and ditch (NPS 2012)	Archaeological Investigation	Contractor	WSI, CEMP
51049	Deserted medieval village (edge of)- Rackheath (NPS 2012)	Archaeological Investigation	Contractor	WSI, CEMP
50501	Deserted medieval village- Rackheath (NPS 2012)	Archaeological Investigation	Contractor	WSI, CEMP
18131	Large rectilinear enclosure. Probably dates from the Bronze Age (NPS 2012). Also prehistoric pits and burnt mound recorded in trial trenches.	Archaeological Investigation	Contractor	WSI, CEMP

Historic Building mitigation

6.6.12 There will be no direct physical impacts on any listed buildings identified within the study area. Visual impacts on the setting of historic buildings are minimised as much as possible, with impacts on all buildings incorporated in mitigation outlined in the Landscape Chapter (Chapter 6).

6.6.13 Construction of the road will result in the loss of some unlisted historic farm buildings and WWII buildings within Rackheath Park. These will be recorded to supplement the existing report on the farmhouse (NHER 42007) and all historic fabric recovered from the site for re-use.

6.6.14 In the case of WWII buildings in the vicinity of Gazebo Farm, these will be investigated and recorded as part of a wider investigation into the WWII buildings and occupation of the parkland. The buildings may have only minimal inherent quality in terms of their fabric, which was designed for only a short life, but have other historic value. Without the NDR these buildings would be left to decay.

Historic Landscape mitigation

6.6.15 The proposals to mitigate the visual impacts of road building on the historic landscape are dealt with in the Chapter 7: Landscapelandscape chapter (Chapter 6).

6.6.16 As a general historic landscape mitigation principal, relict field corners that are created through road construction, will be subject to planting schemes. This has several potential benefits. In terms of the general historic landscape, it means the lines of the former field boundaries are fossilised. The planting provides visual screening. It is also likely to provide biodiversity benefits. The landscape plan includes localised moulding (and where necessary dense planting) to screen the route from the most affected historic buildings.

6.6.17 Mitigation in respect of the severance impact on the historic parkland is more problematic. Severance is difficult to mitigate as key relationships are lost, usually irreversibly. A range of measures have therefore been proposed which provide a degree of compensation, but in this case cannot be regarded as reducing the adverse impact. Mitigation measures include new planting and a combination of mounding and planting to tie into existing parkland and blend the new road into the landscape.

Key affected Historic Landscapes

Beeston Park

6.6.18 Beeston Park will be severely affected by severance. The northern third of the park, which is approximately 200 years old, and the line of the former long carriage drive, which is older and is the sole surviving feature of the earlier park, will be severed and no physical link retained between the two halves.

6.6.19 Incorporated landscape mitigation proposals propose a gradual grading of land towards the road, effectively a large-scale ha-ha. This will allow a visual connection to be retained when viewing the park towards the north. .

6.6.20 Where the route crosses the former parkland to the north of Beeston Hall, a gentle graded mound would screen views of the NDR from the Hall without appearing intrusive within this sensitive landscape. Planting would be restricted to clumps of specimen trees to reinforce the parkland feel. Further east towards Beeston Lane however, a combination of mounding and dense planting would be provided to screen the route from the estate cottages and the church. It is also proposed to update the NCC/UEA survey of 1989–91 to include all changes since this report was produced and to produce a comprehensive photographic record.

Rackheath Park

6.6.21 Rackheath Park will also experience a degree of severance, but to a lesser extent than Beeston as the line of the road is broadly parallel with the eastern boundary of the park and is mostly screened by the landform from the intact parkland area. Extensive mitigation planting and screen mounding is proposed along the route which would help to blend the new road into the landscape and screen it from affected properties.

6.6.22 Information held on the park is not currently as detailed as many others in the county as it was not comprehensively surveyed by NCC/UEA 1989–91. A full report will be produced to include a comprehensive photographic record. This will include a report on the WWII occupation and remains should also be identified, plotted and inventoried.

Horsham St Faith Airfield

6.6.23 An area to the north-west of the airfield site, which formed part of the former WWII airfield and is home to the aircraft museum, will be used as a site compound.

6.6.24 A record of any WWII remains will be made ahead of any site works. It is proposed to relocate the museum to a nearby site of similar size.

Table 6.8: Summary table of Historic Landscape mitigation

Historic Landscape	Impact of scheme	Mitigation to be implemented	Action	Compliance mechanism
Beeston Park	High	Graded Mound Planting schemes Survey report	Contractor Contractor Contractor	CEMP
Rackheath Park	High	Planting and Screen mounding Survey report	Contractor Contractor	CEMP
Horsham St Faith Airfield	High	Record of WWII structures. Relocation of museum	Contractor	CEMP

6.7 Assessment of Effects

Construction impacts on archaeology

6.7.1 The construction of the new road, structures, lagoons, bunds and construction compounds is of most relevance to the assessment. In particular, those areas that will experience major ground disturbance through the construction period will be sensitive.

6.7.2 The construction of the scheme will have a permanent and long term impact on the potential archaeology (where present). Groundworks during the excavation of lagoons or balancing ponds (used for drainage) will have a major effect on any archaeological assets. Ground reduction to formation depth will also have a permanent and long term impact, whereas areas requiring only topsoil stripping, for example, access roads or temporary site compounds, although could cause permanent damage to archaeological remains, when the land is restored at the end of the construction period its

impact on the historic landscape should cease. There is also the potential for impacts relating to compaction, for example the areas set aside for bunds may pose a threat to features and deposits, leaving them inaccessible and susceptible to damage from the weight above. The impact on buried remains can also come from changes in the below ground hydrology, i.e. waterlogged deposits which contain organic archaeological remains may get affected by large scale drainage.

- 6.7.3 The necessary ground disturbance will have an adverse impact (of varying magnitude depending on the value of any designated site) on any archaeological remains within the working route. The magnitude of impacts is the degree of change that would be experienced by the asset and its setting if the scheme were to be completed as compared with a 'do nothing' situation. The determination of magnitude of impact has been based on the vulnerability of heritage assets within the study area, the current state of survival/condition and the nature of the impact upon them. The survival and extent of the archaeological deposits is often uncertain and consequently, the magnitude of impact can be difficult to predict with any certainty.
- 6.7.4 Archaeological assets within the NDR working corridor will be of differing values and, as such overall effects of differing significance will be generated. The assessment of the significance of known archaeological sites is detailed in the tables which follow the assessment of value and magnitude of impact.

Prehistoric sites

Site 30315

- 6.7.5 The enclosures discovered at this site, visible as crop marks and geophysical anomalies, have been dated to the Roman and medieval period during archaeological evaluation (NPS 2008). The large ditch which forms the parish boundary may have originated during the Iron Age and is of local importance. As the ditch is a linear earthwork running for a long distance to both the south and north of the proposed NDR any strategy to avoid the heritage asset would not be possible. The new road will only cause partial damage to the monument where it bisects it, resulting in a loss to only a small percentage of the ditch which only survives below ground (at this location) as a whole. The value of Site 30315 has been assessed to be medium, and the magnitude of impact has been assessed to be moderate adverse.

Site 124468

6.7.6 The construction of the road will directly impact this site. The archaeological evaluation (NPS 2012) revealed a number of discrete features with two dated to the Bronze Age along with an undated ditch. It is likely that the pottery represents just one vessel – a Biconical Urn. Such vessels were current in the Middle Bronze Age (MBA) (around 1800–1300BC) and have been found accompanying burials and in domestic contexts. The geophysical survey did not reveal any definite evidence of prehistoric occupation, but often prehistoric drip gullies are shallow and will not necessarily show on geophysical survey results, especially within an area of high cultivation disturbance from potato planting. The value of Site 124468 (Volume 2, Chapter 6: Cultural Heritage, Section C MMD-233906-DT-0889) has been assessed to be medium, and the magnitude of impact has been assessed to be moderate adverse.

Site 18131

6.7.7 The construction of the road will directly impact this site. This site is of Medium value and the extensive cropmarks and geophysical anomalies have been proven as archaeological (NPS 2008), although dating was unclear. The enclosure may represent a Neolithic elongated mortuary enclosure. Neolithic long mortuary enclosures are one of the rarest prehistoric monuments in Britain with only a handful having been excavated to modern standards. Crop marks identified on the NMP to the immediate north of this suspected ‘mortuary enclosure’ are of a similar shape and size, but look more characteristic of a Roman or medieval field system. This site is of archaeological importance, especially as it remains somewhat enigmatic even after archaeological evaluation.

6.7.8 The large number of pits may indicate deliberate backfilling, which may provide evidence of prehistoric ‘ritual’ activity. The high quantity of burnt flint (362 fragments) and flint tools (53 in total) recovered from this site may indicate these discrete features are flint extraction pits rather than ritual in any way. Additional discrete features have been identified during the 2012 geophysical survey to the west of this enclosure, which are probably associated. The anomalies/pits proven in trial trenching (NPS 2008) on the inside of the enclosure have proven to be large and deliberately backfilled. Within trench 2 the pottery recovered was either early Neolithic or early Iron Age. Internal features within mortuary enclosures are generally sparse, with only a few ever having internal features recorded. The value of Site 18131 has been assessed to be medium, and the magnitude of impact has been assessed to be moderate adverse.

Site 124223

6.7.9 The construction of the road will directly impact this site. This site is adjacent to the possible mortuary enclosure (described above). A large ditch 2.4m wide was established close to area 18131. It is possible that the cropmarks and features seen here are associated. The remainder of the area does not hold any further potential as the trenches were mainly blank with only sparse ditches or natural tree hole features present. The value of Site 124223 has therefore been assessed to be low, and the magnitude of impact has been assessed to be moderate adverse.

Site 124224

6.7.10 Two ditches were revealed which formed part of a large enclosure seen as cropmarks (NMP) to the southwest of the NDR. The ditches remained undated after evaluation. The NDR only affects the northern limits of this enclosure, with the majority remaining undisturbed by the proposed road. The value of site 124224 has been assessed as low and the magnitude of impact as moderate adverse.

Site 35668

6.7.11 The construction of the road will directly impact this site. The only archaeological evidence recovered from this field were two ditches (Trenches 6 and 15) and two pits (Trenches 9 and 11). The ditch from Trench 6 produced 16th – 17th century pottery. The two pits in Trenches 9 and 11 had similar fills consisting of grey-brown-black sandy silt. Four sherds of late Bronze Age pottery were recovered from the pit within Trench 11, also the environmental sample produced evidence of fish bone, wheat and oat. The location of Bronze Age activity within this region is not unusual as numerous Bronze Age sites are recorded to the west at Horsford. The value of Site 35668 has therefore been assessed as low with a moderate adverse magnitude of impact.

Site 35669

6.7.12 The earlier fieldwalking and metal detecting surveys had produced Roman metalwork and medieval pottery. Several discrete bipolar magnetic anomalies (linear in shape) towards centre of field are likely to represent further electricity cables, one of which was located in Trench 6.

6.7.13 The trial trenching revealed several undated ditches and pits from which prehistoric pottery and worked flint were recovered. One pit was dated to the Roman period and also included burnt flints. The scarcity of the archaeological features seen within the trenches and the limited cropmarks identified from the National Mapping Programme would lead to the suggestion that this site holds little further potential. The site 35669 has been assessed as low value with a moderate adverse magnitude of impact.

Site 123748

6.7.14 The construction of the road will directly impact this site, west of 49748, situated on an interfluvium between two shallow valley/watersheds. Trenches 2, 4 and 6 were placed on the line of a postulated Roman Road which ran between Brampton and Thorpe St Andrew. Although no direct evidence for the road was encountered, compact natural ground was observed in Trench 2. Iron Age pottery was recovered from the compact ground and from a pit or tree hole within the same trench. There is the possibility that this road may have originated in the Iron Age and although there was only limited evidence for the road, the site is likely to hold further potential given the clear cropmarks and evidence of extraction pits. The value of Site 123748 has been assessed to be low, and the magnitude of impact has been assessed to be moderate adverse.

Site 49748

6.7.15 A total of 20 trenches were placed across this field to a cumulative length of 800m (Volume 2, Chapter 6: Cultural Heritage, Section 6C MMD-233906-DT-0892) between chainage 13400 and 14200. Of the 20 trenches, 14 contained archaeological features and deposits. The majority were undated ditches showing that earlier land divisions had occurred prior to the open field system that presently exists. The construction of the road will directly impact this site.

6.7.16 A series of ditches were uncovered in Trench 2, one of which contained early Neolithic pottery. Enclosures of possibly Neolithic date have been recorded elsewhere along the route in particular at site 18131 (described above). The value of this area within site 49748 has been assessed as medium and the magnitude of impact as moderate adverse.

Site 123960

6.7.17 This site at Broadland Gate, which was evaluated as the area for the contractors compound, proved known cropmarks as archaeological and at least two phases of activity. It has proven difficult to accurately date the ditches as only sparse finds were present, such as a few pieces of prehistoric pottery or worked flints. Even though the site lies over a probable prehistoric field enclosure the archaeology is sealed by a layer of subsoil. Even though the construction of the compound will directly impact this site, the ground reduction is not expected to be greater than the depth of the surviving subsoil. The value of site 123969 has therefore been assessed as low and the magnitude of impact as minor adverse.

Site 123955

6.7.18 The evaluation of area 123955 Postwick Hub confirmed the survival of a large enclosure and other cropmark features (HER 124995) as well as archaeological remains not recorded as cropmarks.

6.7.19 It may be that all of the ditches relate to a field system contemporary with the enclosure, although the lack of dating evidence or stratigraphic relationships encourages caution. This work demonstrates that these features are not of Roman origin, and are probably very much earlier; the landscape of Postwick having been greatly utilised during the prehistoric period, from the Neolithic to the Bronze Age. The value of site 123955 has been assessed as medium and the magnitude of impact as moderate adverse.

Site 49758

6.7.20 Construction associated with the Postwick Hub section of the NDR is likely to have an impact on the archaeology. There are prehistoric archaeological features present and surviving in good condition beneath the topsoil. The archaeological anomalies were first detected by magnetometer survey (AS 2006) and confirmed with three trial trenches (NPS 2008).

6.7.21 The value of site 49758 has been therefore assessed as medium and the magnitude of impact as moderate adverse.

Saxon

Site 124298

6.7.22 Site 124298 (Trench 2) contained two pits and a ditch. This area will not be directly affected by the construction of the road. Recovered from one of the pits was a sherd of early Saxon pottery and the environmental sample taken contained cereal grains, charcoal, charred root/stem which may imply midden-type waste. Midden deposits imply settlement located relatively close by.

6.7.23 This site was very similar to that of site 35668 (Volume 2, Chapter 6: Cultural Heritage, Section C MMD-233906-DT-0891) in the fact that very little archaeological evidence was recovered but what was found has considerable value in the understanding of activity within the western part of the Broadland region. It lies within the area of St Faith's Fairstead from which numerous metal detected finds have been recovered. One of these finds was an early Saxon copper alloy wrist clasp from site (HER 8126) which is of interest because it places what was found during the evaluation into the context of wider early Saxon activity. The value of Site 124298 has been assessed to be Medium, and the magnitude of impact has been assessed to be negligible as the area lies outside of the 'footprint' of the new road. Other medieval ditches discovered at this site are within the route of the new road and have been assessed as low value with a moderate adverse magnitude of impact.

Medieval

Site 41884

6.7.24 This was a small site evaluated with just one trial trench which did not produce any archaeological evidence. The value of site 41884 has been assessed as negligible and the magnitude of impact as moderate adverse.

Site 124298

6.7.25 The trial trench evaluation confirmed the field boundaries as medieval, although with no clear evidence of habitation. The site has been assessed as of low value and the magnitude of impact will be moderate adverse.

Site 51049

6.7.26 To the west of site 51049, lies the probable site of the parish church of Little Rackheath (Holy Trinity) which was abandoned by the 16th century. It is highly probable that the features recorded at site 51049 are part of the deserted medieval settlement with the nucleus around or close by the parish

church. It is probable that the village became deserted during the reshaping of the landscape for Rackheath Park, as cropmark evidence recorded from within the park may pre-date the establishment of the park. This may have been due to topographical change or truncation by later military activity. The land slopes to the north, forming the southern edge of an east-west valley. The settlement was very likely abandoned by the 14th century as no pottery after this date was ascertained. The construction of the road will directly impact this site. The value of site 51049 has been assessed as medium and the magnitude of impact as moderately adverse.

Site 50501

6.7.27 An early Saxon pottery sherd was recovered from Rackheath, site 50501 (Volume 2, Chapter 6: Cultural Heritage, Section C MMD-233906-DT-0893), which may indicate an outlying settlement precursor to the deserted medieval village of Little Rackheath. This field was similar to site 51049 in that it did not have any cropmark evidence and very little was recovered during the fieldwalking and metal detecting survey. The geophysical evidence revealed bipolar magnetic anomalies which were most likely natural in origin. However, the results of the evaluation may go some way to suggest that the sub-surface features could have been part of, or within the area of, the deserted medieval village of Little Rackheath. Dating the site has proven problematic and some of the pit features may have been natural. The presence of early Saxon finds in this location may conform to the model of topographical location of early Saxon occupation which often occurs on the high grounds in a river valley on light well drained soils (Penn 1993). The construction of the road will directly impact this site. The value of site 50501 has been assessed as medium and the magnitude of impact as moderate adverse.

Post-medieval

Site 124299

6.7.28 This site indicated a medieval or post-medieval date range of field ditches which hold limited potential. The value of site 124299 has been assessed as low and the magnitude of impact as moderate adverse.

Undated/ambiguous

Site 50493

6.7.29 Although this site was originally considered an important WWII crash site, no evidence of any wreckage was established during the archaeological trial trench evaluation (NPS 2012) (Volume 2, Chapter 6: Cultural Heritage, Section C MMD-233906-DT-0889). Ten trenches were excavated along this route and often machining went through c. 1m deep colluvial deposit (s) with no sign of any wreckage materials. The value of site 50493 has been assessed as not significant and the magnitude of impact as moderate adverse.

Site 18126

6.7.30 Geophysical anomalies were clearly present and visible as cropmarks (NMP) but 3 trial trenches revealed no archaeological features. This area would therefore seem to not hold any further archaeological potential. The value of site 18126 has been assessed as not significant and the magnitude of impact as moderate adverse.

Site 49745

6.7.31 The site yielded very little archaeological evidence and is not considered to be important even though the site yielded a great variety of metal detected finds over the years associated with St Faith's Fairstead. The value of the site 49745 has been assessed as not significant and the magnitude of impact as moderate adverse.

Site 41874

6.7.32 Site 41874 Beeston St Andrew is to the east of the B1150 and Site 41884. The proposed route of the NDR crosses the postulated line of a Roman road within this field (NHER 7598). The road is marked on Fadens map of 1797 and is thought to have run between Brampton and Thorpe St Andrew. At this point the line of the road is marked by the thin north-west south-east 'Broadway'. A trench was placed across the postulated line of the Roman road but no trace of it was revealed. The road may have been ploughed away in recent years. Other trenches to test anomalies in this area proved largely negative. Site 41874 has been assessed as not significant with a moderate adverse magnitude of impact.

Site 124225

6.7.33 This area is covered by the footprint of the proposed road and adjacent balancing pond. This site consisted of four trenches of which two produced archaeological features and deposits of a likely modern date. The geophysical anomalies were weak. It is unlikely this area holds any further archaeological potential. The value of site 124225 has been assessed as low and the magnitude of impact as moderate adverse.

Site 49757

6.7.34 This site was subject to fieldwalking and flints and Roman pottery were recovered. The area was then evaluated with trial trenches which proved to be negative (NPS 2008). The site has been assessed as not significant and magnitude of impact as moderate adverse.

6.7.35 The table below summarises the archaeological sites within the study area affected by the proposed scheme. Working from west to east, the value of each site and the magnitude of impact have been assessed. Information on the relevant value and magnitude criteria are found in tables 6.1 & 6.2.

Table 6.9 Summary table of known archaeological sites affected by the construction of the proposed NDR road scheme

NHER/Site	Archaeological Resource	Value of Resource	Magnitude of impact from construction	Significance of construction effects
30315	Possible Iron Age Ditch and bank-on line of parish boundary	Medium	Moderate adverse	Moderate
30315	Field systems of possible IA date evaluated by trial trenches and further associated features seen in to the west	Medium	Moderate adverse	Moderate

NHER/Site	Archaeological Resource	Value of Resource	Magnitude of impact from construction	Significance of construction effects
124468	Prehistoric discrete features	Medium	Moderate adverse	Moderate
124223	Ditches and pits probably prehistoric.	Low	Moderate adverse	Slight
124224	Ditches & pits probably prehistoric	Low	Moderate adverse	Slight
18126	Cropmarks and geophysical anomalies shown on aerial photographs but not present in trial trenches	Negligible	Moderate adverse	Neutral
35668	Metal detected finds & post-medieval ditches	Low	Moderate adverse	Slight
35669	Small number of prehistoric ditches and pits	Low	Moderate adverse	Slight
123748	Possible Iron age track/Roman Road	Low	Moderate adverse	Slight
49748	Ditch or pit with early Neolithic pottery	Medium	Moderate adverse	Moderate

NHER/Site	Archaeological Resource	Value of Resource	Magnitude of impact from construction	Significance of construction effects
49748	14 trenches (out of 20) with ditches. Additional 2013 geophysical adjacent to site results showing enclosures	Low	Moderate adverse	Slight
123960	2 phases of prehistoric ditches	Low	Minor adverse	Slight
123955	Large prehistoric enclosure and cropmarks	Medium	Moderate adverse	Moderate
49758 (T1 & T3)	Rectilinear enclosure with ditches and pits of prehistoric origin- possibility of additional ring ditches in the area for the new lagoon	Medium	Moderate adverse in areas of landscaping and lagoon	Moderate
124298	Early Saxon pits and ditch	Medium	No change-trench with Saxon remains was outside of road footprint. Minor adverse impact over 'footprint' of	Slight within scheme boundary

NHER/Site	Archaeological Resource	Value of Resource	Magnitude of impact from construction	Significance of construction effects
			road	
124298	Medieval ditches and pits	Low within footprint of scheme	Moderate adverse	Slight
41884	Possible Roman road, but negative archaeological evidence	Negligible	Moderate adverse	Neutral
51049	Deserted medieval village - edge of Rackheath	Medium	Moderate adverse	Moderate
50501	Deserted medieval village- Rackheath	Medium	Moderate adverse	Moderate
124299	Medieval/post-medieval ditches	Low	Moderate adverse	Slight
50493	Possible WW II crash site, not identified in trial trenching	Negligible	Moderate adverse	Neutral
18131	Large rectilinear enclosure. Probably dates from the Bronze Age. Also prehistoric pits and burnt	Medium	Moderate adverse	Moderate

NHER/Site	Archaeological Resource	Value of Resource	Magnitude of impact from construction	Significance of construction effects
	mound recorded in trial trenches.			
49745	Medieval metal detector finds but no definite archaeology	Negligible	Moderate adverse	Neutral
41874	Medieval and post-medieval artefacts recovered during fieldwalking. No archaeological evidence in trenching	Negligible	Moderate adverse	Neutral
124225	Ditches & pits probably modern	Low	Moderate adverse	Slight
49757	Flints and Roman pottery from fieldwalking-trenches negative	Negligible	Moderate adverse	Neutral

Operational impacts on Archaeology

6.7.36 The operational effects on the archaeology are considered to be permanent and long term (an effect of 15 years or more). During the operation of the road, there would be no physical impacts on buried archaeological remains or other heritage assets arising from the operation of the NDR.

Historic Buildings

6.7.37 Construction and operation of new roads can affect historic buildings through physical impacts on the historic structures or changes to their setting. However, the NDR scheme has been designed to avoid any direct physical impacts on any buildings, including historic buildings. All of the impacts of the scheme on historic buildings are therefore impacts on their settings. Impacts on the setting of historic buildings can result from the construction and/or operation of a new road and can be beneficial or adverse. Impacts on setting can include:

- the interruption or improvement of important views to or from a historic building;
- the introduction or removal of large, prominent or intrusive structures within the setting of a historic building;
- the introduction or removal of visual intrusion, such as moving vehicles, the presence of road signs or lighting;
- significant changes in matters such as noise, dust, odour or air quality affecting the historic building's context and/or amenity value; and,
- the severance or restoration of relationships between associated historic buildings, such as a church and manor house.

Construction impacts on the setting of Historic Buildings

6.7.38 The construction impacts on the setting of historic buildings can be adverse if the views from or to historic buildings are affected during the construction of the road. While construction is taking place the impacts are considered to be temporary and short term (less than 3 years), but the finished construction of the road will make permanent landscape changes. Heavy plant movements will make significant changes in matters such as noise, dust, odour or air quality. In addition there will be low visual impacts from road signs.

6.7.39 The construction impacts on statutory listed buildings are set in Table 5.10 and locally important historic buildings are set out in Table 5.11.

6.7.40 The only buildings which the scheme has a direct impact on are two undesignated historic buildings in Rackheath Park which will be demolished. Rackheath Hall and the associated listed bridge will have their setting changed during the construction of the scheme. It is anticipated that Horsford

Hall, which is close to a proposed new roundabout (c.125m), will have some visual and audible impacts as a result of construction works.

Operational impacts on the setting of Historic Buildings

6.7.41 Impacts on setting can affect the continued use of a historic building by making it more or less attractive to users. Historic buildings which remain in active use are generally better maintained and more likely to survive in the long term.

6.7.42 Operational impacts may arise as a result:

- Maintenance of drainage ditches-removal of archaeological deposits (loss damage)
- Lighting- impact on setting of assets
- Traffic- damage to assets by pollutants and noise pollution
- Maintenance- damage to assets

6.7.43 Operational improvements may arise as a result of

- Improvement of lighting ambience
- Beneficial landscape changes such as professionally designed planting schemes.

6.7.44 The following table describes the significance of construction and operational effects on the historic buildings within the defined study area.

Table 6.10 Construction and operational effects on listed buildings.

Listed Buildings	NHER/ Listed building	Value of Asset	Approximate distance of receptor to the NDR	Potential construction Impacts	Potential Operational Impacts	Magnitude of impact from construction	Magnitude of change from operation	Significance of construction effects	Significance of operational effects
Poplars Farm	228423	Medium	500m	Poplars is screened by well established hedgerows. The visual and audible impacts from construction will be minimal	As Poplars is well screened the operational impacts will be minimal	Negligible adverse	Negligible adverse	Slight	Neutral
The Lindens, Horsford, (Grade II)	43921-228418	Medium	560m	Audible and construction visual impacts will	Operational impacts are considered to be	No change	No change	Neutral	Neutral

Listed Buildings	NHER/ Listed building	Value of Asset	Approximate distance of receptor to the NDR	Potential construction impacts	Potential Operational impacts	Magnitude of impact from construction	Magnitude of change from operation	Significance of construction effects	Significance of operational effects
Parish Church, Horsford (Grade II*)	7795-228419	High	160m	be neutral due to mature trees and hedgerow on south side of Drayton Lane which would screen any view of construction	neutral as The Lindens is well screened	Minor adverse	Negligible adverse	Slight	Slight

Listed Buildings	NHER/ Listed building	Value of Asset	Approximate distance of receptor to the NDR	Potential construction Impacts	Potential Operational Impacts	Magnitude of impact from construction	Magnitude of change from operation	Significance of construction effects	Significance of operational effects
Horsford Hall, Horsford (Grade II)	17520-228420	Medium	125m	Minimal as the Parish Church is well screened, construction activities may be audible	Operational impacts	Moderate adverse	Moderate adverse	Moderate	Moderate

Listed Buildings	NHER/ Listed building	Value of Asset	Approximate distance of receptor to the NDR	Potential construction Impacts	Potential Operational Impacts	Magnitude of impact from construction	Magnitude of change from operation	Significance of construction effects	Significance of operational effects
				<p>traffic and heavy plant movement may have some audible impacts. Visual impacts will be minimal as the work will be screened by mature trees and fence on the eastern side of Holt Road</p>					

Listed Buildings	NHER/ Listed building	Value of Asset	Approximate distance of receptor to the NDR	Potential construction Impacts	Potential Operational Impacts	Magnitude of impact from construction	Magnitude of change from operation	Significance of construction effects	Significance of operational effects
Little Orchard, Horsford (Grade II)	20966-228421	Medium	250m	Low audible construction impacts as the cottage will be well screened from the NDR by mature trees and hedgerows around its perimeter	Operational impacts are considered to be minimal as Little Orchard is well screened with mature hedgerows around its perimeter	Minor adverse	Negligible adverse	Slight	Slight
The Kennels, Horsham & Newton St Faith	43951-228099	Medium	650m	Low audible construction impacts but the cottage will be well	No operational impacts as The Kennels is	Minor adverse	No change	Slight	Neutral

Listed Buildings	NHER/ Listed building	Value of Asset	Approximate distance of receptor to the NDR	Potential construction impacts	Potential Operational impacts	Magnitude of impact from construction	Magnitude of change from operation	Significance of construction effects	Significance of operational effects
(Grade II)				screened from the NDR by mature trees and hedgerows around its perimeter	well screened with mature hedgerows around its perimeter				
The White House, Horsham & Newton St Faith (Grade II)	48738-228098	Medium	400m	There are clear views from Old Norwich Rd eastwards towards the proposed route. There will be distant	Views will be screened by planting. Expected operational impact from background noise during peak	Minor adverse	Minor adverse	Slight	Slight

Listed Buildings	NHER/ Listed building	Value of Asset	Approximate distance of receptor to the NDR	Potential construction impacts	Potential Operational impacts	Magnitude of impact from construction	Magnitude of change from operation	Significance of construction effects	Significance of operational effects
				views of construction works	travel times				
The Lilacs, Horsham & Newton St Faith (Grade II)	12250-228092	Medium	665m	Fields with low hedges between the cottage and the NDR. Construction impacts negligible	No operational impacts are predicted	Negligible adverse	No change	Slight	Neutral
Smeeth Farm house, Gt Plumstead (Grade II)	11826-228486 & 87 (barn)	Medium	576m	The farmhouse is well screened from the NDR	No operational impacts anticipated	Minor adverse	No change	Slight	Neutral

Listed Buildings	NHER/ Listed building	Value of Asset	Approximate distance of receptor to the NDR	Potential construction Impacts	Potential Operational Impacts	Magnitude of impact from construction	Magnitude of change from operation	Significance of construction effects	Significance of operational effects
Gateway to Spixworth hall (Grade II)	8022-359869	Medium	1km	No visual or audible impact	No impacts	No change	No change	Neutral	Neutral
Gateway to Rackheath Park (Grade II)	8173-228195	Medium	370m	Cast iron gate piers, with no gate. No construction impacts	No operational impact predicted	No change	No change	Neutral	Neutral
Walls to south Beeston St Andrew Hall (Grade II)	8174-228069	Medium	590m	There are no visual or audible impacts from construction	Low audible impacts from traffic movements and	No change	Negligible adverse	Neutral	Neutral

Listed Buildings	NHER/ Listed building	Value of Asset	Approximate distance of receptor to the NDR	Potential construction Impacts	Potential Operational Impacts	Magnitude of impact from construction	Magnitude of change from operation	Significance of construction effects	Significance of operational effects
Rackheath Hall (Grade II)	8172-228196	Medium	270m	anticipated	possible reduction in air quality.				
				The route passes very close to Rackheath Hall and will adversely affect the nearby Heath Wood. Although the buildings of Rackheath Hall are well enclosed by	Operational impacts will be from traffic, noise, dust and air quality	Moderate adverse	Moderate adverse	Moderate	Moderate

WWII Buildings, Rackheath Park	55989	Low	None	The route demolishes these WWII buildings	Remaining structures will have visual and audible impacts from NDR and traffic noise	Major adverse	Major adverse	Moderate	Moderate
Hall Farm, Rackheath	47126	Low	640m	Low visual and audible impacts during construction	Operational impacts are likely from traffic, noise, dust and air quality.	Moderate adverse	Moderate adverse	Slight	Slight

Non - designated Historic Buildings	NHER Ref.	Value of Asset	Approximate distance of receptor to NDR	Potential construction Impacts	Operation impacts	Magnitude of Impact from construction	Magnitude of impact from operation	Significance of construction effects	Significance of operation effects
Laurel Farm, Gt & Lt Plumstead	50041	Low	170m	Construction impacts on setting during earthmoving operations	Audible impacts from traffic movement	Moderate adverse	Moderate adverse	Slight	Slight
Great Plumstead Hall	21637	Low	470m	Low visual construction impact on setting considered to be low as mature trees surround the house	Audible impacts from traffic movement	Moderate adverse	Moderate adverse	Slight	Slight
St Andrew's Church, Beeston St Andrew	8142	Low	200m	Site of St Andrews Church. The construction	Operational impacts from traffic, noise, dust	Minor Adverse	Minor adverse	Slight	Slight

Non - designated Historic Buildings	NHER Ref.	Value of Asset	Approximate distance of receptor to NDR	Potential construction Impacts	Operation impacts	Magnitude of Impact from construction	Magnitude of impact from operation	Significance of construction effects	Significance of operation effects
Spixworth Hall	8022	Low	1km	of the road will be visible from the site. Audible impacts from, heavy plant are expected, but as the site survives below ground only the impacts are not considered significant	and air quality			Slight	Neutral

Non - designated Historic Buildings	NHER Ref.	Value of Asset	Approximate distance of receptor to NDR	Potential construction Impacts	Operation impacts	Magnitude of Impact from construction	Magnitude of impact from operation	Significance of construction effects	Significance of operation effects
Cottages				hedgerows and trees. Minimal visual and audible construction anticipated	movement unlikely at this distance				

Historic landscapes

6.7.45 The NDR traverses across historic landscapes which form the character of the local setting. At the western end of the route in the parish of Spixworth is a landscape of small fields and old lanes with boundaries lost during the 19th century. Towards the eastern end of the route was the former Mousehold Heath Area which with settlement traditionally restricted to its edges. The area was re-organised during parliamentary enclosure in 1800. The early clearance phase of construction will entail removal of some historic buildings in Rackheath Park (WWII structures and redundant farm buildings). Other historic buildings in close proximity to the works are those at West and Quaker Farms, although tranquillity is already low in those locations due to their close proximity to Norwich Airport.

Construction impacts on Historic Landscapes

6.7.46 The historic parklands in particular are likely to experience a significant and on-going reduction in tranquillity levels as the road is constructed within their existing boundaries. The construction of the NDR will have varying degrees of adverse effect during the construction of the road. Such effects can be caused by landscape changes brought about by ground reduction and landscaping.

6.7.47 The likely impacts of the scheme on the historic landscape units have been identified as:

- Temporary and permanent land-take due to road construction and operation
- Temporary and permanent severance due to road construction and operation
- Visual disruption during road construction and operation
- Noise and light pollution

Operational impacts on historic landscapes

6.7.48 The operational impacts of the NDR on the local historic landscapes will have varying degrees of adverse impact, and will be primarily from a result of traffic noise created when the road is in operation.

Table 6.13 Historic landscapes construction and operation significance on setting

Historic Landscapes	Value	Construction Impacts	Operational impacts	Magnitude of impact from construction	Magnitude of impact from operation	Significance of construction effects	Significance of operational effects
Spixworth Park	Medium	None anticipated	None anticipated	No change	No change	Neutral	Neutral
Red Hall (Beeston Old Hall) Park	Medium	Low audible impacts from road construction	Traffic and noise impacts during operation	Minor Adverse	Minor Adverse	Slight	Slight
Beeston Park	Medium	Severance of the northern third of the park; land-take for road construction and operation; audible and visual impacts during and post construction	Noise from traffic, lower air quality and pollution	Major Adverse	Moderate adverse	Large	Moderate
Sprowston	Medium	Low audible impacts	Noise from traffic,	Minor	Minor	Slight	Slight

Historic Landscapes	Value	Construction Impacts	Operational impacts	Magnitude of impact from construction	Magnitude of impact from operation	Significance of construction effects	Significance of operational effects
Lodge Park		from road construction	lower air quality and pollution	adverse	adverse		
Sprowston Hall Park	Low	No impacts	No impacts	No change	No change	Neutral	Neutral
Rackheath Park	Medium	Severance along eastern boundary of the park; land-take for road construction and operation	Moderate audible and visual impacts during operation. Impacts from traffic noise and air quality on roundabout on Wroxham Road on the north-eastern corner of Rackheath Park.	Moderate Adverse	Moderate Adverse	Moderate	Moderate

Historic Landscapes	Value	Construction Impacts	Operational impacts	Magnitude of impact from construction	Magnitude of impact from operation	Significance of construction effects	Significance of operational effects
Gt Plumstead Hall and Park	Low	Low audible and visual impacts during construction	Low audible and visual impacts from road operation	Minor adverse	Minor adverse	Slight	Slight
Horsham St Faith Airfield	Low	Severance and land-take for site compound. Relocation of museum.	Low audible and visual impacts from road operation	Moderate Adverse	Moderate adverse	Slight	Slight
Catton Hall Grade II* Registered Park and Garden	High	Scheme at nearly 2km distant, no impacts during construction	No visual impacts as scheme is too distant and significant views from park are to the south, not towards scheme. Any reduction in traffic along the inner ring road	No change	No change	Neutral	Neutral

Historic Landscapes	Value	Construction Impacts	Operational impacts	Magnitude of impact from construction	Magnitude of impact from operation	Significance of construction effects	Significance of operational effects
			will not have an impact on the park as it is well screened through its planting along its boundary.				

Climate Change

Table 6.14: Relationship of cultural heritage and climate change

Potential impacts on cultural heritage	Relationship to climate change resilience
Public access to historic assets may be impacted in a beneficial or negative way, with opportunities for heritage related education and tourism	No significant climate change adaptation issues
Loss of the physical and visual integrity of the site due to severance, such that key relationships are lost. This is particularly important where features are clustered together	No significant climate change adaptation issues
Loss/damage of all or part of above or below ground archaeological remains e.g. through demolition, excavation or disposal of soils or land-take	No significant climate change adaptation issues
Structural damage to historic buildings due to proximity of excavation, demolition works, vibration etc.	No significant climate change adaptation issues
Temporary or permanent change to the character or setting of designated or undesignated heritage asset from direct and or indirect impacts	Climate change could exacerbate changes to character or setting of historic assets and sites neighbouring the NDR
Increase or decrease in noise, vibration or dust such that the amenity or physical fabric of a nationally or regionally important site is either adversely affected or improved	Drought, high temperatures and wind can exacerbate issues such as dust generation.
Air pollution e.g. affecting masonry	Warmer and dryer seasonal climates can exacerbate the effects of air pollutants
Water table fluctuation e.g. can affect the preservation of archaeological features	Changes in precipitation can exacerbate fluctuations in water

Potential impacts on cultural heritage	Relationship to climate change resilience
	table levels.
Water pollution and soil contamination	Flooding from severe events can potentially cause water pollution and soil contamination

6.7.49 It is not considered that the scheme will exacerbate the effects of climate change on any heritage assets, and as such no specific mitigation measures for cultural heritage have been identified.

6.8 Conclusions

Archaeology

- 6.8.1 The construction impact on the archaeological resource along the line of the route will be in most cases moderately adverse. Topsoil stripping and landscaping works to achieve the required construction depth of the road will impact on buried archaeology which has been proved in most cases to be less than 0.50m beneath the present ground level.
- 6.8.2 Given the archaeological potential of the general area identified by this assessment study, it is likely that previously unknown archaeological sites and deposits exist within the study area. Aerial survey, combined with fieldwalking, metal-detector survey and geophysics has provided a good appreciation of the archaeology of an area on a landscape scale, but further surveys are required to ascertain the location and nature of archaeological remains across the proposed scheme.
- 6.8.3 By the very nature of the scheme, there will be a loss of unknown archaeological deposits if encountered during construction work but these will be fully recorded as part of the mitigation strategy.
- 6.8.4 The fundamental aim of archaeological mitigation is to avoid impacts on nationally important or highly significant remains, wherever possible, by aligning routes away from such sites, and no archaeological remains of high value have been located within the scheme boundaries. The large number of prehistoric sites identified along the route cannot be effectively avoided, as shifting the alignment of the road in any direction will impact on further cropmarks cannot be effectively avoided, as shifting the alignment of the road

in any direction will impact on further cropmarks and doubtless further heritage assets.

- 6.8.5 After careful consideration and assessment of the archaeological information gathered, this assessment has concluded that there are no scheduled monuments, or undesignated remains of equal value, that are likely to be affected by the proposed road scheme. This means that preservation of any of the identified sites in situ is not a requirement under any local plan policies or of those policies within the National Planning Policy Framework. An archaeological mitigation strategy will be produced and will set out the detailed requirements for recording below-ground archaeological deposits which will be impacted by the scheme
- 6.8.6 As physical preservation in situ is not possible in places, preservation by record will be necessary to record the locally important archaeological sites, which have been identified during fieldwalking, geophysical survey and trial trenching.

Historic Buildings

- 6.8.7 A total of 61 historic buildings were identified for assessment. The only direct impacts on historic buildings are the demolitions of some undesignated WWII structures at Rackheath, which are currently in poor condition. These structures will be recorded prior to their demolition.
- 6.8.8 The main statutory listed historic buildings which will have their setting affected significantly are Rackheath Hall (plus its bridge and gateway) and Horsford Hall. It is anticipated that there will be moderately adverse visual and audible impacts during construction and operation.

Historic Landscapes

- 6.8.9 To the north-east of Norwich, the proposed route passes through an area characterised by a cluster of historic parks and series of blocks of ancient woodland. None of the parkland is included on the English Heritage register of historic parkland. The parkland is generally of medium value reflecting 'averagely well-preserved historic landscapes with reasonable coherence'. Catton Hall grade II* Registered Park and Garden is located approximately 2km to the south of proposed scheme, within the urban area of Norwich. The impacts on this park have also been considered, however it is concluded that there is no change to the setting of the park and therefore no effect.

6.8.10 The impact of the proposed route causes a major adverse degree of severance to Beeston historic park. A second park at Rackheath will be adversely affected, but to a lesser degree. In view of the difficulty of mitigating against severance, it has not been possible to reduce the magnitude of impact through mitigation.

7. Landscape

7.1 Introduction

General

- 7.1.1 This chapter considers the likely significant effects that the scheme would have on the character and quality of the landscape, together with changes in people's views, particularly from residential properties. 'Landscape effects' is used as a term to define changes resulting from impacts of the proposed Scheme on the surrounding landscape or townscape, whereas 'visual effects' defines the changes in views for the local community.
- 7.1.2 The landscape evaluation in this chapter includes the classification of the landscape into broadly homogeneous units of character, and an assessment of their relative sensitivity to the changes that would result from the scheme. The sensitivity of the views from properties is also considered in order to determine significance criteria for the analysis, as described in the following sections.
- 7.1.3 The chapter is supported by figures and drawings in volume 2 including the landscape design (drawings MMD-233906-DT-0866 to MMD-233906-DT-0878 and MMD-233906-DT-0941), photomontages of the Scheme from viewpoints agreed with Norfolk County Council (drawings MMD-233906-DT-0879, MMD-233906-DT-0880 and Photomontage Locations 1 to 9), representative cross sections (drawings MMD-233906-DT-0956 to MMD-233906-DT-0960), details of the visual assessment (Zones of Visual Influence and Schedules; drawings MMD-233906-DT-0953 to MMD-233906-DT-0955) and field survey notes (Volume 2, Chapter 7: Landscape, Section G). The field survey has been carried out and updated at various times over a number of years from 2004 up to the present time.

Consultation, Scoping Report and Scoping Opinion

- 7.1.4 The Scheme has been subject to extensive consultation with a wide range of interested parties over a number of years, including as part of the process defining the scope of the Environmental Statement (ES). The ES Scoping Report (Volume 1, Appendix 4 Scoping Report) defined the key issues proposed to be covered in the Environmental Statement and described the methodologies to be followed. This chapter is based upon the outline set out in the Scoping Report. A Scoping Opinion was published by the Secretary of

State in April 2013, highlighting details to be covered in the ES. This chapter addresses the issues raised within the Scoping Opinion concerning landscape and visual effects.

7.2 Methodologies

Overall Approach

- 7.2.1 There are several sources of relevant guidance for assessing the landscape, townscape and visual impacts of new development projects. The primary guidance for assessing the landscape and visual effects of Trunk Road schemes is provided in the Department for Transport (DfT) Design Manual for Roads and Bridges (DMRB) Volume 11, as updated by Interim Advice Note 135/10. Although the NDR is not a trunk road, the DMRB is the primary guidance for assessing the landscape and visual effects of major road infrastructure, and has therefore been followed for this assessment.
- 7.2.2 Further guidance is also provided by the 'Guidelines for Landscape & Visual Impact Assessment' (GLVIA) published by the Institute of Environmental Assessment and the Landscape Institute (third edition, 2013), and detailed guidance for undertaking landscape character assessments to inform planning policy and decisions is provided in the 'Landscape Character Assessment Guidance for England and Scotland' (LCAG), published jointly by The Countryside Agency and Scottish Natural Heritage (2002). These have also been drawn upon as appropriate in developing the methodology for the assessment.
- 7.2.3 Consultation has been undertaken with the relevant consultees to inform the methodology used and the extent of the study area, wherever possible.

Study area

- 7.2.4 The study area for the Landscape and Visual assessment has been broadly taken as the area bounded by the 'Zone of Visual Influence' (ZVI) of the proposed scheme (see MMD-233906-DT-0953). This is a band extending up to 1km either side of the of the NDR (i.e. the distance beyond which views are unlikely to be significant) and its associated works (including temporary construction site areas), and is indicative of the area of land from which there is potentially a view of any part of the proposed road, its structures, or the traffic which will use it.
- 7.2.5 The ZVI was generated using Key Terra-Firma software, taking points along the route at 200m intervals. Hedgerows are assumed to be 2m high, existing

woodland 8m high and settlements 7m high. Vehicle heights are assumed to be a maximum of 5m high. A height of 6m has been assumed for the mature tree planting scheme at year 15.

- 7.2.6 The ZVI for the NDR is curtailed by topography, vegetation blocks and visual barriers such as housing development, and consequently there are no long distance views beyond which visual effects need to be considered.
- 7.2.7 However, the boundaries of the landscape character areas have been extended beyond the ZVI in order to set the NDR into a wider landscape context (see drawings MMD-233906-DT-0670 and MMD-233906-DT-0671). For the same reason, the figures showing topography (drawing MMD-233906-DT-0668) and landscape designations (drawing MMD-233906-DT-0669) extend beyond the ZVI.

Timescale

- 7.2.8 Landscape and visual effects have been assessed by comparing the predicted effects of the scheme with the situation if the scheme were not constructed (i.e. the landscape baseline as it would exist before the projected completion of the NDR in 2017). The assessment is considered at two distinct stages, namely, during construction and once the road is operational. Operational effects are further separated (following the DMRB methodology) into the year immediately after opening and 15 years hence, to allow for the screening effect of the maturing planting scheme. Effects are considered for winter in year 1 (to represent a 'worst case' scenario) and summer in year 15 (to allow for the screening effects of foliage, and hence a 'minimum effect' scenario). Effects are also considered in night time conditions to assess lighting impacts.

Methodology for the Assessment of Landscape Effects

Landscape Baseline Conditions

- 7.2.9 The term landscape commonly refers to the view or appearance of the land. However, both DMRB and GLIVIA use a fuller description of landscape as a combination of both cultural and physical characteristics or components, which give rise to patterns that are distinctive to particular localities and help to define a 'sense of place'. The landscape is not therefore simply a visual phenomenon but relies upon other influences including topography, land use

and management, ecology and historical and cultural associations. A similar approach can be adopted when considering built up or 'townscape' areas.

7.2.10 The landscape baseline has therefore been defined in terms of the specific landscape character types and areas that are found within the study area, reflecting the differing vegetation cover, settlement and field patterns and other landscape characteristics encountered along the route. These have been referenced to landscape character types and areas defined in previous national and local authority studies where appropriate, in order to set them into a broader landscape context.

7.2.11 The character areas and their associated boundaries were developed from fieldwork using the field survey sheet contained in LCAG as a template, which was then adapted to suit the specific characteristics of the landscape being considered. The survey sheets are included in Volume 2, Chapter 7: Landscape, Section G and provide the opportunity to record both the objective elements within the landscape (or townscape) in question and the subjective impressions of the viewer, together with a representative photograph for each landscape character area.

Magnitude of Impact Criteria for Landscape Character

7.2.12 The magnitude of impact is the degree of change that would arise if the NDR were to be constructed. Factors to consider are:

- the scale of the impact (e.g. would the change be large and widespread or small and localised?)
- the nature of the impact (e.g. would the change contrast markedly with the receiving landscape or blend in?)
- whether it is an adverse or beneficial change; and
- the timescale involved (i.e. of short duration or longer term).

7.2.13 Indicative criteria used for the assessment are given in Table 7.1.

Table 7.1 Magnitude and Nature of Impact and Typical Descriptors for Landscape Character (Source: DMRB Vol. 11)

Magnitude of Impact	Typical Criteria Descriptors
Major Adverse	Total loss or large scale damage to existing character or distinctive features and elements, and/or the addition of new but uncharacteristic conspicuous features and elements.
Moderate Adverse	Partial loss or noticeable damage to existing character or distinctive features and elements, and/or the addition of new but uncharacteristic noticeable features and elements.
Minor Adverse	Slight loss or damage to existing character or features and elements, and/or the addition of new but uncharacteristic features and elements.
Negligible Adverse	Barely noticeable loss or damage to existing character or features and elements, and/or the addition of new but uncharacteristic features and elements.
No Change	No noticeable loss, damage or alteration to character or features or elements.
Negligible Beneficial	Barely noticeable improvement of character by the restoration of existing features and elements, and/or the removal of uncharacteristic features and elements, or by the addition of new characteristic elements.
Minor Beneficial	Slight improvement of character by the restoration of existing features and elements, and/or the removal of uncharacteristic features and elements, or by the addition of new characteristic elements.
Moderate Beneficial	Partial or noticeable improvement of character by the restoration of existing features and elements, and/or the removal of uncharacteristic and noticeable features and elements, or by the addition of new characteristic features.

Major Beneficial	Large scale improvement of character by the restoration of features and elements, and/or the removal of uncharacteristic and conspicuous features and elements, or by the addition of new distinctive features.
------------------	---

Landscape Sensitivity

7.2.14 Having identified the landscape character areas within the study area and the magnitude of impact arising from the scheme, an assessment of landscape sensitivity (i.e. the ability of the landscape to accommodate change arising from the NDR) has been carried out. This used the landscape character analysis to understand how the different character areas would be affected by the Scheme (i.e. by determining how the components that make up landscape character would be affected by the NDR). Whilst it is possible to record potentially sensitive landscape receptors as part of the baseline, it is considered more appropriate to consider landscape sensitivity as part of the assessment of the significance of effects, since it depends on the type of impact arising from the Scheme. Therefore, the landscape methodology assesses sensitivity in conjunction with the landscape impacts.

7.2.15 The features that make up the landscape (e.g. pattern, tranquillity, cultural elements and land cover) have been assessed as to their ability to accommodate change of the type and scale proposed, using the indicative criteria in Table 7.2.

Table 7.2 Landscape Sensitivity and Typical Examples (Source: DMRB Vol. 11)

Sensitivity	Typical Descriptors and Examples
High	<p>Landscapes which by nature of their character would be unable to accommodate change of the type proposed. Typically these would be;</p> <p>Of high quality with distinctive elements and features making a positive contribution to character and sense of place.</p> <p>Likely to be designated, but the aspects which underpin such value may also be present outside designated areas, especially at the local scale.</p> <p>Areas of special recognised value through use, perception or historic</p>

Sensitivity	Typical Descriptors and Examples
	<p>and cultural associations.</p> <p>Likely to contain features and elements that are rare and could not be replaced.</p>
Moderate	<p>Landscapes which by nature of their character would be able to partly accommodate change of the type proposed. Typically these would be;</p> <p>Comprised commonplace elements and features creating generally unremarkable character but with some sense of place.</p> <p>Locally designated, or their value may be expressed through non-statutory local publications.</p> <p>Containing some features of value through use, perception or historic and cultural associations.</p> <p>Likely to contain some features and elements that could not be replaced.</p>
Low	<p>Landscapes which by nature of their character would be able to accommodate change of the type proposed. Typically these would be;</p> <p>Comprised some features and elements that are discordant, derelict or in decline, resulting in indistinct character with little or no sense of place.</p> <p>Not designated.</p> <p>Containing few, if any, features of value through use, perception or historic and cultural associations.</p> <p>Likely to contain few, if any, features and elements that could not be replaced.</p>

Significance of Effects on Landscape Character

7.2.16 The evaluation of the significance of the landscape effects of the Scheme is derived by assessing the sensitivity of the landscape against the magnitude of impact (bearing in mind the effectiveness of the mitigation measures), as shown in the matrix in Table 3. Effects that fall within the categories of ‘moderate’, ‘large’ and ‘very large’ are deemed to be significant.

7.2.17 It should be noted that environmental effects can be either beneficial or adverse, and that in some circumstances the addition of new features (e.g. ‘gateway features’ such as art work or a distinctive bridge design) can enhance the landscape, resulting in a significant beneficial effect. Typical descriptors of the significance of effect categories in the matrix are provided in Table 7.3.

Table 7.3: Significance of Effect Categories (Source: DMRB Vol. 11)

Magnitude of Impact						
Landscape Sensitivity		No Change	Negligible	Minor	Moderate	Major
	High	Neutral	Slight	Slight/Moderate	Moderate/Large	Large/Very Large
	Moderate	Neutral	Neutral/Slight	Slight	Moderate	Moderate/Large
	Low	Neutral	Neutral/Slight	Neutral/Slight	Slight	Slight/Moderate

Table 7.4 Typical Descriptors of Significance of Effect Categories for Landscape Character (Source: DMRB Vol. 11)

Significance Category	Typical Descriptors of Effect
Very large beneficial (positive) effect	<p>The project would:</p> <p>greatly enhance the character (including quality and value) of the landscape.</p> <p>create an iconic high quality feature and/or series of elements.</p> <p>enable a sense of place to be created or greatly enhanced.</p>
Large beneficial (positive) effect	<p>The project would:</p> <p>enhance the character (including quality and value) of the landscape.</p> <p>enable the restoration of characteristic features and elements lost as a result of changes from inappropriate management or development.</p> <p>enable a sense of place to be enhanced.</p>
Moderate beneficial (positive) effect	<p>The project would:</p> <p>improve the character (including quality and value) of the landscape.</p> <p>enable the restoration of characteristic features and elements partially lost or diminished as a result of changes from inappropriate management or development.</p> <p>enable a sense of place to be restored.</p>
Slight beneficial (positive) effect	<p>The project would:</p> <p>complement the character (including quality and value) of the landscape.</p> <p>maintain or enhance characteristic features and elements.</p> <p>enable some sense of place to be restored.</p>
Neutral effect	<p>The project would:</p> <p>maintain the character (including quality and value) of the landscape.</p>

Significance Category	Typical Descriptors of Effect
	<p>blend in with characteristic features and elements.</p> <p>enable a sense of place to be retained.</p>
Slight adverse (negative) effect	<p>The project would:</p> <p>not quite fit the character (including quality and value) of the landscape.</p> <p>be at variance with characteristic features and elements.</p> <p>detract from a sense of place.</p>
Moderate adverse (negative) effect	<p>The project would:</p> <p>conflict with the character (including quality and value) of the landscape.</p> <p>have an adverse impact on characteristic features or elements.</p> <p>diminish a sense of place.</p>
Large adverse (negative) effect	<p>The project would:</p> <p>be at considerable variance with the character (including quality and value) of the landscape.</p> <p>degrade or diminish the integrity of a range of characteristic features and elements.</p> <p>damage a sense of place.</p>
Very large adverse (negative) effect	<p>The project would:</p> <p>be at complete variance with the character (including quality and value) of the landscape.</p> <p>cause the integrity of characteristic features and elements to be lost.</p> <p>cause a sense of place to be lost.</p>

Methodology for the Assessment of Visual Impact

Visual Baseline Conditions and Sensitivity to Change

7.2.18 The baseline for visual impact has been determined through gaining an understanding of the visual amenity of the area, which is informed by the Landscape Character Assessment, and the potential extent of visibility of the project, which is determined from the ZVI. Field work has then been carried out using the DMRB methodology to determine the extent of visibility of the Scheme from affected receptors. This has been carried out using public rights of way, and has therefore involved a degree of extrapolation and judgement in determining the actual extent of visibility of the Scheme.

7.2.19 In accordance with the DMRB methodology, unlike landscape sensitivity (which depends on the type of change proposed), the sensitivity of visual receptors (i.e. people, viewers) can reasonably be assumed in advance of any potential change, and have therefore been assessed as part of the visual baseline studies. Visual receptors include people in their homes, users of Public Rights of Way (PROW) and other areas of open space or recreational landscapes, people at work and people travelling along roads or railway lines. Indicative levels of visual sensitivity and typical examples or related receptors are provided in Table 7.5.

7.2.20 The identification of various categories of visual receptor and the assumed visual sensitivity of each forms part of the visual baseline against which the change in the view brought about by the proposed Scheme is assessed.

Table 7.5 Visual Sensitivity and Typical Receptors (Source: DMRB Vol. 11)

Sensitivity	Type
High	Residential properties. Users of Public Rights of Way or other recreational trails (e.g. National Trails, footpaths, bridleways etc.). Users of recreational facilities where the purpose of that recreation is enjoyment of the countryside (e.g. Country Parks, National Trust or other access land etc.).
Moderate	Outdoor workers Users of scenic roads, railways or waterways or users of

Sensitivity	Type
	designated tourist routes. Schools and other institutional buildings, and their outdoor areas.
Low	Indoor workers Users of main roads (e.g. trunk roads) or passengers in public transport on main arterial routes. Users of recreational facilities where the purpose of that recreation is not related to the view (e.g. sports facilities).

Magnitude of Impact Criteria for Visual Amenity

7.2.21 The magnitude of impact, or degree of change, arising from the NDR will depend on a number of factors such as the scale and nature of the proposed change, the proximity of the new works to the receptor and the number of people / receptors affected. The criteria in Table 7.6 have been used to define the magnitude of the visual impacts on identified receptors.

Table 7.6: Magnitude of Impact and Typical Descriptors (Source: DMRB Vol. 11)

Magnitude	Description
Major	The project, or a part of it, would become the dominant feature or focal point of the view.
Moderate	The project, or a part of it, would form a noticeable feature or element of the view which is readily apparent to the receptor.
Minor	The project, or a part of it, would be perceptible but not alter the overall balance of features and elements that comprise the existing view.
Negligible	Only a very small part of the project would be discernable, or it is at such a distance that it would form a barely noticeable feature or element of the view.
No change	No part of the project, or work or activity associated with it, is discernible.

Significance of Effects on Visual Amenity

7.2.22 In determining the significance of visual effects, the sensitivity of potential visual receptors within the ZVI is combined with the magnitude of change. This depends on the location, context and expectations of the viewer (e.g. the occupier of a residential property with open views would be potentially highly sensitive to any change, whereas an office worker within an urban context would be less sensitive).

7.2.23 The evaluation of the significance of the visual effects of the project is derived by assessing the sensitivity of the receptor (Table 7.5) against the degree of change in the view resulting from the project (Table 7.6). These aspects can be combined to form a significance matrix as shown in Table 7.7. Typical descriptors of the significance levels in the matrix are provided in Table 7.8.

7.2.24 Effects that fall within the categories of ‘moderate’, ‘large’ and ‘very large’ are deemed to be significant. In general terms a major magnitude of change on a highly sensitive receptor will produce an effect of large or very large significance, particularly if a large number of receptors are affected, and a minor magnitude of change on a less sensitive receptor will produce an effect of slight or neutral significance. Major changes for less sensitive receptors and minor changes for more sensitive receptors could also produce significant levels of effect.

Table 7.7 Significance of Effect Categories (Source: DMRB Vol. 11)

Magnitude of Impact						
Visual Sensitivity		No Change	Negligible	Minor	Moderate	Major
	High	Neutral	Slight	Slight/Moderate	Moderate/Large	Large/Very Large
	Moderate	Neutral	Neutral/Slight	Slight	Slight/Moderate	Moderate/Large
	Low	Neutral	Neutral/Slight	Neutral/Slight	Slight	Slight/Moderate

Table 7.8 Typical Descriptors of the Significance of Effect Categories (Source: DMRB Vol.11)

Significance	Typical Descriptors of Effect
Very large Beneficial	The project would create an iconic new feature that would greatly enhance the view.
Large Beneficial	The project would lead to a major improvement in a view from a highly sensitive receptor.
Moderate Beneficial	The proposals would cause obvious improvement to a view from a moderately sensitive receptor, or perceptible improvement to a view from a more sensitive receptor.
Slight Beneficial	The project would cause limited improvement to a view from a receptor of medium sensitivity, or would cause greater improvement to a view from a receptor of low sensitivity.
Neutral	No perceptible change in the view.
Slight Adverse	The project would cause limited deterioration to a view from a receptor of medium sensitivity, or cause greater deterioration to a view from a receptor of low sensitivity.
Moderate Adverse	The project would cause obvious deterioration to a view from a moderately sensitive receptor, or perceptible damage to a view from a more sensitive receptor.
Large Adverse	The project would cause major deterioration to a view from a highly sensitive receptor, and would constitute a major discordant element in the view.
Very Large Adverse	The project would cause the loss of views from a highly sensitive receptor, and would constitute a dominant discordant feature in the view.

7.3 Context

Technical

- 7.3.1 Natural England has divided the country into 159 Natural Character Areas, each of which is defined by a unique combination of landscape, biodiversity, geodiversity and cultural and economic activity. The study area for the route falls within the southernmost part of Natural Character Area 78: Central North Norfolk. This is a large area covering over 70 000 hectares which essentially extends from Norwich to the North Norfolk Coast, and is largely rural in character. However, of relevance to this assessment is the fact that it is noted that urbanisation dominates close to the northern edge of Norwich, and this is a feature of the study area for the NDR.
- 7.3.2 Several studies have been carried out in the past which cover parts of the study area and are of relevance to the landscape;
- In 1995 Norfolk County Council produced an assessment of the landscape character of the county which was published as a consultation draft under the title Norfolk Countryside Conservation Strategy Landscape Assessment (NLA). This was a broad assessment reflecting the large scale character areas defined by the Natural Character Area map.
 - In 1999 Broadland District Council (BDC) commissioned Chris Blandford Associates (CBA) to carry out a landscape assessment of the district to help define areas of important landscape quality, and this work has informed the designation of the 'Areas of Landscape Value' throughout the District.
 - In 2007 CBA produced a Green Infrastructure Strategy for the Norwich area on behalf of the Greater Norwich Development Partnership, The aim of the Strategy is "to create a bold vision for the Greater Norwich Area and to establish a strategy for green infrastructure that will complement and support good quality housing and substantial economic growth by: providing high quality, accessible green infrastructure within a comprehensive landscape structure; promoting ecological networks and continuity and links between habitats; improving quality of life; helping to address climate change; improving access to habitats and greenspace; and encouraging community wellbeing." (pg 2).
 - In 2007, BDC commissioned CBA to produce an updated landscape character assessment of the district, which was published in May 2008. This report updated the earlier landscape character study in line with the 2002 LCAG methodology, but with the new aim of determining how sustainable development can be accommodated into the landscape of the district. This

work has since been developed into the 'Landscape Character Assessment Supplementary Planning Document' by BDC, which went to public consultation in November/December 2011 and was adopted on 21st October 2013.

- 7.3.3 Landscape studies were included in the Wensum Valley Project strategies, the results of which were broadly confirmed by the BDC studies. The findings of the NLA study were used in the 1999 BDC study, which divided Broadland District into thirteen 'character zones' (of which five cover the study area for this assessment), each divided into specific 'local character areas'. The 2008 BDC study carried a broader remit (i.e. informing sustainable development policy) and consolidated this earlier work into six broad 'landscape character types' (of which three cover the study area), which were also divided into 'landscape character areas'.
- 7.3.4 For the purposes of the baseline for this assessment the 1999 BDC study was found to be the most useful, since it contains a finer level of detail than the 2008 study and its remit to inform Areas of Landscape Value was more appropriate in informing the baseline studies for the NDR, rather than the focus on sustainable development found in the later BDC reports. The findings of the BDC studies have been cross referenced where appropriate in this assessment (the BDC character areas are shown in drawing MMD-233906-DT-0669).
- 7.3.5 The NDR would pass through the area covered by the remit of the Green Infrastructure Strategy for the Norwich area. The landscape design for the NDR has been prepared with the Green Infrastructure Strategy in mind, and the extensive mitigation proposed will help to meet the aims of the Strategy.

Planning and Legislative Context

General

- 7.3.6 This section identifies statutory designations and planning policy in so far as they relate to the landscape and visual effects of the NDR.
- 7.3.7 With the exception of Norwich Airport (which is covered by Norwich City Council) the study area falls within Broadland District. There are no nationally designated areas within the study area which relate to landscape, although parts of the study area have been designated as 'Areas of Landscape Value' by Broadland District Council (see drawing MMD-233906-DT-0669).

- 7.3.8 The Broads Authority Executive Area lies to the north and south of the scheme, the closest part of the boundary lying to the south of Postwick where it follows the flood plain of the River Yare, 0.5 km away from the intersection of the NDR with the A47 trunk road. In the north, the closest part of the boundary of the Broads area to the NDR lies 1.5km to the north of the Springs at Rackheath (see drawing MMD-233906-DT-0669). Due to a combination of distance, intervening vegetation, undulating topography and the existing urban character of the Postwick Junction, the Scheme will not have any significant landscape or visual effects on the Broads Authority Area. This is confirmed by the extent of visibility as shown on the ZVI drawings (MMD-233906-DT-0953 to MMD-233906-DT-0955).
- 7.3.9 There is one Registered Park and Garden close to the study area; Catton Park is a Grade 2 listed historic parkland lying to the south of the scheme within the northern suburbs of Norwich (see drawing MMD-233906-DT-0669). The northern boundary of the Park lies 2km to the south of the proposed NDR where it passes to the south of Spixworth (see drawing MMD-233906-DT-0669). Due to the presence of intervening housing developments and vegetation, the scheme will not have any landscape or visual effects on Catton Park. This finding is confirmed by the ZVI see drawings MMD-233906-DT-0953 to MMD-233906-DT-0955 in vol 2, which shows that no views of Catton Park are possible from the Scheme for either construction, year 1 or year 15.
- 7.3.10 Both the adopted and the emerging development plan identify the Norwich area as the focus for future major growth and development. The emerging Joint Core Strategy covering the Norwich, Broadland and South Norfolk areas, in particular, proposes at least 7000 dwellings by 2026 (rising to around 10,000 eventually) in the vicinity of Rackheath, to the north east of Norwich. The Beyond Green Development between Spixworth and the edge of Norwich would encompass parts of Beeston Park. It is likely that Parkland would be retained within the housing areas and new areas of heathland would be created as a stepping stone to Mousehold Heath (on the edge of Norwich), in conjunction with the Green Infrastructure Strategy.

National planning policy

- 7.3.11 The National Planning Policy Framework (NPPF) sets out the Government's planning policies for England by providing a framework within which councils can provide their own distinctive local plans. Of relevance to landscape is Chapter 11: Conserving and Enhancing the Natural Environment, part of

which provides guidance on protecting and enhancing valued landscapes. (see, in particular, paragraphs 115 and 116).

7.3.12 The NDR will comply with the NPPF by avoiding the highest quality landscapes (i.e. The Broads area) and by providing extensive mitigation to minimise landscape effects on important local landscapes.

Regional planning policy

7.3.13 The following policies from the Joint Core Strategy for Broadland, Norwich and Norfolk (as amended February 2013) have been considered:

7.3.14 Policy 1 addresses climate change and the protection of environmental assets. One of the key features of this policy is the need to provide additional green infrastructure to reduce fragmentation of habitat and enhance the recreational resource. The landscape scheme provided by the NDR (see drawings MMD-233906-DT-0866 to MMD-233906-DT-0878 and MMD-233906-DT-0941) will help to further this aim by increasing the overall area of woodland that currently exists in the locality, providing a green network along this new transport corridor.

7.3.15 Policy 2 promotes the need for good design within new development and highlights the need for landscaping that reflects local distinctiveness and landscape character. This reinforces Spatial Planning Objective 9 which outlines the unique characteristics of the area covered by the JCS and states that it is a priority to maintain and improve these special qualities. The landscape character assessment carried out for the NDR informs the landscape design and complies with this policy.

7.3.16 Policy 12 addresses the importance of Green Infrastructure for the Norwich urban area and fringe parishes, including the protection of the landscape setting of the urban area and the importance of tree planting to enhance amenity and habitat. The mitigation design for the NDR seeks to comply with this policy by providing a green wooded corridor which will link to existing green infrastructure.

Local planning policy

7.3.17 The following policies from the Broadland District Council Local Plan (Replacement, adopted 2006) have been considered:

- 7.3.18 Policy ENV 8 aims to protect the distinctive character of Areas of Landscape Value in the District. The landscape design of the NDR has been prepared with the aim of maintaining local character within Areas of Landscape Value by using mitigation such as mounding and planting appropriate to these areas.
- 7.3.19 Policy ENV 10 aims to protect and maintain the visual qualities of historic parklands. The landscape design of the NDR has been prepared with the aim of minimising the impact on local parkland areas (i.e. Beeston and Rackheath Parks) though the use of appropriate mitigation such as mounding and planting which would blend into the local parkland landscape.
- 7.3.20 Policy TRA 17 states that new highways will incorporate appropriate landscaping, making use of native species where possible. The landscape design for the NDR would fully comply with this policy.
- 7.3.21 Policy CS1 from the Broads Core Strategy (adopted 2007) has also been considered, which aims to protect the distinctive qualities of the Broads landscape. As noted in para 9.3.8, the NDR would not affect the landscape quality of the Broads and policy CS1 is not relevant.

Climate Change

- 7.3.22 During the lifetime of the Scheme it is expected than climate change will have an effect on the landscape of the NDR. Such changes could include the need for planting to cope with increased temperature extremes and damage from storm events such as high winds and high rainfall. It is anticipated that the landscape scheme will adapt naturally to climate change as it matures. The planting will be actively maintained by the local authority such that any specific species failures attributed to changing climate will be substituted by more appropriate species if and when required. However, it is anticipated that the wide range of native species used in the planting scheme will provide a high degree of natural resilience to climate change.

Design Tolerances

- 7.3.23 The engineering design has a general tolerance of 250mm in terms of lateral and vertical movement, which would not make any material difference to the findings of the landscape and visual assessment.

7.3.24 For the following roundabout junctions the vertical tolerances are increased to 500mm; Fir Covert Road, Reepham Road, Drayton Lane, Norwich Airport, Wroxham Road, Salhouse Road, Plumstead Road (north) and Postwick North East. These potential increases would also not make any material difference to the findings of the landscape and visual assessment.

7.4 Baseline Conditions

Introduction

- 7.4.1 The centre of Norwich consists of a significant sized commercial environment centred on a historic medieval core. On the edges of the city are extensive urban fringes typically consisting of relatively modern residential suburbs of rather uniform visual character. Away from the urban area the surrounding villages are generally historic in character with varied features such as ancient churches and historic buildings and with a strong sense of history associated with their setting within the landscape.
- 7.4.2 The topography of the area is shown in Volume 2, Chapter 7: Landscape, Section C, drawing MMD-233906-DT-0668. At the western end of the route corridor, commencing at the A1067, the land is undulating and blocks of deciduous woodland dominate the view. Westwards towards Thorpe Marriot the character starts to change on account of flatter topography dominated by large coniferous plantations, providing a considerable degree of enclosure. The landscape then becomes much more open and featureless towards the A140.
- 7.4.3 The study corridor is then dominated by the airport, which occupies a flat plateau area surrounded by open arable land which is largely devoid of significant landscape features. Just to the north of the airport, but largely screened from it by a low ridge, lies the attractive village of Horsham St. Faith.
- 7.4.4 Beyond here landscape character once again becomes more enclosed as it passes through a wooded landscape characterised by the presence of large parklands, noticeably Beeston Park and Rackheath Hall, and has an attractive landscape quality. Beyond Rackheath the character begins to change further, with a higher degree of woodland cover and more undulating landform.
- 7.4.5 The eastern end of the corridor is characterised by flatter topography and a much more open landscape of arable farmland. The route terminates at the A47 in the vicinity of Broadland Business Park where the landscape becomes more urban in character.

Lighting and Tranquillity

- 7.4.6 Despite the close proximity to Norwich, the route would pass through fairly tranquil countryside, particularly in the vicinity of the wooded parkland areas of Rackheath and Beeston.
- 7.4.7 The airport in the vicinity of the route has a remote feel to it on account of its open character and lack of built development. However, this feeling is broken by the noise of aircraft activity on a regular basis.
- 7.4.8 In general, the high degree of open arable cultivation along the route corridor gives the impression of a sparsely populated area, although in fact there are many small hamlets and isolated properties spread throughout the area, and the small rural roads that link these are well trafficked. This fact is evidenced at night, where lighting from houses and associated localised street lighting are very much in evidence. There is also considerable sky glow from Norwich to the south.
- 7.4.9 The northern urban fringe of Norwich (including Taverham and Drayton) is defined in Norfolk County Council's Environmental Lighting Policy as being within the well lit 'urban area and their suburbs' category. Horsford and Spixworth lie within the 'Market Towns and existing well lit villages' category, and the remaining parts of the study area (including the footprint for the NDR) are within the 'Rural Dark Landscapes' category. However, the only part of the NDR to be lit is the Postwick Hub. Since this area is already well lit (from the existing business development and the A47 junction) lighting impacts arising from the NDR will predominantly be from vehicle headlights.

Landscape Character

- 7.4.10 The boundaries of the landscape character areas are shown in Volume 2, Chapter 7: Landscape, Section E, drawings MMD-233906-DT-0670 and MMD-233906-DT-0671, and a representative photograph (together with field survey notes following the LCAG methodology) for each area included in Volume 2, Chapter 7: Landscape, Section G. A description of the generic landscape character types and specific landscape character areas within the study area are as follows:

Settlements (landscape character type S)

7.4.11 Built up areas can be generically classed together as a single landscape character type. However, there are differences in character across the spectrum of the built environment, ranging from modern planned settlements of uniform character to historic villages with a more varied architecture, each of which would form a distinct landscape character area. The individual settlement landscape character areas vary considerably across the study area and are as follows;

Thorpe Marriott (landscape character area S1)

7.4.12 This large settlement was constructed entirely from new in the 1990s as an overflow housing development for Norwich. Like the other modern developments of Thorpe End and Spixworth, the boundary of the built up area is very tightly controlled and sharply delineated, and is screened from the countryside on the north and west sides by a dense coniferous shelter belt, which has now reached maturity. This development joins with Taverham to the south, but is separated from it by the green corridor of Marriott's Way and its associated grassland recreational areas.

Horsford (landscape character area S2)

7.4.13 This village has steadily expanded since the 1930s along the B1149 Holt Road, and now encompasses several farm buildings and cottages of older date along its margins. Like Horsham St. Faith, this village has also been allowed to develop in a piecemeal fashion over the years and also has an informal development pattern.

Horsham St. Faith (landscape character area S3)

7.4.14 This is an ancient village with a historic core surrounded by a mix of housing styles, many of which have established mature gardens. Unlike the more modern planned developments of Thorpe End and Spixworth, the village has developed in a piecemeal fashion over many years and therefore has a more informal development pattern.

Spixworth (landscape character area S4)

7.4.15 Spixworth was originally a small village centred on the parish church, with Spixworth Hall and associated parkland lying adjacent immediately to the

west. However, since the 1930s a large residential settlement has been created to the southeast in response to housing pressure in Norwich, which has expanded in recent years to create a uniform character of single and two-storey detached and semi detached dwellings. The boundary of the built up area is very tightly controlled and sharply delineated to the south.

Rackheath (landscape character area S5)

7.4.16 Rackheath is a rather spread out settlement that includes an industrial estate and a large area of housing in between the Wroxham and Salhouse roads. Housing comprises a mix of styles ranging from older bungalows to modern detached two-storey dwellings. The industrial estate is on land that was formerly used as a Second World War airfield, and concrete tracks and building remains from this period still survive in the woodland to the south of the village.

Thorpe End (landscape character area S6)

7.4.17 Thorpe End was originally conceived and built as a 'garden village', with a higher degree of open space and landscaping than would normally be provided for such a development. The original village was constructed largely to the south of the Plumstead Road and consisted of detached dwellings with large gardens set within the context of tree lined avenues. The village has been extended to the north of Plumstead road in recent years, using high standards of paving and landscaping in keeping with the 'garden village' concept.

Postwick (landscape character area S7)

7.4.18 Postwick is an old village with a tightly defined core clustered around the parish church. It lies to the south of the A47 on land that falls gently towards the River Yare floodplain. Properties on the northern edge of the village tend to be fairly large with mature well wooded gardens and boundaries.

Norwich Urban Fringe (landscape character area S8)

7.4.19 This area occurs on the outskirts of Norwich and largely comprises the built edge of the suburbs where they adjoin the surrounding farmland, although in some places the boundary is less abrupt where cemeteries, playing fields or

woodland lie in between. The northern fringe of Norwich is generally characterised by newer residential development dating from the 1930s onwards, but with substantial expansion in recent years. This has led to a tendency for some settlements to become joined up, particularly along the arterial roads. The most noticeable example of this is Hellesdon, Drayton and Taverham along the A1067, which have all been classed as part of this zone for the purposes of this study.

Transport Infrastructure (landscape character type T)

7.4.20 This landscape character type is characterised by strongly delineated boundaries which define its role as an area for specific transportation uses, namely the landscape character areas of Norwich Airport and the A47 trunk road.

Norwich Airport (landscape character area T1)

7.4.21 The route of the NDR passes along the northern edge of Norwich Airport, which is a largely featureless and expansive open area in stark contrast to the busy terminal area to the south. Norwich Aviation Museum occupies part of the site and there are a few airport buildings in evidence, including the control tower and the complex of building and structures that forms the Petans safety training business.

The A47 corridor (landscape character area T2)

7.4.22 The A47 Norwich Southern Bypass with its associated earthworks and landscape planting forms a dominant linear landscape feature with a quite distinct character. The scale of the road and its associated infrastructure, such as overbridges and lighting columns, creates an urban feel around the eastern end of the study area, particularly as other development in the vicinity (such as the expanding Broadland Business Park and the Postwick Park and Ride site) reinforce this urban character. However, the area around the Park and Ride site forms part of the area designated as an Area of Landscape Value.

Wensum Valley (landscape character type WV)

7.4.23 The River Wensum occupies a broad gently sloping shallow valley as it flows eastwards towards the centre of Norwich and is dominated by wet pasture

and marshland for the most part. As it reaches the urban fringe the land use changes to reflect this, with recreational features such as playing fields and golf courses becoming evident. The edge of the study area affects the edge of one such character area as follows:

Wensum Valley (landscape character area WV1)

7.4.24 The area lying immediately to the south of the A1067 (at the commencement of the scheme) slopes down to meet the river Wensum, and contains a golf course. There are a few mature trees and short hedgerow lengths left as remnant features from previous farming use, but the overall character is now dominated by the greens, fairways and bunkers of the golf course. This character area forms part of character zone B in the 1999 BDC study (subdivided as B3), and described as 'comprising of a stretch of the River Wensum between Lenwade and Norwich, this character area includes the river floodplain, its northern and southern slopes and a tributary of the river extending up to the town of Reepham' and was confirmed in the 2008 BDC study (where it is now numbered as landscape character area A1). Much of this area is designated as an Area of Landscape Value by Broadland District Council.

Gravel Hills (landscape character type GH)

7.4.25 This character type is defined by a ridge formed of gravelly materials of glacial origins, forming a distinct topographical feature which broadly lies in a north south orientation at the western end of the corridor and is cut through by the Wensum valley. It is characterised by steep slopes covered in mature deciduous woodland interspersed by small arable fields. The Scheme affects the northern edge of this broad landscape character type, affecting one specific landscape character area as follows.

Gravel Hills (landscape character area GH1)

7.4.26 This character area occurs at the western edge of the scheme where steep slopes covered in mature deciduous woodland mark the transition between the river Wensum valley and the arable plateau land further to the north. This area also forms part of character zone B in the 1999 BDC study (A1 in the 2008 study), subdivided as area B2, and much of it is designated as an Area of Landscape Value by Broadland District Council.

Expansive Largely Open Arable Farmland (landscape character type OA)

7.4.27 This landscape character type contains land in intensive arable cultivation and is characterised by a lack of small scale topographic or vegetation features, creating the feeling of an expansive open area of landscape. This area encompasses the majority of the 1999 BDC study character zone I (western part of E3 in the 2008 study), defined as ‘an area of essentially open land in mixed use forming a landscape buffer between the urban edge of Norwich and the woodlands and plantations to the north’. Within this broad character type three distinct character areas have been identified for this study as follows:

In the vicinity of Marriotts Way (landscape character area OA1)

7.4.28 This area of arable plateau has a different character than that lying further to the east on account of the sense of enclosure provided by the coniferous shelterbelt surrounding Thorpe Marriott and the coniferous plantation of Drayton Drewray to the north. Further enclosure is provided by the route of Marriotts Way, which occupies the well vegetated route of a former railway line. This area is classed as the western part of I1 in the 1999 BDC study (western part of E3 in the 2008 study), which does not make a distinction between this area and OA2 (described below) reflecting the broader approach of the district wide BDC studies. Some of this area (to the north of Reepham Road) is designated as an Area of Landscape Value by Broadland District Council.

Thorpe Marriott to Horsham St. Faith (landscape character area OA2)

7.4.29 The open arable plateau continues eastwards towards the A140 and across to the airport near Horsham St. Faith, with the land falling away on either side of the Reepham Road which forms a shallow ridge line through the centre of this character zone. This area has a very expansive and open feeling, with few landscape features, although localised farm buildings and houses on the edge of Horsford and Thorpe Marriott provide the occasional focal point. This area is covered by the eastern part of area I1 and part of I2 in the 1999 BDC study (E3 in the 2008 study).

North of Norwich Airport (landscape character area OA3)

7.4.30 This area is a continuation of the open plateau area, and occupies the area between Horsham St. Faith and the airport boundary, extending eastwards towards Spixworth and effectively merging into the airport to the south. The airport is given a separate character area (see T1 above) on account of the dominating influence of aviation activities, although the airport boundary and associated buildings and operations (including the static aircraft exhibits associated with Norwich Aviation Museum and the Petans complex) tend to influence and dominate the character of this particular area. This area is subdivided as parts of area I2 and I3 in the 1999 BDC study (E3 in the 2008 study).

Partly Enclosed Arable Farmland (landscape character type EA)

7.4.31 This character type forms the largest part of the eastern side of the study area and is characterized by generally flat topography in arable cultivation, but with a high density of hedges and small woodland blocks. Isolated properties and farms with mature well vegetated gardens are spread throughout the area, helping to reinforce the feeling of a landscape with a fairly high level of vegetation cover. Much of this area adjoins the urban fringe of Norwich and 'semi urban' land uses such as Sprowston Manor golf course, playing fields and cemeteries also help to define the landscape character. Within this broad landscape character type there are four distinct character areas as follows:

Spixworth Park (landscape character area EA1)

7.4.32 This area is centred on the remains of Spixworth Park. Although the parkland is now mostly in arable cultivation, many of the original shelterbelts and copses are still intact, giving this area an enclosed wooded feel which is quite distinct from the surrounding area. The 1999 BDC study included this area as part of the 'open arable' category described above, but gave it a separate subcategory (I3) to reflect this change in character (although within the larger character areas in the 2008 report it is included within area E3).

Adjacent to Norwich Urban Fringe (landscape character area EA2)

7.4.33 Between the urban edge of Norwich and the more rural character areas lying further to the north lies an area of mixed use and varying character, ranging from areas of arable land bounded by large housing developments such as near Spixworth, through to well wooded enclosed areas such as that near Sprowston Manor Golf Course. A distinctive factor of this area is that urban

elements are a dominant component of the arable landscape, and it is this which influences the landscape character, be it a playing field, cemetery, golf course or housing development. The 1999 BDC study classed the majority of this area as J1 (E3 in the 2008 report), a subdivision of zone J which includes the parklands lying to the north (which are subdivided as E4 in the 2008 report), and was summarised as ‘this tract of land extends north east from Norwich and encompasses former areas of heathland that today are under arable cultivation, along with an area of historic parkland and a number of recently expanded settlements’. The coniferous plantations adjacent to the Salhouse and Plumstead Roads are designated as an Area of Landscape Value by Broadland District Council.

In the vicinity of the Railway Crossing (landscape character area EA3)

7.4.34 In between Thorpe End and New Rackheath arable cultivation is interspersed with rough grazing pasture and the character of the landscape changes accordingly, becoming noticeably more open. This area is also dominated by the busy Norwich to Plumstead Road and the railway line, and consequently does not have the same remote rural character as EA1. This area forms part of zone J in the 1999 BDC study, and was given the subdivision of J4 (E4 in the 2008 report).

North of the A47 (landscape character area EA4)

7.4.35 This area is in intensive arable cultivation characterised by large flat fields, but with dense hedgerows and mature hedgerow trees alongside the roads and tracks that cross the area. In addition there are several properties with large mature grounds in the area, which reinforce the feeling of enclosure. Principally these are Smee House Nursery, Red House and Oaks Farm. This area forms part of the western side of a larger character zone (zone L, subdivided as L1 in the 1999 BDC report) which was defined as ‘this undulating landscape extends eastwards from the edge of Norwich, forming a wide belt adjacent to the River Yare. Typical urban fringe developments and numerous commuter settlements contrast with areas of high quality farmland, woodland and minor river valleys’ (in the 2008 report, this area is included as part of E3, which tends to form a narrow belt adjoining the northern urban fringe of Norwich).

Enclosed Well Wooded Arable Farmland (landscape character type WA)

7.4.36 This landscape character type is characterised by extensive woodland cover resulting from the presence of three former estates that effectively form a contiguous landscape; Beeston Park (still extant though much of the former parkland is ploughed), Rackheath Hall (now converted to apartments but mature largely deciduous shelterbelts still remain within a farmed landscape), and Sprowston Manor (former parkland converted to golf course, though many parkland features remain). Beeston and Rackheath Parks are directly affected by the route and are described below, together with a smaller area of parkland at Red Hall and the adjoining landscape centred on 'The Springs at Rackheath' to the north. Sprowston Manor is included as part of character area EA2 on account of the urbanising influence of the conversion of much of the former parkland to golf course, but the more natural northern boundary woodlands and shelter belts are included within this character type. The area is encompassed by the central part of character zone J in the 1999 BDC study, and is mostly subdivided as J2 (E4 in the 2008 study).

Red Hall (landscape character area WA1)

7.4.37 This is a very small area lying on the western edge of this character area, separated from Beeston Park to the east by the busy B1150 North Walsham Road. It is a distinctive small scale parkland enclave in strong contrast to the surrounding arable land, and comprises pasture (used as horse paddocks) with mature specimen trees surrounded by mature woodland. The 1999 BDC study did not subdivide this area from the arable area I3 (E3 in the 2008 study) on account of the broader scope of that study, but as this area stands in marked contrast to the surrounding intensive arable cultivation it has been given a separate subdivision for the purposes of this study.

Beeston Park (landscape character area WA2)

7.4.38 This distinct character area is centred on Beeston Hall which is bounded by mature deciduous shelterbelts. The main frontage of the Hall to the south faces an area of parkland that is maintained in its original condition with grassland and parkland trees. To the north the original parkland is ploughed, although the surrounding shelterbelts give it a distinct well wooded character. This area forms the western part of subzone J2 in the 1999 BDC study (E4 in the 2008 study). This area is designated as an Area of Landscape Value by Broadland District Council.

The Springs at Rackheath (landscape character area WA3)

7.4.39 The Beeston Hall estate is contiguous with an area of well wooded landscape on distinctive undulating topography extending towards Rackheath and bounded by the A1151 Wroxham Road. This area is centred on an area of wet woodland ('The Springs at Rackheath'), which is important in defining the character of this area, and which forms the eastern part of J2 in the 1999 BDC study (E4 in the 2008 study). This area is designated as an Area of Landscape Value by Broadland District Council.

Rackheath Park (landscape character area WA4)

7.4.40 Although the original parkland is now all ploughed, the original shelterbelts remain and these, combined with the undulating topography, create a distinctive landscape character zone, forming the southern part of subzone J2 in the 1999 BDC study (E4 in the 2008 study). This area is designated as an Area of Landscape Value by Broadland District Council.

Woodland (landscape character type W)

7.4.41 Within the broad landscape character type of woodland there are two areas of dense woodland directly affected by the route, both with very different and distinct landscape characters as follows:

Drayton Drewary (landscape character area W1)

7.4.42 This woodland is mature coniferous plantation which forms part of a large network of interconnected blocks which are centred around the area to the north of Horsford, all of which are largely of coniferous composition and are extensively used for informal recreation. Towards the centre of Drayton Drewary, however, the woodland changes to deciduous woodland dominated by birch, interspersed with some open patches of grazing land. This woodland forms the southern boundary of character area E in the 1999 BDC study (B1 in the 2008 study) subdivided as area E3 and described as 'north-west of Norwich, the distinct soils of this character area create a unique landscape of woodland and plantations, interspersed with arable farmland'. This area is designated as an Area of Landscape Value by Broadland District Council.

Hall Farm (landscape character area W2)

7.4.43 This is an area of deciduous woodland that has been allowed to establish to the south of Rackheath Park in the vicinity of the semi derelict Hall Farm. During the war airmen from nearby Rackheath airfield were billeted at Rackheath Hall and the presence of wartime buildings and concrete access tracks throughout this area gives it a distinct character, particularly where the vegetation has grown up around such remains. The area also contains some isolated residential properties and small industrial units, and forms the southernmost part of area J2 in the 1999 BDC study (E4 in the 2008 study). This area is designated as an Area of Landscape Value by Broadland District Council.

7.5 Mitigation

Objectives

- 7.5.1 Mitigation of the scheme has involved optimising the route alignment in order to retain existing features or vegetation of interest and reduce visual impact. This has involved lowering the vertical alignment and adjusting the horizontal alignment where possible in order to minimise landscape and visual intrusion, subject to engineering considerations.
- 7.5.2 An extensive landscaping scheme has been designed (see drawings MMD-233906-DT-0866 to MMD-233906-DT-0878 and MMD-233906-DT0941) in order to integrate the road into the surrounding landscape as far as possible, and to reduce visual effects near housing. This has involved extensive mounding and grading out of side slopes to blend the road as far as possible into the surrounding topography, together with linking the road planting with adjoining existing vegetation. New planting has been provided in excess of the 6 to 1 replacement ratio recommended by the Forestry Commission, and the species chosen will be mostly native and deciduous to reflect those found in the immediate locality.
- 7.5.3 In the vicinity of the airport (approximately 2 km either side of Horsham St. Faith) the planting mixes would be adjusted to reduce the risk of bird strike hazards to aircraft; shrub planting would be kept trimmed to 2 m in height and the percentage of large trees reduced. In addition, the proportion of berry producing shrubs would also be reduced, to avoid attracting large flocks of birds which could prove hazardous to aircraft.
- 7.5.4 Effective mitigation measures for short-term construction impacts are difficult due to the short time scale for the proposed implementation of the works. This would preclude effective screening through planting. However, good and effective site management will ensure that waste materials and debris are

controlled to avoid items from blowing off site. Careful planning and management of the construction process will minimise the loss of existing trees and shrubs. Such careful site planning and management will be achieved through the Construction Environmental Management Plan (CEMP). Volume 2, Chapter 24: Construction Environmental Management Plan (CEMP).

- 7.5.5 The construction sequence has been optimised to avoid double handling of material and excessive vehicle movements (e.g. the earthworks balance is designed such that only localised movement of material will be necessary along individual stretches of the new road).
- 7.5.6 The landscape planting would be carried out as part of the main engineering contract, and would include maintenance for two years after the initial planting (to include replacement of plant failures and weed control). After that the County Council would be responsible for the longer term maintenance of the planting scheme. Details of the ongoing landscape management requirements will be set out in a separate landscape management plan.

Landscape Design

- 7.5.7 The landscape design is shown in DCO Document 2.8 Detailed Landscape Planting Proposals, drawings MMD-233906-DT-0866 to MMD-233906-DT-0941 and MMD-233906-DT-0941. This is further illustrated by cross sections which are shown in DCO Document 2.9 Indicative Sections, drawings MMD-233906-DT-0956 to MMD-233906-DT-0960.
- 7.5.8 Between the A1067 Fakenham Road and Reepham Road extensive planting of the side slopes will help to blend the road into this well wooded valley landscape and screen it from the isolated properties in the vicinity. A combined ecological and landscape mitigation area is proposed to link some of the existing woodland areas, which would comprise a mixture of woodland, scrub and grassland (see cross section 1). This design theme continues through to the woodland at Drayton Drewray, where additional planting and mounding are provided as compensation for woodland lost and to strengthen the screen from Thorpe Marriot (see cross section 2). Additional planting of severed field corners is also proposed where the route passes under Marriots Way to help compensate for the loss of vegetation along the cycle path. A cycle path is proposed along the back of the mounding to link Furze Lane and Marriotts Way to Reepham Road and Drayton Drewray.

- 7.5.9 From Reepham Road the route crosses open arable land, and linear strips of planting are proposed alongside the NDR to link the road into the existing hedge structure. Larger blocks of planting are provided to fill in severed field corners, which in conjunction with mounding would help to integrate the NDR into this open landscape (see cross section 3). This concept continues through to the junction with the A140, where the opportunity is taken to provide extensive woodland planting to help blend this large structure into the landscape.
- 7.5.10 The route is left open and largely unplanted where it passes Norwich airport, although localised mounding is provided to screen West Farm from the route. Where the route passes Horsham St. Faith mounding would be provided to screen the road from view.
- 7.5.11 Beyond the airport the landscape becomes more enclosed, and the roadside planting would become denser to reflect this local character, particularly in the vicinity of the Buxton road crossing where extensive planting would be used in conjunction with earth mounding to screen the route from view and link it into the coniferous shelter belt to the south of Spixworth (see cross section 4). Further mounding would be provided where the route crosses the B1150 North Walsham Road to screen the scheme from houses on the edge of Spixworth (see cross section 5).
- 7.5.12 Where the route crosses the former parkland to the north of Beeston Hall, a gentle graded mound would screen views of the NDR from the Hall without appearing intrusive within this sensitive landscape. Planting would be restricted to clumps of specimen trees to reinforce the parkland feel. Further east however, a combination of mounding and dense planting would be provided to screen the route from the estate cottages.
- 7.5.13 On passing Beeston Lane, the route would then be screened by mounding and planting from properties to the south. Land in proximity to the proposed A1151 Wroxham Road Roundabout would be used to provide landscape and ecological mitigation, providing a habitat link between the two woodlands (see cross section 6).
- 7.5.14 After crossing the A1151 Wroxham Road the route will be heavily planted to reflect the surrounding woodland blocks in the vicinity of Rackheath Park, and to help screen it from nearby properties. Planting is augmented by mounding in places to help achieve this aim.
- 7.5.15 Beyond Salhouse Road the route rises to cross the Norwich to Sheringham railway line, and extensive dense planting is proposed on the lower

embankment slopes to help reduce the impact of the route in this flat landscape. A low mound along the crest will screen views of cars from surrounding properties (see cross section 7).

7.5.16 The route then crosses a fairly open arable landscape, with isolated farms and houses. Localised mounding and dense planting will be used to screen properties where needed along the route (see cross section 8).

7.5.17 The route terminates at the A47 Postwick junction, and dense planting will be used as appropriate to help to blend the new highway structures into the landscape.

7.6 Assessment of Landscape Impacts

Introduction

7.6.1 This section assesses the significance of the effects of the proposals on the character of the landscape. The assessment is based upon consideration of the magnitude of change brought about by the scheme and the sensitivity of the landscape through which the NDR would pass. Photomontage visualisations of how the completed scheme will look from various locations have been agreed with Norfolk County Council and are included in Volume 2, Chapter 7: Landscape, Section J and K, drawings MMD-233906-DT-0879, MMD-233906-DT-0880 and Photomontage Locations 1 to 9.

Construction Impacts

7.6.2 Although construction impacts are of a temporary nature and short term, localised impacts on landscape character could be moderately adverse during the construction process. Such impacts would include the presence of site compounds and operations such as temporary earthmoving stockpiles and bridge construction scaffolding. In general, the movement of plant and materials necessary to construct the NDR will occur along the route within the boundary of the road, giving rise to adverse impacts throughout the construction period along the entire length of the route. However, specific additional impacts will also occur at certain locations where major works (such as the creation of new bridge crossings) could potentially give rise to significant effects.

7.6.3 Night time impacts will be minor since work will be largely limited to day light hours (7am to 7pm). The site compounds will be lit at night for security reasons, but since these are situated close to existing main road access points, impacts will not be significant.

7.6.4 The locations of compounds, storage areas and borrow pits are shown on the drawings R1C093-R1-5014 to R1C093-R1-5026 and explained further in chapter 2. The following paragraphs outline specific construction impacts that could occur along the various sections of the route.

A1067 to Fir Covert Road (ch 0 to 1700)

7.6.5 A small site compound is proposed adjacent to the new roundabout with the A1067 to facilitate construction of the new junction. These works will be seen within the context of the existing A1067, resulting in a moderate impact in a moderately sensitive landscape, giving rise to moderate adverse effects on landscape character during the construction period.

7.6.6 Two construction site areas (one involving a gas main diversion at ch. 1200 and the other a topsoil storage area at ch. 1600) are proposed alongside the route in the vicinity of Spring Farm and Fir Covert Road, which will give rise to additional vehicle movements in this vicinity. However, the combination of topography and existing woodland cover would reduce the magnitude of impact to moderate adverse levels, which in a landscape that is judged to be moderately sensitive to this type of change would result in moderate adverse effects overall during the construction period.

Fir Covert Road to Reepham Road (ch 1700 to 2900)

7.6.7 The bridge over Marriotts Way will involve a small site compound with an associated materials storage area. The construction of the bridge would cause a major impact in this fairly open landscape, due to the presence of moving vehicles and lifting equipment. However, landscape sensitivity is regarded as being 'low' on account of the overall lack of any distinctive landscape features, and overall therefore a moderate adverse landscape effect is predicted during the construction period.

Reepham Road to A140 (ch 2900 to 6800)

7.6.8 Small localised site compounds and storage areas will be located in the vicinity of the new roundabout junction with Reepham Road, but within the context of this busy local route the impact of additional vehicle movements is regarded as minor. Similarly, the site compound adjacent to Drayton Lane (ch. 5300) would also be within the context of the existing busy Reepham Road. The impact of this compound would also be reduced by the provision of

temporary mitigation mounding along the compound boundary, resulting in a minor adverse magnitude of impact.

7.6.9 Construction of the large grade separated junction with the A140 would be a major engineering undertaking, requiring the provision of an adjacent site compound. However, these works would be carried out within the context of the busy existing road network, and the magnitude of impact is therefore regarded as being moderate adverse.

7.6.10 The landscape over this section of the route is regarded as being of low sensitivity to change on account of the urbanising effect of Thorpe Marriott, the busy local road network, various industrial units and a lack of distinctive landscape features. Taken overall, landscape effects resulting from the construction of the NDR over this section are regarded as being slight adverse.

A140 to Quaker Lane (ch 6800 to 9750)

7.6.11 The main construction site compound for the western part of the NDR is located near to the A140 junction on unused airport land. There would be a large number of construction vehicles leaving and entering the compound, but its location is within the context of the busy existing road network. The impact of this compound would be further reduced by the provision of temporary mitigation mounding along the compound boundary, resulting in a minor adverse magnitude of impact.

7.6.12 A temporary topsoil storage area would be located adjacent to the airport roundabout at ch. 9200, but the impact of this would be no more than moderate adverse within the context of the main NDR earthmoving works.

7.6.13 The landscape sensitivity over this stretch is 'low' on account of the presence of the airport and lack of distinctive landscape features, resulting in slight adverse effects overall.

Quaker Lane to B1150 (ch 9750 to 12100)

7.6.14 Bridge construction over the NDR along Buxton Road would involve a small site compound with associated materials storage area at ch. 10800, which together with a borrow pit on the south side of the NDR at ch.11200 would cause a moderate adverse landscape impact during the construction period,

primarily through the movement of earthmoving vehicles, although temporary mitigation mounding would be provided around the borrow pit.

7.6.15 The main construction site compound for the eastern part of the route is located adjacent to the B1150 at ch. 12000. Temporary screen mounding would be provided around the boundary of this compound, but due to its large size it would have a moderate landscape impact, despite the presence of the busy B1150 nearby.

7.6.16 The landscape over this section of the route is regarded as being of moderate sensitivity on account of the distinctive landscape feature of the mature woodland belt through which the NDR would pass, resulting in moderate adverse landscape effects overall throughout the construction period over this section of the NDR.

B1150 to Salhouse Road (ch 12100 to 16100)

7.6.17 The construction of the shallow earth mounding adjacent to Beeston Park would have a moderate landscape impact until it is completed, largely on account of the presence of earthmoving vehicles. Two small site compounds are located at Gazebo Farm (ch. 15400) and adjacent to Salhouse Road (ch. 16000), but their impact would be minor within the context of the main construction works which is regarded as being moderate adverse overall on account of the extensive earthworks required over this section of the route (i.e. screen mounding up to Wroxham Road at ch. 14200 and cutting slope excavation beyond to Salhouse Road). This is a landscape of moderate sensitivity on account of the distinctive features of undulating topography combined with mature woodland, resulting in moderate adverse effects on landscape character during the construction period.

Salhouse Road to Plumstead Road (ch 16100 to 17000)

7.6.18 The main work element over this length of the NDR would be construction of the railway crossing. This would cause a major impact which would be difficult to mitigate during the period of its construction on account of its prominent position in an open landscape, together with the presence of the construction compounds and vehicles in the immediate vicinity. However, the landscape is of low sensitivity due to the presence of man made elements such as the railway line and adjacent roads with their associated traffic, resulting in an overall moderate adverse landscape effect for the duration of the bridge construction.

Plumstead Road to Smee Lane (ch 17000 to 19000)

7.6.19 Other than the provision of a small topsoil storage area adjacent to the NDR at ch. 18300, the main construction impact over this section will be disruption caused by vehicle movements in the creation of the screen mounding which is necessary along the along almost the entire length. This would result in a moderate impact on an attractive landscape of moderate sensitivity, giving rise to moderate adverse effects on the landscape character of this section of the route for the duration of the construction period.

Smee Lane to A47 (ch 19000 to 20400)

7.6.20 This short section of the route would involve the construction of Postwick Hub and associated links to the A47 trunk road. These works would be within the context of the urban edge of Norwich and a busy traffic interchange, constituting a moderate impact in a landscape of low sensitivity, with consequently slight adverse landscape effects.

Operational impacts

7.6.21 Operational impacts are those which will occur once the NDR has been completed, comprising the effect that the new infrastructure would have on the landscape, together with the impact of the vehicles that would use it. Two scenarios are considered; 'year 1' is the situation that will exist immediately after the road has opened, whilst 'year 15' considers the situation when the mitigation planting will have matured. In year 1 the scheme will appear quite noticeable, with mounding and solid barriers in place but without any appreciable effects from planting. In contrast, by year 15 the NDR will be well vegetated and will blend into the landscape. Night time effects are also considered, principally the impacts of vehicle headlights since the only area to be street lit will be the Postwick junction.

A1067 to Fir Covert Road (ch 0 to 1700)

7.6.22 From the A1067 the NDR will swing north east to follow a secluded shallow valley along the foot of the wooded Deighton Hills, before swinging east to cross Fir Covert Road (see photomontage location 1). The NDR will pass through a currently undisturbed and attractive area of countryside (which

forms the edge of an Area of Landscape Value defined by Broadland District Council), but would follow the topography and be well screened by the surrounding woodland, which would be augmented by additional mitigation planting. Since the NDR would follow the grain of the land and fit well within the valley, it is regarded as having a moderate adverse impact in a moderately sensitive landscape, resulting in moderately adverse effects on the landscape character of this stretch of the NDR in year 1, reducing to 'slight adverse' in year 15 once the mitigation planting has matured. Night time impacts will be 'slight adverse' arising from vehicle headlights along this length of the route.

Fir Covert Road to Reepham Road (ch 1700 to 2900)

7.6.23 From Fir Covert Road, the NDR would cross open fields to pass under Marriotts Way to join the Reepham Road at a roundabout junction. This section would be in cutting for much of its length, although the Marriotts way would be prominent where it rises to cross over the NDR on a bridge (see photomontage location 2). Despite the mitigation planting, this would be a prominent feature that would be out of character in this flat landscape, and is regarded as having a major adverse impact. However, the landscape through which this section runs is regarded as being of low sensitivity due to the encroachment of roads and buildings, and the landscape effect over this length is therefore considered to be moderately adverse in year 1, reducing to 'slight adverse' in year 15 once the mitigation planting has matured. Night time impacts will be 'slight adverse' arising from vehicle headlights along this length of the route.

Reepham Road to A140 (ch 2900 to 6800)

7.6.24 From Reepham Road the NDR would cut through the corner of a coniferous plantation on the edge of Drayton Drewray before crossing open fields to the north of Thorpe Marriott (see photomontage location 3). The woodland lost at Drayton Drewray is entirely of coniferous plantation, and the more interesting area with a higher deciduous tree component interspersed with grassland glades and patches of scrubland further to the north would be unaffected. The NDR would generally fit well into this flat landscape interspersed with large woodland blocks, which is consequently regarded as being of low sensitivity to the type of change proposed. The magnitude of impact is regarded as moderate adverse, which would therefore result in landscape effects that are slight adverse in year 1, reducing the 'neutral' in year 15 once the mitigation

planting has fully matured. Night time impacts will be 'slight adverse' arising from glimpses of vehicle headlights.

7.6.25 Beyond Drayton Drewray the NDR follows a low ridge across open arable land to the A140, running roughly parallel with the busy Reepham Road before crossing the A140 Cromer Road. Due to the nearby presence of these major roads through a largely open landscape, it is regarded as being of low sensitivity. The NDR would be largely screened by mounding over much of this length, but its position along the top of the low ridge line is regarded as having a moderate impact. However, combined with the low sensitivity of the landscape, operational phase landscape effects along this stretch are regarded as being 'slight adverse' in year 1, and therefore not significant. These effects would however remain in year 15, despite the mitigation planting, due to the position of the NDR along the ridge line. Night time impacts will be 'slight adverse' arising from vehicle headlights along this length of the route.

A140 to Quaker Lane (ch 6800 to 9750)

7.6.26 The impact of the A140 junction is reduced by the fact that it is sited largely on the line of the existing A140, which already carries a significant amount of traffic, and the landscape is therefore regarded as being of low sensitivity to the addition of the NDR (see photomontage location 4). However, the addition of further infrastructure into this road dominated location is regarded as having a moderate magnitude of change on account of the increased scale and height of the new junction, with the A140 being carried over the NDR. Combining sensitivity with magnitude of impact would result in slight adverse landscape effects at this location in year 1, which would remain at year 15 on account of the scale of the new junction. Night time impacts would however be 'neutral', on account of the large numbers of vehicles which already use the existing junction at this location.

7.6.27 The NDR would then follow the northern boundary of the airport, where the presence of new mounding to screen the NDR and limited opportunities for planting due to the operational requirements of the airport would have a moderate magnitude of impact in this open landscape (see photomontage location 5). However, the presence of the airport and the open featureless quality of the surrounding landscape is regarded as being of low sensitivity, and overall landscape effects are therefore regarded as being slight adverse for both year 1 and year 15. Since the route is either mounded or in cutting over this length, night time impacts are regarded as 'neutral'.

Quaker Lane to B1150 (ch 9750 to 12100)

7.6.28 The route then passes to the south of Quaker Farm before crossing Buxton Road, which would be taken over the NDR on a bridge resulting in a fairly localised but major degree of change (see photomontage location 6). The landscape here has an attractive well wooded quality and is more tranquil, despite the presence of nearby housing and local roads, and is therefore regarded as being of moderate sensitivity. However, the surrounding woodland provides extensive mitigation opportunities for large woodland belts to be provided to link with the existing vegetation, particularly around the coniferous shelterbelt near Spixworth. Together with screen mounding this will help to blend the NDR into the landscape and overall effects are regarded as moderate adverse in year 1, reducing to slight adverse in year 15 once the mitigation planting is fully mature. Night time impacts will be 'slight adverse' arising from glimpses of vehicle headlights.

B1150 to Salhouse Road (ch 12100 to 16100)

7.6.29 From the B1150 the route would cross the northern part of former parkland (now arable farmland) surrounding Beeston Hall, before crossing open fields to join the A1151 Wroxham Road at a roundabout. Mounding would be provided to screen views of the NDR from the rear of Beeston Hall, which would be gently graded to blend into the existing contours so as to be as unobtrusive as possible. The mitigation provided as the scheme crosses Beeston Park will reduce the effects on this landscape of moderate sensitivity to slight adverse for both year 1 and year 15, although beyond Beeston Park the impact will be moderate adverse in year 1, reducing to 'slight adverse' by year 15 as the dense mitigation planting matures. Night time impacts will be 'neutral' past Beeston Park on account of the screening effect of the mounding, and 'slight adverse' further along the route due to glimpses of vehicle headlights.

7.6.30 From the Wroxham road, the route would follow the valley floor before rising to pass through woodland between the village of Rackheath and Rackheath Hall to join the Salhouse Road at a new roundabout. This is an attractive well wooded area (reflected in its designation as an 'Area of Landscape Value' by Broadland District Council), although the close proximity of housing and urban influences reduces the landscape sensitivity to 'moderate'. The extensive woodland planting proposed as mitigation is regarded as being effective,

resulting in landscape effects that are 'moderate adverse' in year 1, reducing to 'slight adverse' by year 15. Night time impacts will be 'slight adverse' arising from vehicle headlights along this length of the route.

Salhouse Road to Plumstead Road (ch 16100 to 17000)

7.6.31 From Salhouse Road the landscape character changes to become flat, open and largely featureless, and is considered to be of low sensitivity on account of the surrounding urban influences, principally housing development and busy local roads. However, at 9.3 metres above existing ground level the NDR would be very intrusive where it rises to cross the railway line, resulting in a 'major' magnitude of impact (see photomontage location 7). A combination of earth shaping, screen fencing and planting would be used to help screen the road, resulting in a 'moderate adverse' effect on landscape character in year 1, which due to the height of this feature would remain at year 15. The screening effects of the mounding and parapets would however reduce night time effects from vehicle headlights to 'slight adverse'.

Plumstead Road to Smee Lane (ch 17000 to 19000)

7.6.32 The NDR crosses Plumstead Road at a new roundabout before passing through tranquil arable farmland, punctuated by farm buildings, mature woodland copses and country lanes, resulting in an attractive landscape of moderate sensitivity. A combination of mounding and planting would be used over this length to help screen the NDR, resulting in moderate adverse landscape effects in year 1, reducing to 'slight adverse' by year 15 as the mitigation matures (see photomontage location 8). Night time impacts will be 'slight adverse' arising from vehicle headlights along this length of the route.

Smee Lane to A47 (ch 19000 to 20400)

7.6.33 From Smee Lane the landscape becomes more open and the urban influences of business parks on the edge of Norwich become more prominent, ultimately culminating in the overall dominance of the A47 junction infrastructure. This is a landscape of low sensitivity to change that would be subjected to a moderate impact, resulting in slight adverse landscape effects arising from the NDR in year 1, which would remain at year 15 on account of the scale of the new infrastructure (see photomontage location 9). Night time impacts arising from the new junction lighting and vehicle headlights are

regarded as being only 'slight adverse' on account of the large amount of street lighting and vehicle movements that already exist in the locality.

Maintenance impacts

7.6.34 Periodic maintenance would be required to the planting along the NDR to ensure that the landscape continued to meet its design intentions. Some operations (such as grass mowing) would be carried out on a regular basis, whereas others (such as tree thinning works) would be less frequent.

7.6.35 Thinning operations would be carried out at approximately five to ten year intervals on a rolling programme such that only short sections of road would be affected at any one time. The density of the trees and shrubs would be reduced as they grow to maturity to allow the best specimens to develop, providing a varied woodland structure of attractive visual appearance and of greater benefit to wildlife.

7.6.36 Owing to the minor magnitude of impact of these works and the small scale piecemeal nature of their implementation, the effects of landscape maintenance are regarded as being only 'slight adverse' at worst and therefore not significant.

7.7 Assessment of Visual Effects

General

7.7.1 This section assesses the visual impact of the proposals and how the view will be affected from residential properties, public rights of way, commercial properties, and transport routes (road and rail). Following the methodology, all residential properties and users of public rights of way are regarded as being of high sensitivity, whilst users of commercial properties and transport routes are regarded as being of low sensitivity.

7.7.2 Details of the visual effects of the scheme are shown in Volume 2, Chapter 7, Section B, drawings MMD-233906-DT-0656 to MMD-233906-DT-0667 and detailed on the visual intrusion schedules in Volume 2. It should be noted that the drawings and schedules concentrate on receptors likely to have noticeable views of the Scheme. However, due to survey constraints (i.e. limited to public rights of way) it is possible that some receptors may have distant or fragmented views of the Scheme that are not recorded on the schedules, although since these will be 'slight adverse' at worst they are not regarded as being significant. The schedules also refer to some receptors as having a 'neutral' effect; these have been highlighted because they are close

to the Scheme, and a noticeable effect is therefore to be anticipated, but existing screening precludes this. Where this occurs the reasons are given in the comments column of the schedules. References given in the text relate to entries in the schedules (note that some references refer to more than one property where these are grouped together for convenience in the schedules).

Zone of Visual Influence

- 7.7.3 The Zone of Visual Influence (ZVI) is the approximate area from within which views of the NDR (i.e. the road and its associated infrastructure, and traffic upon it) might be possible (bearing in mind the assumptions used to develop the model, as detailed in the methodology section), and is shown in Volume 2, Chapter 7, Section F, drawings MMD-233906-DT-0953 to MMD-233906-DT-0955. Three ZVI's have been prepared; the first to represent the situation for the construction stage, the second to represent the Scheme in the first year of opening (i.e. before the planting has established) and thirdly to show the Scheme 15 years after opening, by which time the new planting will be fully effective.
- 7.7.4 During construction and in year 1 the ZVI is quite broad, becoming gradually more enclosed as the mitigation planting matures towards year 15. Initially the construction site will be quite visible but become gradually more screened as the Scheme reaches completion and the mounding and cutting slopes are formed. However, the bare unplanted mounding will in itself draw attention to the road and this is reflected in the ZVI. By year 15 much of this mounding will be fully hidden by mature planting, particularly in areas where there is already a high degree of existing mature tree cover, and the road will effectively blend into the surrounding landscape resulting in a ZVI that is more closely aligned with the Scheme.
- 7.7.5 In general, at the western end of the scheme the ZVI is curtailed by the large woodland blocks in the area, and this largely continues until the NDR passes Thorpe Marriott. From here the woodland stops and the ZVI opens out, reflecting open views across the flat arable landscape, which continues to the A140 junction. In the vicinity of the airport traffic would be screened from view by mounding, but the mounding itself would mark the location of the road and the ZVI reflects this. In contrast, the gently graded mounding across Beeston Park would not be so noticeable and the ZVI is more closely aligned with the road width in this location. The ZVI is constrained by the screening effects of existing woodland in the vicinity of Rackheath, before broadening out again to

reflect views across more open arable land as the NDR traverses eastwards to the end of the Scheme.

Construction impacts

- 7.7.6 Although construction impacts are of a temporary nature and short term, visual effects would in general be moderately adverse during the construction process due to the continued presence of active construction plant and operations involved in earthmoving and carriageway construction throughout the length of the route. In addition, localised works such as bridge construction would cause additional impact for certain locations along the route which are highlighted in the sections that follow.
- 7.7.7 The location of construction compounds, storage areas and borrow pits are shown on drawings R1C093-R1-5014 to R1C093-R1-5026. The presence of such compounds would have a visually intrusive effect on nearby receptors in localised areas for the duration of the construction period, although temporary screen mounding would be provided along the boundaries to screen views of vehicles and personnel within these areas from nearby receptors.
- 7.7.8 The following paragraphs outline specific construction impacts that could occur along the various sections of the route.

A1067 to Fir Covert Road (ch 0 to 1700)

- 7.7.9 Construction of the new junction with the A1067 would give rise to large adverse visual effects for three properties along the A1067 to the south east of the works (1/1, 1/2 and 1/3) and for users of a 'Road used as a Public Path' (RUPP) linking the A1067 to the Deighton Lodge access road (R1). This is due to the large extent of works and associated traffic management needed to construct the new roundabout and tie in with the existing A1067, together with the fact that the rear views of these properties would directly look across to the construction site. Furthermore, due to their elevated position it would not be possible to provide effective temporary screening. Road users on the A1067 would also be affected by the roundabout construction, but due to their low visual sensitivity this effect is considered to be only 'slight adverse'.
- 7.7.10 Two construction site areas (one involving a gas main diversion at ch. 1200 and the other a topsoil storage area at ch. 1600) are proposed alongside the route in the vicinity of Spring Farm and Fir Covert Road, which will give rise to additional vehicle movements in this vicinity with consequent moderate

adverse visual effects on Spring Farm (2/4) and Meadow View (a bungalow on Fir Covert Road; 2/5).

Fir Covert Road to Reepham Road (ch 1700 to 2900)

7.7.11 Three properties along Fir Covert Road would be adversely affected; one lies very close to the works with large adverse effects (2/6). The other lies further away and would be moderately adversely affected for the duration of the works (2/1). The third property lies close to the works but extensive boundary vegetation reduces the visual effects to 'slight adverse' (2/3). A garden centre (C1) and PLG farm supplies (C2) are located close to the works on Fir Covert Road but impacts are expected to be 'neutral' on account of their low sensitivity and the screening effect of intervening storage buildings. Road users on Fir Covert Road would also be affected by the roundabout construction, but due to their low visual sensitivity this effect is considered to be only 'slight adverse'.

7.7.12 Construction of the bridge over Marriotts Way and the roundabout with Reepham Road will involve small site compounds with associated materials storage areas, and these, together with the general road construction will cause large adverse visual effects for two nearby properties along Breck Farm Lane (2/7 and 2/8) and for users of Marriotts Way (R2). A third property at the same location would not be affected due to extensive mature vegetation along the boundary that would effectively screen the works from view (2/9). Road users on Breck Lane and Reepham Road would also be affected by the NDR crossing and roundabout construction respectively, but due to their low visual sensitivity this effect is considered to be only 'slight adverse'.

Reepham Road to A140 (ch 2900 to 6800)

7.7.13 The route would pass the edge of Thorpe Marriott, but the existing shelter belt around the boundary of the settlement would preclude views of the construction works. However, ten properties on the edge of Horsford to the north (3/2 to 3/5 and 4/1) would have direct views across to the construction site, although due to the distance involved effects are regarded as being only 'slight adverse' and therefore not significant. Two RUPP's will be affected by the NDR and be largely adversely affected; R3 will terminate at the new Reepham Road roundabout and R4 bridged over the NDR near Bell Farm. The NDR would run along the rear of a commercial property (C3) with 'slight adverse' effects.

7.7.14 Construction of this section of the NDR would cross largely open land and would have a large adverse effect on five isolated properties that lie close to the route (3/1, 4/5, 5/1 and 5/2). Three of these would overlook construction of the new grade separated junction with the A140 (5/1 and 5/2).

7.7.15 The NDR would run largely parallel with the Reepham Road over this length but due to the low sensitivity of road users and the distance involved effects are regarded as 'neutral'. Since the works would directly affect the A140 however the effect on road users is considered to be 'slight adverse' in visual terms.

A140 to Quaker Lane (ch 6800 to 9750)

7.7.16 The main construction site compound for the western part of the route is located adjacent to the A140 junction and on unused airport land. A screen mound would be constructed early in the process to protect West Farm and associated properties lying adjacent to this area, resulting in moderate adverse visual effects for four properties during construction (5/3). Norwich Aviation Museum (C4) will require relocation on account of the works, resulting in 'large adverse' visual effects. The airport control tower is located close to the works (C5) but faces away from the Scheme with 'slight adverse' effects.

7.7.17 Thirty nine properties along Old Norwich Road and Spixworth Road on the edge of Horsham St Faith would be adversely affected by visual impact as their outlook is across to the construction site of the NDR (6/1 to 6/19). Eight properties (6/1 and 6/3 to 6/6) would have relatively close direct views across to the construction site with consequent large adverse effects until the screen mounding is completed. A further twenty five properties (6/7 to 6/9, 6/11 and 6/13 to 6/16) would be moderately adversely affected, having an outlook across to the NDR, although the works would be further in the distance.

7.7.18 A garage and car workshop (C6) located on the Old Norwich Road and the Petans complex (C7) located on the airport would experience 'slight adverse' visual effects, as would users of the Petans access road and Old Norwich Road where the NDR crosses these roads.

Quaker Lane to B1150 (ch 9750 to 12100)

7.7.19 Two cottages on Quaker Lane (7/2) would lie very close to the route with a direct outlook, with consequently large adverse visual effects. Construction of

the bridge over the NDR along Buxton Road would be very close to two properties, also with large adverse effects (7/3), and a further five properties on Buxton Road would be adversely affected by the borrow pit area and. This would be sited on the other side of the road and be partially screened by existing boundary vegetation; three properties would have large adverse effects (7/4 and 7/5) and two moderate adverse effects (7/4), with a further seven properties being unaffected on account of this screening (7/6). Road users of Quaker Lane and Buxton Road would experience 'slight adverse' effects where the NDR crosses these roads.

7.7.20 Eighteen properties on the edge of Spixworth would be adversely affected during the construction period (7/9 to 7/11). Mitigation measures would be provided comprising the early construction of temporary screen mounds to shield properties from views of the bulk of the working area, reducing these temporary impacts to moderate adverse levels for eleven properties (7/8) and slight adverse for the remaining seven (7/9 to 7/11).

B1150 to Salhouse Road (ch 12100 to 16100)

7.7.21 Four cottages within Beeston Park (8/5 and 8/6) would be moderately adversely affected by views of the construction works, although Beeston Hall (8/3) would only be slightly affected due to its further distance from the works. One further cottage lies close to the works and would have large adverse effects during the construction period (8/4). Users of the B1150 and adjacent farm shop (C8) would experience 'slight adverse' effects due to the roundabout construction.

7.7.22 Construction of the mounding to the west of Wroxham Road, together with the roundabout junction, would adversely affect six isolated properties. Three of these would be largely adversely affected; two lie in close proximity to the works (9/4 and 9/6) and one will have direct views across downwards sloping ground into the construction site (9/3). Users of the Wroxham Road would experience 'slight adverse' effects due to the roundabout construction.

7.7.23 The route would affect the outlook from properties on the edge of Sir Edward Stacey Road and Trinity Close, which look out across a small valley over the route of the NDR to woodland surrounding Rackheath Park to the west. Seven properties would have large adverse effects during construction (9/8 to 9/10) with moderate adverse effects for the remaining three properties (9/7, 9/11 and 9/12).

7.7.24 Thirty two properties on the edge of Rackheath along Green Lane West would have slight adverse effects during construction as the route emerges from cutting and existing woodland cover out into open ground on the edge of the village (10/2 to 10/10). Effects are reduced by intervening vegetation, notably the tall boundary hedge running along the western boundary of Green Lane West. Road users of Green Lane West would be unaffected by the NDR on account of this vegetation with a 'neutral' effect. A small car restoration workshop (C9) lies close to the NDR off Newmans Lane, resulting in 'slight adverse' visual effects.

Salhouse Road to Plumstead Road (ch 16100 to 17000)

7.7.25 The main work element over this length of the route would be construction of the railway crossing. Construction of this would cause large adverse visual impacts which would be difficult to mitigate during the construction period on account of its prominent position in an open landscape, together with the presence of the construction compound in the immediate vicinity.

7.7.26 Thirty properties along Green Lane East on the edge of Rackheath would be adversely affected; six in the 'large adverse' category (10/17, 10/19 to 10/24) and a further three moderately adversely affected (10/16, 10/18 and 10/26). Existing boundary vegetation screens views for the remaining properties and reduces the effects to 'slight adverse'.

7.7.27 The 'Sole and Heel' public house (C10) is situated on the corner of Green Lane East and Salhouse Road and would experience 'slight adverse' visual effects. Road users of Green Lane East would also experience 'slight adverse' visual effects on account of the new bridge construction. However, since rail users on the Norwich to Sheringham line would catch only a momentary glimpse of the NDR, effects on rail users are regarded as 'neutral'.

7.7.28 Eleven properties on the edge of Thorpe End would be affected; all would have direct open views across to the works and fall within the 'large adverse' category (11/7). Newmans Farmhouse, though close to the works, would be largely screened by the surrounding farm buildings and be moderately adversely affected (11/6).

Plumstead Road to Smee Lane (ch 17000 to 19000)

7.7.29 Nine properties along Broad Lane and Plumstead Road at the eastern edge of Rackheath would have views across to the new junction of the NDR with

Plumstead Road, resulting in moderate adverse visual effects during construction for the eight properties on the west side of Broad Lane whose rear windows would overlook the new works (11/1 to 11/4). Eight properties on the edge of Thorpe End would be similarly affected, but effects would be only slight adverse due to the greater distance from the works (11/8 to 11/12). Road users of Plumstead Road would experience 'slight adverse' visual effects on account of the roundabout construction.

7.7.30 There are ten further properties along this length of the NDR that would be affected by the construction of the route. Six of these lie close to the route; four would have 'large adverse' visual effects ((11/5, 11/13, 11/15 and 11/16) as they have open and direct views across to the construction works (especially 'Railway Crossing', 11/5, which lies adjacent to the new rail bridge), whilst the other two will be partially screened by existing vegetation and will be moderately adversely affected (11/14 and 11/17). The remaining four properties lie further away and would be slightly adversely affected (12/1 to 12/4).

7.7.31 Users of the short footpath linking Middle Road to Low Road (R5) will experience 'large adverse' effects due to their high sensitivity and the close proximity of the NDR, as will users of the adjacent footpath (R6), which will be crossed by the NDR. Road users of Middle Road and Low Road are of low sensitivity and effects would therefore be 'slight adverse' where the NDR crosses these roads.

Smee Lane to A47 (ch 19000 to 20400)

7.7.32 Six properties lie within the confines of the former Heath Farm (two of which are recent 'barn conversion' developments), situated within the centre of the Postwick Hub development. Due to their close proximity to the works, five of these would be within the 'large adverse' category (12/5 to 12/8). A cottage within the centre of the group (12/9) is well screened and would only be slightly adversely affected.

7.7.33 Users of the footpath linking Smee Lane to the A47 (R7) will experience 'large adverse' effects due to their high sensitivity and the close proximity of the NDR. Road users of Smee lane and the A47, with associated links to the Postwick Hub, are of low sensitivity and effects would therefore be 'slight adverse' where the NDR crosses and joins into these roads.

Operational impacts on Residential Properties

A1067 to Fir Covert Road (ch 0 to 1700)

- 7.7.34 Screen planting and landscaping works around the new lagoons adjacent to the new A1067 roundabout would reduce adverse visual effects for three properties along the A1067 (1/2 to 1/4) from 'large adverse' in year 1 to 'moderate adverse' in year 15 once the planting has matured.
- 7.7.35 Mounding combined with extensive screen planting would reduce visual effects from 'moderate' to 'slight adverse' for Spring Farm (2/4) and to 'slight adverse' or 'neutral' for properties along Fir Covert Road (2/1 to 2/5) for year 1 to year 15 respectively. However, one property (2/6) would remain moderately adversely affected at year 15, on account of its close proximity to the NDR.
- 7.7.36 Night time effects arising from vehicle headlights would be 'slight adverse' in year 1 reducing to 'neutral' in year 15 once the screen planning has fully matured.

Fir Covert Road to Reepham Road (ch 1700 to 2900)

- 7.7.37 The bridge over Marriotts Way and the short link to the roundabout with Reepham Road will result in a reduction from 'large adverse' in year 1 to 'moderate adverse' visual effects in year 15 for two nearby properties along Breck Farm Lane (2/7 and 2/8) once the screen planting has matured. A third property at the same location would not be affected due to extensive mature vegetation along the boundary that would effectively screen the works from view.
- 7.7.38 Night time effects arising from vehicle headlights would be 'slight adverse' in year 1 reducing to 'neutral' in year 15 once the screen planning has fully matured.

Reepham Road to A140 (ch 2900 to 6800)

- 7.7.39 Extensive mounding and planting would generally reduce visual effects along this section of the NDR to 'slight adverse' or 'neutral' by year 15, (reducing from 'large' or 'moderate adverse' in year 1). However, visual effects on 'The Homestead' (a bungalow on Drayton Lane; 4/5) would remain 'large adverse', even at year 15, due to its close proximity to both the NDR and the link road to the B1149, as would effects on 'New Home Farm' (5/1), which lies immediately adjacent to the link road onto the new A140 junction. Three other properties (3/1 and 5/2) would reduce from 'large adverse' effects in year 1 as

the mitigation planting matures, but would remain 'moderate adverse' at year 15 on account of their close proximity to the new road.

7.7.40 Ten properties on the edge of Horsford to the north (3/2 to 3/5 and 4/1) would have direct views across to the new NDR, which due to the distance involved would be 'slight adverse' in terms of visual effect in year 1. This effect would largely remain at year 15 since the NDR mounding would still be visible along the top of a low ridge.

7.7.41 Night time effects arising from vehicle headlights would be 'slight adverse' in year 1 reducing to 'neutral' in year 15 once the screen planting has fully matured.

A140 to Quaker Lane (ch 6800 to 9750)

7.7.42 Visual effects for the four properties protected by the screen mounding at West Farm (5/3) would remain 'moderate adverse' for both year 1 and year 15 on account of the closeness of the mounding to the properties, which itself would form an intrusive feature.

7.7.43 Thirty nine properties along Old Norwich Road and Spixworth Road on the edge of Horsham St Faith (6/1 to 6/16) would be adversely affected by visual impact as their outlook is across open fields to the NDR. Sixteen properties would be moderately adversely affected in year 1 (6/1, 6/3 to 6/9 and 6/11), and nineteen slightly affected in year 1 (6/10 and 6/12 to 6/16), having a direct outlook across to the NDR, although the works would be in the distance. The lack of planting (due to airport operational constraints) and the visual presence of the screen mounding would mean that these levels of visual effect would remain at year 15.

7.7.44 Night time effects arising from vehicle headlights would be 'neutral' for both year 1 and year 15 on account of the immediate effectiveness of the screen mounding.

Quaker Lane to B1150 (ch 9750 to 12100)

7.7.45 Two cottages on Quaker Lane (7/2) would lie very close to the route with a direct outlook, with consequently large adverse visual effects for both year 1 and year 15. The bridge carrying Buxton Road over the NDR would be very close to two properties (7/3), also with large adverse effects at year 1 and year 15, and a further five properties on Buxton Road would be adversely

affected; three (7/5 and 7/7) moderately adversely affected in year 1 reducing to 'slight adverse' by year 15 as the mitigation planting matures, and the other two (7/4) reducing from 'slight adverse' in year 1 to 'neutral' by year 15.

7.7.46 Eighteen properties on the edge of Spixworth (7/8 to 7/11) would be adversely affected. Extensive mitigation planting and mounding is proposed, reducing levels from 'moderate adverse' (eleven properties; 7/8) and 'slight adverse' (seven properties; 7/9 to 7/11) in year 1 to 'slight adverse' and 'neutral' respectively as the mitigation planting matures.

7.7.47 Night time effects arising from vehicle headlights would be 'slight adverse' in year 1 reducing to 'neutral' in year 15 once the screen planting has fully matured.

B1150 to Salhouse Road (ch 12100 to 16100)

7.7.48 Five cottages within Beeston Park (8/4 to 8/6) would be moderately adversely affected by views of the NDR in year 1, although four of these (8/5 and 8/6) are distant from the road and effects would reduce to 'slight adverse' for these by year 15 as the mitigation planting matures, remaining 'moderate adverse' for the other property (8/4) due to its close proximity to the NDR. Beeston Hall (8/3) is fairly distant from the NDR and visual effects on the rear of the hall would be 'slight adverse' for both year 1 and year 15.

7.7.49 The NDR west of Wroxham Road (together with its roundabout junction) would adversely affect six isolated properties. Three of these (9/3, 9/4 and 9/6) would be largely adversely affected in year 1; two lie in close proximity to the NDR (9/4 and 9/6) and one has direct views across downwards sloping ground to the Scheme (9/3). As the mitigation planting matures these effects would reduce to 'moderate adverse' for two of the properties (9/3 and 9/4) by year 15, but Belmont House (which lies close to the roundabout junction with Wroxham Road; 9/6) would remain 'large adverse', even at year 15.

7.7.50 The route would affect the outlook from properties on the edge of Sir Edward Stacey Road and Trinity Close, which look out across a small valley over the route of the NDR to woodland surrounding Rackheath Park to the west. Nine properties (9/8 to 9/12) would be moderately adversely affected and one (9/7) slightly affected in year 1, reducing to 'slight' and 'neutral' respectively by year 15 once the mitigation planting has matured.

7.7.51 Thirty two properties on the edge of Rackheath along Green Lane West (10/2 to 10/10) would be adversely affected by the NDR as the route emerges from

cutting and existing woodland cover out into open ground on the edge of the village. However, intervening vegetation (notably the tall boundary hedge running along the western boundary of Green Lane West) would reduce visual effects to 'slight adverse' in year 1, reducing to 'neutral' by year 15 once the NDR mitigation planting has matured.

7.7.52 Night time effects arising from vehicle headlights would be 'slight adverse' in year 1 reducing to 'neutral' in year 15 once the screen planting has fully matured.

Salhouse Road to Plumstead Road (ch 16100 to 17000)

7.7.53 The main feature of the NDR over this section of the route is the crossing of the Norwich to Sheringham rail line. Thirty properties along Green Lane East on the edge of Rackheath (10/11 to 10/26) would be adversely affected in year 1; six (10/17, 10/19, 10/20, 10/23 and 10/24) in the 'large adverse' category and a further three (10/16, 10/18 and 10/26) moderately adversely affected. Existing boundary vegetation screens views for the remaining properties and reduces the effects of the impact to 'slight adverse'. By year 15 these effects would have reduced to six 'moderate adverse' (10/17, 10/19, 10/20, 10/23 and 10/24), three 'slight adverse' (10/16, 10/18 and 10/26) and twenty-one 'neutral' (10/11 to 10/15), as the mitigation planting matures.

7.7.54 Eleven properties (11/7) on the edge of Thorpe End would be adversely affected; all would have direct open views across to the works and fall within the 'large adverse' category, reducing to 'moderate adverse' by year 15. Newmans Farmhouse (11/6), though close to the works, would be largely screened by the surrounding farm buildings and be moderately adversely affected in year 1, reducing to 'slight adverse' by year 15.

7.7.55 Night time effects arising from vehicle headlights would be 'slight adverse' for both year 1 and year 15 due to the elevation of the road as it crosses the rail way line, even once the screen planting has fully matured.

Plumstead Road to Smee Lane (ch 17000 to 19000)

7.7.56 Nine properties along Broad Lane and Plumstead Road (11/1 to 11/4) at the eastern edge of Rackheath would have views across to the new junction of the NDR with Plumstead Road, resulting in moderate adverse visual effects in year 1 for the eight properties on the west side of Broad Lane (11/2 to 11/4) whose rear windows would overlook the new junction, reducing to 'slight

adverse' effects by year 15 as the mitigation matures. Effects for the remaining property (11/1) would reduce from 'slight adverse' to 'neutral' by year 15.

7.7.57 Eight properties on the edge of Thorpe End (11/8 to 11/12) would have 'slight adverse' effects in year 1, due to their large distance (0.5km) from the NDR, combined with the screening effects of intervening vegetation. However, these effects would remain at year 15 as the line of the NDR would still be visible in the vista.

7.7.58 There are ten further properties along this length of the NDR that would be affected by the route. Six of these (11/5 and 11/13 to 11/16) lie close to the route; four (11/5, 11/15 and 11/16) would have 'large adverse' visual effects in year 1 as they have open and direct views across to the road, though these effects would reduce to 'moderate adverse' levels for three of these properties (11/15 and 11/16) by year 15 once the mitigation planting has matured. The property known as 'Railway Crossing' (11/5) would remain 'large adverse', even at year 15, on account of its position directly adjacent to the new railway bridge.

7.7.59 The other two properties (11/13 and 11/14) are partially screened by existing vegetation and are regarded as being moderately adversely affected in year 1, reducing to 'slight adverse' by year 15. The remaining four properties (11/17, 12/1, 12/2 and 12/4) lie further away and would be slightly adversely affected in year 1, reducing to 'neutral' by year 15.

7.7.60 Night time effects arising from vehicle headlights would be 'slight adverse' in year 1 reducing to 'neutral' in year 15 once the screen planning has fully matured.

Smee Lane to A47 (ch 19000 to 20400)

7.7.61 Six properties lie within the confines of the former Heath Farm (two of which are recent 'barn conversion' developments), situated within the centre of the Postwick Hub development. Due to their close proximity to the NDR, five of these (12/5 to 12/8) would be within the 'large adverse' category in year 1, though this would reduce to 'moderate adverse' by year 15 as the mitigation matures. A cottage within the centre of the group (12/9) is well screened and would be moderately adversely affected in year 1, reducing to 'slight adverse' by year 15.

7.7.62 Night time effects arising from vehicle headlights and the lighting of the Postwick junction are regarded as 'slight adverse' for both year 1 and year 15, since the additional lighting will be seen within the context of an already lit and well trafficked junction.

Operational impacts on Commercial Properties

7.7.63 There are few commercial properties that would be affected by the new route (a total of ten in all), which is a reflection of the character of the area which is largely defined by housing development and rural farmland. The majority of these would have only 'slight adverse' effects due to the low sensitivity of the receptor for both year 1 and year 15, despite their close proximity to the Scheme.

7.7.64 The exception to this is the aviation museum located adjacent to the airport to the south of Horsham St Faith. This is regarded as a moderately sensitive receptor as the nature of the museum invites quiet reflection and many of the exhibits are outdoors due to their size. Since these would require relocation to facilitate the NDR the magnitude of impact would be major, and this is considered to result in a large adverse significance of effect, which would remain throughout the lifetime of the NDR (i.e. for both year 1 and year 15).

Operational impacts on Public Access Routes

7.7.65 There are few Public Rights of Way that would be affected by the new route (a total of seven in all), which is a reflection of the fact that the area as a whole has a sparse footpath coverage.

7.7.66 Three of these are 'Roads used as Public Paths' which are crossed by the NDR; R1 (from the A1067 to Deighton Lodge access road) would be largely adversely affected in year 1, reducing to 'moderate adverse' in year 15 as the mitigation planting matures. R3 will be shortened by 60m by the new roundabout junction with Reepham Road and R4 will be bridged over the NDR near Bell Farm. Both of these would be largely adversely affected in year 1, although these effects will reduce to 'moderate adverse' at year 15 due to screening effect of the mitigation planting.

7.7.67 R2 is the regionally important Marriotts Way cycle route, part of which would be largely adversely affected in year 1, reducing to 'moderate adverse' in year 15 once the screen planting is fully effective.

7.7.68 The remaining three routes are R5 (footpath from Middle Road to Low Road), R6 (footpath from Low Road to Smee Lane) and R7 (footpath from Smee Lane to A47). These would be largely adversely affected in year 1, reducing to moderately adversely affected by year 15 due to the screening effect of the planting scheme.

7.7.69 Road and rail users within the study area are 'low sensitivity' receptors and consequently would only experience effects ranging from 'slight adverse' to 'neutral' as a result of the Scheme. Due to the close proximity of these routes to the NDR these effects would remain for both year 1 and year 15.

7.8 Conclusions

7.8.1 The predominant landscape character along the NDR is generally one of fairly open arable farmland with urban fringe influences such as housing development, Norwich Airport and the Broadland Business Park. However, a higher quality area is centred around the former parklands of Beeston and Rackheath Halls, where the landscape is characterised by a larger woodland component on more undulating topography.

7.8.2 Despite the close proximity to Norwich the route would pass through fairly tranquil countryside, particularly in the vicinity of the wooded parkland areas of Rackheath and Beeston. In general, the high degree of open arable cultivation along the route corridor gives the impression of a sparsely populated area, although in fact there are many small hamlets and isolated properties spread throughout the area, and the small rural roads that link these are well trafficked.

7.8.3 Extensive mitigation planting and screen mounding is proposed along the route which would help to blend the new road into the landscape and screen it from affected properties.

7.8.4 Tables 9, 10 and 11 summarise the landscape and visual effects of the Scheme for the various sections of the NDR, for construction, year 1, year 15 and night time impacts.

7.8.5 Landscape effects will generally be moderately adverse during the construction period and in the first year of opening, reducing to slightly adverse by year 15 once the mitigation planting has matured. Night time impacts will generally be slightly adverse.

7.8.6 Some 227 residential properties would be adversely visually affected, of which about half would be in the 'large' and 'moderate' adverse categories during

construction and in the first year of the road opening. These levels will drop to 'moderate', 'slight' or 'neutral' for the majority of these properties by year 15 as the mitigation planting matures.

- 7.8.7 There are only seven Public Rights of Way (PROW) and ten commercial properties affected by the Scheme. The PROWs would be largely adversely affected for construction and year 1 due to their close proximity to the NDR, reducing to 'moderate adverse' by year 15 once the mitigation planting has matured. Due to their low sensitivity, commercial properties would be only slightly adversely affected for construction, year 1 and year 15, with the exception of Norwich Aviation Museum which would be largely adversely affected due to the need to relocate the Museum as a result of the Scheme.
- 7.8.8 Combining the above sections to consider the route as a whole, on balance the overall effects in terms of landscape impacts are considered to be moderately adverse as a result of the Scheme for the construction period and in year 1, reducing to slightly adverse by year 15 as the mitigation planting matures. For visual effects, the balance lies between largely and moderately adverse during construction and in year 1, reducing to moderately or slightly adverse by year 15 as the planting scheme matures.

Table 7.9 Summary of Landscape Effects

Location	Sensitivity	Magnitude of Impact	Significance of Effect (Construction)	Significance of Effect (Year 1)	Significance of Effect (Year 15)	Significance of Effect (Night time)

8. Nature Conservation

8.1 Summary

- 8.1.1 This chapter considers the ecological assets that have the potential to be affected by the proposed Scheme.
- 8.1.2 Desk-based studies into Statutory Designated Sites and protected areas have been carried out alongside extensive field surveys of species and habitats, most of which are protected by UK and EU laws. These surveys have taken place over several seasons in many cases, and have allowed us to gain a detailed understanding of the populations within the Zone of Influence (the area in which the proposed Scheme could potentially impact on ecological features).
- 8.1.3 As is best practice, the assessments in the Ecology chapter of this Environmental Statement only considers those ecological receptors that are of sufficient conservation value and potentially vulnerable to Significant impacts arising from the proposed development. These are termed Valued Ecological Receptors.
- 8.1.4 Valued Ecological Receptors that have been assessed include Statutory Designated Sites such as Special Areas for Conservation (SAC) and Sites of Special Scientific Interest (SSSI), and other Designated Sites like County Wildlife Sites (CWS) and Roadside Nature Reserves (RNR). Some of these are directly affected, some indirectly affected, and some not affected at all.
- 8.1.5 Several species of bat are known to use many areas to be affected by the proposed Scheme, roosting in buildings and trees that would be directly and indirectly affected. Bats and their roosts are protected by UK and EU law. Great crested newts are known to exist at three locations, although just one breeding pond is directly affected. Great crested newts are, similar to bats, protected under UK and EU law.
- 8.1.6 A number of badger populations are known to exist around the proposed Scheme. Breeding bird populations are ubiquitous throughout the landscape, their population densities and mixes varying with habitat type and quality. Barn owls, as a particularly sensitive bird species, are given specific consideration. Aquatic invertebrates at Ladies Wood, Church Carr & Springs CWS are considered, as are those sensitive habitats suitable for terrestrial invertebrates.

- 8.1.7 Mitigation measures have been incorporated into the proposed Scheme design to eliminate or reduce impacts on the above Valued Ecological Resources as far as possible. A landscaping scheme has been designed to provide as much benefit to Valued Ecological Receptors as possible, in terms of its species mix, its form and layout, timing of planting and the size/type of species planted. A number of crossings for bats are proposed. These include wire gantries across the carriageway, two bridges that will include hedgerows across them, an underpass, and modified standard bridge designs to include dark corridors to encourage use by bats.
- 8.1.8 New bat roosts would be provided where existing roosts would be lost. Great crested newts that use the one pond to be lost to the proposed Scheme would be relocated to new ponds nearby, and temporary fencing would be erected to ensure that they did not enter into the construction area.
- 8.1.9 Badger fencing would be installed where necessary, to ensure that badgers did not enter onto the carriageway. All habitat clearance would be carried out at such a time, and in such a manner as to ensure that no impacts were caused to breeding birds and any other species present. Numerous other mitigation measures are also proposed.
- 8.1.10 Assessments of the overall effects on Valued Ecological Receptors have been carried out for the Construction phase, and for the Operational phase, which includes the Opening Year of the proposed Scheme and for the Design Year, fifteen years hence. Construction phase impacts include the permanent and temporary habitat loss and severance, and the disturbance due to the presence of plant machinery, people, and construction processes. Operational phase impacts include the presence of traffic using the proposed Scheme, with the associated disturbance in terms of noise etc. Also considered at this stage is the mitigating effect of the extensive landscaping scheme that will be installed towards the end of the Construction phase, and its maturation between Opening Year and Design Year, during which time it will become established as viable habitats for many species.
- 8.1.11 During the Construction phase, the proposed Scheme is predicted to have Significant adverse effects on:
- Fakenham Road RNR;
 - Important Hedgerows (under the Hedgerow Regulations 1997);
 - Bats, or more specifically directly affected roosts in buildings, directly affected roosts in trees, and significant flight paths and areas of activity; and

- Breeding bird species of both High and Medium conservation value;
- 8.1.12 During the Operational phase of the proposed Scheme, Significant adverse effects are predicted to remain in place only for the bats using the significant flight paths along Marriott's Way, at Year 1 only. By year 15 the effects on this flight route would no longer be Significant. No other Significant adverse effects are predicted during the Construction phase.
- 8.1.13 By the Design Year, Significant beneficial effects are predicted for terrestrial invertebrate habitats at the Springs.

8.2 Introduction

Scope of the Assessment

- 8.2.1 Ecology is the study of the interactions of biodiversity and their environment, and nature conservation is concerned with maintaining a favourable conservation status of a species, population, habitat or ecosystem.
- 8.2.2 This chapter considers the ecological assets that have the potential to be affected by the proposed Scheme. It identifies the relevant framework of nature conservation legislation, policies and guidance, gives an in-depth description of the ecological baseline within an identified study area, defines all the mitigation measures included as part of the proposed Scheme, and finally identifies and assesses all potential significant impacts.
- 8.2.3 The remainder of this chapter is structured as follows:
- Section 1.2 describes the methods of assessment for key ecological receptors and likely impacts;
 - Section 1.3 identifies the key ecological receptors and describes the existing baseline conditions;
 - Section 1.4 describes the proposed mitigation and compensation strategy;
 - Section 1.5 summarises the impacts after mitigation and compensation; and
 - Section 1.6 identifies the cumulative impacts from other committed developments in the area.
- 8.2.4 Alongside the assessments in this chapter, potential impacts on Natura 2000 sites (Special Areas of Conservation (SACs) and Special Protection Areas (SPAs) designated under the Council Directive 92/43/EEC on the Conservation of Natural Habitats and of Wild Fauna and Flora and the Directive 2009/147/EC on the Conservation of Wild Birds respectively) are

considered further in the Habitats Regulations Assessment, located in Volume 2, Chapter 17, Section A of the ES. This is a requirement of The Conservation of Habitats and Species Regulations 2010 (known as the Habitats Regulations), which transpose the above EU Directive into UK legislation, and more specifically the Infrastructure Planning (Applications: Prescribed Forms and Procedures) Regulations 2009 (known as the APFP Regulations), which transpose the Habitats Regulations into the NSIP process, which the proposed Scheme is subject to.

Zone of Influence

8.2.5 Current guidance on ecological assessments recommends that all ecological features that occur within a zone of influence (Zol) around the proposed development are investigated (IEEM, 2006). The potential Zol includes:

- Areas directly within the land take for the proposed development and access;
- Areas which will be temporarily affected during construction;
- Areas likely to be impacted by hydrological disruption; and
- Areas where there is a risk of pollution or noise disturbance during construction and/or operation.

8.2.6 For the NDR the Zol is a corridor along the route, the width of which depends on the sensitivity of the relevant habitat or species being considered to disturbance and change in biophysical conditions resulting from the construction and operation of the NDR. The different Zol for different ecological features along the NDR were established in the Scoping Report, which was issued to Natural England earlier in the EIA process. No issues or concerns with the Zols were received. The individual Zols are set out in Table 8.1 below:

Table 8.1 Ecological Features and Zones of Influence

Ecological feature/receptor	Zone of Influence (Zol)
International designated sites	2 km (30 km for sites supporting bats)
National designated sites	2 km
Regional/ County Wildlife Sites	1 km
Local Nature Reserves	1 km
Phase 1 Habitats	1 km
Woodland flora	Site specific (see Section 8.4 Baseline for details)
Grassland flora	Site specific (see Section 8.4 Baseline for details)
Hedgerows	250 m
Aquatic Invertebrates	Site specific (see Section 8.4 Baseline for details)
Badger (<i>Meles meles</i>)	500 m
Barn owl (<i>Tyto alba</i>)	500 m
Bats (potential roost sites in high potential buildings)	1 km
Bats (potential roost sites in high potential trees)	500 m
Bats (foraging routes/activity)	1 km
Breeding Birds	500 m
Over-wintering Birds	500 m
Brown Hare (<i>Lepus europaeus</i>)	500 m
Deer	500 m
Great Crested Newt (<i>Triturus cristatus</i>)	1 km

Ecological feature/receptor	Zone of Influence (Zol)
Reptiles	500 m
Terrestrial Invertebrates	Site specific (see Section 8.4 Baseline for details)
Water Vole (<i>Arvicola amphibius</i>) and Otter (<i>Lutra lutra</i>)	Site specific (see Section 8.4 Baseline for details)

Source: Northern Distributor Road Scoping Report, Mott MacDonald, 233906DT/BSE/NOR/012/A February 2013

8.2.7 In accordance with both standard EIA methodology and the Infrastructure Planning (Environmental Impact Assessment) Regulations 2009 the NDR proposal has been through a Scoping process with the Planning Inspectorate, who manage the application process on behalf of the Secretary of State in respect of Nationally Significant Infrastructure Projects (NSIPs). The Scoping Report is included in in Appendix 4 of this volume of the ES.

8.2.8 The Scoping process provided the applicant, Norfolk County Council, the opportunity to ask the Planning Inspectorate for a formal written Scoping Opinion on the information to be included in the ES. The Scoping Opinion was informed, at least partly, through consultation with a number of prescribed bodies. The Scoping Opinion, which includes advice and recommendations relating to the proposed Ecology survey and assessment work, can be found in the report from the Planning Inspectorate entitled Scoping Opinion Proposed Norwich Northern Distributor Road, which is provided in Appendix 5 of this volume of the ES.

8.2.9 Following the receipt of the Scoping Opinion, further consultation has been undertaken with the Natural England Case Officer for the proposed Scheme as necessary, during the design, mitigation formulation and impact assessment processes. This has built on the historical consultations in previous iterations of the proposed Scheme, which has afforded us a good working knowledge as to the requirements and working processes of Natural England.

8.2.10 Consultation has also been undertaken with the County Ecologist at Norfolk County Council, particularly in terms of facilitating liaison with other developers. The most notable of these has been the developers Beyond Green, who have recently received outline planning permission for 3,525

houses. There has been consultation with the ecologists working for Beyond Green, to ensure that ecology survey results of the adjacent/overlapping survey areas are consistent in a wider landscape context.

Regulatory and Policy Context

Legislative Requirements

8.2.11 Many habitats and species are protected to varying degrees through national and international legislation. Advice relating to wildlife is also given in various policy documents. The main international legislation and policy guidance relevant to this chapter is contained within the following documents.

- Convention on Biological Diversity (CBD) 1992
- The Convention on Wetlands of International Importance, especially as Waterfowl Habitat (Ramsar) 1971
- EC Directive on the Conservation of Natural Habitats and of Wild Flora and Fauna (Habitats Directive 1992) as amended (92/43/EEC)
- EC Directive on the Conservation of Wild Birds (Birds Directive 1979) as amended (79/409/EEC)
- Bern Convention on the Conservation of European Wildlife and Natural Habitats (1979) as amended
- Bonn Convention on the Conservation of Migratory Species of Wild Animals (1979) as amended
- Bonn Convention on the Conservation of Migratory Species of Wild Animals - Agreement on the Conservation of Bats in Europe (1999) as amended

8.2.12 The main piece of UK legislation on nature conservation is the Wildlife and Countryside Act 1981 (as amended) (WCA 1981). Other relevant national legislation includes:

- Environmental Protection Act 1990
- The Conservation of Habitats and Species Regulations 2010
- Protection of Badgers Act 1992
- Wild Mammals (Protection) Act 1996

-
- Countryside and Rights of Way (CRoW) Act 2000
 - Natural Environment and Rural Communities (NERC) Act 2006
 - The Hedgerow Regulations 1997
 - Environment Act 1995

Planning Policy Requirements

8.2.13 The National Planning Policy Framework (NPPF) replaced various Planning Policy Guidance Notes, Planning Policy Statements etc. resulting in a more streamlined set of documents at a national level, to which 'lower level' plans, policies and projects should adhere as appropriate. Regard has been had in this assessment to relevant policy contained within the NPPF.

8.2.14 Chapter 11 of the NPPF 'Conserving and enhancing the natural environment' sets out the Government's policies on biodiversity, landscape and geological conservation. In summary, with regards to ecology and biodiversity, the NPPF requires that the planning system should, amongst other things:

- minimise impacts on biodiversity and provide net gains in biodiversity where possible (paragraph 109);
- recognise the wider benefits of ecosystem services (paragraph 109);
- encourage opportunities to incorporate biodiversity in and around developments (paragraph 118);
- refuse planning permission if significant harm cannot be avoided, adequately mitigated, or, as a last resort, compensated for (paragraph 118);
- not normally permit proposed development on land within or outside a Site of Special Scientific Interest (SSSI) which would be likely to have an adverse effect on the SSSI (either individually or in combination with other developments) (paragraph 118);
- refuse planning permission if development would result in the loss or deterioration of irreplaceable habitats, including ancient woodland and the loss of aged or veteran trees found outside ancient woodland, unless the need for, and benefits of, the development in that location clearly outweigh the loss (paragraph 118); and
- afford the following wildlife sites the same protection as European sites:

- potential Special Protection Areas and possible Special Areas of Conservation;
- listed or proposed Ramsar sites; and
- sites identified, or required, as compensatory measures for adverse effects on European sites, potential Special Protection Areas, possible Special Areas of Conservation, and listed or proposed Ramsar sites.

Local Development Framework and Local Plans

- Non-statutory policies and plans that are relevant to the proposed Scheme are:
- Greater Norwich Development Partnership Joint Core Strategy;
- Green Infrastructure Plan and Implementation Plan;
- Breckland District Council Area Action Plan, currently being formulated;
- Habitats and Species of Principle Importance (previously UK Biodiversity Action Plans); and
- Local Biodiversity Action Plans

Biodiversity Action Plans

8.2.15 In the recent past the UK BAP (www.ukbap.org.uk) was used to describe, protect and enhance the UK's biological resources. UK BAP and local BAP habitats and species have been a material consideration in the planning process, and so likely significant impacts on these ecological receptors should therefore be assessed and mitigation devised if necessary.

8.2.16 The original lists of UK BAP priority species and habitats were created between 1995 and 1999, and were subsequently updated in 2007, following a 2-year review of UK BAP processes and priorities, which included a review of the UK priority species and habitats lists. The aim of the 'Species and Habitats Review' was to ensure that the UK BAP lists of priority species and habitats remained up-to-date and focussed on the correct priorities.

8.2.17 This was the first full review of the lists, generated over 10 years previously, and provided an opportunity to take into account emerging new priorities, conservation successes, and the huge amount of new information that had

been gathered since the original lists were created. Selection of priority species and habitats for the priority lists followed consideration by expert working groups against a set of selection criteria, based on international importance, rapid decline, high risk, and habitats of importance for key species. Following the review, the number of priority species increased from less than 600 to 1150, and the number of priority habitats increased from 49 to 65.

8.2.18 As a result of new drivers and requirements, the 'UK Post-2010 Biodiversity Framework', published in July 2012, has now succeeded the UK BAP. A key aspect of this new mechanism has been the devolution of UK habitat and species action plan lists to individual countries, meaning that Natural England now maintains these lists for England. These lists now link to the Habitats and Species of Principal Importance in England, as detailed in Section 41 of the Natural Environment and Rural Communities (NERC) Act 2006.

8.2.19 Those habitats and species of Principal Importance that are considered likely to be significantly impacted by the proposed Scheme, as they exist either within the proposed Scheme footprint or the ZoI, are listed below. Note the assessment considers all potentially affected ecological receptors (not just those of Principal Importance) as set out in the following section.

8.2.20 Habitats of Principle Importance:

- Arable field margins;
- Hedgerows;
- Mesotrophic lakes;
- Eutrophic standing waters;
- Rivers;
- Ponds;
- Lowland meadows;
- Wood-pasture and parkland;
- Lowland mixed deciduous woodland; and
- Coastal and floodplain grazing marsh;

8.2.21 Species of Principle Importance:

- common toad (*Bufo bufo*);
- great crested newt (*Triturus cristatus*);
- bullfinch (*Pyrrhula pyrrhula*);
- cuckoo (*Cuculus canorus*);
- dunnock (*Prunella modularis*);
- grey partridge (*Perdix perdix*);
- house sparrow (*Passer domesticus*);
- linnet (*Carduelis cannabina*);
- marsh tit (*Poecile palustris*);
- reed bunting (*Emberiza schoeniclus*);
- skylark (*Alauda arvensis*);
- song thrush (*Turdus philomelos*);
- spotted flycatcher (*Muscicapa striata*);
- starling (*Sturnus vulgaris*);
- yellow wagtail (*Motacilla flava*);
- yellowhammer (*Emberiza citronella*);

8.2.22 Despite the UKBAP lists being superseded, the Local Biodiversity Action Plan (LBAP) mechanism remains current. The relevant local biodiversity policy is the Norfolk Biodiversity Action Plan. The habitat and species for which action plans have been prepared, and which are likely to occur within the Zol, are listed below:

8.2.23 LBAP Habitat Action Plans:

- cereal field margins;
- hedgerows;
- lowland meadows and pasture;
- lowland wood pasture and parkland;

- lowland mixed deciduous woodland;
- mesotrophic lakes;
- ponds;

8.2.24 LBAP Species Action Plans:

- water vole (*Arvicola amphibious*);
- otter (*Lutra lutra*);
- brown hare (*Lepus europaeus*);
- barbastelle (*Barbastella barbastellus*);
- brown long eared bat (*Plecotus auritus*);
- noctule bat (*Nyctalus noctula*);
- soprano pipistrelle (*Pipistrellus pygmaeus*);
- barn owl (*Tyto alba*);
- skylark (*Alauda arvensis*);
- song thrush (*Turdus philomelos*);
- swift (*Apus apus*);
- tree sparrow (*Passer montanus*);
- great-crested newt (*Triturus cristatus*);
- white-clawed crayfish (*Austropotamobius pallipes*);
- Desmoulin's whorl snail (*Vertigo moulinsiana*);

8.3 Methodology

General Approach

8.3.1 Current guidance and best practice, predominantly the Chartered Institute for Ecology and Environmental Management (CIEEM, previously IEEM, before receiving royal charter in 2013) Guidelines for Ecological Impact Assessment in the United Kingdom (referred to in the remainder of the report as the CIEEM Guidelines) indicates that an assessment of impacts on ecological assets should focus on those receptors of sufficient ecological value (i.e. key

receptors) within the Zol that could potentially be subject to significant ecological impacts. Nevertheless, some species and habitats, which are not 'valued' receptors with regard to nature conservation still warrant consideration during assessment, and during the development of the proposed Scheme design and mitigation, on the basis of their legal protection, their implications in respect of biodiversity policies, and their ecological value at a local scale. This final criterion ensures a more complete, comprehensive assessment in terms of the geography of receptors within the Zol, and allows a robust, ecologically coherent suite of mitigation measures to be formulated, that addresses and caters for virtually all ecological receptors, and not just those that are likely to be Significantly affected.

- 8.3.2 The identification and assessment of the ecological receptors and likely significant impacts have been undertaken using the methods described below. More detail of the species - and habitat - specific survey methodologies can be found in the technical reports in the Appendices accompanying this chapter (see Environmental Statement, Volume 2, Chapter 8, Sections A to O).

Evaluation of Baseline Conditions

- 8.3.3 A number of standard methods were followed to enable an evaluation of the baseline conditions within the Zol. These included a desk study, an Extended Phase 1 Habitat Survey and an extensive suite of subsequent surveys, detailing both habitats and protected species.
- 8.3.4 The history of the proposed Scheme is such that the ecological surveys to inform the production of the Environmental Statement are the final phase of a progressive sequence of surveys that have taken place over recent seasons, increasing in the level of detail and intensity through each round. The most recent rounds of surveys have been preceded by those carried out to inform various rounds of assessment, as described below.
- 8.3.5 The first surveys were carried out to inform Stage One and Stage Two Environmental Impact Assessments, and were undertaken in line with methodologies as prescribed in the Design Manual for Roads and Bridges. These were produced in 2003 and 2005 respectively. Both of these assessments included ecological surveys, of depth and geographical range appropriate to the level of detail that each assessment required. They were carried out primarily to contribute to the proposed Scheme selection process, whereby a number of route options were identified, compared, assessed and

refined. This work provided a good basic understanding of the ecological baseline.

- 8.3.6 After the production of the two above reports, a Stage 'Two and a Half' Environmental Impact Assessment was also carried out, in 2005. It was produced to provide further confidence in the route selection process undertaken at Stage Two, and to provide the basis for a robust decision-making process and the proposed Scheme design progressed. In terms of the ecological baseline, this assessment provided a further round of surveys, bolstering the knowledge of the ecological baseline further.
- 8.3.7 Full, detailed ecological surveys were undertaken in 2009 and 2010 to inform the production of an Environmental Statement that was to accompany a planning application for a precursor to the proposed Scheme. This planning application was, however, not submitted and the development of the proposed Scheme was effectively put on hold for at least two years between 2010 and 2012.
- 8.3.8 On recommencement of work on the proposed Scheme in 2012, it was necessary to revise and refresh many of the more sensitive protected species and habitat surveys, in order that the Environmental Statement could be produced using robust, valid data. Further detailed ecological surveys were therefore undertaken in 2012 and 2013.
- 8.3.9 The history of the proposed Scheme described above, and the implicated programme of ecological surveys, means that in some cases the protected species and habitat surveys have been carried out, refreshed and revised several times. Those species which are likely to be significantly impacted have received the most survey effort. The above description demonstrates that the available baseline information obtained is more than sufficient for assessment purposes.

Desk Study

- 8.3.10 The identification of the baseline environment was informed by a desk study which included a review of the designated sites, habitats, and protected and notable species within two kilometres of the proposed Scheme. This was undertaken by searching available publications, reports and online databases from Multi-Agency Geographic Information for the Countryside (MAGIC), Nature on the Map, Joint Nature Conservation Committee (JNCC), Natural England, UK BAP and Norfolk BAP websites.

- 8.3.11 Historical records of protected, notable and invasive species, as well as information on non-statutory designated sites, were obtained from the Norfolk Biodiversity Information Service and were reviewed as part of the desk study.
- 8.3.12 Desk-based studies, including a review of Designated Sites, were undertaken for each of the three previous stages of EIA, then updated in 2009, and again in 2012. Further assessment of Statutory Designated Sites is also included in the Habitats Regulations Assessment, in Volume 2, Chapter 17, Section A.

Habitats

- 8.3.13 Basic information on those habitat surveys carried out to inform the ES is given below. For full information, including detailed methodologies see the individual Technical Reports in Volume 2, Chapter 8, Sections A to P.
- 8.3.14 An initial Phase 1 Habitat Survey was carried out in 2005, and repeated in 2009. An update took place in spring 2012. The habitat types within the survey corridor were identified and mapped in compliance with the 'Handbook for Phase 1 Habitat Survey: a Technique for Environmental Audit' (JNCC, 2010). Botanical nomenclature in this chapter follows Stace (2010) for both Latin and English names. Latin names are only mentioned the first time a species is named in the chapter.
- 8.3.15 Detailed flora surveys, to National Vegetation Classification methodology, were undertaken in 2005. These included sensitive, valuable areas of woodland and grassland. Surveys were repeated in 2009, at which time arable field margin surveys were also undertaken. No land-use or other changes have occurred at these sites, so it is not necessary to update these surveys.
- 8.3.16 A hedgerow survey was carried out in 2006. It was updated in 2007 and 2009, and again as part of the Phase 1 Habitat Survey update in 2012 to ensure that all conclusions and recommendations remained accurate.
- 8.3.17 Trees were initially surveyed in 2007. The survey data was updated in 2009. In addition, an Arboricultural Implications Assessment (AIA) to British Standard 5837:2012 has been produced, which includes surveys and assessments from 2012 and 2013. The AIA is included in Volume 2, Chapter 20, Section A. The conclusions of the AIA have been considered in the assessment of impacts and effects on trees and woodlands as necessary.
- 8.3.18 Note that it has not been necessary or appropriate to consider the information in the AIA as part of this assessment, as the potential impacts on trees have

been identified and assessed as part of the Habitats and Species assessment process as appropriate.

Species

8.3.19 As with habitats, basic information on the suite of protected species surveys carried out to inform the ES is provided below. For full information, including detailed methodologies, see the individual Technical Reports in Reports in Volume 2, Chapter 8, Sections A to P.

Bats

8.3.20 Bats and their roosts have been surveyed extensively. The following surveys were carried out, in accordance with the CIEEM Guidelines and Bat Conservation Trust (BCT) document Bat Surveys: Good Practice Guidelines (2nd Edition, 2012) referred to as the BCT guidelines.

8.3.21 All trees and buildings within the relevant Zol were subject to an initial assessment in 2009, with all trees and buildings with high potential for bats within 50 metres of the proposed Scheme boundary subject to survey in 2009, 2010 and 2012. These involved a combination of emergence/re-entry surveys, internal building inspections, activity (transect) surveys, static monitoring (manned and unmanned) and, in 2010 and 2012, tree climbing where appropriate.

8.3.22 Dusk/dawn surveys have been carried out for those trees not surveyed in 2012 due to access constraints and other issues. This includes the high potential and confirmed roost trees identified in the 2012 tree climbing but not surveyed in 2012, confirmed roost trees under the footprint and any trees to be directly impacted by works (lighting, noise etc.).

8.3.23 Hibernation surveys of suitable buildings/structures were carried out over the winter period in 2008/09 and 2011/12. In 2009 an extensive radio-tracking survey took place at the western end of the proposed Scheme. This was supplemented in 2012 with a similarly extensive radio-tracking survey towards the eastern end of the proposed Scheme. A third radio tracking survey took place in spring 2013.

8.3.24 Static monitoring also took place throughout the 2013 season, to supplement and update the static monitoring previously carried out. This was carried out

at known and suspected sensitive locations along the proposed Scheme (including updates of static monitoring locations surveyed in 2009/2010).

8.3.25 Other Protected Species

8.3.26 Badger (*Meles meles*) surveys took place in 2007, and were updated in 2009. They were then repeated in 2012. In each case initial surveys took place over the winter period, when vegetation was low enough to allow setts to be easily found. Subsequent surveys took place in the following summer seasons to identify usage. Setts, foraging routes, latrine sites and other field signs were mapped.

8.3.27 Great crested newt (*Triturus cristatus*) surveys initially took place in 2004, with updates in 2005, 2007 and 2009. They were then repeated in 2012. The full surveys involved an initial Habitat Suitability Index assessment, with subsequent presence/absence surveys undertaken at all those ponds likely to offer suitable breeding habitat for great crested newts.

8.3.28 The unusual weather conditions in the spring and summer of 2012 meant that a proportion of the great crested newt surveys were carried out in sub-optimal conditions. Accordingly, surveys have been carried out during the 2013 season in order to supplement the existing data. Rather than a blanket survey of all suitable ponds within the Zol as in 2012, these surveys focussed on those ponds that were dry in 2012, and those where impacts were predicted. Further surveys to inform the necessary European Protected Species licence applications took place where necessary.

8.3.29 Breeding bird surveys were initially completed in 2007, and updated in 2009. The surveys were repeated in 2012. Surveys followed the modified BTO Common Bird Census survey technique. Overwintering birds were assessed through a desk-based survey in 2007 and updated in 2009.

8.3.30 An on-site wintering bird survey took place during Jan/Feb 2013, to supplement the previous desk-based data reviews that have so far been completed. It was undertaken over a three week period, with a series of transects walked, each taking one day. Each transect was walked twice.

8.3.31 Barn owls (*Tyto alba*), as a species listed in Schedule One of the Wildlife and Countryside Act 1981, were surveyed in 2007. This was updated in 2009, and further records obtained in 2012. Surveys included visits and inspections of suitable nesting sites for barn owls (by a qualified ecologist with a barn owl disturbance licence).

- 8.3.32 Aquatic invertebrates at The Springs County Wildlife Site were first surveyed in 2005, and repeated in 2006/7. Further surveys were undertaken in 2013, as the previous dataset required updating. At the same time, surveys for Desmoulin's whorl snail (*Vertigo moulinsiana*) were repeated, to allow an accurate assessment of the impacts on this sensitive species to be made.
- 8.3.33 Terrestrial invertebrate surveys took place in 2007, and were updated in 2010. In 2012, as part of the Phase 1 Habitat Survey, assessments of terrestrial invertebrates were carried out by focusing on assessing the value of the habitats along the route of the NDR. This was carried out with a view to assessing the likely impacts and informing appropriate compensation measures, including habitat creation. The focus was to consider the wider importance of the landscape for terrestrial invertebrates, and not individual species.
- 8.3.34 Reptile surveys initially took place in 2007, and were repeated in 2010. The results were somewhat localised, with small populations observed in only a few locations. No further specific reptile surveys are necessary; the distribution of the reptiles is closely and predictably tied to suitable habitats, which have been mapped and updated as part of the Phase 1 Habitat Survey.
- 8.3.35 Water vole (*Arvicola amphibius*) and otter (*Lutra lutra*) surveys took place in 2006 and 2007. Otter populations were observed on the River Wensum and associated watercourses, although this was sufficiently far from the proposed Scheme, with no corridors of movement through the landscape that would be affected by the proposed Scheme, that no further surveys are considered necessary. No evidence of otter was identified anywhere else on the proposed Scheme. Also, no evidence of water voles was identified on the few suitable watercourses impacted by the proposed Scheme.

Other, Unprotected Species

- 8.3.36 Brown hares (*Lepus europaeus*) were surveyed in 2007, with a very small, transient population recorded. No subsequent surveys have taken place as hares are regarded as unlikely to be significantly affected by the proposed Scheme due to their very limited population locally, and because they are not a protected species.
- 8.3.37 Deer surveys also took place in 2007. No subsequent surveys have taken place as similar to the brown hare, deer are not a protected species. In addition to being required to help identify and assess potential impacts on species, the deer surveys were also aimed at allowing the project team to

identify locations along the route where deer/vehicle collisions are potentially most likely, to inform the proposed Scheme signing and mitigation design.

Assessment of Nature Conservation Value

8.3.38 The ecological assessment undertaken as part of the Environmental Statement follows the requirements set out in DMRB Volume 11, Section 3, Part 4. It is based on the methodology reported in the Scoping Report and on discussions with Natural England and the Environment Agency, and draws on the ecological impact assessment methodology set out in the CIEEM Guidelines.

8.3.39 The evaluation of the value of ecological assets is based on the criteria given in WebTAG Sub-Objective 3.3.10, the Biodiversity Sub-Objective, as detailed in Table 8.2 below.

Table 8.2 Criteria for Determining Nature Conservation Value of Features

Value	Criteria	Examples
Very High	High importance and rarity, international scale and limited potential for substitution.	<p>High importance and rarity, international scale and limited potential for substitution.</p> <p>An internationally designated site or candidate site; a viable area of a habitat type listed in Annex I of the Habitats Directive, or smaller areas of such habitat which are essential to maintain the viability of a larger whole.</p> <p>Any regularly occurring population of an internationally important species, which is threatened or rare in the UK i.e. UK BAP, red data book species.</p>
High	High importance and rarity, national scale, or regional scale with limited potential for substitution.	<p>A nationally designated site or a discrete area, which meets the published selection criteria for national designation, including Ancient Woodland on NE register.</p> <p>A viable area of a priority habitat identified in the UK BAP.</p>

Value	Criteria	Examples
		Any regularly occurring population of a nationally or regionally important species which is threatened or rare in the county (local BAP).
Medium	High or medium importance and rarity, local or regional scale, and limited potential for substitution.	Any regularly occurring, locally and regionally significant population of a species listed as being nationally scarce. Any County and other sites which the designating authority has determined meet the published ecological selection criteria for designation, including County Wildlife Sites. A regularly occurring, locally significant number of a County and regional important species.
Low	Low or medium importance and rarity, local scale.	A diverse and/or ecologically valuable hedgerow network. Local designated sites including Roadside Nature Reserves.
Negligible	Very low importance and rarity, local scale.	Other sites, species or habitats with little or no local biodiversity and earth heritage interest.

Source: Adapted from HA 205/08 – Design Manual for Roads and Bridges Volume 11 Section 2 Part 5 and Unit 3.3.10 The Biodiversity Sub-Objective Table 1

Identification of the Magnitude of Potential Impacts

8.3.40 As with the assessment of Nature Conservation Value above, the determination of the magnitude of potential impacts is based on the criteria given in WebTAG Sub-Objective 3.3.10, the Biodiversity Sub-Objective, and the IEEM guidance, as detailed in Table 8.3 below.

8.3.41 All potential impacts arising from the proposed Scheme are considered: direct or indirect, temporary, short term or long-term. The duration, timing, frequency and reversibility of predicted impacts are also considered. Duration refers to the time for which the impact is expected to last prior to recovery or replacement of the resource or feature. It is more appropriate to define

durations of impact in relation to ecological characteristics (for example species lifecycles), as opposed to human timeframes.

8.3.42 The timing of predicted impacts is also important. Some changes may only cause an impact if they coincide with critical life-stages or seasons (for example, the bird nesting season). This may be avoided by careful scheduling of the relevant activities.

8.3.43 The effects of any environmental mitigation measures, including alterations to the proposed Scheme design, have been taken into account.

8.3.44 Impacts have been assessed for all ecological features (species, habitats and designated sites) and ecosystem services in the proposed Scheme corridor identified during the assessment which are considered to be significant.

Table 8.3 Criteria for Determining Magnitude of Impact

Magnitude	Criteria
Major negative	The proposal (either on its own or with other proposals) may adversely affect the integrity of the site, in terms of the coherence of its ecological structure and function, across its whole area, that enables it to sustain the habitat, complex of habitats and/or the population levels of species of interest.
Intermediate negative	The site's integrity will not be adversely affected, but the effect on the site is likely to be significant in terms of its ecological objectives. However if, in the light of full information, it cannot be clearly demonstrated that the proposal will not have an adverse effect on integrity, then the impact should be assessed as major negative.
Minor negative	Neither of the above apply, but some minor negative impact is evident. (In the case of Natura 2000 sites a further appropriate assessment may be necessary if detailed plans are not yet available).
Neutral	No observable impact in either direction.
Positive	Impacts which provide a net gain for wildlife overall.

Source: Adapted from HA 205/08 – Design Manual for Roads and Bridges Volume 11 Section 2 Part 5 and Unit 3.3.10 The Biodiversity Sub-Objective Table 2

8.3.45 The CIEEM guidance states that professional judgement should be used when valuing the importance of ecological features and the magnitude of potential impacts (rather than relying fully on specific categorisation of impacts such as WebTAG). This means that the WebTAG criteria should be used as a guide only, with the ecologist carrying out the assessment able to alter values and impacts if, in their professional judgement, this is appropriate and would most accurately reflect the likely impacts of the proposed Scheme.

Mitigation and Monitoring Measures

8.3.46 EIA best practice, and more specifically the process required by the Highways Agency Advice Note HA200/08 Aims and Objectives of Environmental Assessment (DMRB Vol11 Section 1) (which superseded Interim Advice Note 76/06, of the same title) and Advice Note HA205/08 Assessment and Management of Environmental Effects (which superseded Interim Advice Note 81/06 Management of Environmental Effects), is reliant on the design of the proposed Scheme being an iterative process, with on-going, regular input from those environmental specialists within the EIA process into the evolving design. This allows environmental issues to be considered and addressed at the earliest possible stage, and moves away from older practices whereby mitigation measures were 'bolted on' to a semi-finalised design.

8.3.47 This mechanism is reflected in the assessment process, whereby the impacts are assessed on the premise that mitigation measures are an inherent part of the proposed Scheme. This means that it is no longer good practice to assess pre-mitigation impacts, and then follow these with residual impacts. Instead, the single-phase process works on the premise that the mitigation is the default design, and one set of impacts and effects are assessed.

8.3.48 Mitigation measures have been incorporated into the design of the NDR to where possible avoid or minimise any adverse impacts on the ecological features within the ZoI. Where significant adverse impacts are considered likely, compensation measures have been devised during the EIA process as appropriate.

8.3.49 Mitigation, compensation and biodiversity enhancement measures for this project have been devised using the CIEEM guidelines, consultation with Natural England and other stakeholders, and through the application of best practice.

Pre and During Construction Mitigation

8.3.50 Where construction-phase impacts (including those that may occur during initial pre-construction preparatory activity) are predicted, mitigation measures have been formulated to address these.

Post-Construction Mitigation

8.3.51 Post-construction, permanent mitigation is also identified where significant impacts are predicted. There has been concerted effort to design post-construction mitigation measures, such that they can be installed during the first stages of construction. This has the dual benefits of allowing them to establish and become a part of the wider landscape earlier than they would otherwise, and it also reduces the need to provide temporary mitigation, which would then be removed and replaced by permanent features and measures.

8.3.52 Ecological mitigation is closely tied to the mitigation measures proposed through other environmental discipline assessments, most notably landscape, whereby the landscape design plays an inherent part of mitigation for the loss and severance of habitats.

Assessment of Environmental Effects

8.3.53 The impact magnitude and the nature conservation value of the relevant ecological feature are combined to determine the likely Significance of each effect. This is carried out using the matrix detailed in Table 8.4 below. Those effects that are Moderate, Large or Very Large, are considered to be ecologically Significant. The CIEEM guidelines define an ecologically significant effect as an effect (negative or positive) on the integrity of a defined site or ecosystem and/or the conservation status of habitats or species within a geographical area. This links back to the criteria for determining the Nature Conservation Value of features, meaning that Significant effects can be considered to be so at the geographical scale at which the Conservation Value relates.

Table 8.4 Assessing the Significance of Potential Effects

Magnitude of Potential Impact	Nature Conservation Value of Features				
	Very High	High	Medium	Low	Negligible
Major Negative	Very large adverse	Very large adverse	Moderate adverse	Slight adverse	Neutral
Intermediate Negative	Large adverse	Large adverse	Moderate adverse	Slight adverse	Neutral
Minor Negative	Slight adverse	Slight adverse	Slight adverse	Slight adverse	Neutral
Neutral	Neutral	Neutral	Neutral	Neutral	Neutral
Positive	Large beneficial	Large beneficial	Moderate beneficial	Slight beneficial	Neutral

Source: Adapted from HA 205/08 – Design Manual for Roads and Bridges Volume 11 Section 2 Part 5 and Unit 3.3.10 The Biodiversity Sub-Objective Table 3

8.3.54 The above matrix places the overall effects on an ecological asset into one of five criteria – Neutral, Slight, Moderate, Large and Very Large. These could be either adverse or beneficial effects. Table 8.5 below provides qualitative descriptions as to these five criteria, and indicates the extent to which the ecological assets in these criteria are likely to have been considered during the decision-making process.

Table 8.5 Description of the Significance of Effect Categories

Significance category	Typical description of effect
Very Large	<p>Only adverse effects are normally assigned this level of significance.</p> <p>They represent key factors in the decision making process.</p> <p>These effects are generally, but not exclusively, associated with sites or features of international importance that are likely to suffer a most damaging impact and loss of resource integrity.</p> <p>However, a major change in a site or feature of local importance may also enter this category.</p>
Large	<p>These beneficial or adverse effects are considered to be very important considerations and are likely to be material in the decision-making process.</p>
Moderate	<p>These beneficial or adverse effects may be important, but are unlikely to be highly important to the decision making factors.</p> <p>The cumulative effects of such factors may influence the decision making if they lead to an increase in the overall adverse effect on a particular resource or receptor.</p>
Slight	<p>These beneficial or adverse effects may be raised as local factors.</p> <p>They are unlikely to be critical in the decision making process, but are important in enhancing the subsequent design of the project.</p>
Neutral	<p>No effects or those that are beneath levels of perception, within normal bounds of variation or with the margin of forecasting error.</p>

Source: Adapted from HA 205/08 – Design Manual for Roads and Bridges Volume 11 Section 2 Part 5

Confidence in Predictions

8.3.55 Owing to the potential unknowns and uncertainties in the assessment process, each predicted overall effect on ecological resources is given a confidence level, to indicate the certainty (or otherwise) of the prediction. In each case it takes into account the timescales being considered, the vulnerability of the ecological resource, its robustness/sensitivity to change.

Table 8.6 Confidence in Predictions

Confidence level	Criteria
Certain	Probability estimated at 95% chance or higher
Probable	Probability estimated above 50% and below 95%
Unlikely	Probability estimated above 5% but less than 50%
Extremely unlikely	Probability estimated at less than 5%

Phases of the Project

8.3.56 The significance of effects has been considered during the following phases of the project:

Construction Phase

8.3.57 For effects during this phase, account has been taken of the operations required to construct the proposed development including the sites for Contractors' compounds, haul routes and borrow and disposal areas. Further details of the proposed Scheme construction are set out in Volume 2, Chapter 2.

Operational Phase

8.3.58 For effects during this phase, consideration has been given to the land take required to construct the project together with any drainage and other ancillary

works. The impact of traffic and other related effects on the designated sites, habitat and species, and the on-going, long term maintenance requirements and actions have also been considered.

8.4 Baseline Conditions

8.4.1 This section presents descriptions of the key and protected ecological receptors in the relevant Zol. More detailed descriptions and survey data and maps are presented in the various Technical Reports on each of the surveys and species types, in Volume 2, Chapter 8, Sections B to O.

Designated Sites

8.4.2 There are six statutory designated sites within 2km of the proposed Scheme. There are 16 non-statutory designated sites, and 13 ancient woodlands within 2km of the proposed Scheme. These are shown on the Environmental Constraints Map, drawing number MMD-233906-DT-0881 Environmental Constraints - Ecology, in Appendix 2 of this volume of the ES. Their citations can be found in Volume 2, Chapter 8, Section A; summaries are provided in the sections below:

Statutory Designated Sites

8.4.3 The Broadland Ramsar Site is located approximately 1.9 km from the proposed Scheme, south east of the Postwick junction. It covers 5462.4 hectares, and is designated for its wetland habitats, and for overwintering bird species including Tundra swan (*Cygnus columbianus bewickii*), Eurasian wigeon (*Anas penelope*), gadwall (*Anas strepera strepera*) and northern shoveler (*Anas clypeata*). The citation for this designation also makes reference to notable flora including fen orchid (*Liparis loeselii*) and floating water-plantain (*Luronium natans*), and to notable fauna including marsh harrier (*Circus aeruginosus*), bittern (*Botaurus stellaris stellaris*), otter and Desmoulin's whorl snail. Broadland Ramsar Site is of Very High conservation value.

8.4.4 Broadland Special Protection Area (SPA) is coincident with the Broadland Ramsar Site. It is designated for a number of breeding species, including bittern and marsh harrier, and for several overwintering bird species, including Bewick's swan, ruff (*Philomachus pugnax*), gadwall and shoveler. Broadland SPA is of Very High conservation value.

- 8.4.5 The Broads Special Area for Conservation (SAC) is broadly coincident with both the Broadland Ramsar site and Broadland SPA. It covers an area of some 5890 hectares, and is designated for a wealth of habitats and species. The habitats cited in the designation include those of the watercourses and water bodies, and the associated fens and woodland. Species include Desmoulin's whorl snail, fen orchid and ramshorn snail (*Anisus vorticulus*). The Broads SAC is of Very High conservation value.
- 8.4.6 The River Wensum SAC is located 300 metres south of the proposed Scheme, at its western end, where it ties in with the existing A1067 Fakenham Road. In geographical terms, the designation relates predominantly to the main river body itself, and covers the stretch from its springs upstream of Fakenham to Hellesdon Mill on the western edge of Norwich. It is designated for its *Ranunculus* vegetation, and due to the presence of white-clawed crayfish (*Austropotamobius pallipes*), Desmoulin's whorl snail, brook lamprey (*Lampetra planeri*), and bullhead (*Cottus gobio*). The River Wensum SAC is of Very High conservation value.
- 8.4.7 The River Wensum SSSI, coincident with the Wensum SAC, is designated for its status as an enriched, calcareous lowland river. It is probably the best whole river of its type in nature conservation terms in the United Kingdom. The upper reaches are fed by springs that rise from the chalk and by run-off from calcareous soils rich in plant nutrients. This gives rise to dense beds of submerged and emergent vegetation characteristic of a chalk stream. Lower down, the chalk is overlain with boulder clay and river gravels, resulting in aquatic plant communities more typical of a slow-flowing river on mixed substrate.
- 8.4.8 It provides habitat for a diverse fish population, including brown trout (*Salmo trutta fario*) in its upper reaches, with a sizeable diversity of macrophytes and semi-aquatic vegetation, the communities of which vary in composition along the course of the river, reflecting the above described changes in underlying geology. An abundant and diverse invertebrate fauna is also known to exist along the course of the river. The River Wensum SSSI is of High conservation value.
- 8.4.9 The proposed Scheme is approximately 1.9 km from the Mid-Yare National Nature Reserve (NNR). The NNR covers 783 hectares, and is designated primarily for its peatland habitats, although it also makes reference to its full range of Broadland habitats, including broads, dykes, tall fen, fen-meadows and alder-willow woodland. Also of note is the range of invertebrates, including the swallowtail butterfly (*Papilio machaon*) and Norfolk hawker

dragonfly (*Aeshna isosceles*), and bird species; many of the UK's Cetti's warblers (*Cettia cetti*) live in the NNR. It is also a breeding site for marsh harriers and bearded tits (*Panurus biarmicus*). During the winter the lowland wet grasslands are host to wigeon (*Anas penelope*), white-fronted geese (*Anser albifrons*) and bean geese (*Anser fabalis*). In the spring and summer the fen-meadows and wet grasslands are breeding grounds for lapwing (*Vanellus vanellus*), redshank (*Tringa totanus*) and snipe (*Gallinago gallinago*). The Mid-Yare NNR is of High conservation value.

8.4.10 Two Local Nature Reserves (LNR) are located within 2km of the proposed Scheme. Whitlingham Marsh LNR is located approximately 550 metres to the west of the Postwick junction. This 15 hectare site is designated primarily for its reed-bed habitat and associated species of flora and fauna. It is of Medium conservation value.

8.4.11 Whitlingham LNR is approximately 1.5 km to the west of the Postwick junction. This 100 hectare site is designated for its reed-bed habitats, as with Whitlingham Marsh LNR above. It is also of Medium conservation value.

Non-Statutory Designated Sites

8.4.12 There are fifteen County Wildlife Sites within 1 km of the proposed Scheme. These are detailed below. As with above, their full citations can be found in Volume 2, Chapter 8, Section A.

8.4.13 The River Wensum Pastures CWS (Ref. 2070) is located 450 metres west of the extreme western end of the proposed Scheme. It covers an area of 37 hectares, and is an area of predominately improved cattle-grazed pasture adjacent to the River Wensum SSSI, crossed by a network of drains supporting a species-rich flora associated with aquatic habitats. It lies on the flat Wensum floodplain and is subject to periodic flooding. Parts of the site are undulating in relief and ephemeral ponds form in some of the hollows. Low lying neutral grassland is dominated by coarse grasses to a short sward. There are tree lines and occasional trees and scrub scattered across the site. Species include grey poplar (*Poplar x canescens*), oak and crack willow (*Salix fragilis*).

8.4.14 Attlebridge Hills CWS (Ref. 1344) is located 40 metres from the proposed Scheme footprint. This site, approximately 24 hectares in size, is a varied structure, broad-leaved semi-natural woodland. The canopy is dominated by mature oak (*Quercus robur*), sycamore (*Acer pseudoplatanus*), sweet chestnut (*Castanea sativa*) with extensive areas of mixed coppice of hazel

(*Corylus avellana*), sycamore and sweet chestnut. The ground flora is typical of such woodlands but also contains red campion (*Silene dioica*), viper's bugloss (*Echium vulgare*), nipplewort (*Lapsana communis*) and common centaury (*Centaureum erythraea*).

- 8.4.15 Triumph & Foxburrow Plantations CWS (Ref. 1343) is located 620 metres north of the proposed Scheme. This large site (around 50 hectares) site is a mixed broad-leaved woodland with good rides. The woodland canopy is dominated by sweet chestnut, oak and birch with the occasional larch (*Larix* spp.) and pine (*Pinus* spp.). The coppice layer is mostly hazel (*Corylus avellana*) while some of the sweet chestnut coppices may be a century old. The ground flora is a mixture of red campion (*Silene dioica*), herb-Robert (*Geranium robertianum*) wood sage (*Teucrium scorodonia*) and on the open grassy rides marsh cudweed (*Gnaphalium uliginosum*) is found.
- 8.4.16 Walsingham Plantation CWS (Ref. 1351) is located 110 metres from the Proposed Scheme. This small site, just 10 hectares, is a broad-leaved semi-natural woodland, with a canopy dominated by oak, with silver birch, beech, and sycamore also present. The coppice layer is slight and mainly elder (*Sambucus nigra*). The ground flora is composed mostly of bracken (*Pteridium aquilinum*), bramble (*Rubus fruticosus* agg.), ivy (*Hedera helix*) and ground-ivy (*Glechoma hederacea*). Moschatel (*Adoxa moschatellina*), climbing corydalis (*Corydalis claviculata*) and herb-Robert, red campion (*Silene dioica*) and wood avens (*Geum urbanum*) are also found.
- 8.4.17 Marriott's Way CWS (Ref. 2176) is partially beneath the proposed Scheme footprint. It is a linear route, now a permissive footpath, cycleway and equestrian route, following a disused railway from the edge of Norwich City Centre to Aylsham, via Reepham. In total it covers around 69 hectares. Trees and scrub are the dominant vegetation along Marriott's Way, forming an almost continuous corridor as far as Reepham, with a more scattered coverage eastward to Aylsham. Oak and hawthorn occur all the way along the path, with occasional other locally frequent species such as sweet chestnut in the woods at Attlebridge, or alder at Whitwell Common, and other species occurring with varying frequency. Grassland and forbs growing within it form the greatest component of the vegetation. Much of Marriott's Way is on acidic ground, with light, sandy soil but plants also found in neutral and basic soils are also present.
- 8.4.18 Whinney Hills & Common CWS (Ref. 1352) is located 515 metres from the proposed Scheme. This site is a large area of common land. The area now supports mature acid woodland, although patches of heathland do still occur

within the site. On lower marshy ground, older areas of woodland support alder whilst in other areas sweet chestnut coppice occurs. On the higher, dry ground the canopy consists of a mixture of mature and semi-mature trees. Silver birch is most common with frequent oak and rowan. The ground flora is not diverse and both bramble and bracken are common. Heather (*Calluna vulgaris*) is abundant in places as a remnant of the former habitat. In wetter areas the woodland has a different character with a canopy dominated by mature coppiced alder. The centre of the site is derelict sweet chestnut coppice over a poor ground flora with no heather. To the north-east of the site is an area of wet heath with abundant tall heather and dense tussocks of purple moor-grass (*Molinia caerulea*).

8.4.19 Black Park & The Thicket CWS (Ref. 1395) is located 920 metres north of the proposed Scheme. It is a large area (around 32.5 hectares) of oak-dominated acid woodland, with many standard trees and a big area of well-spaced mature trees to the north. The ground flora is varied with a wide range of species. There are numerous small, and several large, ponds in the south-eastern part of the site. Both wet and dry ditches occur around the site, with the wet ditches supporting species such as remote sedge (*Carex remota*), alder, fool's water-cress (*Apium nodiflorum*) and bugle (*Ajuga reptans*). There are a number of old boundary banks within the wood, often with old oak pollards and hazel on them, or old hawthorn hedge. An ancient monument, Castle Hill, is a separate small site to the south.

8.4.20 Horsham Meadows CWS (Ref. 2178) is located 810 metres from the proposed Scheme, and is 8.5 hectares in size. This site consists of three fields of cattle-grazed pasture, over heavily undulating terrain. A small stream runs from west to east. A number of large, shallow hollows, believed to be either fossil pingos or thermokarst hollows, are a significant feature of the site. Many hold water during the winter months, and support a very diverse, often fen-like flora. The grassland surrounding the hollows is generally less diverse, and frequently damp and tussocky. An area of tall reed grading into mature willow scrub and more mature tree cover occupies a narrow block at the north-east corner of the site.

8.4.21 Spixworth Bridge Meadows CWS (Ref. 2205) is located 950 metres north of the proposed Scheme. This is a large area of mixed grassland, some very species-rich. The land is in a valley with Spixworth Beck running through. There are many wet, damp and dry ditches. An area of alder (*Alnus glutinosa*) carr occurs on the northern edge of the site. The two fields at the western end of the site and much of the land north of the beck are ungrazed, unimproved neutral grassland which is long and rank. There is abundant species-rich

marshy grassland in the low-lying parts of the site. The southern boundary of the site has some fine mature oaks, with a varied hedge of hawthorn, hazel, blackthorn, field maple, apple (*Malus domestica*), dog rose (*Rosa canina*) and honeysuckle (*Lonicera periclymenum*), with dog's mercury (*Mercurialis perennis*) growing beneath.

8.4.22 Canham's Hill CWS (Ref. 1335) is located around 600 metres from the proposed Scheme, and is around 7.7 hectares in size. It is comprised of rough unmanaged ground, a mixture of self-seeded mature woodland, some bracken (*Pteridium aquilinum*) and a small open area of unimproved neutral grassland.

8.4.23 Ladies Wood, Church Carr & Springs CWS (Ref. 1393) is located just 20 metres from the proposed Scheme. It is around 14 hectares in size, and includes a variety of aquatic and semi-aquatic habitats. The lakes are generally species poor and fringed by willow (*Salix cinerea*) carr, with a very small number of macrophyte species present. The lake is used by a local angling club, and as such has seen artificial stocking of non-native fish species. The watercourses have been modified in recent seasons, and an otter fence erected to prevent a repeat of the otter predation that caused previous fish stocks to be affected.

8.4.24 There are two areas of marshy grassland and one area of improved grassland. The woodlands are dominated by oak and sweet chestnut, with a fairly diverse understorey. The ground flora is often dominated by dense bracken (*Pteridium aquilinum*) and bramble (*Rubus fruticosus*) although swards of abundant bluebell (*Hyacinthoides non-scripta*) are also evident. An area of lime (*Tilia x vulgaris*) coppice is also present. Part of the site is ancient woodland.

8.4.25 Tollshill Wood CWS (Ref. 2021) is located 490 metres southwest of the proposed Scheme, and covers around 10 hectares. It is an area of ancient, broad-leaved semi-natural woodland, which benefits from ongoing management in terms of coppicing, ride creation and enhancement etc. The canopy is varied in structure and density, and is dominated by sycamore and sweet chestnut, with frequent oak and beech (*Fagus sylvatica*). The ground flora includes areas of dense bluebell (*Hyacinthoides non-scripta*), with the notable wood anemone (*Anemone nemorosa*) also present.

8.4.26 Paynes Yard Wood, The Owlery & March Covert CWS (Ref. 1392) is located 10 metres from the proposed Scheme. The site is around 17 hectares in size. Paine's Yard Wood and The Owlery are varied woodlands of largely native

species and of a varied structure, including abundant deadwood and stored coppice. Mature ash is a dominant species throughout, much of it arising from large coppice stools. Oak and birch are frequent and hazel coppice dominates some areas. The ground flora is dominated by large stands of bluebell in places. A pond occurs on the eastern boundary, and to the north the woodland narrows dramatically, where the woodland follows the parish boundary, which is marked by a bank and impressive oaks, which occur as pollards and coppice stools. A mature hedge also follows the boundary and links the wood with The Owlery.

8.4.27 Whitlingham Marsh CWS (Ref. 2212) is located 400 metres west of the Postwick junction part of the proposed Scheme. This site is an area of inundated swamp, consisting mostly of sedgebeds. The marsh is bisected from north to south by a line of alders and a small pond lies close to the centre of the site. The entire site is dominated by greater pond-sedge (*Carex riparia*), with a greater degree of diversity in the western half than to the east.

8.4.28 Whitlingham Fen CWS (Ref. 279) is located 550 metres west of the Postwick junction part of the proposed Scheme. It is just 6 hectares, and is a linear site running along the eastern side of the Whitlingham sewerage treatment works. It consists largely of fen and wet scrub woodland but also includes a series of open ponds. The area is largely unmanaged. The fen vegetation is dominated by reed sweet-grass (*Glyceria maxima*) or greater pond-sedge (*Carex riparia*). The wet woodland is dominated by mature willow (*Salix* spp.) scrub with occasional hawthorn and elder. The ponds lie towards the centre of the site and have abundant growth of semi-aquatic species. Drier peripheral areas contain great willowherb (*Epilobium hirsutum*) and broad-leaved ragwort (*Senecio fluviatilis*) whilst willow (*Salix* spp.) scrub is a frequent invader of shallow muddy margins.

8.4.29 All of the above County Wildlife Sites are of Medium conservation value.

Roadside Nature Reserves

8.4.30 Fakenham Road RNR is within the footprint of the proposed Scheme. The site is important for hoary mullein (*Verbascum pulverulentum*). It is of Medium conservation value.

Ancient Woodlands

8.4.31 The following thirteen Ancient Woodlands are located within 1 km of the proposed Scheme. Ten of these are Replanted Ancient Woodlands, and three are Ancient Woodlands.

8.4.32 Mileplain Plantation Replanted Ancient Woodland, covering an area of 22.17ha, is located approximately 1.1 km to the north of the proposed Scheme, where it ties in to the existing A1067 Fakenham Road. It is part of a much wider area of woodland that also includes the Deighton Hills and Attlebridge Hills woods, both of which are immediately adjacent to the proposed Scheme.

8.4.33 Primrose Grove Replanted Ancient Woodland is located approximately 1.2 km west of the proposed Scheme, also where it ties in to the existing A1067. It is beyond the River Wensum, and covers an area of 14.79 ha. In addition, Snake Wood, also an Ancient Replanted Woodland, is located approximately 1.1 km metres south of this location. It is 8.62 hectares, on the extreme western edge of Taverham.

8.4.34 The Wilderness Ancient Woodland is approximately 1.6 km north of the Cromer Road junction part of the proposed Scheme. It is just 1.7 hectares in size. Immediately to the north, 1.7 km from the proposed Scheme, is The Wilderness Replanted Ancient Woodland, covering 5.6 hectares.

8.4.35 Northwest of the A1151 Wroxham Road, Church Wood and Ladies Carr, both of which are component parts of the CWS described above, are both Replanted Ancient Woodlands. Church Wood is approximately 500 metres north of the proposed Scheme, and covers an area of 3.62 ha. Ladies Carr is around 50 metres north of the proposed Scheme is 3.432 ha. Church Wood, another block of woodland in the same area, is Ancient Woodland, covering 3.7 ha. It is situated around 260 metres north of the proposed Scheme.

8.4.36 Also in this area, Sprowston Wood Replanted Ancient Woodland is located around 40 metres to the south of the proposed Scheme. It covers an area of 11.19 hectares.

8.4.37 Tollshill Wood Replanted Ancient Woodland is around 520 metres southwest of the proposed Scheme, adjacent to the A1151 Wroxham Road. It covers an area of 9.31 ha.

8.4.38 To the south of the A1151 Wroxham Road, Ortolan's Grove Ancient Woodland is located immediately adjacent to the proposed Scheme. It covers an area of just 0.78 ha.

8.4.39 Bulmer Coppice Replanted Ancient Woodland is located on the Salhouse Road, approximately 800 metres south west of the proposed Scheme. It covers an area of 7.54 ha.

8.4.40 Racecourse Plantation Replanted Ancient Woodland, part of the larger Racecourse Plantation woodland block, is located approximately 1.3 km west of the proposed Scheme. It covers an area of 12.81 ha, and is situated to the immediate north of the Plumstead Road.

8.4.41 All of the above Ancient Woodlands are of Medium conservation value.

Tree Preservation Orders

8.4.42 Broadland District Council has provided details of Tree Preservation Orders (TPO) within 1 km. The only TPO (ref. TPO 1991 No.10) within the Zol surrounds Keepers Cottage along the A1151 Wroxham Road, adjacent to the proposed new junction with the NDR.

8.4.43 The TPO covers four individual trees, oak and one sycamore, a group of four horse chestnut trees and two stands of mixed woodland. Woodland one contains mainly sycamore, ash, oak, birch and sweet chestnut. Woodland two consists mainly of oak, horse chestnut, sycamore and ash. A copy of the order can be found in Volume 2, Chapter 8, Section A.

8.4.44 The Keepers Cottage TPO is considered to be of Low conservation value.

Important Hedgerows under the Hedgerow Regulations 1997

8.4.45 A survey was carried out to identify those hedgerows that are designated as Important under the Hedgerow Regulations 1997, which would be directly affected by the proposed Scheme.

8.4.46 A total of eleven hedgerows are classified as Important and would be directly affected by the proposed Scheme. They are all species rich, containing at least 5 woody species per 30 metres of hedgerow, most commonly hawthorn, blackthorn, field maple, hazel, holly and dog rose. Tree species with the hedgerows typically include oak, ash, birch, hornbeam and sweet chestnut.

8.4.47 The Important hedgerows are detailed in the table below:

Table 8.7 Important Hedgerows to be affected by the proposed Scheme

Number	Location	Length to be removed (m)
1	Runs along the eastern side of Holt Road in Horsford, starting at the crossroads with Church Street and Drayton Lane and running south.	185
2	Runs between arable fields that are located between Holt Road and Drayton Lane to the south of Horsford.	75
3	Runs between arable fields that are located between Holt Road and Drayton Lane to the south of Horsford. Adjoins above hedgerow.	166
4	Runs along the footway/cycleway between West Lane and the A140 in Horsham St Faith.	65
5	Runs along the eastern edge of Old Norwich Road, from Horsham St Faith towards Norwich Airport.	94
6	Runs along the western side of St Faith's Road from the turning onto Quaker Lane in Spixworth.	161
7	Runs along the eastern side of St Faith's Road from the turning onto Quaker Lane in Spixworth.	161
8	Runs along the southern side of Quaker Lane in Spixworth, starting at the turning onto St Faith's Road, running east.	109
9	Runs along the western side of Buxton Road in Spixworth, starting at Quaker Lane and going south.	109
10	Runs along the eastern side of Buxton Road in Spixworth, starting at Arthurton Road and going south.	623
11	Runs along the north-western side of Salhouse Road in New Rackheath, starting at Green Lane East and running southwest.	329

8.4.48 The above Important hedgerows are of Medium conservation value. Full details can be found in the Phase 1 Habitat Survey report (Mott MacDonald, 2013) in Appendix B of this document, and the Hedgerow Survey Report (Mott MacDonald, 2009), in Volume 2, Chapter 8, Section B.

Habitats, Plant Communities and Flora

8.4.49 Plans showing the results of the individual habitat and species surveys are included in the individual Technical Reports in Volume 2, Chapter 8, Sections B to O. Such is the volume and geographical extent of habitat and protected species data that it is not appropriate to produce overarching maps.

Phase 1 Habitat Survey Results

8.4.50 The following sections include brief descriptions of the main habitat types and plant communities present within the Zol of the proposed Scheme. It summarises information from the Extended Phase 1 Habitat Survey, and also includes information from the Detailed Botanical Survey and the Hedgerow Survey reports. Although the latter report has already been referenced above in terms of identifying those Important hedgerows according to the Hedgerows Regulations 1997, the ecological baseline data it contains is pertinent to this section of the baseline description.

8.4.51 Detailed descriptions of the habitats, plant communities and flora, along with target notes (TN) are included in the Extended Phase 1 Habitat Survey (Mott MacDonald, 2012), in Volume 2, Chapter 8, Section B. The Phase 1 habitat maps (also showing locations of target notes) are found in the habitat survey report.

8.4.52 The results of the National Vegetation Classification botanical survey are included in the Detailed Botanical Survey Report in in Volume 2, Chapter 8, Section C. The results of the hedgerow survey are included in the Extended Phase 1 Habitat Survey Report.

Semi-Natural Woodland

8.4.53 A number of blocks of semi- natural woodland are distributed throughout the Zol. In general terms they are typical of woodland of the area, and reflect the neutral and acid soils that underlie the area. Canopies include abundant oak, with frequent ash, sycamore and silver birch, and occasional sweet chestnut,

horse chestnut and various other species. Some woodland blocks include a notable proportion of pine species in the canopy, most often Scot's pine. This is often a reflection of the sandy, acid substrate on which the woodland is growing.

8.4.54 Understoreys vary in quality and species composition, apparently dependent on the degree of management that the woodland receives. They generally contain frequent hazel, hawthorn, elder and field maple competing with younger specimens of the above tree species. In some cases the understorey is virtually absent.

8.4.55 Field layers show similar variability, reflecting both the degree of management and the soil types locally. Those older woodlands that have been a part of the landscape for centuries often have field layers dominated by bluebell and dog's mercury, with numerous other woodland flora species, highlighting an untouched, delicate ecosystem that is dependent on the complex soil structure and a healthy mycorrhizal fungi community. Other areas have a field layer dominated by gorses, where acidic, sandy soils proliferate, whereas other, less well managed field layers are dominated by nettles, bracken, bramble etc.

8.4.56 Many of the woodland blocks in the ZOI are designated as CWS or Ancient Woodland, and hence have already been described. These include Attlebridge Hills, Walsingham Plantation, Sprowston Wood, Ladies Wood, Church Carr & Springs, Ortolan's Grove and Paine's Yard Wood, the Owlery and March Covert. Other notable blocks include Drayton Drewray, Upper Blacksmith's Wood and Heath Wood, which are described below.

8.4.57 Drayton Drewray is a well-established semi-natural woodland which, in the south-eastern corner to be affected by the route, contains abundant Scot's pine, with pockets of mature oak and birch. The understorey contains occasional elder, gorse and non-native species such as rhododendron. Ground flora in this area is poor, largely dominated by bracken and bramble. In the wider area, to the north and west, the woodland is much more diverse and valuable, with much greater species diversity and ecological value. Whinney Hills & Common CWS makes up part of the wider Drayton Drewray woodland area.

8.4.58 Heath Wood shows clear signs of having been a well-established, very old woodland. It is now managed for timber production, so the canopy contains abundant pine (*Pinus*) species, although oak and sweet chestnut are also found occasionally, particularly to the edges. The understorey is,

corresponding with its managed nature, poorly represented, with occasional elder and hazel present. The field layer though is far more representative of an old broadleaved woodland, with abundant bluebell and dog's mercury, and associated woodland herb species.

8.4.59 Woodlands are Habitats of Principle Importance and LBAP Habitats.

Plantation Woodland

8.4.60 Few planted woodlands are located through the Zol. At Beeston Park exotic conifer species have been planted and some of the older woodlands such as Sprowston Wood have also been planted with exotic conifer and poplar species.

8.4.61 Spixworth Belt is a long shelter belt of Scot's pine with a canopy and understorey of frequent oak, elder and ivy, a poor field layer dominated nettle and bramble. A block of hazel coppice is present along the northern boundary.

8.4.62 Parts of Heath Wood, close to Rackheath, are coniferous plantation, although it was previously a semi-mature broadleaved woodland. It contains abundant Scot's pine, with stands of abundant sycamore and birch and occasional other broadleaved species, including an area of mature beech coppice. It has a sparse understorey, bramble and bracken dominated field layer, with bluebell carpets in the central area.

Parkland and Scattered Trees

8.4.63 Two areas of parkland are located within the Zol, Beeston Park and Rackheath Park. Little of the original, historical parkland remains at Beeston, to the immediate south of Beeston Hall, the bulk having been ploughed for arable production. A number of mature parkland trees remain. These are predominantly oak.

8.4.64 Rackheath Park consists mainly of mature parkland trees. However, areas of the original park have been converted to arable production. Very few parkland and scattered trees are located within the footprint of the proposed Scheme. The Phase 1 Habitat Survey maps in Volume 2, Chapter 8, Section B show the extents of the parkland and arable land at Rackheath Park.

8.4.65 Parklands are Habitats of Principle Importance and LBAP Habitats.

Semi-Improved Grassland

8.4.66 Although there are several areas of grassland within the Zol, species rich semi-improved grassland is only recorded at one site, near Gazebo Farm, just northwest of Heath Wood. It has developed from arable reversion 10 - 15 years ago, and contains a mix of Yorkshire-fog (*Holcus lanatus*), creeping bent (*Agrostis stolonifera*), common mouse-ear (*Cerastium fontanum*), creeping buttercup (*Ranunculus repens*), cock's-foot (*Dactylis glomerata*), white clover (*Trifolium repens*), ribwort plantain (*Plantago lanceolata*) and sweet meadow grass (*Anthoxanthum odoratum*). It is heavily rabbit grazed, and contains ruderal species such as bramble and nettles locally.

Improved and Amenity Grassland

8.4.67 Most of the grassland sites are improved grassland mainly dominated by ryegrass. Fields of improved grassland are fairly evenly distributed throughout the Zol.

Arable Land and Arable Field Margins

8.4.68 Arable land dominates the Zol. Intensive farming practices means that the presence of field margins is limited; crop production areas have been maximised at the expense of other, semi-natural habitats, field margins included. No field margins are present between the Airport and Postwick. Those arable field margins that are present are Habitats of Principle Importance and LBAP habitats.

Standing water

8.4.69 Two substantial areas of standing water are present within the Zol, these are the two large lakes that make up Ladies Wood, Church Carr and Springs CWS, as has already been described in Section 8.4 Baseline Conditions – Non Designated Sites. A number of small ponds also exist, some within arable fields and others within woodlands. The largest complex of ponds is at Gazebo Farm, just northwest of Heath Wood. This pond network is described in more detail in the Great Crested Newt survey report in Volume 2, Chapter 8, Section F.

8.4.70 Ponds are Habitat of Principle Importance and a LBAP habitat.

Species-Rich Hedgerows

8.4.71 As a common field boundary, a number of species rich hedgerows, many that contain trees, are present in the Zol, particularly from the airport east to Postwick. The Phase 1 Habitat Survey Report in Volume 2, Chapter 8, Section B, contains more detail.

Species-Poor Hedgerows

8.4.72 Species poor hedgerows are distributed throughout the Zol. Hawthorn is the dominant woody species, with blackthorn, field maple and dog rose also occasionally present.

8.4.73 All hedgerows are Habitats of Principle Importance and LBAP habitats.

8.4.74 All of the above habitats that do not currently benefit from being within a Statutory or Non-Statutory Designated Site are considered to be of Low conservation value.

8.4.75 The table below provides a summary of the habitat types that would be permanently lost to the proposed Scheme:

Table 8.8 Areas of Main Habitats Lost to the Proposed Scheme

Habitat Type	Amount Lost to Proposed Scheme
Semi-Natural Woodland	5.3 Ha
Plantation Woodland	10.4 Ha
Parkland and Scattered Trees	1.8 Ha
Semi-Improved Grassland	25.8 Ha
Improved Grassland	36.0 Ha
Arable	229.9 Ha
Species-Rich Hedgerows	4437 m
Species-Poor Hedgerows	9752 m

Phase 2 (National Vegetation Classification Woodland and Grassland Flora)

8.4.76 Those most valuable and diverse woodlands, semi-improved grasslands and arable field margins within the ZOI were surveyed according to the National Vegetation Classification (NVC) methodology. The results give a more detailed understanding of the flora communities that a simple Phase 1 Habitat Survey provides, and so allow a more detailed, accurate assessment of the potential impacts that the proposed Scheme may have. More detailed descriptions, and plans showing the locations of the surveyed habitats, are included in the Phase 2 Botanical Survey Report in Volume 2, Chapter 8, Section C.

8.4.77 The following NVC woodland classifications were identified:

Table 8.9 NVC Woodland Classifications

NVC Community	NVC Sub-Community	Habitat	Location
W6 <i>Alnus glutinosa- Urtica dioica</i> woodland	W6a typical sub-community	Broadleaved plantation woodland	Strip Plantation, Rackheath
W8 <i>Fraxinus excelsior- Acer campestre- Mercurialis perennis</i> woodland	W8d <i>Hedera helix</i>	Broadleaved plantation woodland	Heath Wood, Rackheath.
W10 <i>Quercus robur- Pteridium aquilinum- Rubus fruticosus</i> woodland	W10a typical sub-community	Semi-natural broad-leaved woodland	Ladies Wood, Beeston St Andrew
W10 <i>Quercus robur- Pteridium aquilinum- Rubus fruticosus</i> woodland	W10a typical sub-community	Semi-natural broad-leaved woodland	Spixworth Plantation
W10 <i>Quercus robur- Pteridium aquilinum- Rubus fruticosus</i> woodland	W10c <i>Hedera helix</i>	Broadleaved plantation woodland	Woodland south of Spixworth Park
W10 <i>Quercus robur- Pteridium aquilinum- Rubus fruticosus</i> woodland	W10a typical sub-community	Mixed plantation woodland	Heath Wood, Rackheath

NVC Community	NVC Sub-Community	Habitat	Location
W10 <i>Quercus robur</i> - <i>Pteridium aquilinum</i> - <i>Rubus fruticosus</i> woodland	W10a typical sub-community	Mixed plantation woodland	Tithe Plantation, south of Spixworth
W10 <i>Quercus robur</i> - <i>Pteridium aquilinum</i> - <i>Rubus fruticosus</i> woodland	W10c <i>Hedera helix</i>	Coniferous plantation	Spixworth Plantation
W16 <i>Quercus spp.</i> - <i>Betula spp.</i> - <i>Deschampsia flexuosa</i> woodland	W16a <i>Quercus robur</i>	Mixed plantation woodland	Dole Plantation, Thorpe Marriot)

8.4.78 Of the areas of semi-improved grassland within the Zol, a small number support a slightly higher number of species but they are not classified as species-rich. Two areas of grassland with slightly higher species richness and occurring under the footprint of the proposed Scheme were surveyed. The area at Brick Yard Farm was dominated by non-native species and may have been sown at some stage. The Fakenham Road Roadside Nature Reserve consists largely of coarse grass species and scattered scrub, but does include hoary mullein (*Verbascum pulverulentum*).

8.4.79 The following NVC grassland classifications were identified:

Table 8.10 NVC Grassland Classifications

NVC Community	NVC Sub-Community	Habitat	Location
MG1 <i>Arrhenatherum elatius</i> grassland	MG1a <i>Festuca rubra</i>	Semi improved neutral grassland	Adjacent to Brick Yard Farm, Reepham Road
MG1 <i>Arrhenatherum elatius</i> grassland	MG1b <i>Urtica dioica</i>	Semi improved neutral grassland (species-poor)	Fakenham Road RNR

8.4.80 Arable fields are the main land use within the survey corridor. These include cereal and non-cereal crops and fields recently seeded with grass. Set-aside field margins are found in a few locations, and they support vegetation resembling semi-improved neutral grassland, with a higher proportion of arable weeds.

8.4.81 Some field margins adjacent to Marriott’s Way, and those to the east of Tithe Plantation and to the north of Beeston Park are frequently disturbed and hence have an open habitat structure with an abundance of arable weeds. These are classified as vegetation of open habitats. The field margins north of Postwick and adjacent to Marriot’s Way are less disturbed and more closely resemble semi-improved neutral grassland.

8.4.82 The following arable field margin NVC classifications were identified:

Table 8.11 NVC Arable Field Margin Classifications

NVC Community	NVC Sub-Community	Habitat	Location
OV9 <i>Matricaria perforata</i> - <i>Stellaria media</i> community	OV9d <i>Bilderdykia convolvulus</i> - <i>Veronica persica</i>	Vegetation of open habitats	Adjacent to Marriot’s Way
OV22 <i>Poa annua</i> - <i>Taraxacum officinale</i> community	OV22c <i>Crepis vesicaria</i> - <i>Epilobium adenocaulon</i>	Vegetation of open habitats	To east of Tithe Plantation, south of Spixworth
OV25 <i>Urtica dioica</i> - <i>Cirsium arvense</i> community	N/A	Vegetation of open habitats	North of Beeston Park and north of Beeston Lane
MG1 <i>Arrhenatherum elatius</i> grassland	MG1a <i>Festuca rubra</i> sub-community	Semi improved neutral grassland	North of Postwick on north side of A47
MG1 <i>Arrhenatherum elatius</i> grassland	N/A	Semi improved neutral grassland	Adjacent to Marriot’s Way

8.4.83 Arable field margins are a priority habitat in the Norfolk LBAP and the (outgoing) UK BAP habitat.

Protected, Notable and Invasive Plant Species

8.4.84 No protected or notable plant species were noted as part of the Phase 1 Habitat Survey.

8.4.85 Four stands of Japanese knotweed were identified within the survey corridor.

- North of Heath Farm, close to the existing Postwick junction;
- Hall Farm, Rackheath;
- Around the pond north of Gazebo Farm, Rackheath; and
- Gazebo Covert, Rackheath.

8.4.86 The stand at Heath Farm has been subject to attempts to eradicate this species, although further efforts are likely to be required in the future.

8.4.87 Rhododendron shrubs are frequent in the understorey of Heath Wood, Rackheath.

8.4.88 Winter heliotrope (*Petasites fragrans*) is dominant on the verge of Middle Road. This species is non-native and invasive, although it is not listed on Schedule 9 of the Wildlife and Countryside Act 1981 (as amended).

Protected Animal Species

Bats

8.4.89 All 18 UK bat species and their roosts are protected under the Wildlife and Countryside Act 1981 and the Conservation of Habitats and Species Regulations 2010. In addition, the barbastelle (*Barbastella barbastellus*), noctule (*Nyctalus noctula*), soprano pipistrelle (*Pipistrellus pygmaeus*) and brown long-eared bat (*Plecotus auritus*) are all Species of Principle Importance and Norfolk BAP species.

8.4.90 Bats are ubiquitous within the Zol. The frequency with which they occur in the Zol and the wider landscape, combined with above levels of protection, means bats have been subject to a high level of survey effort, both temporally and spatially. The history of the proposed Scheme has allowed several

seasons of data to be obtained. Surveys have been updated regularly as it is not permissible to base assessments of impact on data more than 18 months old.

8.4.91 The volume of survey data means that it is not possible, nor appropriate, to include all survey results here; instead, the text below provides a brief overview of results. Full details of all surveys are included Bat Survey Report (Mott MacDonald, 2013), located in Volume 2, Chapter 8, Section E.

8.4.92 A total of ten bat species have been identified within the Zol. These are listed below.

- common pipistrelle (*Pipistrellus pipistrellus*);
- soprano pipistrelle (*Pipistrellus pygmaeus*);
- Nathusius' pipistrelle (*Pipistrellus nathusii*);
- brown long-eared (*Plecotus auritus*);
- Natterer's (*Myotis nattereri*);
- Daubenton's (*Myotis daubentonii*);
- noctule (*Nyctalus noctula*);
- serotine (*Eptesicus serotinus*);
- Leisler's (*Nyctalus leisleri*); and
- barbastelle (*Barbastella barbastellus*)

8.4.93 A number of hibernation roosts were identified, in churches and other buildings within 2km of the proposed Scheme. Evidence of bats was found in eleven of the seventeen churches visited; seven of these are predicted to be of high potential for hibernating bats. The nature of the construction of churches means that actually finding hibernating bats is unlikely; many of the potential roost locations are completely inaccessible. However, hibernating bats were located in one church.

8.4.94 Fourteen other potential hibernation sites were surveyed. Evidence of hibernating bats was found at four of these, whilst evidence of other roost types (maternity roost, feeding perch etc) was found at several others. Note that access to some of these buildings and structures was not possible, for a variety of reasons (derelict, unsafe structures, access denied by landowner,

buildings being demolished etc). One potential hibernation roost, Hall Farm, is located within the footprint of the proposed Scheme. This building is fenced off as is it derelict, so surveys this season were not possible. However, surveys in previous seasons identified hibernating bats. Conditions in the roost remain largely the same, so it is feasible to assume that hibernating bats are still using this location.

8.4.95 Other suitable buildings within 50 m of the proposed Scheme were surveyed during the summer season to identify usage by bats. Of the ninety one buildings surveyed, 11 roosts were confirmed. These included:

- Eight brown long-eared roosts;
- Four common pipistrelle roosts; and,
- Two soprano pipistrelle roosts.

8.4.96 Other bat species were recorded close to the buildings during the dusk and dawn surveys, displaying either foraging or commuting behaviour. These include:

- noctule;
- Leisler's;
- *Myotis* spp.; and,
- barbastelle.

8.4.97 Quaker Farm, to the east of Norwich airport, was subject to particularly high survey effort due to its known value for several species of bats. The numerous survey types here (unmanned automated surveys, manned emergence and re-entry surveys etc) demonstrated that the buildings here (particularly the flint and thatch barn) are used by the following species:

- common pipistrelle;
- soprano pipistrelle;
- barbastelle;
- *Myotis* spp; and
- brown long-eared

8.4.98 A large number of individual trees within 25 m of the proposed Scheme (parkland trees, trees in hedgerows, gardens etc) were climbed to identify the potential for roosting locations and to search for roosting bats. Of the 192 trees climbed, ten were confirmed as roost locations, for pipistrelles, brown long-eared, Natterer's and barbastelle.

8.4.99 Those trees identified as of high potential for bat roosts, but not suitable for climbing, were subject to emergence/re-entry surveys. Of the 67 trees surveyed, roosts were identified at 27. Roosting species included common and soprano pipistrelle, brown long-eared, Natterer's, noctule, barbastelle, serotine and *Myotis* spp.

8.4.100 A total of ten blocks of woodland with 25 m of the proposed Scheme were surveyed. Bat activity was observed in each of them; roosts were confirmed in three. (Note that the survey methodology for woodlands was not specifically aimed at identifying specific roost locations). All species of bat known within the ZOI listed previously were identified during these surveys.

8.4.101 The transect surveys, aimed at quantifying levels of activity in various areas, and allowing comparisons between them, demonstrated high activity in virtually all areas surveyed. The 2009/2010 survey data was not analysed at a species level. Instead it grouped types of bat (big bats – noctule, serotine and Leisler's), *Myotis* spp, with particular attention to barbastelles. Early recordings were analysed, which would indicate potential roosts nearby. (Bat calls picked up a short time after sunset imply that roost site must be nearby as bats would not have had time to travel far. This method of analysis capitalises on the fact that different species of bat are known to emerge a set period after sunset). Activity was picked up in virtually all areas.

8.4.102 The 2012 transect provided additional spatial coverage to the 2009/2010 transects. It recorded six species:

- common pipistrelle;
- soprano pipistrelle;
- Nathusius' pipistrelle;
- *Myotis* species;
- noctule; and,
- serotine.

8.4.103 Transects in 2013 have covered all of the previously completed transects from both 2009/2010 and 2012. All known species within the Zol, as listed at the beginning of this session, were identified during these surveys. Analysis was carried out in a similar way to in 2009/2010, whereby early calls of big bats, *Myotis* spp and barbastelles were identified. As in the previous period, activity was observed in most areas. A number of additional roosts were also identified.

8.4.104 A large number of unmanned static surveys were carried out. These were planned to coincide and reinforce the transects above, by using the same geographical areas and features. The surveys in 2009 identified a number of species, as listed below:

- common pipistrelle;
- soprano pipistrelle;
- Nathusius pipistrelle;
- barbastelle;
- noctule;
- serotine;
- *Myotis* spp; and
- brown long-eared

8.4.105 The bat report includes some detailed analysis of the data, comparing month by month recordings for each of the areas. This has been carried out by group of species, rather than at a species level, with the exception of barbastelles.

8.4.106 Similar to the transect surveys, unmanned static surveys took place in 2010 and 2012 to provide additional spatial coverage of the Zol. Activity by at least nine species was identified:

- barbastelle;
- *Myotis* spp.;
- noctule;
- Leisler's;

- serotine;
- brown long-eared;
- common pipistrelle;
- soprano pipistrelle; and,
- Nathusius' pipistrelle.

8.4.107 Four radio tracking sessions were carried out as part of the detailed survey package for the proposed Scheme. Two sessions were undertaken during the 2009 survey season in June and August. One session was carried out in August 2012, focusing on the eastern end of the Zol. An additional session was undertaken in May 2013, as an update to the 2009 data and to collect additional information for the eastern end of the proposed Scheme.

8.4.108 The radio tracking surveys were carried out to provide a more detailed understanding of bat movements throughout the wider landscape, to allow a more informed, accurate assessment of the impacts on bats that the proposed Scheme would have. Radio tracking focussed on the more sensitive species within the Zol, most notably barbastelles.

8.4.109 Through the radio tracking sessions it has been demonstrated that, within the Zol, Marriott's Way and Middle Lane are very well-used bat routes, particularly for the more sensitive species.

8.4.110 In May 2013, 100 bats were trapped, including common pipistrelle, soprano pipistrelle, barbastelle, brown long-eared, serotine, Natterer's and Daubenton's. Of these, six barbastelles were tagged and radio-tracked. Note that the weather conditions during early part of 2013 were poor.

8.4.111 In August 2012, 75 bats were trapped, including common pipistrelle, soprano pipistrelle, Nathusius' pipistrelle, barbastelle, brown long-eared, serotine, Natterer's and Daubenton's. Three barbastelles were tagged and radio-tracked.

8.4.112 In June 2009, 302 bats were trapped, including barbastelle, Daubenton's, Natterer's, brown long-eared, common pipistrelle, soprano pipistrelle and Nathusius' pipistrelle. A total of 19 of these were tagged and radio-tracked, nine of which were barbastelles.

8.4.113 In August 2009, 230 bats were trapped. Of these, 22 barbastelles were tagged and radio-tracked.

8.4.114 The radio-tracking surveys allowed a greater understanding of bat ranges, and allowed individuals to be caught in various locations and tracked back to roosts elsewhere in the study area, sometimes a distance of several kilometres. Emergence surveys of these confirmed roosts allowed the total number of individuals using these roosts to be quantified.

8.4.115 The surveys have demonstrated that the following features within the Zol are of particular importance to bats:

- Access road between Fakenham Road and the shooting school at Deighton Hills, lined by a hedgerow to the north;
- Marriott's Way;
- Tree line through farmland south of Horsford, west of Drayton Lane;
- Quaker Lane;
- Spixworth Plantation;
- Beeston Estate;
- Accommodation track in Rackheath Estate;
- Newman's Road;
- Double tree line off Toad Lane;
- Middle Road;
- Footpath between Smee Lane and Low Road;
- Smee Lane;
- Hedgerow south of Smee Lane (2nd one south of Smee Lane, running parallel to the road); and,
- Hedgerow east of Broadland Way (running parallel to the road).

8.4.116 In assigning conservation values to bats within and around the Zol, to allow the appropriate level of assessment, it is prudent to consider aspects of bat ecology separately. The following six aspects, each considered to be of Very High conservation value will therefore be assessed:

- Three directly affected roosts in buildings;

- Seven directly affected roosts in trees;
- Indirectly affected roosts;
- Overall barbastelle populations;
- Significant flight paths and other features of importance; and
- Other areas of activity

8.4.117 Detailed bat survey results are available in the Bat Survey Report (Mott MacDonald, 2013), located in Volume 2, Chapter 8, Section D.

Badgers

8.4.118 Badgers and their setts are protected in the UK under the Protection of Badgers Act 1992 against killing/injuring, disturbance to and interference with setts.

8.4.119 A total of seven badger setts were identified within the ZOI. Associated with each sett, various features were identified.

8.4.120 Sett 1 is a complex of five individual setts covering an area of 100m by 75m in the Deighton Hills woodland, and so is not within the footprint of the proposed Scheme. It consists of one main sett, two annexe, one subsidiary and one outlying sett. There are active paths leading from this sett to the pasture land to the south, and badger hairs were found on the fence between the pasture and the shooting club. It is likely that the badgers are using the pasture land for foraging and there are signs of frequent digging in the field boundary. The other setts were primarily disused with more extensive vegetation in the holes and no signs of recent activity; however, in previous visits some of these were well used. An additional outlier was noted during this visit which appeared to have been recently dug. The new outlier sett is located closer to the shooting club entrance approximately 150m from the main sett. It consisted of one entrance with a large freshly dug spoil heap. This sett is considered to be of Medium conservation value.

8.4.121 Sett 2 is located within Drayton Drewray, beyond the footprint of the proposed Scheme. No direct evidence of badgers was found at the sett or in the surrounding woodland. However, the spoil heaps outside the holes were sufficiently large for it to be unlikely to have been dug by anything other than badgers. It is therefore likely that this is a seasonally used outlier sett. The visit to this sett showed no change in activity, with strong evidence that it is

currently being used by rabbits. This sett is considered to be of Low conservation value.

8.4.122 Sett 3 is situated along a hedgerow between two arable fields opposite Quaker Farm on Quaker Lane. The sett is within the footprint of the proposed Scheme and consists of two entrances. Neither entrance showed signs of recent use in 2012. However, there was evidence of active use in both 2007 and 2010. As this sett is unoccupied, it is considered to be of Low conservation value. Should badgers re-occupy it, the assessment will need to be revised.

8.4.123 Sett 4 is situated mid-way along Spixworth Plantation, within the footprint of the proposed Scheme. It consists of a sett with nine entrances along a bund within the plantation. All entrances were filled with leaf litter and vegetation; there was no evidence of recent use by badgers, although they may be seasonally used. The sett was not previously recorded in 2007 or 2010. As this sett is unoccupied, it is considered to be of Low conservation value. Should badgers re-occupy it, the assessment will need to be revised.

8.4.124 Sett 5 is located within Spixworth Woodland, but not within the footprint of the proposed Scheme. Evidence of badger, fox and rabbit was found in the immediate vicinity of the holes at this sett making it difficult to assign a status to them. This sett was not previously recorded in 2007 or 2010. Paths were found that passed three other areas of holes and to the pasture land to the north and west of the woodland. The proposed road would travel through this pastureland. These other areas of holes showed no direct evidence of badgers but as they are on an active badger path the suitable holes were classified as partially active. Two further areas of activity were found as well as several groups of holes that may have been dug by badgers but currently only showed evidence of being inhabited by rabbits or foxes. The two active areas were classified as subsidiary setts. This sett is considered to be of Medium conservation value.

8.4.125 Sett 6 is situated along a hedgerow in farmland to the east of Thorpe End, and is within the footprint of the road. It currently appears to be occupied only by rabbits, although it may be seasonally used by badgers. This sett was not previously recorded in 2007 or 2010. As this sett is unoccupied, it is considered to be of Low conservation value. Should badgers re-occupy it, the assessment will need to be revised.

8.4.126 Sett 7 is located directly beneath the footprint of the proposed road where it crosses Marriott's Way. It consists of a single entrance hole. This sett

was not recorded in any previous surveys but was discovered during other survey work in May 2013. Given the location of the sett within dense brambles and on a steep slope, a detailed assessment of the entrance itself has not been possible. As a result, it is not possible to confirm that this is a badger sett. However, until such confirmation is possible (usually through the clearance of vegetation), it will be assumed that this is a badger sett to ensure appropriate mitigation measures are taken. This sett is considered to be of Medium conservation value.

- 8.4.127 The detailed survey results can be found in the Badger Survey Report (Mott MacDonald, 2013), in Volume 2, Chapter 8, Section E.

Great Crested Newts

- 8.4.128 Great crested newts are protected under the Wildlife and Countryside Act 1981. They are also protected under the Conservation of Habitats and Species Regulations 2010, and are listed under the IUCN Red List, Appendix II of the Bern Convention and Annexes II and IV of the EC Habitats Directive. Great crested newts are also a Species of Principle Importance and a LBAP species.
- 8.4.129 As has been described previously, surveys for many species and habitats have been carried out more than once during the life of the proposed Scheme. Surveys for great crested newts took place in 2012, and were supplemented during 2013 to address some of those ponds that could not be surveyed the previous year, either as they were dry or because access was denied. These surveys served to update those that took place in 2011, 2009 and 2007.
- 8.4.130 Preliminary assessments using Habitat Suitability Index scores (Oldham et al., 2000) were completed for 122 ponds in the Zol over 2012 and 2013. Of these 122 ponds, 65 were identified as suitable habitat for great crested newts.
- 8.4.131 Of the 65 ponds that were initially identified as having potential for great crested newts, a total of 12 ponds were found to support great crested newts.
- 8.4.132 The survey results demonstrate that four meta-populations are located within the Zol. A meta-population is a series of subpopulations that are linked by the dispersal of individuals; great crested newts commonly move between ponds that are within around 250m of each other and usually not further than

1.3km (English Nature, 2001). Information on the four meta-populations is shown in the table below.

Table 8.12 Great Crested Newt Meta-Population Results

Meta-Population Location	No of Ponds	Population Size	Peak Meta-Population Counts
Dog Lane, Horsford	Three (ponds 5, 6 and 7)	Medium	26
Spixworth Road, Horsham St Faith	One (pond 15)	Small	6
Quaker Lane, Spixworth	One (pond 16)	Medium	27
Newman Road, Rackheath	Seven (ponds 37, 42, 44, 47, 48, 41 and 45)	Medium	43

8.4.133 Each of these meta-populations is of Very High conservation value, due to their status as European protected species.

8.4.134 A number of ponds within the Zol were not surveyed during the 2012/2013 seasons, mostly because landowner access was not available. Most of these had been surveyed in previous seasons. Where possible these ponds were visually assessed for their suitability for great crested newts from nearby areas where access was possible, and by using recent aerial photography. This information was combined to formulate suitable mitigation proposals, based on the professional judgement of licensed ecologists, using where necessary the precautionary principle.

8.4.135 Detailed great crested newt survey results can be found in the Great Crested Newt Report (Mott MacDonald, 2013), located in Volume 2, Chapter 8, Section E.

Breeding Birds

8.4.136 All nesting birds are protected in the UK under the Wildlife and Countryside Act 1981 with those species listed on Schedule 1 of the Act being

conferred additional protection from disturbance when breeding. Specific reference has been made in this section to those birds listed on Schedule 1 as well as Red and Amber List 'Birds of Conservation Concern' (Eaton et al 2009), Annex 1 Birds Directive and those listed as Species of Principle Importance and Norfolk BAPs.

8.4.137 Breeding evidence was recorded for a total of 61 species within the Zol of the proposed scheme, of which:

- One species is listed on Schedule 1 – little ringed plover (*Charadrius dubius*);
- 14 species are Species of Principle Importance in England, six of which have Norfolk BAPs;
- 11 species are Red List Birds of Conservation Concern;
- 16 species are Amber List Birds of Conservation Concern; and
- 35 species are Green List Birds of Conservation Concern.

8.4.138 A full species list can be found in the Breeding Bird Survey Report in Volume 2, Chapter 8, Section G.

8.4.139 Blue tit (*Cyanistes caeruleus*), chaffinch (*Fringilla coelebs*), robin (*Erithacus rubecula*), wren (*Troglodytes troglodytes*) and great tit (*Parus major*) were the most numerous species in terms of the maximum number of individuals detected. Chaffinch, wren, robin and skylark (*Alauda arvensis*) were the most numerous species in terms of the maximum number of singing males. A total of 28 species were confirmed breeding with a further three probably breeding and 29 species possibly breeding.

8.4.140 Groups of birds, whose total number exceeds 1% of the total population within a specific geographic scale, i.e. international, national, region, county etc., are considered to be significant at that geographic scale. The following species within the Zol were found to exceed 1% of the median Norfolk population estimate and are therefore considered to be of county value: blackcap (*Sylvia atricapilla*), buzzard (*Buteo buteo*) and goldcrest (*Regulus regulus*). It is likely that the number of buzzard nest locations within the Zol does not exceed to 1% of the median Norfolk population estimate but more likely is that the number of home ranges overlapping the Zol exceeds the 1% threshold.

8.4.141 Little ringed plover (2 birds) were recorded on one visit in apparently suitable breeding habitat at the mineral extraction site immediately north of

Quaker Farm. No further evidence of little ringed plover was recorded at this site and it is considered likely that the birds may have come from larger mineral extraction areas to the north of Church Lane/Spixworth Park. Breeding could be recorded within the Zol in the future given the apparently suitable habitat near Quaker Farm but it is considered to occur incidentally within the Zol at the time of the surveys and does not exceed the 1% of the median Norfolk breeding population estimate.

- 8.4.142 A single singing male yellow wagtail (*Motacilla flava flavissima*) was recorded on a site visit in 2012 (east of Broadland Way) and in 2007 (south of Holt Road). This species is considered to occur incidentally within the Zol and does not exceed the 1% of the median Norfolk breeding population estimate.
- 8.4.143 Turtle dove (*Streptopelia turtur*) was recorded on a site visit in 2007 (south of Holt Road). This species was not recorded in 2012 or 2013 and is considered to occur incidentally within the Zol. Hobby (*Falco subbuteo*) is listed on Schedule 1 of the Wildlife and Countryside Act and was recorded on site visits in 2007 and incidentally in 2013 at a single location close to the proposed route alignment. Hobby was not recorded at this location during surveys in 2012. Given the legal protection from disturbance whilst breeding afforded to this species, this species poses a potential constraint to the programming of construction if confirmed as breeding prior to or during construction.
- 8.4.144 A small colony of sand martin (*Riparia riparia*) was located in mineral workings at Spring Farm, Taverham, The colony consisted of approximately 12 active cavities and is the only sand martin colony located along the proposed scheme route.
- 8.4.145 Utilisation distribution of breeding birds highlighted areas of high intensity bird use for woodland, mature trees in hedgerows and residential areas. Therefore these habitats are likely to constitute good resource areas for breeding birds within the area of the proposed Scheme. Farmland fields dominate the area of the proposed route but the intensity of bird use is generally low.
- 8.4.146 Those bird species listed on Schedule 1 of the Wildlife and Countryside Act 1981 (as amended), those on the RSPB Red list, and those listed as Species of Principle Importance and/LBAP species are considered as being of High conservation value. Those species listed on the RSPB Amber List are considered as being Medium conservation value.

8.4.147 Those 15 species on Schedule 1 of the Wildlife and Countryside Act 1981, Species of Principle Importance and on the RSPB Red List, and therefore of High conservation value are:

- Bullfinch (*Pyrrhula pyrrhula*)
- Cuckoo (*Cuculus canorus*)
- Dunnock (*Prunella modularis*)
- Grey Partridge (*Perdix perdix*)
- House Sparrow (*Passer domesticus*)
- Linnet (*Carduelis cannabina*)
- Little Ringed Plover (*Charadrius dubius*)
- Marsh Tit (*Poecile palustris*)
- Reed Bunting (*Emberiza schoeniclus*)
- Skylark (*Alauda arvensis*)
- Song Thrush (*Turdus philomelos*)
- Spotted Flycatcher (*Muscicapa striata*)
- Starling (*Sturnus vulgaris*)
- Yellow Wagtail (*Motacilla flava*)
- Yellowhammer (*Emberiza citronella*)

8.4.148 Those 13 species on the RSPB Amber list, and therefore of Medium conservation value, are:

- Green Woodpecker (*Picus viridis*)
- House Martin (*Delichon urbicum*)
- Kestrel (*Falco tinnunculus*)
- Mallard (*Anas platyrhynchos*)
- Meadow Pipit (*Anthus pratensis*)

- Mistle Thrush (*Turdus viscivorus*)
- Sand Martin (*Riparia riparia*)
- Stock Dove (*Columba oenas*)
- Swallow (*Hirundo rustica*)
- Tufted Duck (*Aythya fuligula*)
- Wheatear (*Oenanthe oenanthe*)
- Whitethroat (*Sylvia communis*)
- Willow Warbler (*Phylloscopus trochilus*)

8.4.149 Groups of birds, whose total number exceeds 1% of the total population within a specific geographic scale, i.e. international, national, region, county etc., are considered to be significant at that geographic scale. It is therefore considered that the following species, not included in the lists above, are also of Medium conservation value:

- Blackcap (*Sylvia atricapilla*)
- Goldcrest (*Regulus regulus*)

8.4.150 Detailed breeding birds survey results can be found in the Breeding Bird Report (Mott MacDonald, 2013), in Volume 2, Chapter 8, Section G.

Over-wintering Birds

8.4.151 The Norfolk Bird Atlas provided a primary source of data for the desk-based aspect of the survey. Norfolk bird atlas surveys were carried out between 1999 and 2007 on a tetrad basis (2 x 2 km) with each tetrad visited twice in winter within the same calendar year. Historical data was collected for the wider area in which the proposed Scheme is located.

8.4.152 From the Norfolk Bird Atlas it was determined that a total of 73 species are likely to regularly overwinter within the wider area encompassing the ZOI of the proposed Scheme, of which:

- Two are listed on the EU Wild Birds Directive Annex 1 – golden plover (*Pluvialis apricaria*) and kingfisher (*Alcedo atthis*);
- 16 species are Species of Principle Importance in England, six of which have Norfolk BAPs;

- 15 species are Red List Birds of Conservation Concern;
- 25 species are Amber List Birds of Conservation Concern; and
- 35 species are Green List Birds of Conservation Concern.

8.4.153 It was determined that 15 of the 73 species found were recorded throughout the wider area in which the proposed Scheme is located: blackbird (*Turdus merula*), black-headed gull (*Chroicocephalus ridibundus*), blue tit (*Cyanistes caeruleus*), chaffinch (*Fringilla coelebs*), dunnoek (*Prunella modularis*), fieldfare (*Turdus pilaris*), greenfinch (*Chloris chloris*), great tit (*Parus major*), jay (*Garrulus glandarius*), kestrel (*Falco tinnunculus*), magpie (*Pica pica*), robin (*Erithacus rubecula*), starling (*Sturnus vulgaris*), woodpigeon (*Columba palumbus*) and wren (*Troglodytes troglodytes*).

8.4.154 The total number of species in any one tetrad ranged from 28 to 54 species; across all the sampling areas the average was 40.4 species.

8.4.155 The desk-based assessment was followed up by site surveys, which were undertaken in February 2013 at seven sample sites selected across the proposed route. Sites were selected to be representative of woodland and farmland habitats found across the proposed route. Surveys were conducted based on the British Trust for Ornithology Winter Farmland Bird Survey methodology.

8.4.156 A total of 58 species were recorded overwintering within the ZoI of the proposed Scheme, of which:

- One is listed on the EU Wild Birds Directive Annex 1 (golden plover);
- 12 species are of principle importance in England, six of which have Norfolk BAPs;
- 12 species are Red List Birds of Conservation Concern;
- 15 species are Amber List Birds of Conservation Concern; and
- 30 species are Green List Birds of Conservation Concern.

8.4.157 Nine species were recorded at all sampling sites: blackbird, blue tit, carrion crow (*Corvus corone*), chaffinch (*Fringilla coelebs*), great tit, magpie, robin, woodpigeon and wren. The most frequently observed species were: blue tit (96 observations), great tit (75), chaffinch (72), robin (63) and blackbird (61).

- 8.4.158 Eight species were recorded only once during the sampling surveys: grey heron (*Ardea cinerea*), little owl (*Athene noctua*), lesser redpoll (*Carduelis cabaret*), marsh tit (*Poecile palustris*), nuthatch (*Sitta europaea*), sparrowhawk (*Accipiter nisus*), teal (*Anas crecca*), and tufted duck (*Aythya fuligula*). Limited suitable habitat within the sampling areas is likely to explain the paucity of grey heron, lesser redpoll, marsh tit, nuthatch, teal and tufted duck observations. Bird behaviour is likely to explain the reduced ability to detect little owl (largely nocturnal) and sparrowhawk (relatively large home range).
- 8.4.159 The total number of species in any one sampling area ranged from 24 to 33 species; across all the sampling areas the average was 28.6 species.
- 8.4.160 Utilisation distribution of over-wintering birds highlighted areas of high intensity bird use for woodland, mature trees in hedgerows and residential areas. Therefore these habitats are likely to constitute good resource areas for overwintering birds within the area of the proposed Scheme. Farmland fields dominate the area of the proposed route but the intensity of bird use is generally low but punctuated by clusters of high bird numbers attributed to concentrations of woodpigeon, black-headed gull and common gull (*Larus canus*). Congregations of gull species were related to field ploughing activities at the time of surveying. Other congregatory species, i.e. lapwing (*Vanellus vanellus*) and golden plover, were identified in relatively low numbers at two locations (Horsham St. Faith and near A47 (golden plover only)). The location just north of the A47 with golden plover (8 birds) appears to be a traditionally used site in winter and early spring with birds recorded here on previous surveys in April 2007 (98 birds) and April 2012 (45 birds).
- 8.4.161 Those overwintering bird species listed on Schedule 1 of the Wildlife and Countryside Act 1981 (as amended), those on the RSPB Red list, and those listed as Species of Principle Importance and/LBAP species are considered as being of High conservation value. Those species listed on the RSPB Amber List are considered as being Medium conservation value.
- 8.4.162 The results of the over-wintering bird surveys can be found in the Over-wintering Bird Survey report (Mott MacDonald, 2013), located in Volume 2, Chapter 8, Section H.

Barn Owl

- 8.4.163 Barn Owls are listed on Schedule 1 of the Wildlife and Countryside Act 1981, meaning it is an offence to intentionally or recklessly cause disturbance at, on or near an 'active' nest. They are also a Norfolk BAP species.
- 8.4.164 The survey results include four aspects: the identification of actual nesting or breeding sites, the identification of potential nesting, roosting or resting sites, and the assessment of habitats in terms of their suitability for utilisation by barn owls for hunting. The latter aspect relates directly to the likelihood of the habitat to support populations of barn owl prey species. Potential accident black-spots were also identified, primarily to inform the proposed mitigation strategy, in an effort to eliminate or reduce potential vehicle collision mortality.
- 8.4.165 Six occupied breeding sites and three roost or rest sites were identified within the Zol. Two of the nest sites were nest boxes that have subsequently fallen into disrepair and are no longer available as suitable nest sites. On the basis of the records collected in this study it is likely that the home ranges of at least six breeding pairs overlap with the Zol. This represents at least 1% of the Norfolk population. The barn owl population within the Zol is therefore of High conservation value.
- 8.4.166 One of the known nesting sites is within the footprint of the proposed Scheme.
- 8.4.167 A total of 256 potential nesting, roosting or resting sites were found along the proposed Scheme. Of these the majority were mature trees covered in ivy and therefore it could not be ascertained whether they had suitable cavities or not. The density of potential nest, roosting and rest sites increases east and south along the route of the proposed road.
- 8.4.168 The corridor of the proposed Scheme is dominated by arable farmland, within which suitable habitat is largely found along the field margins and hedgerows, and as small fragments of fallow or cattle-grazed grassland. The distribution shows six, relatively evenly spaced centres of resource utilisation. The highest known utilisation area is at the River Wensum/Fakenham Road end of the proposed Scheme. The utilisation of much of the proposed Scheme area is moderate with lower utilisation recorded in the areas between Fir Covert Road and Reephams Road, and Thorpe End along Plumstead Road.
- 8.4.169 Detailed results of the barn owl survey can be found in the Barn Owl Survey Report (Mott MacDonald, 2012), located in Volume 2, Chapter 8, Section I.

Aquatic Invertebrates

- 8.4.170 In 2006 and 2007, sampling sites were located at four points around the lake and in two ditches within The Springs CWS. Samples were taken from both the vegetation at the edge of the lake and softer sediments approximately 3m from the shore. In 2013, samples were taken from the same four points around the lake, but from only one of the ditches.
- 8.4.171 Biological water quality ranged from moderate to very good in the lake, with slightly lower scores in the outflow stream and poor scores in the boundary ditch. Scores in 2013 were slightly higher overall than in 2006 and 2007, indicating a slight water quality improvement. Biological water quality information is, however, interpreted here with caution, as many of the standard scoring systems were developed for flowing water. Sweep samples from the lake in all years contained the most diverse macro-invertebrate communities, with a good range of species found. The majority of invertebrate species found are widespread and common in this type of habitat, however a single specimen of Desmoulin's whorl snail (*Vertigo moulinsiana*) was found in September 2006. This species is categorised as rare in the British Red Data Books, is listed on Section 41 of the NERC Act (2006) and is a Norfolk Biodiversity Action Plan Priority Species and is listed on Annex II of the EC Habitats Directive.
- 8.4.172 A specific survey for Desmoulin's whorl snail was subsequently carried out in May 2008. Adults and juveniles were found at locations around The Springs lake and in the wet woodland between the two lakes. A repeat survey for Desmoulin's whorl snail in 2013 found very few individuals present, possibly indicating that there has been a change in ground moisture levels at the site.
- 8.4.173 While the general aquatic invertebrate community is of Low conservation value, the population of Desmoulin's whorl snail is of High conservation value. However, it is considered, because of the diversity and sensitivity of the general aquatic invertebrate population at The Springs, that it is appropriate to consider the whole population, including Desmoulin's whorl snail, through the remainder of the assessment. The aquatic invertebrate population is therefore considered to be of High conservation value.
- 8.4.174 Detailed results of the aquatic invertebrate surveys can be found in the Invertebrate Survey Report (Mott MacDonald, 2013), located in Volume 2, Chapter 8, Section J.

Terrestrial Invertebrates

- 8.4.175 An initial, detailed set of terrestrial invertebrate surveys were carried out by Norfolk Wildlife Services in 2007. These surveys did not reveal the presence of any protected terrestrial invertebrate species within the works corridor of the proposed NDR (Norfolk Wildlife Services, 2008). Therefore, it was not necessary to repeat these surveys. However, it was still important to identify those habitats with the potential to support terrestrial invertebrate assemblages of conservation importance so that they can be mitigated for appropriately.
- 8.4.176 The survey comprised a habitat suitability assessment of the area within the ZOI, considering the potential to support both particularly diverse assemblages (relative to the surrounding habitat) and assemblages that may contain specialised and potentially rare species. The habitats present along the route were surveyed in the field during a walkover of the whole length of the proposed Scheme route by an ecologist using knowledge and experience to identify features of particular importance to terrestrial invertebrates.
- 8.4.177 Seven sites containing habitats of six different types of at least Low Conservation Value for terrestrial invertebrates were identified along the proposed Scheme.
- 8.4.178 The Fakenham Road Roadside Nature Reserve is designated for hoary mullein (*Verbascum pulverulentum*), a Nationally Scarce species that only grows as a native in East Anglia. The majority of the verge consists of a mainly south-facing bank, towards the eastern end of which are some areas of bare earth. Bare earth habitats can have particular value for invertebrates, most notably ground-nesting, solitary bees (e.g. *Andrena* spp.) and wasps. In addition, a number of thermophilic species use bare earth habitats for both foraging and basking, for example, a variety of ground beetles (*Carabidae*), rove beetles (*Staphylinidae*) and centipedes (*Chilopoda*) as well as a number of fly species (particularly *calypterates*) that appear to utilise patches of bare earth as swarm-markers and for lekking activity.
- 8.4.179 Larvae of the mullein moth (*Shargacucullia verbasci*), a relatively common species in the southern half of Britain, were found feeding on the hoary mullein. The Fakenham Road RNR is of Low conservation value for terrestrial invertebrates.
- 8.4.180 The wide road verge on the southern side of Reepham Road, which runs for approximately 1.3km, appears to have been planted relatively recently i.e. within the last five years. Directly adjacent to the road is a strip of

grassland approximately 10m wide. A number of flowering plant species are present, and a large number of pollinating insects (particularly honey bees (*Apis mellifera*) and bumble bees (*Bombus* spp.)) were in evidence at the time of the survey.

- 8.4.181 Within the context of the surrounding arable landscape, where nectaring opportunities are limited, this site offers above average potential for nectar feeding terrestrial invertebrate species. This habitat is assessed as being of Low Conservation Value.
- 8.4.182 An area of habitat at the junction of Holt Road and the A140 at Harts Hill was also assessed. This small site (approximately 1ha) appears to be a Sustainable Drainage System (SuDS) pond and surrounding semi-improved grassland and scrub.
- 8.4.183 The pond has matured and has a well-established reed bed dominated by common reed (*Phragmites australis*) at the western end, which is starting to become overgrown. The water was clear at the time of the visit and there were no signs of eutrophication or pollution. The area immediately around the pond consists of semi-improved grassland. The site slopes up away from the pond resulting in north- and west-facing banks. Beyond this and around the edge of the majority of the site is an area of young plantation woodland. This site has a high level of structural complexity, meaning that the different habitats on the site are non-uniform in their structure giving rise to many different niches and thus maximising the number of opportunities for invertebrates to occupy.
- 8.4.184 This is a varied site containing a number of microhabitats and topographical niches suggesting that there is the potential for a diverse terrestrial invertebrate fauna. Such a site is relatively unusual within the context of the surrounding arable landscape. However, given the limited time that this habitat has existed, this site is assessed as being of Low Conservation Value.
- 8.4.185 Arable field margins adjacent to Marriott's Way and in Beeston Park are both currently unplanted and apparently unmanaged. They contain a range of grass and herb species, and so could become of particular importance to invertebrates, most notably ground beetles and some phytophagous insects. Within the context of the surrounding agricultural landscape, these strips offer a significant increase in botanical diversity relative to the surrounding arable crops and, therefore, increased foraging and

breeding opportunities for terrestrial invertebrates. These arable field margins have been assessed as being of Low Conservation Value.

- 8.4.186 An area of immature plantation woodland at The Springs contains mostly poplars (*Populus* spp.) and goat willow (*Salix capraea*), and there are a number of water features present including a pond and Dobb's Beck. Woodland can be a very important habitat for invertebrates. Some of the most important microhabitats are deadwood features, such as large fallen timbers, dead limbs retained on trees, water-filled rot holes and areas where sap is exuding (sap runs, which can be particularly important for many hoverfly species). Typically, these features develop on old or veteran trees. However, this is immature plantation woodland (most likely less than 30 years old) and it is highly unlikely that the features described above are present here.
- 8.4.187 Surveys carried out in the adjacent Springs CWS in 2007 (Mott MacDonald, 2008) identified a population of Desmoulin's whorl snail (*Vertigo moulinsiana*) around the Springs Lake. Desmoulin's whorl snail is classified as "Rare" in the British Red Data Book (i.e. it is an RDB3 species) and is listed as a priority species under Section 41 of the NERC Act 2006. It is also listed on Annexe II of the EC Habitats Directive and is a priority species on the Norfolk BAP (Norfolk Biodiversity Partnership, 2011).
- 8.4.188 This area of woodland is broadly suitable for Desmoulin's whorl snail and is contiguous with the adjacent CWS where it is known to occur, so its presence cannot be ruled out. However, the immature woodland is sub-optimal habitat for this species and the likelihood of its presence is reduced as a result. The potential presence of Desmoulin's whorl snail means that this area of habitat is of Medium conservation value. Desmoulin's whorl snail is considered more thoroughly in the Aquatic Invertebrates section below.
- 8.4.189 An area of semi-improved grassland at Gazebo Covert has a high level of structural diversity. Additional physical complexity is provided by the topography, and the diversity of habitat types, which include rabbit grazed grassland, ruderal vegetation scrub, woodland edge etc.
- 8.4.190 Such a large and varied patch of contiguous, largely unmanaged, grassland habitat is unusual within the context of the surrounding agricultural landscape. The varied microhabitats present on the site offer the potential for a diverse invertebrate fauna. However, the habitat is of Low conservation value.

8.4.191 Detailed results of the terrestrial invertebrate surveys can be found in the Terrestrial Survey Report (Mott MacDonald, 2013), located in Volume 2, Chapter 8, Section K.

Reptiles

8.4.192 It is an offence under the Wildlife and Countryside Act 1981 to intentionally kill or injure reptiles including grass snake, adder (*Vipera berus*), slow worm (*Anguis fragilis*) and common lizard (*Zootoca vivipara*). All UK reptile species are designated as Species of Principal Importance.

8.4.193 The combined results of the reptile surveys demonstrated that reptiles are absent from many parts of the Zol. In the 2010 survey a total of two grass snakes, three common lizards, one adder and one slow worm were recorded during the survey, spread over four locations. In the 2007 survey six grass snakes were recorded within the survey area, over three locations. These locations overlapped, meaning that in total five locations were identified with reptiles present. The survey results are summarised in the table below:

Table 8.13 Summary of the 2007 and 2010 Reptile Survey Results

Location Number	Location Description	Grass Snake	Adder	Common Lizard	Slow Worm
1	Species-rich hedgerow with trees, northwest of The Springs	1 (2007) 2 (2010)		1 (2010)	
2	Edge of woodland plantation, Sprowston Wood	1 (2007)			
3	Near to broadleaved semi-natural woodland and hedgerow, south of A1151 Wroxham Road	2 (2007)			
4	Edge of Osier Car, broadleaved semi-natural woodland, south of A1151	2 (2007)	1 (2010)		1 (2010)

Location Number	Location Description	Grass Snake	Adder	Common Lizard	Slow Worm
	Wroxham Road				
5	Species-rich hedgerow with trees, close to Heath Wood, Rackheath			2 (2010)	

8.4.194 Locations 2, 3, 4 and 5 represent a cluster of sites in the vicinity of The Springs, corresponding with a watercourse and waterbodies, and with an associated mosaic of habitats, many of which are damp throughout much of the year. These habitats partly influence the pattern of land-use in the vicinity. Both combine to offer the best habitat within the Zol for reptiles, with good connectivity throughout, so the cluster here is not unexpected.

8.4.195 The general absence of reptiles throughout much of the rest of the Zol would be at least partly explained by the land-use, predominantly arable farmland, with interspersed linear features to field boundaries offering the only potential habitat for reptiles, in terms of both shelter and sources of prey.

8.4.196 Historical data also includes a record of an adder within Drayton Drewray, in 2005, which is reinforced by an anecdotal record of an adder in a similar location in 2010.

8.4.197 The reptile populations within the Zol are of Medium conservation value. However, given the sparse, fragmented nature of the reptiles populations it is unlikely that significant effects would be felt, so no further assessment is undertaken.

8.4.198 Detailed reptile survey results can be found in the Reptile Survey Report (Mott MacDonald, 2012), located in Volume 2, Chapter 8, Section L.

Water Vole and Otter

8.4.199 Water voles and their burrows are protected by the Wildlife and Countryside Act 1981. Their breeding and resting places are fully protected from damage, destruction or obstruction; it is also an offence to disturb them in these places. Otters are protected under both the Wildlife and Countryside

Act 1981 and the Conservation of Habitats and Species Regulations 2010. Both species are also designated as Species of Principle Importance and as Norfolk BAP species.

- 8.4.200 The surveys were informed initially by the Phase 1 Habitat survey, which identified likely habitats within the Zol that had the potential to be used by water vole and otters. The Springs CWS was only suitable location.
- 8.4.201 No direct sightings or field signs of either otter or water vole were observed. Norfolk Biodiversity Information Service did not have any records for this site.
- 8.4.202 In recent seasons the Angling club has erected otter fencing around the entire lake at this location, as a result of otter having preyed on the stocked fish populations here. It is likely that this was an isolated event; now fenced off, otters are precluded from entering the site. The lake is at the very top reaches of Dobb's Beck, a tributary of the River Bure some four miles to the North, which becomes a far more regulated, partly culverted ditch upstream of The Springs, with very little suitable habitat for otters. Subsequent surveys for field signs of otters around The Springs have not identified any evidence of their ongoing presence.
- 8.4.203 Otters are thus not likely to be using The Springs currently, and so it is not considered necessary to address these species in the subsequent sections of this report.
- 8.4.204 Detailed water vole and otter survey results can be found in the Water Vole and Otter Survey Report (Mott MacDonald, 2007), located in Volume 2, Chapter 8, Section M.

Brown Hare

- 8.4.205 The field surveys did not identify any brown hares within the Zol. A small number of incidental sightings were recorded by ecologists surveying other protected species in advance of the brown hare report being produced. Conversations with landowners in advance of the brown hare surveys, to arrange access, indicated that populations were very low, in many cases absent from parts of the Zol, with many landowners suggesting that they had not been seen in the vicinity of the proposed Scheme for many years. The brown hare population is therefore considered to be patchy within the Zol, with populations either absent or very low.

8.4.206 The brown hare is subject to some arguably contradictory protection mechanisms. It is a game species, so can be killed during the appropriate season. However it is a Species of Principal Importance and Norfolk BAP species. These non-statutory designations mean that a Low to Medium conservation value is considered appropriate.

8.4.207 Despite the above conservation value, it's very limited population within the Zol means that no significant effects are considered likely within the context of the proposed Scheme. It is therefore not considered necessary to address this species in the subsequent sections of this report.

8.4.208 The detailed results of the brown hare survey can be found in the Brown Hare Survey Report (Mott MacDonald, 2007), located in Volume 2, Chapter 8, Section N.

Other Notable Animal Species

Deer

8.4.209 Deer are not afforded any specific protection in the UK. They were surveyed for two related reasons. Where large populations exist and are likely to cross the proposed Scheme measures can be taken to reduce the chances of deer/vehicles collisions. This would serve to protect deer locally, and would also reduce the likelihood of injuries to motorists, which can be severe.

8.4.210 The deer survey methodology included three main means of identifying deer species, population sizes and distribution through the Zol. The first was entirely desk-based, involving the interrogation of the deer vehicle collisions online database and the Norfolk Biodiversity Information Service. The second involved a landowner questionnaire, asking about species identified, locations and numbers. The third, and perhaps the most valuable, was the series of field surveys.

8.4.211 Desk-based research identified muntjac (*Muntiacus reevesi*), fallow (*Dama dama*), roe (*Capreolus capreolus*) and Chinese water deer (*Hydropotes inermis*) within the search area. The deer vehicle collision database recorded between 11 and 50 collisions between January 2003 and December 2005, although it is recognise that this data is now old, and provides nothing more than an index, with which to compare the area of the proposed Scheme with other areas of the county, or country.

8.4.212 The landowner questionnaires indicated the presence of the above species, as well as red deer (*Cervus elaphus*). Of the 25 responses from

farmers/landowners, two recorded deer on their land most days. Seven recorded deer fairly often, eight saw deer occasionally, and eight stated that they never saw deer on their land.

8.4.213 In terms of species, the most commonly observed was the muntjac, which was recorded in 14 of the 25 responses. Roe was the next most frequent, with 11 positive responses, then fallow with nine. Four responses recorded red deer as being observed, and three recorded Chinese water deer in a cluster between the A1151 Wroxham Road and Spixworth Park. The Springs, the only area of wetland of any note in the study area, is located within this cluster.

8.4.214 Fallow deer were recorded using the majority of the study area, with the exception of the stretch between Postwick and the A1151 Wroxham Road. Roe deer were recorded over almost the whole study area. Red deer were recorded around Deighton Hills, in Beeston Park, on the Trafford Estate and in Rackheath Park.

8.4.215 The field surveys, a combination of actual deer sightings and searches for field signs such as deer slots (footprints), droppings, ring barking of trees etc, demonstrated that there are a number of sensitive locations and commuting routes within the study area that are regularly used by deer, as identified during both the desk and field surveys, which will be bisected by the proposed route. These are highlighted below.

8.4.216 Fallow, Roe and Muntjac regularly commute between Deighton Hills and the Walsingham Plantation.

8.4.217 The southern edge of Drayton Drewray is well used. The predominant species here is likely to be Roe.

8.4.218 The Quaker Farm/Beeston Park area is well-used by Fallow and Roe, with occasional use by Muntjac, Chinese Water Deer and Red Deer. The overall movements appear to be in and east/west orientation, following the woodland belts.

8.4.219 Beeston Park to The Springs. This is most likely to be used by Roe, but Chinese Water Deer and Muntjac may also occasionally use this commuting route.

8.4.220 Movement of deer between Ortolan's Grove and the rest of Rackheath Park, and also to Gazebo Covert, is highly likely, primarily by Roe and Muntjac.

- 8.4.221 Gazebo Covert, Heath Wood and March Covert, which are all different parcels of land within one block of woodland, are inhabited by a moderate-sized population of Roe and Muntjac. Red Deer may also occasionally use this area.
- 8.4.222 The deer populations within the Zol are considered to be of Negligible to Low conservation Value, due to their notable sizes, and the absence of any legal protection.
- 8.4.223 The detailed deer survey results can be found in the Deer Survey Report (Mott MacDonald, 2007), located in Volume 2, Chapter 8, Section O.

Summary of Valued Ecological Resources for Further Consideration

- 8.4.224 As recommended in the current EclA guidance (CIEEM, 2006), the assessment in this ES only considers those ecological receptors which are both of sufficient conservation value and vulnerable to significant impacts arising from the proposed development. These are termed Valued Ecological Receptors.
- 8.4.225 It is generally considered inappropriate to attempt to address all ecological receptors and likely impacts in EIAs; instead, the focus should be on key ecological receptors and ecological features which are covered by the relevant nature conservation and environmental legislation and policies. The EIA Directive and resulting UK Regulations only require the assessment of significant effects.
- 8.4.226 Such is the frequency and distribution of designated and protected habitats in the Zol that few remain unassessed. Only those low value habitats (arable fields, semi-improved grassland, amenity grassland etc) do not undergo assessment in this section.
- 8.4.227 The assessment methodology described in Section 8.2 shows that significant effects (Moderate, Large or Very Large effects, either adverse or beneficial) only occur in relation to those ecological resources valued as having Medium, High or Very High conservation value. Accordingly, only those ecological resources should be considered as Valued Ecological Resources.
- 8.4.228 Those Valued Ecological Receptors considered vulnerable to significant impacts from the proposed Scheme, and therefore requiring further consideration in terms of mitigation and assessment of impacts, are listed below:

8.4.229 Designated Sites:

- Broadland Ramsar site;
- Broadland SPA;
- Broads SAC;
- River Wensum SAC;
- River Wensum SSSI;
- Mid- Yare NNR;
- Attlebridge Hills CWS;
- Marriott's Way CWS;
- Whinney Hills & Common CWS;
- Ladies Wood, Church Carr & Springs CWS and Ancient Woodland;
- Payne's Yard Wood, The Owlery & March Covert CWS;
- Fakenham Road RNR;
- Sprowston Wood Ancient Woodland;
- Ortolan's Grove Ancient Woodland; and
- Important Hedgerows

8.4.230 Species:

- Bats, to include:
 - Directly affected roosts in buildings;
 - Directly affected roosts in trees;
 - Indirectly affected roosts;
 - Significant flight paths and other features of importance; and
 - Other areas of activity;
- Badgers;

- Great Crested Newt meta-populations at Dog Lane, Horsford, Quaker Lane, Spixworth, and Newman's Road, Rackheath;
- Breeding bird species of High and Medium conservation value;
- Overwintering bird species of High and Medium conservation value;
- Barn owls;
- Aquatic Invertebrates, including Desmoulin's whorl snail; and
- Terrestrial Invertebrate habitats of Medium conservation value;

8.4.231 The following habitats, although of Low conservation value, are also considered to be important components of the semi-natural environment within the ZOI, so the effects on these habitats are also assessed:

- Woodlands;
- Parkland;
- Arable field margins; and
- Hedgerows

8.4.232 No habitats other than those included within the above Designated Sites are considered to be Valued Ecological Receptors, which would require further consideration in this chapter.

8.4.233 The following Ecological Resources described within the Baseline Conditions section above, are excluded from further consideration in this Chapter. This is because their conservation value is not sufficiently high, according to those criteria already described, to be considered as Valued Ecological Receptors, or because they are considered unlikely to be significantly impacted by the proposed Scheme.

8.4.234 As these are not required to be assessed, it is therefore not necessary to formulate specific mitigation measures or to assess the impacts on the Ecological Receptors in the subsequent sections of this report. However, generic mitigation associated with the proposed Scheme may serve to benefit the remaining Ecological Receptors, below, in general terms.

8.4.235 Designated Sites:

- River Wensum Pastures CWS;

- Triumph & Foxburrow Plantations CWS;
- Walsingham Plantation CWS;
- Black Park & The Thicket CWS;
- Horsham Meadows CWS;
- Canham's Hill CWS;
- Tollshill Wood CWS;
- Spixworth Bridge Meadows CWS;
- Whitlingham Marsh CWS;
- Whitlingham Fen CWS; and
- Keeper's Cottage TPO

8.4.236 Habitats:

- Those habitats outside of Designated Sites, apart from woodlands, parkland, arable field margins and hedgerows.

8.4.237 Species:

- Great crested newt meta-population at Spixworth Road, Horsham St Faith;
- Fakenham Road RNR, as a potential terrestrial invertebrate habitat;
- Reepham Road verge, as a potential terrestrial invertebrate habitat;
- Junction of Holt Road and the A140 at Harts Hill, as a potential terrestrial invertebrate habitat;
- Arable field margins at Marriott's Way, as a potential terrestrial invertebrate habitat;
- Arable field margins at Beeston Park, as a potential terrestrial invertebrate habitat;
- Semi-improved grassland and Gazebo Covert, as a potential terrestrial invertebrate habitat;
- Reptile populations;

- Brown hare; and
- Deer

8.5 Mitigation

- 8.5.1 The following section describes the general, overarching processes, features and parameters that would be provided as an inherent part of the proposed Scheme. These would not be provided specifically for one species or set of species, however their inclusion would act to provide mitigation for the unavoidable habitat loss, disturbance etc. Where possible, the proposals for the overarching features have been manipulated and refined in order that the benefits can be extended or enhanced, on a species-by-species basis.
- 8.5.2 It should be borne in mind that the proposed Scheme has already been subject to environmental assessment, in a route selection and refinement process. Environmental factors have been considered alongside a multitude of other factors to ensure that the most beneficial, least damaging design has been formulated. This means that the proposed Scheme has been subject to a process whereby as many direct impacts as possible are eliminated, by ensuring that it avoids as many of the ecological and environmental assets as has been practically possible. This has been possible because of the extensive environmental data that was held even at the beginning of the detailed design process.
- 8.5.3 This practice of considering environmental assets during, and not after production of the proposed Scheme design has been an iterative process. It has been sustained through the design stage that has run concurrently with the environmental assessment process, with the embedding of those Environmental Scientists co-ordinating the ES production into the project design team. This supports the contention that it is no longer necessary to assess initial impacts, then consider mitigation, and reassess residual impacts throughout the chapters of this ES; the up-to-date scheme design method has evolved to ensure a collaborative, pro-active process to ensure that environmental issues are identified and addressed as early in the design process as possible.
- 8.5.4 Volume 11 Section 3 Part 4 (Ecology & Nature Conservation) of the Design Manual for Roads and Bridges includes a number of potential impacts that road construction could cause. These include:
- direct loss of wildlife habitats through land-take;

- severance, where a scheme may create a barrier and divide existing habitats or wildlife corridors (eg hedgerows);
- creatures may be killed trying to cross a road which cuts across their traditional territory or foraging routes;
- disruption to the local hydrology;
- polluted run-off from roads can lead to pollution of local watercourses;
- road structures may cause problems for certain birds and mammals;
- effects of road lighting - road lighting can adversely affect invertebrates and disorientate birds;
- air pollutants from road traffic may have effects on local habitats and species;
- spray from road traffic; and
- disturbance during construction.

8.5.5 These have been used as the starting point from which all specific potential impacts have been identified, and for which mitigation measures have been incorporated in the proposed Scheme. Mitigation measures have been formulated with specific input from those specialist ecologists working on the proposed Scheme.

Proposed General Mitigation Measures

8.5.6 The majority of the carriageway within the proposed Scheme will be constructed in cutting or false cutting, meaning that the level of the carriageway will be lower than the existing ground level. The excavated soil will be then used to create earth banks either side of the carriageway. This fundamental aspect of the design has been included to reduce the potential disturbance, in terms of visual intrusion, noise etc, for nearby residents. This screening mechanism would also serve to mitigate the likely disturbance experienced by wildlife in the vicinity.

8.5.7 Further to the above, an extensive landscaping/habitat creation scheme is proposed. This would include areas of woodland, scrub, grassland and hedgerows, as well as ponds and areas of damp grassland associated with the SuDS system, and has been designed to provide enhanced screening for adjacent and nearby properties wherever possible. Again, the screening

would serve to mitigate the likely disturbance on wildlife, as well as human receptors. However, it is acknowledged that the planting would take a number of seasons to become established and function effectively as a screen to reduce visual impact. It is also acknowledged that, as the planting will mostly be broadleaved, the screening capacity during the winter months will be less effective.

8.5.8 Dead wood forms a valuable wildlife habitat. As is becoming common practice, some timber gained from felling trees during habitat clearance would be retained during construction, and incorporated into the new landscaped areas. This would provide many conservation features and boost the associations between the new woodland creation and the invertebrates and fungi that play an essential role in sustaining them.

8.5.9 The habitat creation will also act to mitigate for the loss of habitat. The proposed Scheme is likely to cause severance of habitats, with potential adverse effects on the less mobile, more sensitive species, although the habitat creation would serve to provide connectivity where currently very little exists, for example those areas characterised by large fields of arable monoculture, with few linear boundary habitats. In some locations it has been prudent to propose planting established trees and shrubs, as opposed to whips that would otherwise be ubiquitous, where it is considered to be important to mitigate the impacts on protected species from the earliest opportunity, to provide viable, usable commuting routes for use by protected species as soon as planting occurs.

8.5.10 The total areas/lengths of proposed habitats are shown in the table below:

Table 8.14 Total Areas of Proposed Habitat Creation

Habitat Type	Area to be Created (ha)
Broadleaved Woodland	61.2 ha
Scrub	5.2 ha
Grassland (total)	120.9 ha
Grassland (in infiltration lagoons)	22.0 ha
Lagoons	7.4 ha

Habitat Type	Area to be Created (ha)
Hedgerows	9093 m

8.5.11 The landscaping/habitat creation scheme has been carried out in consultation with ecologists etc from other organisations, responsible for the environmental aspects of adjacent proposed developments. This has included work with Beyond Green, who are proposing a development of 3,525 houses between the current urban fringe and the proposed Scheme, from east of the airport to Beeston Park. A degree of collaboration has taken place with the developers of the airport-related industries on the north-eastern part of the airport, which the proposed Scheme will be located close to. Input was also provided into the Broadland District Council Area Action Plan for its Growth Triangle. The proposed Scheme is a fundamental consideration for this strategy as it runs through a significant portion of the area being considered, and it is inextricably linked with the wider Green Infrastructure and ecological functioning of the area. Intermediary liaison with the County Ecologist has also taken place, who has an active interest in all of the above developments, and other, county-wide ecology issues.

8.5.12 In accordance with the Water Framework Directive and various other related pieces of legislation detailed in Volume 1, Chapter 14, Road Drainage and the Water Environment, the drainage of the proposed Scheme has been designed with SuDS principles as a core parameter. This means that, over the majority of the proposed Scheme, storm water will flow from the carriageway into adjacent swales (wide, shallow depressions in the grassed verges). Water in the swales will then flow to one of the series of drainage lagoons.

8.5.13 Each of the drainage lagoons consist of two parts. The first of the lagoons in each pair would be lined, so will retain water, and will include facilities to allow pollution events to be contained, and the pollutants removed. The second, much larger, unlined lagoon would function as the infiltration area, where storm water will gradually infiltrate into the ground, at a rate similar to the known rate at which infiltration occurs naturally in each locality. The swales themselves will also be unlined, so infiltration to groundwater will also occur from these features.

8.5.14 The pollution and flood prevention mechanisms described above would ensure that changes to the groundwater infiltration rates and locations, and the quality of surface and groundwater, would not be adversely affected. This means that all those ecological features and habitats in the vicinity of the

proposed Scheme that depend on the existing water regime, would be unaffected.

8.5.15 All Construction phase mitigation measures would be included in the Construction Environmental Management Plan (CEMP). This document describes all general mitigation measures and procedures to be followed throughout the Construction phase, at all locations within the proposed Scheme, and so would act to reduce impacts on all Valued Ecological Receptors.

8.5.16 Measures would centre on good construction practice to ensure that disturbance in all its forms were minimised. Effective, well thought-out measures to eliminate potential pollution events would be installed. Refuelling of vehicles and plant would be allowed only in specific areas away from sensitive locations, over bunded trays. Fuel would be stored in double-bunded bowsers and tanks. Spill kits would be readily available at these locations.

8.5.17 Dust suppression measures would be put in place, and Construction phase drainage would be carefully addressed to eliminate the potential for pollution of the rivers, other watercourses and groundwater. Timing of works would be carefully considered, so that disturbance at sensitive times would be avoided as far as possible. Lighting would be directional, with hoods wherever possible, to reduce light spill.

8.5.18 Whilst these measures will be ubiquitous throughout the proposed Scheme, where specific Construction phase mitigation measures would specifically benefit one designated site, habitat or species, this is described in the sections below. Further, specific Construction phase mitigation measures are also described as necessary.

8.5.19 The proposed environmental mitigation measures for the proposed Scheme are shown on drawing numbers MMD-233906-DT-0552-0563 Proposed Mitigation Measures in Volume 1, Appendix 3.

Proposed Site and Species Specific Mitigation Measures

8.5.20 The mitigation measures set out below, particularly those for protected species, are proposed based on the assumption that the current patterns of use and occupation remain the case up to and during construction. On-going monitoring (see the following section) will determine whether this is the case and should changes occur, the mitigation would be adapted to suit. However,

for the purposes of the impact assessment, current known patterns of use and occupation are considered.

Statutory Designated Sites

- 8.5.21 The Broadland Ramsar site, Broadland SPA, the Broads SAC and the Mid-Yare NNR (all coincident in geographical terms) are nearly 2 km from the south-easternmost part of the proposed Scheme at the Postwick junction. All include the River Yare as a main feature in this location, and depend largely on its integrity and favourable condition.
- 8.5.22 In order that the proposed Scheme has no effect on either the quality or quantity of the water in the River Yare, and in accordance with the various pieces of legislation that relate to water quality, flood risk and sustainable drainage, the proposed Scheme has been designed to ensure that all storm water is allowed to attenuate and infiltrate on site. Overland flow would therefore be eliminated from moving from the proposed Scheme into the River Yare, meaning that no impacts on the river's flood regime would be caused by the proposed Scheme. The proposed drainage scheme has been designed to cope with a one in a hundred year storm event.
- 8.5.23 The proposed SuDS drainage system, inputting storm water to groundwater, would ensure that potential pollutants and contaminants – hydrocarbons, heavy metals, de-icing salt – would not enter the River Yare via surface water overland flow during the Operational phase.
- 8.5.24 Another potential source of disturbance on the four above sites is the potential visual impact, particularly in terms of night-time lighting intrusion. Modern street lighting specifications are such that light spill can be minimised, through the appropriate height of lighting columns, the use of directional lamps and hoods, and by the careful specification of the specific lamp types. The lighting scheme at Postwick junction has been designed with input from ecologists and landscape architects to ensure that these mitigation measures are all built into the lighting scheme. No lighting would be installed on the rest of the proposed Scheme.
- 8.5.25 As with the sites described above, potential impacts on the River Wensum SAC and SSSI, located close to the western end of the proposed Scheme, would be mitigated for by ensuring that the quality and quantity of water entering the river, either by overland or groundwater flow, would be of the same quality and quantity as currently occurs. This would be achieved in the same way as with the previous sites, with a drainage system designed to

contain storm water, and to allow infiltration to groundwater. The same pollution control features as above would also be present.

8.5.26 The proposed landscaping scheme is designed to reduce the visual impact on the setting of the River Wensum SAC and SSSI. The notable distances between the proposed Scheme and the Broadland Ramsar, Broadland SPA, Broads SAC and Mid-Yare NNR are too great for landscaping to be considered as a viable mitigation measure.

8.5.27 Construction phase mitigation would be in accordance with those measures already described, and would be employed throughout the Construction phase across the whole site.

8.5.28 The above Ramsar, SPA and SAC designations are considered more fully in the Habitats Regulations Assessment report, as a requirement of the Habitats Regulations 2010. This potentially three-phase document concluded at Stage One of its assessment, that there would be no reasonably foreseeable adverse significant impacts on the conservation status of the Broadland Ramsar, Broadland SPA and Broads SAC. The document is included in Volume 2, Chapter 17, Section A.

8.5.29 It was not possible to scope out potential impacts on the River Wensum SAC at Stage One, due to its proximity to the proposed Scheme and the ease with which it could potentially affect its flow regime and water quality, with adverse significant impacts on the conservation status of its qualifying features. Further, more detailed scientific assessment was therefore carried out at Stage Two. This concluded that no foreseeable significant adverse impacts were likely on the River Wensum. It was therefore not necessary to progress to Stage Three of the assessment.

Non-Statutory Designated Sites

8.5.30 A length of Marriott's Way CWS would be lost to the proposed Scheme. The length of the CWS to be directly affected has been minimised as far as possible, such that the approach ramps to the overbridge would be as steep as design parameters allow. The proposed earth banks, either side of the approach ramps, would be planted with those species currently growing in this location, to replicate the habitats that are to be unavoidably lost. In the wider context, the proposed landscaping scheme would provide connectivity between Marriott's Way and other areas of semi-natural habitat, where currently little exists. Where the proposed Scheme crosses Marriott's Way it is an isolated linear feature in a landscape of arable land and improved

grassland, so connecting it to other areas of habitat, via the landscaping proposed on either side of the proposed carriageway, would be of benefit.

- 8.5.31 During construction, adherence to the CEMP would ensure that no accidental damage to those remaining parts of the CWS would occur.
- 8.5.32 Note that mitigation for Marriott's Way as a permissive footpath, cycle route and equestrian route is discussed in the Effects on All Travellers chapter. Mitigation in terms of the use of Marriott's Way by bats is discussed later in this Chapter.
- 8.5.33 The quality and quantity of water to The Springs CWS (both the waterbodies and the associated surrounding habitats) will be regulated by a different regime than the remainder of the proposed Scheme, as the height of the water table is too high to allow effective infiltration to take place. Instead, a positive drainage system is proposed, whereby storm water will be released, after attenuation to the adjacent watercourse. The attenuation system would ensure no further flashiness of the existing watercourse is caused. It would also incorporate a filtering/treatment process, using an area of newly-created reedbed that would function as a semi-natural facility to achieve this. It is predicted that water quality entering the watercourse here would be of as good, if not better quality, than currently occurs.
- 8.5.34 It would be necessary to mitigate for the potential indirect impacts on those CWSs close to the proposed Scheme. These include Attlebridge Hills CWS, Whinney Hills & Common CWS, and Payne's Yard Wood, The Owlery & March Covert CWS. Disturbance would be minimised by good, effective measures during construction, as have already been described.
- 8.5.35 During the operational phase the landscaping and earth bunding will act to screen the CWSs from the proposed Scheme, to reduce the visual and other impacts on the sites. The landscaping will be designed to marry up with and enhance those already in place within the CWS's.
- 8.5.36 Fakenham Road RNR, which is within the footprint of the proposed Scheme, would be subject to a seed harvesting process at the appropriate time of year, so that seeds of the valuable species here could be stored during construction. The topsoil of the verge would then be carefully stripped and carefully stored away from other areas of topsoil. On completion of construction in this location, it would be returned to site and used to re-build the verge. The harvested seeds would then be replanted, allowing the existing seedbank within the soil to remain loosely in the same location. These two

processes would maximise the chances of the existing valuable flora to re-establish.

8.5.37 No mitigation is proposed for the Important Hedgerows, aside from that already described. The lengths to be removed have been minimised as far as possible. Replacement hedgerows will be planted as part of the proposed landscape scheme. See the Proposed Mitigation Measures drawing number MMD-233906-DT-0552-0563 for more information.

Bats

8.5.38 The mitigation measures that are proposed relate to the maintenance of landscape permeability and functionality for bats. Full information on proposed bat mitigation is given below, and discussed in the bat report in Volume 2, Chapter 8, Section D. The key mitigation measures recommended include:

- Provision of replacement roosts within suitable locations;
- Appropriate working methods and timing for destruction of existing roost sites (i.e. trees and buildings);
- Provision of safe passage for bats across the proposed road route including green bridges, bat gantries, modified accommodation bridges and tunnels/underpasses;
- Provision of dark-flyways to encourage bats to use the safe crossing points; and
- Careful consideration of the proposed Scheme to ensure that no features are included that would require street lighting, which would impact on bat activity.

8.5.39 In addition, an appropriately-designed monitoring programme would be put in place to evaluate the success of the mitigation and determine any long term residual impacts of the proposed scheme. These are detailed in the next sections.

8.5.40 All identified bat roosts to be lost to the development would be replaced with a structure of appropriate size and construction to compensate for the loss of the existing roost. A total of seven tree roosts and three building roosts are currently due to be removed as part of the development. Bat Conservation Trust mitigation guidelines indicate that bat roosts should be provided on a 'like for like' basis; this principle has been adopted throughout the proposed Scheme.

- 8.5.41 All seven confirmed bat roosts in trees and two of the building roosts were identified as summer roosts, therefore removal would take place over the winter months (between November and February). One of the building roosts to be removed by the proposed Scheme was identified as a hibernation site as well as being used for roosting by at least two species of bat during the summer months. The condition of the building (with it being in a derelict state) makes it difficult to exclude the bats under a license. Therefore, the timing for the removal of this roost is more critical and would be confined to March/April or September/October (weather dependent) in order to avoid the main roosting periods.
- 8.5.42 Two new bat houses would be constructed in advance of the loss of the existing roosts in buildings. These would be adjacent to Hall Farm, to mitigate for the loss of this building, and adjacent to Gazebo Farm to mitigate for the loss of the old military building here. The design for the bat houses will be in line with Natural England Mitigation Guidelines and tailored for the specific species known to use the existing roosts. Both bat houses will feature four gable ends as bats are known to prefer entry to buildings via these features. Roof orientations and angles have been designed to maximise thermal properties for bats, and roof voids would be large and free of interruptions, to aid pre-emergence activity for brown long-eared bats, as is their preference when selecting roost sites.
- 8.5.43 The interior of the buildings would include features that bats can roost on and in, and the north-facing wall would include a wider cavity to provide an additional hibernation roost location. The Hall Farm bat house, which is to mitigate for a hibernation roost as well as a maternity roost, would include design features to recreate hibernation conditions, with the required constant temperature and humidity.
- 8.5.44 To mitigate for the loss of the seven known bat roosts in trees, bat boxes will be installed in trees to be retained, close to the existing roosts which will be lost to the development. A minimum of three boxes per tree will be used as a standard for each replacement roost site. These would be of types that would be utilised by those species being displaced.
- 8.5.45 In addition, bat boxes will also be installed in woodland areas to replace trees with features of high bat potential, which will be removed as part of the development. The bat boxes would be placed at varying heights and orientations around the trees to provide a variety of suitable microhabitats for bats at different times of the year, as recommended in the BCT mitigation

guidelines. These locations would be selected in consultation with the project ecologist.

- Drayton Drewray (24 bat boxes);
- Spixworth Plantation (15 bat boxes); and
- Heath Wood (9 bat boxes).

8.5.46 A significant number of large/important maternity roosts of various species are located within close proximity (500 m) of the proposed scheme. However, while most bat species, such as barbastelle, are thought to be particularly sensitive to disturbance, many of the bats recorded in the vicinity of the proposed NDR route already use roosts in close proximity to existing A-roads (although these tend to be unlit and potentially quieter than a major road, such as dual carriage-way). The landscaping scheme has been designed to minimise any potential impact on the identified roosts in the vicinity of these roost locations. No lighting is proposed as part of the proposed Scheme, with the exception of at Postwick junction, which will serve to reduce impacts on general bat activity.

8.5.47 A number of additional buildings and ruins at Gazebo Farm, with suitability for potential use by bats, are also due to be removed as part of the development. These buildings are not considered suitable for emergence/re-entry surveys due to the presence of a high number of potential features and sheltered location, which make visibility and line of sight to the features poor. As such it is recommended that all of the features within such structures are subject to a pre-demolition inspection using an endoscope, to identify bat usage as far as is possible, and is safe.

8.5.48 Severance of flight routes due to the removal of habitats and linear features has the potential to adversely impact on bat populations locally and in the wider landscape. The removal of connectivity throughout their ranges is likely to mean that, for some bat species, use of these routes would no longer be viable. This could result in the severance of foraging areas from roost sites, maternity roosts and areas of summer activity from hibernation roosts etc, with marked adverse impacts on bat populations in the short and longer term.

8.5.49 To mitigate for these potential impacts, a combination of wire bat gantries, modified accommodation bridges and green bridges would be provided, which would promote the continued use of the identified major flight routes that would be severed by the proposed Scheme.

8.5.50 Wire bat gantries would be installed at the following locations:

- Deighton Hills – shooting school access track;
- Tree line south of Horsford;
- Quaker Lane;
- Beeston Estate 1 – Tree line/woodland north east of the Hall buildings;
- Beeston Estate 2 – Farm track off Beeston lane, west of The Springs;
- Double tree line off Toad Lane; and
- Smee Lane

8.5.51 The wire bat gantries have been designed with guidance from national experts in the field of bat ecology. It is acknowledged that basic wire bat gantries across roads are not generally successful, as demonstrated by Berthinussen and Altringham, 2012. However, the type of gantry assessed in this paper was a very basic gantry with little physical substance across the roads. Those gantries that would be installed as part of the proposed Scheme are different, with wire mesh a 'V' shaped profile, across the roads. This design has been formulated with direct guidance from a national bat expert, and is based on specific experience and monitoring of similar structures, which have been proven to be successful.

8.5.52 They have also received input from the Contractors for the proposed Scheme. Attention has been given to the required spans in relation to the carriageway and the adjacent features (swales, earthworks etc), the specific locations and the foundation design. Timing of vegetation clearance and gantry construction has also been carefully considered. This means that permanent gantries would be installed early in the construction process, immediately after vegetation clearance at the bridge locations, negating the requirement for the inclusion of temporary gantries during the construction phase.

8.5.53 Where possible, replanting of hedgerows/treelines leading up to the gantries will also take place at this time, but if not possible, temporary fencing will be using to fill any gaps in the flight route. Temporary fencing should be complemented by artificial or dead foliage to mimic a hedgerow as best as possible; while quick growing vegetation (such as honeysuckle) should be planted in combination with a more traditional hedgerow planting design.

- 8.5.54 Two green bridges (land bridges) would be included as part of the proposed Scheme. This first would be at Marriott's Way, due to its importance as a significant commuting route for local bat populations, including barbastelles. The green bridge would be constructed at this location to ensure continuity of the habitat over the proposed Scheme, along the existing flight path. It would include two hedgerows, one either side of the proposed footway/cycleway/equestrian route. The tall parapets would be solid, to exclude as much light from the headlights of traffic using the NDR beneath as possible.
- 8.5.55 A second green bridge would be constructed at Middle Lane. This route has also been identified as a significant barbastelle commuting route. It is proposed that one hedgerow would be included within this highway bridge, which will also include a two-way carriageway and a footway/cycleway. As above, the tall parapets would be solid, to exclude as much light from the headlights of traffic using the NDR beneath as possible.
- 8.5.56 As with the wire gantries above, detailed consideration has been given to the timing and duration of the proposed construction of these bridges. The main phases of habitat clearance and construction have been programmed such that they take place over winter periods as far as possible to avoid impacts on bats. Where necessary, this has included spreading the construction over two winter periods, such is the required duration of the construction of the bridges.
- 8.5.57 A suitable planting scheme would be provided to complement the proposed bat bridges and ensure continuity of flight routes. Planting on the green bridges and leading up to all of the bat bridges would include semi-established shrubs and trees, to a minimum height of 1.5 m, to provide a tangible habitat/structure along which bats could commute as soon as it is planted. The planting scheme would act to enhance and improve connectivity of the new bat bridges to the wider landscape. This would serve to encourage bats to use the designated crossing points and dissuade them from using areas close to the road where there is an increased risk of collision mortality.
- 8.5.58 Two further highway bridges are proposed, the design of which has been modified to increase the potential for use by bats. The proposed bridge at Buxton Road would include the provision of a dark corridor, created along the proposed footway/cycleway part of the bridge, using solid parapets each side to reduce the intrusion of light from the headlights of cars using the proposed NDR beneath.

- 8.5.59 The proposed bridge at Newman's Road would also be constructed to include tall, solid parapets, either side. The effect in both of these cases would be to create a dark corridor to encourage movement of bats across the proposed Scheme.
- 8.5.60 A bat underpass is proposed for the crossing point in Rackheath Estate. This dual function feature will also serve as a culvert as part of the drainage scheme, to allow surface water in the existing drainage ditch network unimpeded movement, as is currently the case. The underpass will be 2.5 m in width and 2 m in height, catering for the low-flying bat species that are known to use this route.
- 8.5.61 During the Construction phase, the bat mitigation guidelines set out in DMRB Volume 10, Section 1, Part 8 (HA 80/99 Nature Conservation Advice in Relation to Bats) would be strictly adhered to. Any lighting along the route and within site compounds would be bat friendly. The lighting would, wherever possible, be low level and directional, oriented away from areas used by bats. This is especially important near roost areas or important flight routes. The potential use of hoods or cowls would further minimise light spill. These issues are addressed in the CEMP, in Volume 2, Chapter 24, Section A.
- 8.5.62 Details on the above mitigation measures (wire gantry and other bridge designs, bat house layouts and elevations etc.) can be found in the Bat Report, in Volume 2, Chapter 8, Section D.
- 8.5.63 The high levels of bat activity across the proposed Scheme as a whole and in the wider landscape, including the high number of identified roosting sites, significant flight routes and foraging grounds utilised by multiple species, highlight the importance of the NDR route for local bat populations. As a result a European Protected Species (EPS) license from Natural England is being sought to allow derogation from the legislation in relation to adverse effects on sites (roosting, flight routes and feeding grounds) used by bats prior to the commencement of vegetation clearance for the proposed Scheme. This is not being sought within the DCO application; a separate application to Natural England, outside of the DCO process, is being made. Evidence of the submission to Natural England can be found in in Volume 2, Chapter 18, Section A.

Badgers

- 8.5.64 The following mitigation measures are proposed for those active badger setts within the Zol.

8.5.65 As the setts under the footprint will be closed (setts 3, 4, 6 and 7) and the remaining setts are more than 100m away, mitigation during construction will be limited to ensuring as far as possible the safety of any badgers which may stray into the works areas. In most cases permanent badger fencing would be installed in the earliest phases of construction, coincident with the proposed Scheme extents boundary during the early stages of construction. Once in place it would not need to be moved or altered, so it would remain in place through operation as well as during construction.

8.5.66 The following additional mitigation measures would be implemented on site during construction:

- Ensure chemicals are safely stored;
- Open trenches would be covered at the end of each working day, or include a means of escape for any animal falling in (this would be a ramp at 45 degrees every 20m along the trench and can be either dug into the edge or a plank to act as a ramp); and
- Any temporarily exposed open pipe system would be capped in such a way as to prevent badgers gaining access.

8.5.67 Badger activity at Sett 1 primarily takes place to the north and west of the setts. Foraging in the farmland to the south of the sett, towards the proposed Scheme, is recorded, although no evidence of badgers was found in Walsingham Plantation. This spatial pattern of activity means that it is not necessary to construct a tunnel beneath the road. Instead, it is sufficient to install badger fencing along the northern boundary of the proposed Scheme, to ensure the access to the construction area is not likely. The fencing would remain in place during both Construction and Operational phases of the proposed Scheme.

8.5.68 Similarly, at Sett 2, the majority of badger activity, and large areas of prime badger habitat, lie to the north of the proposed Scheme, on the same side as the sett itself. Activity to the south of the proposed Scheme has been recorded, although this habitat is sub-optimal. It is therefore considered that the construction of a tunnel beneath the road is not necessary. As with above, badger fencing would be installed along the northern boundary of the proposed Scheme to preclude their access to the construction zone and carriageway during the construction and operational phases respectively.

8.5.69 At Sett 5, there was no evidence that badgers are regularly crossing the route of the proposed Scheme, although this cannot be ruled out completely. To this

end, badger fencing is proposed to the southern edge of the proposed Scheme during both the construction and operational phases.

- 8.5.70 Sett 7 is within the footprint of the proposed Scheme, and so will be closed. As this sett is an outlier only, its use during winter would be unlikely, so its closure during this period would be proposed. Monitoring of the sett, to ensure that this is the case, is discussed in the next section.
- 8.5.71 During construction, temporary badger fencing would be installed at the edges of the proposed Scheme. On completion of construction, permanent badger fencing will be installed in conjunction with the proposed Green Bridge at Marriott's Way, to ensure that badgers do not stray onto the carriageway here, and to encourage them to use the Green Bridge, thereby ensuring that fragmentation of the home range of the population, does not occur.
- 8.5.72 No mitigation is proposed for the inactive setts. All setts will be monitored to ensure that they do not become active again. See the Monitoring section later in the chapter for details.

Great Crested Newts

- 8.5.73 The ponds used by the Dog Lane, Horsford meta-population are at least 120 metres north of the earthworks for the Bell Farm Lane bridge approach ramps, and at least 290 metres from the carriageway and associated earthworks. The available terrestrial habitat between these ponds and the proposed Scheme is limited to a small number of arable field margins, and there are no ponds suitable for use by newts south of the proposed Scheme, so it is not considered necessary to provide continuity of access to habitats beyond the proposed Scheme in this location.
- 8.5.74 A precautionary approach will be employed whereby newts will be excluded from the footprint of the proposed Scheme by the installation of temporary newt fencing during construction, where it is felt there is a risk of intrusion into the working area. The fencing would therefore be installed around the area of the proposed earthworks for the northern approach ramp, and the track heading north towards Dog Lane. No further fencing is proposed, as other areas will be well beyond 250m, and in sub-optimal (arable) habitat with limited connectivity. It will be installed during the very earliest stages of the construction process. Its installation will be timed in order to eliminate or minimise adverse impacts on newts, and to ensure that no newts are likely to remain within the construction area. The fencing will remain in place throughout the construction phase.

- 8.5.75 On completion of construction, the temporary newt fencing will be removed. This will provide newts with access to the landscaped areas within the proposed Scheme, tying up with the existing field boundaries, and offering linking routes to other areas where currently there is none. The connectivity of habitats should therefore be increased, as should the total area of terrestrial habitat. The landscaped areas will include woodland, scrub and grassland.
- 8.5.76 No permanent newt fencing is proposed as modern, best practice indicates that a road with a greater rate of use than 20 vehicles per hour effectively functions as its own deterrent to movement for newts (and other amphibian and reptiles species). The proposed Scheme would have a volume of traffic that exceeds the above rate by a significant margin, meaning that the risk of mortality of newts is sufficiently low to mean that newt fencing is not necessary.
- 8.5.77 The Quaker Lane, Spixworth meta-population, using pond 16, is 100 metres from the proposed Scheme. As with the Dog Lane, Horsford meta-population, newts will be excluded from the proposed Scheme by the installation of temporary newt fencing, to allow trapping and relocation to take place, ensuring that no newts remain in the construction areas. As with the above, it will be installed during the very earliest stages of the construction process. Its installation will be timed in order to eliminate or minimise adverse impacts on newts, and to ensure that no newts are likely to remain within the construction area. The fencing will remain in place throughout the construction phase.
- 8.5.78 On completion of construction, the temporary newt fencing would be removed. This would allow the newts access to the areas of landscaping in the vicinity, including access to the proposed drainage lagoons, one of which would be lined, and therefore would contain water for periods of time.
- 8.5.79 The Newman Road, Rackheath meta-population will be subject to the loss of one breeding pond, in addition to areas of terrestrial habitat suitable for use by great crested newts. Further to the precautionary exclusion process described for the two above meta-populations, it would be necessary to carry out a trapping and exclusion exercise, to remove newts from these areas in advance of any construction taking place. In advance of this, it will be necessary to create new receptor ponds to which the relocated newts can be relocated.
- 8.5.80 The existing pond has a maximum surface area of around 500 square metres, so it is proposed to provide four new ponds, each of around 250 square metres, in land adjacent to the proposed Scheme, to the immediate southwest

of the pond to be lost. Smaller ponds are known to be more suitable for breeding great crested newts than larger ones; 250 square metres is within the optimum size range, as indicated in the Great Crested Newts Mitigation Guidelines (Natural England, 2001).

- 8.5.81 Two of the proposed ponds would be created in advance of the DCO process being completed, on land within the jurisdiction of Birse/NCC, and would be planted with aquatic and semi-aquatic plant species, such that they would become suitable for newts to breed in. The ponds would be on land currently owned by the construction contractors for the proposed Scheme, to allow them to become established in advance of the trapping and relocation process detailed below. The two remaining ponds would be created during the Construction phase.
- 8.5.82 As previously, newts will be excluded from the proposed Scheme by the installation of temporary newt fencing. As above, the fencing would be installed coincident with the fence-lines demarcating the proposed Scheme extents, on both sides of the proposed Scheme, including the pond to be removed. It would be installed over sufficient length to ensure that newts using other ponds around Newman's Road would not then be able to enter the construction area. It will be installed during the very earliest stages of the construction process. Its installation will be timed in order to eliminate or minimise adverse impacts on newts, and to ensure that no newts are likely to remain within the construction area. This fencing will remain in place throughout the construction phase.
- 8.5.83 Additional lengths of temporary fencing would be installed between those along the proposed Scheme extents to create entirely contained areas or compartments within the area to be lost to the proposed Scheme. These areas would be subject to a trapping and relocating exercise by licensed ecologists to ensure that all newts (and possibly other amphibian species) within these areas are removed and relocated to the newly created habitats described above. This would ensure that the areas of the proposed Scheme, including those areas to be used temporarily, during construction only, will be 'sterile' and no newts would be killed or injured.
- 8.5.84 Once the trapping and relocation exercise had been completed, the temporary fences across the construction area would be removed, but those to the edges would remain in place throughout the construction phase. This would allow the road and associated features to be constructed, whilst at the same time ensuring that no newts would be killed or harmed.

- 8.5.85 All temporary fencing would be removed after construction, allowing access for newts to the newly-created landscaping areas. These areas will tie up with the proposed bat underpass/drainage culvert approximately to the north of this area. Although not specifically for great crested newts, this feature would potentially allow newts safe passage beneath the road, providing continued access to the terrestrial habitat east of the proposed Scheme, and to those drainage lagoons that are to be lined and therefore hold water for sustained periods.
- 8.5.86 As with the previous two meta-populations, no permanent newt fencing is proposed after construction.
- 8.5.87 The grassland habitat around which this meta-population is based, and within which the proposed ponds would be situated, would be managed to benefit great crested newts as far as possible. It is proposed that trees around those ponds within woodland inside the DCO boundary would be trimmed back, to allow more light to the pond and to reduce the seasonal input of leaf litter which currently acts to silt up the ponds and remove oxygen from the water as it rots. Wherever appropriate, silt would be removed from ponds to increase depth and reduce the likelihood of drying out, and aquatic and semi-aquatic plants would be planted to further improve the condition of these ponds for breeding great crested newts. These improvements would be made to those ponds within the DCO boundary, which make up at least half the number of ponds that supports this meta-population.
- 8.5.88 The suitability of the terrestrial habitat within the DCO associated with each of the meta-populations would be bolstered by the inclusion of features such as artificial refugia and hibernacula. These would provide places to shelter during both the active, summer season and the hibernation period. It is also likely they would be used by other species of amphibians, and possibly reptiles.
- 8.5.89 It is acknowledged that there remain a small number of ponds where surveys for great crested newts were not possible. Precautionary mitigation for those ponds has been considered in full in the Great Crested Newt Survey Report. In each case, the ponds were considered to be of sufficient distance from the road, and/or separated by unsuitable terrestrial habitat, that the risk of harming or killing newts was very low. Mitigation to account for these risks around these ponds is therefore not considered necessary.
- 8.5.90 The above work will be subject to a European Protected Species mitigation licence. This is not being sought within the DCO application; a separate application to Natural England, outside of the DCO process, is being made.

Evidence of submission of a draft EPS Licence application having been made to Natural England can be found in Volume 2, Chapter 18, Section A.

Breeding Birds

- 8.5.91 The main mitigation measure for reducing impact on breeding birds is to carry out habitat clearance during the winter months when breeding activity can be ruled out. The early phase of the construction programme has been formulated with this principle at its core.
- 8.5.92 All temporary areas associated with construction, for example access tracks, lay down areas and compounds, would be sited to minimise their impact on breeding birds. Areas of amenity or heavily grazed grassland or arable land have been selected for these temporary areas as far as possible, which would be reinstated after construction. Where this is not possible then alternate areas would be provided to compensate for this loss.
- 8.5.93 During construction, industry best practice guidelines relating to potential disturbance would be followed. These would ensure that light emissions are minimised by reducing construction during the hours of darkness and providing lamps that allow their illumination to be directed away from sensitive areas. Any chemical spills would be cleared quickly and effectively to prevent accidental poisoning of birds and other wildlife, and any dangerous or sharp equipment should be stored safely when not in use. Construction procedures would be subject to national limits for noise and pollution emissions. This would serve to reduce the effects on wildlife locally, as well as the nearby human population.
- 8.5.94 Although noise and light pollution are not considered to significantly impact breeding birds, the bunds and earthworks and subsequent habitat creation would reduce both light and noise pollution to the surrounding habitats. The absence of lighting throughout the proposed Scheme, with the exception of the Postwick junction, will benefit breeding birds in the surrounding landscape. In addition, the road has been designed to use low noise tarmac throughout.
- 8.5.95 The landscaping scheme has been designed with input from the ornithologists involved in the surveys and subsequent reporting and analysis of data. As such, specific habitat types and layouts have been included that would serve to maximise the value of the proposed woodland, scrub, hedgerow and grassland habitats. Detrimental effects would also be avoided as far as possible.

- 8.5.96 Where possible grassland has been proposed behind hedgerows or trees/scrub, which would act as screening and would also mean birds flying over the proposed Scheme would do so at a height that would reduce the risk of vehicle collision mortality. This has been achieved wherever possible, taking into account the needs and requirements of other protected species. The grassland would be allowed to grow to sufficient height that it would provide shelter for abundant small mammals, a potential food source for birds of prey.
- 8.5.97 Screen planting would be planned in conjunction with the recommendations for barn owls (see below). The planting of hedgerows and trees/woodland as well as embankments and noise barriers would encourage birds to fly higher over the carriageway, reducing mortality.
- 8.5.98 The loss of mature trees can have an adverse effect on cavity nesting species. The provision of areas of woodland in the landscaping scheme would ultimately provide potential nesting sites for these species, although the establishment of the woodlands, to the point where this proposition becomes viable, is likely to take many seasons. In acknowledgement of this, nesting boxes will be erected in suitable areas, aimed mostly but not exclusively at cavity nesting species, to be used until such time as the natural alternatives become useable. Details of the specific type and size of bird boxes is provided in the Breeding Bird Survey Report in Volume 2, Chapter 8, Section G.
- 8.5.99 The landscaping proposals for the drainage lagoons along the proposed Scheme would include provision for birds likely to use these areas. An artificial nest bank with a minimum of 50 nest cavities would be created to compensate for the likely loss of a small sand martin colony near Spring Farm, Taverham. This would be incorporated into the drainage lagoon near the Fakenham Road.

Barn Owls

- 8.5.100 The known nesting site that is to be directly affected by the proposed Scheme would need to be removed, by a suitably experienced, licensed ecologist, at a time outside of the nesting season. As already described, habitat clearance would take place outside of the nesting season, in order that no nesting or breeding birds would be affected.
- 8.5.101 Where nesting, roosting and rest sites occur within 150m of construction activities appropriate screening with fine mesh will be installed

under the supervision of a suitably qualified ecologist, to the edge of the proposed Scheme. Where nesting, roosting and resting sites are to be removed during construction these will be capped or blocked under the supervision of a suitably qualified ecologist.

8.5.102 If there is any indication that barn owls are nesting within 150m of construction activities at any time, work would stop within 150m of the site until the matter can be fully investigated and appropriate mitigation measures implemented.

8.5.103 Site compounds would be managed to ensure that potential impacts on barn owls were eliminated or reduced. Measures would be taken to ensure that there was no risk of barn owls drowning in open containers of liquid, as this avoidable mechanism of mortality has been recorded in the past. If pest control were necessary on site, care would be taken to avoid accidental deaths of barn owls through eating poisoned rats and mice. These measures would be included in the Construction Environmental Management Plan.

8.5.104 The proposed Scheme has been designed such that a large part of the route will be in cutting or false cutting. It will include a landscaping scheme that will include the creation of woodland, scrub, hedgerows and grassland on the verges, embankments and other areas. These features of the design are primarily aimed at reducing the visual impact of the proposed Scheme, and also the impacts of noise and vibration for nearby receptors. However, the proposed landforms and planting scheme would also serve to reduce the potential impact on barn owls, which are susceptible to mortality due to vehicle collisions, whereby the proposed embankments and associated landscaping would act as a barrier to low flight across the carriageway, forcing barn owls up and over moving vehicles. Specific attention has been paid to two potential collision blackspots, from Fakenham Road to Fir Covert Road and from Rackheath Park to Wroxham Road, to ensure that the proposed landforms and planting scheme are sufficient to effectively reduce vehicle collision mortality as far as possible.

8.5.105 Ten barn owl boxes would be erected in a series parallel to the proposed route at 2 km intervals, at a distance of at least 1.5 km from the proposed Scheme. The majority of these boxes would be placed on the northern side of the proposed route as the land to the south has a strong urban component and is therefore less suitable for barn owls. Boxes would be installed where there is suitable roosting and foraging habitat.

8.5.106 Norfolk County Council owns, or has rights over, sufficient land in the wider landscape that this would be achieved without the need to depend on private landowners.

Aquatic Invertebrates

8.5.107 The proposed Scheme would not have any direct impacts on the aquatic invertebrates at The Springs. However, it will be necessary to mitigate for potential indirect impacts such as pollutants and silt entering surface and groundwater here, and for potential alterations to the groundwater hydrological regime, that would otherwise affect the availability of suitable semi-aquatic vegetation on which Desmoulin's whorl snail lives.

8.5.108 The following general mitigation measures would be put in place:

8.5.109 Measures to prevent silt run-off from site operations (such as construction of temporary settlement lagoons) should be constructed as early as possible in the works programme;

8.5.110 Spillages of liquid to ground during construction would be mitigated by implementation of an environmental management plan with appropriate refuelling procedures, including an effective spill containment plan, to ensure that it does not enter either the surface or groundwater; and

8.5.111 Groundwater and water table monitoring would take place to ensure that no changes to groundwater levels occur.

8.5.112 These measures would be incorporated into the Construction Environmental Management Plan.

8.5.113 The potential indirect impacts on the aquatic invertebrates at The Springs during the Operational phase are similar to those addressed during the Construction Phase, relating to water quality and quantity. The proposed Scheme has been designed to include a drainage system that caters for very large storm events, to ensure that storm water enters The Springs at approximately the same rate as currently occurs, so no impacts in terms of increased flashiness and the water level regime would occur. At this location, this has been achieved by designing an attenuated positive drainage system rather than using infiltration to dissipate the water created during flood events, as the water table in this location is too high, meaning that that infiltration is not viable.

8.5.114 Incorporated into this design are pollutant containment features. A reedbed filtering/attenuating system is included in the drainage design for this location, which will filter storm water as it moves slowly through this semi-natural feature. This will serve to improve storm water quality before being discharged into the existing watercourse. Mechanisms to contain pollutants from large spills, for example fuel or other substances spilt during a road traffic accident, are also included in the design, to allow discharge of polluted water to watercourses to be contained and removed.

Terrestrial Invertebrates

8.5.115 No specific mitigation measures are proposed in relation to the habitats of above average suitability for invertebrates at the immature plantation woodland at The Springs. However, it will benefit from those mitigation measures aimed at reducing the adverse impacts of other aspects of the proposed Scheme.

8.5.116 The potential invertebrate populations are likely to be susceptible to pollution in its various forms. A decrease in air quality, and an increase in airborne particulates and dust could have adverse impacts on the resilience of the populations. Pollution of surface and ground-water in the vicinity could adversely affect the habitats, and disturbance associated with both the construction and operational phases of the proposed Scheme could also affect the habitats and invertebrates themselves.

8.5.117 There would therefore be secondary mitigating effects for these habitats and potential populations from those in-built mitigation measures of the proposed Scheme envisaged to reduce such effects. Whilst it is hard to mitigate for the potential localised, short term drop in air quality due to the presence of plant machinery during construction, dust production can be greatly reduced by the inclusion of measures such as damping down of the ground before construction takes place whenever necessary. Further detail of such mitigation is given in other assessment chapters of this ES. Such mitigation would be included within and secured through the Construction Environmental Management Plan (CEMP).

8.5.118 Pollution prevention measures during construction would also be included within the CEMP. These are likely to include the availability of spill kits in sensitive areas, strict rules on locations and procedures for refuelling plant and machinery, double-bunded fuel tanks and bowsers etc. Such

measures would greater reduce the risk of pollution events that would adversely affect water quality.

- 8.5.119 Operational phase mitigation to prevent water pollution is centred on the requirement for the design to adhere to the principles of Sustainable Drainage Systems (SuDS) wherever possible. This requirement stems from legislation such as the Water Framework Directive, which itself relates to water quality and quantity (flood risk) and the need for designs to include measures such that neither of these aspects are adversely affected. The surface and ground-water regimes would remain functioning as they currently do, meaning that habitats and dependent species would not be adversely affected in any way.
- 8.5.120 The provision of earth bunds, to reduce the visual impact and noise from the proposed Scheme during its operational phase, would reduce the effects of disturbance on the habitats and potential invertebrate species are minimised as far as possible.
- 8.5.121 Existing and proposed habitats within the DCO boundary, and consequently the terrestrial invertebrates colonising them, would benefit from the careful design of the landscaping scheme that has taken place, and the selection of suitable species mixes. The provision of grassland is particularly important for terrestrial invertebrates.
- 8.5.122 Grassland would include appropriate short sward seed mixtures, to provide food sources for invertebrates and to ensure that vegetation does not grow too high, thereby allowing the warming effect of the sun. Rabbits would be allowed to colonise the verges in order to maintain the short swards and to create areas of bare earth, to benefit invertebrate species. Mowing/cutting would be undertaken after the flowering season and the arisings removed to prevent the accumulation of nutrients and the consequent development of rank grassland.
- 8.5.123 The inherent connectivity of the proposed landscaping would allow invertebrate areas to be connected to the wider landscape to enable dispersal via hedgerows and rough grass margins.

Generic Mitigation for Species and Habitats not considered Valuable Ecological Resources

Habitats

- 8.5.124 The permanent loss of areas of valuable habitat to the proposed Scheme would be mitigated for by the proposed landscaping scheme, which would ensure that similar habitat is provided. The habitats planted would greatly outweigh the habitats lost, in terms of total areas. During the early stages of design a ratio of 3:1 was proposed, although in reality the total areas of habitats created is likely to far exceed this requirement.
- 8.5.125 The temporary loss of habitats, where site compounds, materials storage, batching plants, topsoil storage etc are required, has been minimised by careful design. Wherever possible they would be positioned on arable land, avoiding habitat features of value.
- 8.5.126 The remaining trees and woodland would be protected during construction, with fencing to eliminate impacts within root protection areas, as required by British Standard 5837:2012 Trees in Relationship to Design, Demolition and Construction.

Reptiles

- 8.5.127 It is considered that the reptile populations within the Zol are sufficiently low that individuals could be effectively displaced from the areas where they were recorded, using a precautionary approach. Phased vegetation removal, whereby vegetation is first strimmed to a height of 150mm, and then on subsequent days strimmed to ground level, would be used to displace reptiles, as sufficient habitat would remain beyond the proposed Scheme footprint to allow them to move with no adverse effects. The lack of suitable habitats, and the on-going disturbance associated with the construction of the proposed Scheme should preclude their presence from the site of the proposed Scheme during construction.
- 8.5.128 As with great crested newts above, no fencing is proposed as a road with a greater rate of use than 20 vehicles per hour effectively functions as its own deterrent to movement for amphibian and reptiles species.

Deer

- 8.5.129 The potential risk of deer vehicle collisions with the serious implications in terms of public safety, as well as the health and wellbeing of the deer population has been addressed by a number of measures. The proposed Scheme design includes wide verges and swales along the majority of the proposed route. Further, the landscaping scheme has been designed in such

a way that there is little or no woodland or scrub vegetation adjacent to the road where known crossing points are severed by the proposed Scheme.

8.5.130 These combine to mean that visibility of deer on the carriageway edges for motorists would be good, allowing deer to be identified and their movements predicted, allowing motorists the time to react accordingly, reducing the chances of collisions. It would also allow deer visibility of approaching vehicles, making unpredicted crossings far less likely.

8.5.131 Signing along the carriageway would indicate to motorists that they were entering an area where deer populations are known, providing an early indication as to potential issues.

8.5.132 In addition, it is intended that scaring devices (reflectors) would be installed where known crossing points are severed. These would be mounted on posts, and would reflect approaching car headlights towards the adjacent habitats, creating a dazzling effect that would startle deer and deter them from crossing when vehicles are approaching. This would further reduce the chances of deer vehicles collisions.

Summary of Proposed Mitigation

8.5.133 The mitigation measures described above are summarised in the tables below:

Table 8.15 Summary of General Mitigation Measures

Mitigation Measure	Target	Location	Purpose	Timing
Habitat Clearance during winter season	Birds	Throughout scheme	To ensure that breeding birds are not disturbed. Also benefits other species.	Construction phase
Extensive landscaping scheme	Various	Throughout scheme	To provide replacement and additional habitat, new connectivity, addressing severance etc.	Operational phase
Inclusion of retained deadwood in landscaped areas	Various	Throughout scheme	To provide features of conservation interest, and to boost associations between new planting and invertebrates and fungi that help to sustain them.	Operational phase
Localised provision of more established trees/shrubs	Bats, birds	Throughout scheme	To address severance of existing important flight-lines and commuting routes. To provide higher flight-lines, reducing chance of bat and birds vehicles collision mortality.	Operational phase
Cutting/false cutting	Bats, birds	Throughout scheme	Contributes to providing higher flight lines, reducing chance of bat and birds vehicles collision mortality. Also acts as screening for breeding birds etc in wider landscape.	Operational phase
SuDS Drainage system	Various	Throughout scheme	Maintains existing rate of input to surface and groundwater, eliminating changes in aquatic and semi-	Operational phase

Mitigation Measure	Target	Location	Purpose	Timing
			aquatic habitats. Contains pollution incidents to ensure that surface and groundwater are no affected.	
Prudent siting of site compounds	Various	Throughout scheme	To ensure that no impacts beyond those that are absolutely necessary are caused.	Construction Phase
Construction -Phase pollution prevention	Various	Throughout scheme	To eliminate the risk of pollution to surface and groundwater by silt, hydrocarbons, dust etc, and to reduce light pollution, disturbance etc.	Construction Phase

Table 8.16 Summary of Site and Species Specific Mitigation Measures

Mitigation Measure	Target	Location	Purpose	Timing
Seed harvesting and topsoil storage	Hoary mullein and general sward	Fakenham Road RNR	To allow the re-creation of valuable plant communities currently designated as Roadside Nature Reserve.	Construction phase
Timed removal of roosts	Bats	Various locations	To ensure that roosts are not removed during use by bats. Summer roosts to be removed during winter, for example.	Construction phase
Hand-searches of buildings due for demolition	Bats	Around Gazebo Farm, Rackheath	Although not currently thought to be used as roosts, it would be necessary to ensure that demolition took place with the confidence that no bats were using them.	Construction phase
Absence of Street Lighting (except at Postwick junction)	Bats	Throughout scheme	To reduce impacts on bat activity throughout the proposed Scheme	Operational phase
Green Bridges	Bats	Marriott's Way and Middle Road	To provide continuity of the two most significant flight-lines over the proposed Scheme.	Operational phase
Bat Gantries	Bats	Seven locations throughout scheme	To provide continuity of major flight-lines over the proposed Scheme.	Construction and Operational Phases. (To be installed early

Mitigation Measure	Target	Location	Purpose	Timing
				in construction process).
Modified Highway Bridges to include Dark Corridors	Bats	Buxton Road and Newman's Road bridges	To provide dark corridors within the bridge structure, allowing continuity of movement over the proposed Scheme.	Operational phase
Underpass	Bats	Rackheath Park	To provide continuity of flight-lines for low-flying species, allowing continuity of movement over the proposed Scheme.	Operational phase
Bat houses	Bats	Gazebo Farm and Hall Farm, Rackheath	To mitigate for the loss of two buildings in which bats roost.	Construction and Operational Phases. . (To be installed early in construction process).
Bat boxes	Bats	Drayton Drewray, Spixworth Plantation and Heath Wood	To provide additional roosting locations, mitigating for those that are lost.	Construction and Operational Phases. (To be installed early in construction process).
Sensitive lighting during construction	Bats	Throughout scheme	To reduce or eliminate further impacts on bats during construction.	Construction Phase
Covering open	Badgers	Throughout scheme	To remove potential impacts on badgers during the	Construction Phase

Mitigation Measure	Target	Location	Purpose	Timing
trenches, closing exposed pipework			Construction phase.	
Badger fencing	Badgers	Various locations	To ensure that badgers do not stray onto the construction site and completed proposed Scheme, reducing the chance of vehicle collision mortality.	Construction and Operational Phases
Timed Closure of Outlier Sett	Badgers	Marriott's Way	Closure of small outlier sett will be carried out during winter when not in use.	Construction phase
Four new ponds	Great crested newts	Gazebo Farm	To mitigate for the loss of a GCN breeding pond beneath the footprint of the proposed Scheme.	Construction and Operational Phases. (Two to be installed prior to construction, remaining two early in construction process).
Underpass	Great crested newts	Rackheath Park	Not specifically provided for GCNs but offers the potential for continuity of movement either side of the proposed Scheme.	Operational phase
Temporary newt fencing	Great crested newts	Areas around Dog Lane, Horsford,	To allow the trapping and relocation, and subsequent exclusion of GCNs from the	Construction Phase

Mitigation Measure	Target	Location	Purpose	Timing
		Quaker Farm, Spixworth, and Gazebo Farm, Rackheath	construction site.	
Refugia and Hibernacula	Great crested newts	As above	To provide potential locations for taking refuge and hibernating, to mitigate for the disturbance and loss of habitat caused by the proposed Scheme.	Operational phase
Bird boxes	Breeding birds	Various suitable locations	To provide replacement breeding locations, mitigating for those beneath the footprint of the proposed Scheme.	Construction and Operational Phases
Fine mesh screening to the edge of the Construction site	Barn Owls	Various locations	To reduce the visual intrusion and on-going disturbance to nesting barn owls within 150 metres.	Construction Phase
Barn owl boxes	Barn Owls	Beyond scheme footprint	To provide further nesting opportunities compensating for those lost to the proposed Scheme.	Construction and Operational Phases
Installation of log piles, deadwood, etc	Various	Throughout scheme	To provide habitat for reptiles, small mammals, invertebrates etc, with associated benefits to wider ecosystems.	Operational phase

Mitigation Measure	Target	Location	Purpose	Timing
Reflective deer scarers	Deer	Between sensitive woodland areas	To startle deer when vehicles approach, reducing the chances of deer vehicles collision mortality.	Operational phase

Monitoring

Designated Sites

8.5.134 No specific monitoring is proposed in regard to Designated Sites.

Habitats

8.5.135 It will be necessary to monitor newly created habitats, as part of the initial, two year maintenance period. (After this time maintenance responsibility would revert to Norfolk County Council as the Highway Authority). During this initial maintenance period the health of planted trees and shrubs will be monitored, and any that die during this period would be replaced. Particular attention would be paid to those trees on Marriott's Way and Middle Road Green Bridges, where the soil depth and general conditions will make for challenging growing conditions.

8.5.136 As recommended in the Arboricultural Implications Assessment in Volume 2, Chapter 20, Section A, existing trees would be monitored over a five year period, to ensure the health of those remaining trees, and the health and safety implications of their being located adjacent to the proposed carriageway, footways, cycleways, bridleways etc. This would take into account potential changes in growing conditions that could affect the trees, their health and their stability, which could be affected by slight alterations in groundwater availability, additional wind-loading etc.

Bats

8.5.137 A long term monitoring programme, during and after construction, would be instigated to provide certainty that the mitigation, compensation and enhancement measures put in place for a scheme are functioning effectively, and to allow quick and efficient changes to be made to correct any problems identified through the monitoring.

8.5.138 No clear guidance is available on the level of monitoring that might be appropriate for a road scheme. The Highways Agencies Interim Advice Note 116/08 (Highways Agency, 2008) simply states that monitoring for bats should be appropriate to the level of mitigation provided and should be included within contractual requirements. Where a significant level of mitigation is proposed, as has been put forward for this scheme, monitoring is particularly

important in order to determine the success (or not) of the mitigation put in place. The monitoring methodology would be put together to monitor in and around newly created features (e.g. the bat bridges) and also to monitor against previously identified baseline survey work.

8.5.139 A monitoring programme for bats is provided in the table below.

Table 8.17: Proposed Bat Monitoring for NDR

Activity	Monitoring Period	Months of Checks
Unmanned static monitoring, 12 locations, as during 2013 survey season.	15 years (years 1, 2, 3, 5, 10 and 15).	Late April, June and September each year.
Manned static monitoring of bat bridge and bat tunnel locations, three visits per season.	15 years (years 1, 2, 3, 5, 10 and 15).	Late April, June and September each year.
Survey for dead bats at 10 selected monitoring locations. Early morning twice each year.	15 years (years 1, 3, 5, 10 and 15).	Late April and September each year.
Counts of known roosts within 50 m of the works area: Two dusk surveys per roost.	15 years (years 1, 3, 5, 10 and 15).	May-August inclusive each year (repeat at same time each monitoring visit for each roost)
Monitoring counts of each bat house. Two dusk surveys.	15 years (years 1, 2, 3, 5, 10 and 15).	May-August inclusive each year (repeat at same time each monitoring visit for each roost)
Bat box checks. Twice a year.	15 years (years 1, 3, 5, 10 and 15).	May/June and August/September.
Hibernation surveys of known roosts within 2 km.	15 years (years 1, 3, 5, 10 and 15).	Jan to March.

Activity	Monitoring Period	Months of Checks
Radio-tracking (barbastelles).	7 years (years 1 and 7).	May/June or Aug each year, focussing on same areas identified as important through baseline surveys.

Badgers

8.5.140 Prior to construction, monitoring of all badger setts will be required, to ensure that the assessments of impacts, and mitigation measures, remain appropriate.

8.5.141 Setts 3, 4 and 6 showed no signs of recent activity during the latest survey. Sett 7 did show signs of recent occupancy. As these setts are all within the footprint of the road they will need to be closed prior to construction. If monitoring can demonstrate these setts are not in use, they can be destroyed without a licence from Natural England. If they are re-occupied, a licence will be required. Closure works must normally take place between July and November. However, as setts 3, 6 and 7 are all outlier setts, their use during the winter is unlikely and it may be possible to close them outside of this period if monitoring can confirm lack of winter use.

8.5.142 Occupancy would be determined by daily manual monitoring for at least 21 consecutive days, placing triggers in a position where they would be disturbed if a badger entered or exited the sett, or alternatively with a remote infra-red camera. The latter would have the advantage that it can constantly monitor the site and confirm badger presence (for example, a rabbit may dislodge the sticks in the entrance, giving an inaccurate picture of occupancy).

8.5.143 If during the monitoring any sett is found to be active a licence would be required from Natural England in order to close it. Closures of active setts involve placing one-way wooden gates outside each entrance. These are monitored for 21 days to ensure there is no evidence of re-entry, before the sett is dug out. Licences take up to 30 working days to be processed by Natural England and are not normally issued between December and June when badgers are breeding (although outlier setts can be closed during this period as they are not typically used for over-wintering).

8.5.144 As badgers are a mobile species new setts could be excavated between the survey and the start of works. The proposed Scheme would be resurveyed at least ten to twelve weeks prior to the start of construction to identify any new evidence.

8.5.145 During the operational phase, monitoring would take place for at least five years to assess the effectiveness and condition of the proposed badger fencing, and also the mortality rate of badgers on the new road.

Great Crested Newts

8.5.146 The proximity of the great crested newts meta-populations at Quaker Lane, Spixworth and Newman Road, Rackheath to the proposed Scheme mean that construction phase and post-construction monitoring of the will be required, to ascertain the effectiveness of the proposed mitigation and enhancement measures.

8.5.147 A full population survey of known existing breeding ponds and the four new ponds would be carried out. These surveys will require six visits to each pond on suitable nights (i.e. when the overnight temperature is 5°C or greater and there is no heavy rain) between mid-February and mid-June. The visits should not be on consecutive nights and at least half of them must be carried out in the peak period between mid-April and mid-May. The round of surveys will need to be repeated each year post construction for six years. On completion of the six years of monitoring, a report will be prepared for Natural England as part of the mitigation licence return.

Breeding Birds

8.5.148 A key feature of the mitigation package would be to monitor its success post construction. This monitoring would seek to measure any change in species composition, species number and the number of individuals using the habitats alongside the new road; in particular those habitat areas that will have been created for the use of wildlife. The monitoring programme would involve establishing a baseline data set in the year prior to construction by surveying the route three times between March and June inclusive using a method based used to collect data for this assessment. This would then be repeated each year until five years post construction.

Barn Owls

8.5.149 It would be necessary to monitor the success of the ten barn owl boxes. This would be carried out by a suitably qualified ecologist holding a valid Natural England or British Trust for Ornithology licence to disturb breeding barn owl in Norfolk.

8.5.150 The use of screening as a way to reduce barn owl mortality is fundamental in reducing road casualties and the success of this should be carefully measured. It is also essential that regular maintenance is undertaken on mitigation measures, for example, ensuring the continuity of the screening planting and maintenance of barn owl boxes.

Aquatic Invertebrates

8.5.151 Monitoring of the macro-invertebrate communities should be carried out during and following construction at all sites to establish whether there has been any change from the baseline. This should be carried out at the same time of year as the baseline survey (autumn and spring). Monitoring should be carried out during construction and in years 1, 3 and 5 following construction to assess any operational impacts.

8.5.152 Monitoring of the Desmoulin's whorl snail population should also be undertaken during construction and in years 1, 3 and 5 following construction at the appropriate time of year (mid to late summer).

Terrestrial Invertebrates

8.5.153 No monitoring of the habitats of above average suitability for terrestrial invertebrates is proposed.

8.6 Assessment of Impacts

8.6.1 This section assesses the likely effects of the proposed development based on the successful implementation of the mitigation measures proposed in Section 8.5. Impacts are assessed for the Valuable Ecological Resources listed in Section 8.4.5, during both the Construction phase and the

Operational phase; the latter considers impacts in the Opening Year (Year 1) and in the Design Year (Year 15).

- 8.6.2 Impacts during the Construction phase are those that would occur throughout the two year construction phase, and include the immediate impacts from both the temporary and permanent habitat removal, along with the associated effects this would have. Indirect impacts during construction are also considered; this include the disturbance cause during construction, due to the presence of people, vehicles and plant, the inevitable noise and vibration, localised impacts on air quality due to dust production and pollution, visual impacts on adjacent areas etc.
- 8.6.3 Operational phase impacts are those that occur once the proposed Scheme is opened. The continued absence of habitat lost during the Construction is assessed, against the provision of new habitats within the proposed landscaping scheme, and the return of those areas lost temporarily, for example site compounds, topsoil storage areas, batching plants etc.
- 8.6.4 The indirect effects of the vehicles using the road are also considered. These include disturbance, in terms of noise and vibration, light from vehicles headlights, visual intrusion on adjacent areas etc. As such, it has been necessary to incorporate an in-combination approach to all assessment, such that the potential impacts of disturbance due to, for example alterations in air quality, changes in the noise regime or alterations to surface or groundwater, are included.
- 8.6.5 Cumulative effects are identified and assessed in Volume 1 Chapter 15.

Construction Phase

Statutory Designated Sites

- 8.6.6 No impacts are predicted on Statutory Designated Sites (Broadland Ramsar site, Broadland SPA, The Broads SAC, Mid-Yare NNR, or the River Wensum SAC or SSSI) during the Construction phase of the proposed Scheme. The distance between the Statutory Designated Sites and the proposed Scheme, combined with the mitigation measures to be employed during construction, would ensure that this is the case. As the magnitude of the impact is Neutral, the overall effect would be Neutral. The confidence in these predictions is Certain.
- 8.6.7 No Significant effects are therefore anticipated on any Statutory Designated Sites during the Construction phase of the proposed Scheme.

8.6.8 These conclusions are explored and explained more fully in relation to the SACs, SPAs and Ramsar sites in the NDR Habitat Regulations Assessment report (Mott MacDonald, 2013).

Non-Statutory Designated Sites

8.6.9 No impacts are predicted on the Attlebridge Hills, Whinney Hills & Common, and Payne's Yard Wood, The Owlery & March Covert CWSs; the distances between these sites and the proposed Scheme, and the context of their existing settings are sufficient to ensure this. The magnitude of the impact would be Neutral, with a corresponding Neutral overall effect. The confidence in these predictions is Certain.

8.6.10 Marriott's Way CWS would be directly impacted by the proposed Scheme. Unavoidable loss of habitat would be required to construct the carriageway and associated linear drainage features etc, as well as the proposed overbridge that will ultimately allow the continuation Marriott's Way, both as a habitat and as a footway and cycle and equestrian route. A total length of approximately 300 metres of Marriott's Way would be affected; this length has been greatly reduced during the design process, and represents a small proportion of the total habitat of the CWS, as Marriott's Way continues in a similar form in either direction of the proposed Scheme for several kilometres. The construction of the proposed Scheme, and consequently the loss of habitat would be phased to further minimise the impacts. The magnitude of the impact on this site is predicted to be Minor Negative, leading to a Slight Adverse overall effect during construction.

8.6.11 No impacts are predicted on Ladies Wood, Church Carr & Springs CWS and Ancient Woodland; the site would not be subject to any habitat loss, and the proposed mitigation measures would be sufficient to eliminate any indirect effects. The magnitude of the impact during construction is predicted to be Neutral. The overall effect would therefore also be Neutral.

8.6.12 The confidence in the above predictions is Probable.

8.6.13 Fakenham Road RNR would be directly affected. The whole of this small site would be lost to the proposed Scheme, although the valuable species of flora would have their seeds harvested in advance of construction, and the topsoil, and therefore soil-stored seedbank, would be stored, for reinstatement on the new verge. The magnitude of the impact during construction would be Major Negative as the whole of the site would be removed, giving a Moderate

Adverse overall effect. This would constitute a Significant adverse effect. The confidence in this prediction is Certain.

8.6.14 A part of Ortolan's Grove Ancient Woodland would be permanently lost to the proposed Scheme, meaning that direct adverse impacts are unavoidable. Despite its designation as Ancient Woodland this small site is already fairly degraded. Few mature trees remain in this area, which is now mainly scrub with many self-set young elm trees (*Ulmus* spp), all of which are dead or dying as a result of Dutch elm disease. The most notable, valuable trees are on the south-eastern edge of the wood and comprise of two large, veteran lapsed sweet chestnut (*Castanea sativa*) coppice stools and a small-leaved lime (*Tilia cordata*). The degraded nature of the area means that the ecological integrity of the site, and its status as Ancient Woodland, is already compromised to a major extent.

8.6.15 It is therefore considered that the magnitude of the impact of the proposed Scheme is dissipated by the degradation to the site that has already taken place, as the inherent value of the site has already been greatly reduced. It is therefore considered that, despite its status as Ancient Woodland, the magnitude of impacts on Ortolan's Grove Ancient Woodland is predicted to be Minor Negative. The overall effect would therefore be Slight Adverse. The confidence in this prediction is Probable.

8.6.16 The adverse effect on Ortolan's Grove Ancient Woodland during the Construction phase is therefore not Significant.

8.6.17 Sprowston Wood Replanted Ancient Woodland would not be directly affected. Indirect Construction phase impacts, associated with the disturbance caused by construction vehicles and plant, are likely to be minimal, when considering the distance between the woodland and the proposed works, and when considered in the context of the existing surroundings, adjacent to the A1151 Wroxham Road. The magnitude of these impacts is therefore predicted to be Neutral, with a corresponding Neutral overall effect. The confidence in this prediction is Certain.

8.6.18 The eleven Important Hedgerows would be permanently lost to the proposed Scheme. No Construction phase mitigation is feasible, so the magnitude of the impacts on each of these hedgerows is Major Negative. This means that the overall effect is Moderate Adverse, and is therefore a Significant adverse effect. The confidence in this prediction is Certain.

- 8.6.19 The Construction phase of the proposed Scheme is likely to have direct and indirect effects on three notable areas of woodland, at Drayton Drewray, Spixworth Plantation and Heath Wood. Direct effects would be caused by the unavoidable loss of habitat to the proposed Scheme. Indirect effects are also likely on those remaining adjacent areas of habitat. Severance is likely, whereby one contiguous habitat is split into two or more individual blocks.
- 8.6.20 Associated with this is the introduction of edge effects where currently there are none. Edge effects are the way conditions (daylight, precipitation input, temperature variation, wind loading, disturbance etc) progressively change as you move from the edge to the centre of the woodland (or other habitat). For example, at the edge of the woodland ground flora is likely to be comprised of species that are light tolerant or light-loving. The ground flora species mix is likely to alter away from the edge of the woodland towards the centre, where available light is much less. The ground flora here will contain species tolerant of much darker conditions.
- 8.6.21 The severance and habitat loss that the proposed Scheme will cause will create edge effects where currently there are none; those areas of the interior of the woodlands that would become edge habitats would suffer adverse impacts as those species present may be unable to thrive in the new conditions. The impacts of edge effects are likely to be most marked at Heath Wood and Drayton Drewray; Spixworth Plantation is a long, thin belt of woodland, so there are very few areas that currently do not experience edge effects to some degree already.
- 8.6.22 The Construction phase may also create indirect effects on woodland by the alteration of the groundwater regime, whereby the earthworks may interrupt or reduce groundwater movement, potentially affecting the availability of water for the trees, shrubs and plants.
- 8.6.23 The magnitude of the impacts on the above woodlands are predicted to be Minor to Intermediate Negative This depends on the size and the proportion of the woodland block to be lost to the proposed Scheme, and the integrity and health of the existing habitats. The overall effects in all cases will therefore be Slight Adverse. The confidence in these predictions is Probable.
- 8.6.24 Note that the above assessment of impacts and effects consider just the habitat; assessment of protected and other species likely to be using these habitats are made elsewhere in the section as appropriate.

8.6.25 One small area of parkland would be directly affected by the proposed Scheme, at Beeston Park to the immediate north of Beeston Hall, where habitat loss is inevitable. At this location, the habitat is primarily semi-improved grassland. Few standard trees are present as you would expect in parkland; instead small woodland blocks are present. Some areas of historical parkland are now arable fields.

8.6.26 The magnitude of the impact on parkland habitats is predicted to be Minor Negative, leading to a Slight Adverse overall effect. The confidence in this prediction is Certain.

8.6.27 The consideration of parkland as a landscape feature, as opposed to a habitat or habitats, is given in Volume 1 Chapter 7 Landscape.

Arable Field Margins

8.6.28 A small number of arable field margins would be lost to the proposed Scheme. However, these habitats are ephemeral, becoming established in a very short time. They are also fairly easily replicated; relocation of the topsoil would be likely to include the seedbank, so a very similar sward would be likely to grow soon after relocation. The magnitude of the impact on these habitats is therefore considered to be Neutral, with a corresponding Neutral overall effect. The confidence in this prediction is Certain.

Hedgerows

8.6.29 In common with Important Hedgerows already discussed, unavoidable loss of further hedgerows would occur during the Construction phase of the proposed Scheme. No Construction phase mitigation is feasible, although the lengths of hedgerow to be removed would be minimised as far as possible. In most cases only a section of the hedgerows would be removed, so the magnitude of the impacts on each of these hedgerows is Intermediate Negative, giving a Slight Adverse overall effect. The confidence in this prediction is Probable.

Bats

Directly Affected Roosts in Buildings

8.6.30 The loss of the three buildings used as roosts within the footprint of the proposed Scheme would be mitigated for by the advanced provision of two new bat houses. (One of the existing buildings, although a roost in the past, is

unlikely to be used as anything more than a feeding perch now, as its ongoing dereliction means that conditions are no longer suitable for more permanent, notable roosts. The most recent records of bats using this building are as a feeding perch only). Despite the provision of the bat houses, and the proposed timing of demolition of the existing roosts to minimise impacts, adverse effects would still be likely during the Construction phase.

- 8.6.31 Although the proposed bat houses would be located as close to those buildings to be lost as possible, it is possible that it would take some time for the bats to find and become accustomed to the new buildings. The roosts in the current buildings are likely to have been used for many seasons now, so their use is likely to have become habituated to a certain extent. This may mean that uptake and utilisation of the new roost site is not immediate, and that some of the bats temporarily move to find alternative roost sites in the wider landscape.
- 8.6.32 However, it is not uncommon for bats to use different roosts during and between seasons. Moving between roosts is a known feature of bat activity; this is one of the main reasons why up-to-date survey data is so important in accurately assessing impacts. This means that the impact on the recruitment rate for those bats using these roosts should be limited. Any adverse effects are likely to be temporary, lasting only one or two seasons. The new bat houses, once their usage has become established, would offer more secure, long-lasting roost locations, in which almost all aspects of the design have been formulated expressly to maximise appeal for roosting bats.
- 8.6.33 The loss of habitat during the Construction phase, considered in more detail below, would act to compound the above impacts.
- 8.6.34 During construction, the magnitude of the impacts on bats roosting in directly affected buildings, even with the described mitigation measures in place, is predicted to be Intermediate Negative. This means that the overall effect would be Large Adverse. This is considered to be a Significant adverse effect. The confidence in this prediction is Probable.

Directly Affected Roosts in Trees

- 8.6.35 The loss of seven known bat roosts in trees would have similar adverse impacts on bats as those described above. New potential roost sites would be created by the provision of bat boxes in the vicinity of each existing roost in advance of their loss. As each of the seven known trees with bat roosts are used as summer roosts, they would be removed at a time of year when bats

would not be using them. However, the same temporary effects as above are likely, with a possible slight impact on rates of recruitment over a short period of perhaps a season or two, until such time as new roost sites are identified and habituated.

8.6.36 The loss of habitat during the Construction phase, considered in more detail below, would act to compound the above impacts.

8.6.37 The impact on the bats using those roosts to be lost to the proposed Scheme would be experienced in conjunction with other aspect of the Construction phase, most notably the permanent and temporary loss of habitat locally. The impacts associated with habitat loss are discussed in detail below.

8.6.38 During construction, the magnitude of the impacts on bats roosting in directly affected trees is therefore predicted to be Intermediate Negative. This means that the overall effect would be Large Adverse. This is considered to be Significant. The confidence in this prediction is Probable.

Indirectly Affected Roosts

8.6.39 Those roosts in buildings and trees in areas adjacent to the proposed Scheme should experience limited indirect adverse impacts. The mitigation measures employed during construction, to avoid sensitive times of the year wherever possible, and to minimise indirect effects of disturbance through carefully specified lighting equipment etc, would serve to achieve this. The main effect on bats using indirectly affected roosts would be due to the habitat loss to the proposed Scheme, which is discussed in detail below.

8.6.40 The magnitude of the specific impact on indirectly affected roosts is predicted to be Minor Negative, giving a Slight Adverse overall effect. The confidence in this prediction is Probable.

Significant Flight Paths and Other Features of Importance

8.6.41 The pattern of land use within the Zol is such that a large proportion of the habitats of value to bats are linear features that bisect arable fields and other areas of lower utilisation, as many of the bat species are dependent on using linear features for navigation, shelter and as a source of prey species. This means that the main effect of the extensive habitat loss within the Zol is one of severance of flight paths and commuting routes. Small pockets of wider,

non-linear habitat of value to bats, for example blocks of woodland, are also to be lost.

- 8.6.42 The permanent loss of habitat to the proposed Scheme would affect a large number of significant flight routes, throughout the length of the route. This is by virtue of the size of the proposed Scheme, and the value and volume of the habitats, and hence the size of bat populations, locally. Many of these routes are used in large numbers by several species of bats, including the most sensitive species found within the Zol, the barbastelle. For several of the bat species present within the Zol, the habitat lost, and the linear features severed, would mean that without mitigation, movement through the landscape would be impeded, as they are dependent on the habitat features along which to fly.
- 8.6.43 The most sensitive species are those clutter-dependent, light intolerant species such as barbastelle and brown long-eared bat species, which rely heavily on the shelter of the woodlands, tree canopies and hedgerows, and the physical structure, shelter and darkness that these features provide. These species would experience the most notable impacts. Other species, such as the pipistrelles, also tend to use linear features as commuting and foraging routes, but are more light tolerant, so negotiating gaps in linear features is less problematic. These species would be impacted to a slightly lesser degree. Other species, such as the noctule, are high-flying and light tolerant, so are less dependent on linear features and darkness to be able to move through the landscape. These species would experience the least adverse impacts.
- 8.6.44 The habitat loss may sever roost sites from foraging areas, hibernation roosts from summer roosts, or may sever different parts of the home range of bats, which can cover very large areas. Even in one night some species of bat could easily travel several kilometres.
- 8.6.45 The most important flight path within the Zol is Marriott's Way, by virtue of the frequency of use by bats. All species of bat within the Zol have been recorded using this feature, including individuals from the sizeable barbastelle population known to be centred in habitat several km to the west. Of comparable importance is the flight path along Middle Road, Great Plumstead. The grounds and buildings of Great Plumstead Hall are known to be used by various bat species, and Middle Road is a well-used route for nightly foraging, and for seasonal movement of bats through the wider landscape.

- 8.6.46 The severance of all significant flight paths would be mitigated for by the provision of crossing structures, either a wire gantry, green bridge, tunnel or modified highway bridge structure, as described in the Mitigation section. However, as has been described with the proposed new roosts above, there is likely to be a short term effect on bat movement through the wider landscape even with these features in place, as the process of habituation takes place. The bats would be presented with unfamiliar absences of habitat along which to fly, and unfamiliar structures which would have taken their place. It is likely that use of these significant flight paths would be reduced until the use of these crossing points became the norm.
- 8.6.47 Until habituation takes place, the severance of significant flight paths, and the loss of habitat along which to feed, could result in short term drops in feeding rates. Consequent effects, if the health and physical condition of bats is affected too much, would be a short term drop in breeding success, with an inherent dip in recruitment rates to bat populations locally. This would be likely to last as long as the habituation of new crossing points and flight paths takes, typically one or two seasons.
- 8.6.48 The underpass at Rackheath Park is likely to be the first mitigation structure to be habituated by bats. Structures such as this are known to be readily used, and the underpass would be installed at a level very similar to the existing ground level, and therefore the existing flight level. This, along with the barrier/funnel effect that the proposed Scheme would have on bat flight routes in this location due to its elevation above the existing landscape, mean that the tunnel should be readily accepted and used by bats in this location, with only a short period of habituation required.
- 8.6.49 The wire gantries would be constructed during the first winter of the Construction phase, so there would be no impacts during the summer season. Instead the new crossing points would be in place for when bats emerged from hibernation, so the impact would be between, and not during seasons. The design of gantry, specifically the shape and orientation of the wire mesh between the columns, has been chosen as it is thought to be the most easily adapted to by bats.
- 8.6.50 An advantage of installing the permanent wire gantries during the early stages of the Construction Phase mean that, although habitat loss would be evident, there should be little in the way of features beneath them to act as a source of disturbance during the habituation process. Were the installation of permanent gantries to be delayed until the end of the Construction phase, the habituation process would be impaired by the presence of volumes of traffic

using the road, with the associated noise and lighting from vehicle headlights. Instead, there would be little or no sources of disturbance (noise, light, people) at night during the Construction phase to exacerbate the impacts of the severance of the linear habitats.

8.6.51 The construction of the Green Bridges at Marriott's Way and Middle Road, and the modified highway bridges at Buxton Road and Newman's Road, would take more than twelve months. In the case of Marriott's Way the construction programme is 18 months, although this includes a pause specifically to minimise impacts on bats using this route. However, the duration of the construction of these bridges means that, with the exception of Marriott's Way, at least one full season would pass with severance likely to be unavoidable.

8.6.52 The loss of portions of woodland habitat at Spixworth Plantation and Heath Wood, both of which are known to be of importance for bat populations, is also likely to have adverse impacts on bat populations locally. Spixworth Plantation, a linear woodland belt, would be severed by the proposed Scheme. Extensive habitat recreation would take place to mitigate for the severance, although its viability before becoming established is likely to be limited. The severance of habitat at Heath Wood is to be mitigated for by the provision of a modified highway bridge to provide a dark corridor between the remaining areas. As with previously, there would be a period between the loss of habitat and the provision of the bridge during which connectivity is not provided, and despite sensitive phasing of the works the duration of the construction of this bridge is such that impacts on bats, between their hibernation periods, is likely.

8.6.53 The number and sensitivity of significant flight routes that would be severed, and the number of bats known to be impacted by the severance that the loss of habitat will cause, means that the magnitude of the impacts on bats using these routes, even with the above mitigation, is predicted to be Minor to Intermediate Negative depending on a number of factors including location, species, duration of disturbance, degree of change of habitat etc. The overall effects would therefore be Slight to Large Adverse. These effects are considered to be Significant. The confidence in this prediction is Probable.

Other Areas of Activity

8.6.54 The above assessments deal with the majority of the likely impacts on bats, so few other features require assessment. A notable proportion of the

permanent and temporary areas to be lost to the proposed Scheme are comprised of habitats such as arable fields, amenity and improved grassland, which are of limited value and usage by bats as they offer little in the way of shelter or sources of prey species. Impacts due to the loss of these areas are likely to be limited.

- 8.6.55 The temporary loss of habitat during the Construction phase is likely to have very little additional effect on bat populations with the Zol. All site compounds, topsoil storage areas, batching plants etc have been designed such that only arable and low value grassland would be lost. It would not cause any severance additional to that already considered.
- 8.6.56 The magnitude of the impact due to the loss of these areas during Construction is predicted to be Minor Negative, giving a Slight Adverse overall effect. The confidence in this prediction is Certain.

Badgers

- 8.6.57 Four of the seven identified setts are active; however three of these are outside of the footprint of the proposed Scheme, and so would not be directly impacted. Just one active sett, Sett 7 is within the footprint. However, as an outlier sett it is used only occasionally, and it will be closed when monitoring demonstrates that no badgers occupy it. This means that there would be negligible adverse impacts on badgers due to the closure of setts.
- 8.6.58 Further impacts on the badgers using those occupied setts would be likely due to the required loss of habitat to the proposed Scheme, although in most cases the habitat is generally sub-optimal and not within the likely main territory; the proposed Scheme has been designed in order that optimal habitats are avoided as far as possible. The loss of habitat should be considered in the context of the large sizes of territories. It is acknowledged that Scheme as such as this can influence badger behaviour such that the 30 metres of habitat adjacent to the road becomes less favourable, and therefore less well used, which means an additional impact on the amount of habitat effectively lost to the proposed Scheme.
- 8.6.59 Severance of populations is likely to have only a slight impact on populations. The population at Sett 1 is known not to move far to the south and east of the road, as only a small area of foraging habitat is available in this direction; instead the optimal habitat is away from the road, in the opposite direction. The risk of vehicle collision mortality for this population is addressed as far as

practically possible by the badger fencing, which would prevent them from entering onto the carriageway.

8.6.60 Similarly with Sett 2, the habitats to the south, beyond the proposed Scheme are sub-optimal, whereas the wooded habitats to the north are far more valuable, with much more activity known in this direction. Again, badger fencing would preclude their access to the carriageway, all but eliminating the risk of vehicle collision mortality.

8.6.61 The badgers using Sett 5, a newly discovered sett to the west of the proposed Scheme, are likely to regularly travel to habitats to the east, within and beyond the route. Severance of habitats is therefore likely, although vehicle collision mortality would be eliminated as the badger fencing would prevent access to the carriageway. The area between the woodland and carriageway would include a sizeable area of grassland, scrub and woodland landscaping, and the fence would be positioned towards the carriageway side of this planting, so that as much of the original area would remain as accessible as possible.

8.6.62 The installation of badger fencing, coincident with the proposed Scheme extents, at the earliest stages of construction, means that vehicle collision mortality would be very unlikely.

8.6.63 Considering all of the above, it is predicted that during construction that the magnitude of the impacts on occupied badger setts is likely to be Minor Negative. This means that a Slight Adverse effect is therefore likely. On those unoccupied badger setts the impact would be Neutral, so a Neutral effect is likely. The confidence in these predictions is Probable.

8.6.64 In summary, no Significant effects on badgers are anticipated during the Construction phase.

Great Crested Newts

8.6.65 Each of the three great crested newt meta-populations being considered at this stage is of Very High conservation value due to their European level of protection.

8.6.66 During construction the Dog Lane, Horsford meta-population is likely to be indirectly impacted by a loss of small areas of terrestrial habitat, although these areas will be at least 100 metres from the ponds used, associated with linear features to the edges of large arable fields, with no further breeding ponds in this direction. The duration of the impact is likely to be restricted to one season, and the exclusion will be timed to take place during the seasonal

cycle when impacts can be eliminated or minimised. This means that the magnitude of the impacts is likely to be Neutral. A Neutral effect during construction is therefore predicted. The confidence in this prediction is Probable.

8.6.67 The Quaker Lane, Spixworth meta-population is likely to experience a loss of some terrestrial habitat, as the proposed Scheme is 100 metres from pond 16. The duration of the impact is likely to be restricted to one season, and the exclusion will be timed, as above, to take place when impacts can be minimised. The magnitude of the impacts is likely to be Minor Negative. A Slight Adverse effect is therefore predicted. The confidence in this prediction is Probable.

8.6.68 The Newman's Road, Rackheath meta-population will be directly impacted by the permanent loss of a pond and some terrestrial habitat. Although three new ponds will be provided in advance, and the population subject to a trapping and relocation exercise, timed to be as effective as possible, the disturbance may result in short term reduction in breeding success in those seasons when construction is taking place. However, sufficient other breeding ponds and terrestrial habitats will remain, that the viability of the meta-population is not likely to be jeopardised, so the magnitude of the impacts here is assessed as Minor Negative. The meta-population is therefore likely to experience a Slight Adverse effect. The confidence in this prediction is Probable.

8.6.69 No significant adverse effects on great crested newts are therefore anticipated during construction.

Breeding Birds

8.6.70 There are 15 breeding bird species of High conservation value and 15 species of Medium conservation value within the Zol.

8.6.71 Direct impacts during construction centre on the permanent and temporary loss of habitat to the proposed Scheme. Habitat clearance will avoid the nesting season, so this aspect of the impacts is negated, although there remains the net loss of breeding, foraging and commuting habitats that the proposed Scheme will cause, and the fragmentation that is likely, due to the severance of linear and other habitats.

8.6.72 Arable land makes up a significant proportion of the habitat to be lost to the proposed Scheme. Breeding bird utilisation of arable farmland was relatively diffuse but the spatial scale of the proposed route is taken into context when

considering the overall impacts. Breeding bird habitat utilisation of woodland and hedgerows was comparatively high especially where mature trees were present. Given the high utilisation of woodland locations any impacts here are likely to have a notable effect on the avifauna within the Zol.

- 8.6.73 The loss of woodland, acknowledged as being the most important habitat within the Zol, supporting the largest, most diverse breeding bird populations, has been avoided as far as possible through careful route selection and refinement, although loss of an area of Heath Wood and the corner of Drayton Drewray will occur. In each of these cases, displacement, rather than loss, of breeding birds is likely as sizeable proportions of both woodlands will remain. The loss of these habitats is considered in the context of the wider landscape, however, as it is likely that individual breeding and home ranges of birds are not restricted to the footprint of the proposed Scheme. No slow flowing or standing water habitats will be lost under the footprint of the proposed Scheme.
- 8.6.74 The impacts of severance of habitats is very hard to predict, and is likely to vary species to species. The proposed Scheme footprint is a minimum of approximately 80 metres in width, taking in the carriageways, verges, swales, embankments, footway/cycleways etc. However, the width fluctuates along its length, where drainage lagoons, wider landscaping areas, embankments of bridges, junctions etc are proposed. These additional, adjacent features have generally been designed to avoid linear habitat features as far as possible, minimising the impact of the severance.
- 8.6.75 There is a lack of evidence to suggest roads act as a physical barrier to movement of bird species although there may be behavioural barriers and some avoidance as a result of degraded habitats. In a fragmented landscape behavioural barriers can have greater significance, especially for specialist woodland species such as marsh tit (*Poecile palustris*) where the dispersal behaviour of this species is known to be sensitive to habitat fragmentation resulting in poor settlement beyond the natal wood.
- 8.6.76 The proposed scheme does not fragment likely corridors of movement between significant areas of woodland within the Zol i.e. Attlebridge Hills, Deighton Hills and Drayton Drewray, and Church Wood and Belaugh Broad, Wroxham (outwith the Zol). The adverse effects of the potential to create a barrier to dispersal and interaction between populations are considered only likely to affect the population of marsh tit in The Springs, where the proposed Scheme would create a barrier to movement to the south.

- 8.6.77 Indirect impacts on breeding birds in the Zol centre on the construction noise and increased human presence, which are likely to cause disturbance and displacement of birds. The disturbance effects of lighting and of localised decreases in air quality, primarily associated with dust production, are also likely to contribute to disturbance and displacement, although to a slightly lesser extent. Impacts are likely to take the form of reduced breeding success as a result of nest abandonment, increased predation, changes in nest site selection, reduced density of breeding birds and changes in community structure.
- 8.6.78 Construction activities at many locations within the proposed Scheme are likely to be phased and intermittent, meaning that impacts would be short term only, although some locations, particularly around the proposed bridges, will require longer, more sustained construction activities. With a construction programme of two years, portions of this will be outside the breeding season, so no effects on breeding birds would be felt during these times.
- 8.6.79 Although the effects of artificial light on breeding birds are still poorly understood it has been found to impact on birds in a number of ways. Extending the number of hours available for feeding could be conceived as a positive impact however it could potentially have an adverse impact on prey populations and result in food shortages for the bird species concerned. Further, it has been identified in many bird species that lighting can cause them to come into breeding condition prematurely by creating artificially long days in winter. Early breeding attempts could potentially fail if there is insufficient food to feed young or if weather conditions prove too adverse for young birds to survive. The specific effects on barn owls are considered in the next section.
- 8.6.80 In considering the above, and the status of almost all breeding bird species within the Zol as representing less than 1% of the county breeding population, it is predicted that there would be an Intermediate Negative impact on breeding birds during the Construction phase. This means that, for those species of High conservation value there would be Large Adverse overall effects, and for species of Medium conservation value there would be Moderate Adverse overall effects. The effects during construction on those species of High and Medium conservation value would therefore be Significant. The confidence in these predictions is Probable.

Overwintering Birds

- 8.6.81 Impacts on overwintering birds would be similar to those described above for breeding birds, although the seasonal sensitivity would be lower as no breeding activity would be taking place over winter. The habitat loss and indirect impacts due to disturbance during the Construction phase.
- 8.6.82 It is predicted that there would be a Minor Negative impact on overwintering birds during the Construction phase. This means that, for those species of both High and Medium conservation value there would be Slight Adverse overall effects. No Significant effects are therefore anticipated on overwintering birds during the Construction phase. The confidence in these predictions is Probable.

Barn Owls

- 8.6.83 The barn owl populations identified within the Zol are of High conservation value.
- 8.6.84 Three main adverse impacts are likely during the Construction phase of the proposed Scheme. The first is the loss of one known nesting/breeding site. This is a direct, unavoidable and permanent loss, which is likely to have a displacement effect in terms of the barn owl population within the Zol, and a potential short term reduction in breeding success for the local population, whilst new nesting/breeding sites are identified, and breeding territories re-established.
- 8.6.85 The proposed Scheme will require the loss of areas of habitat over which barn owls currently hunt. Suitable short, semi-improved grassland within the footprint of the proposed Scheme is currently associated with grass verges, arable field margins and some grazed areas. Large portions of the habitats within the footprint are not particularly suitable for hunting over, however, and the ranges of barn owls can be several square kilometres in size in order to include sufficient suitable hunting habitat. The loss of suitable habitat due to the proposed Scheme should therefore represent only a small proportion of the habitat used by those barn owls recorded within the Zol. It is not considered that severance of habitats would result in direct fragmentation of barn owl home ranges, due to the mobility of the species.
- 8.6.86 The construction phase of the proposed Scheme is likely to have another, indirect effect, whereby the likely disturbance may accentuate the above potential decrease in breeding success within the Zol. The presence of construction plant, vehicles and people, and the associated noise, vibration, lighting and other activities is considered likely to deter barn owls from

successfully breeding for several hundred metres either side of the proposed Scheme.

8.6.87 Considering all of the above impacts, it is predicted that the overall magnitude of the impact on barn owls during construction would be Minor Negative, giving a Slight Adverse effect. The confidence in this prediction is Probable.

8.6.88 No significant adverse effects on barn owls are therefore anticipated during construction.

Aquatic Invertebrates

8.6.89 The aquatic invertebrate population at The Springs is of High conservation value.

8.6.90 Aquatic invertebrate populations at The Springs will not be directly impacted by the proposed Scheme, as no habitat will be lost and no changes to the hydrology of the site are predicted. Indirect effects, associated with changes to water quality or quantity, in terms of both surface water and groundwater, will be mitigated for by the effective control of events likely to cause such issues. During construction, there remains the potential for disturbance by construction vehicles, plant and processes, although pollution prevention and control measures would ensure that there would be no foreseeable accidental pollution of surface- and ground-water. Indirect impacts caused by a decrease in air quality remain possible.

8.6.91 The magnitude of impacts on the aquatic invertebrates would be is Minor Negative; this means that there would be a Slight Adverse effect during construction. The confidence in this prediction is Certain. No significant effects on aquatic invertebrates are therefore anticipated during construction.

Terrestrial Invertebrates

8.6.92 The immature woodland plantation at The Springs, as a habitat that offers an above average suitability for terrestrial invertebrates, is of Medium conservation value. During construction, there remains the potential for disturbance by construction vehicles, plant and processes, and for accidental pollution of surface- and ground-water. Indirect impacts caused by a decrease in air quality remain possible. There should be no direct loss of habitat, as the proposed Scheme has been designed to eliminate this potential impact.

8.6.93 It is therefore considered that the magnitude of the impacts on this habitat and its likely population of terrestrial invertebrates is Minor Negative; this means that there would be a Slight Adverse effect during construction. The confidence in this prediction is Certain.

8.6.94 No significant adverse effects on this habitat are therefore anticipated during construction.

Operational Phase

Statutory Designated Sites

8.6.95 No changes to the construction phase impacts are predicted, either at Year 1 or Year 15 of the Operational phase of the proposed Scheme. The magnitude of the impacts on all Designated Sites (Broadland Ramsar site, Broadland SPA, The Broads SAC, the River Wensum SAC and SSSI, and the Mid-Yare NNR) would remain Neutral, with a Neutral overall effect. The confidence in this prediction is Certain.

Non Designated Sites

8.6.96 The direct effect of the habitat loss on Marriott's Way CWS is likely, at Year 1, to have only been partly mitigated by the proposed landscaping and habitat recreation. Whilst the majority of the planting here would be un-established trees and shrubs, linear features of more established planting within the landscaped areas would offer the connectivity required by bats and other protected species even at this early stage.

8.6.97 The indirect impacts during the Operational phase associated with the traffic, namely disturbance through noise and lighting from headlights, and due to the likely decrease in air quality, combined with the above mean that the magnitude of impacts at Year 1 are predicted to remain Minor Negative, with a Slight Adverse overall effect. By Year 15 the habitat is likely to be well established, with connectivity of habitats fully restored and functioning. The maturity of the habitats would act to reduce or eliminate some of the indirect impacts associated with the road described above. It is therefore predicted that at Year 15 the magnitude of the impacts on Marriott's Way would be Neutral, with a corresponding Neutral overall effect. The confidence in these predictions is Probable.

8.6.98 No direct adverse impacts are anticipated on The Springs CWS, as the drainage system of the proposed Scheme will ensure that water quality and quantity entering the watercourse here would remain as is currently the case. Indirect impacts, due to disturbance and a potential decrease in air quality, are likely to be limited given the geographical context of the site, adjacent to the existing A1151 which is already subject to heavy traffic volumes. It is therefore predicted that the magnitude of the impact at Years 1 and 15 would be Neutral, with a corresponding Neutral overall effect. The confidence in this prediction is Probable.

8.6.99 No impacts are predicted on the remaining CWSs during the Operational phase of the proposed Scheme. The magnitude is therefore Neutral, and the overall effect is also Neutral. The confidence in these predictions is Certain.

8.6.100 During the operation of the proposed Scheme the Fakenham Road RNR would begin to re-establish. At Year 1 the habitat is not likely to be to the same quality as existing, so the magnitude of impact would remain Minor Negative, giving a Slight Adverse overall effect. By Year 15 the habitat would be well-established and very similar to existing. The habitat currently exists next to a heavily trafficked road, so re-establishing in similar conditions would not be an issue. The magnitude of impact at Year 15 is therefore predicted to be Neutral, giving a Neutral overall effect. The confidence in these predictions is Probable.

8.6.101 The Operational phase impacts on Ortolan's Grove ancient woodland would be minimal. Indirect impacts on the health of the woodland due to factors such as a slight decrease in air quality in the immediate vicinity, and the altered hydrological and hydrogeological regime, would be of a Minor Negative magnitude, giving a Slight Adverse overall effect. This would be the case at both Year 1 and Year 15. The confidence in this prediction is Probable.

8.6.102 The impacts on Sprowston Wood, being slightly further away, are predicted to be Neutral, with a corresponding Neutral overall effect. Again, this would be the case at Year 1 and Year 15. The confidence in this prediction is Certain.

Woodland

8.6.103 During the Operational phase of the proposed Scheme the impacts on those remaining areas of woodland would be indirect, and likely to act mainly by disturbance. The increase in noise and vibration, whilst unlikely to affect

the habitat itself, is likely to affect the function of the habitat for fauna within it; the effect would be at its most notable close to the carriageway, and would dissipate with distance.

8.6.104 Similarly, a potential drop in air quality is likely to indirectly affect the woodland habitats, increasing stress on trees and shrubs, increasing their susceptibility to disease and generally affecting the health and integrity of the habitat. As above, these impacts would dissipate with distance from the proposed Scheme.

8.6.105 At Year 1 these impacts are likely to be marked. The sudden, indirect effects associated with the volumes of traffic using the proposed Scheme on opening are likely to be an initial cause of stress on the adjacent, remaining woodland habitat. The magnitude of the impact at Year 1 is therefore considered to be Minor Negative, giving a Slight Adverse overall effect. At Year 15, the conditions, and therefore impacts, are likely to remain the same. The confidence in these predictions is Probable.

Parkland

8.6.106 The impacts on the remaining parkland habitats are similar in principle to those described above for woodlands. However, the limited areas of parkland habitat, and the already reduced ecological value, particularly when partially lost to arable and other land-uses, mean that the magnitude of the impacts on parkland habitats are predicted to be Neutral, with a corresponding Neutral overall effect. This would be the case both at Year 1 and Year 15. The confidence in this prediction is Certain.

Arable Field Margins

8.6.107 The ephemeral nature of arable field margins, and the comparatively harsh conditions in which they often exist, mean that those remaining in the vicinity of the proposed Scheme should not experience any tangible impacts. The magnitude of the impacts, and associated overall effect, are therefore predicted to be Neutral, at both Year 1 and Year 15. The confidence in this prediction is Probable.

Hedgerows

8.6.108 In common with woodlands, hedgerows adjacent to, and in the vicinity of, the proposed Scheme, are likely to be indirectly affected by disturbance, potential increases in noise and vibration and slight decreases in air quality locally. The sudden change in air quality and noise at Year 1 is predicted to give rise to Minor Negative magnitude impact, leading to a Slight Adverse overall effect. These impacts are likely to remain the case at Year 15. The confidence in this prediction is Probable.

Bats

Directly Affected Roosts in Buildings and in Trees

8.6.109 At Year 1 those bats that would have been displaced from their roosts will be beginning to habituate themselves with the bat houses and other new roost sites. They are also likely to have returned to other, previously used roost sites and/or discovered new alternatives. It is likely that the habituation process would still be in process, with new/altered routes to and from the new roosts. The degree of impact is likely to be affected by the differing adaptability between those species having been displaced, the amount of associated habitat and number of significant flight paths that were lost during the Construction phase, the amount and location of newly created habitats, flight paths etc.

8.6.110 It is therefore predicted that the magnitude of the impact on the bats using those roosts in buildings or trees that are directly affected by the proposed Scheme at Year 1 would be Minor Negative, giving a Slight Adverse overall effect. The confidence in this prediction is Probable. By Year 15, the use of the new roosts would be well established, with their locations and features part of the ingrained habits and seasonal cycles of the affected bats. The impacts associated with having been displaced from roosts are likely to have been negated, so the magnitude of the impact at this time is predicted to be Neutral. The overall effect would therefore be Neutral. The confidence in this prediction is Probable.

Indirectly Affected Roosts

8.6.111 It is predicted that those indirectly affected roosts, in buildings, structures and trees not directly affected by the proposed Scheme would experience very little in the way of indirect impacts. The nature of the footprint of the proposed Scheme is such that the road itself is only a proportion of the total area, and so those roosts beyond the edge of the footprint of the

proposed Scheme would in some cases be tens of metres further from the new road itself. The habitat creation, and its screening effect, along with the screening of the earthworks along the majority of the route, would mean that at both Year 1 and Year 15, the magnitude of the impact would be Neutral, with a corresponding Neutral overall effect. The confidence in this prediction is Probable.

Significant Flight Paths and Other Features of Importance

8.6.112 As outlined in the prior section on Construction phase impacts, the degree to which impacts are felt is likely to depend on a number of factors.

8.6.113 The flight path along Marriott's Way is the most sensitive within the ZOI, and would also be subject to the most significant physical change, due to the undisturbed nature of the feature currently, and the sheer physical size of the proposed Scheme at this location. At Year 1 the habituation of the proposed green bridge, which will include established planting up all approach ramps, and across the bridge deck itself, is still likely to be in its early stages. This is because of the length of the construction process, with construction at this location not due for completion until towards the end of the overall scheme construction programme.

8.6.114 The indirect impacts due to disturbance, caused by the volume of vehicles using the proposed Scheme, and the inherent noise, vibration and lighting from headlights, although very different to the existing situation, should be of limited impact. The design of the proposed Scheme at Marriott's Way, and the inherent mitigation measures included, should ensure that the bats using the route experience little in the way of indirect impacts due to disturbance.

8.6.115 The risk of vehicle collision mortality at Marriott's Way, as bats would be guided up and over traffic by the solid structure, should be low.

8.6.116 However, the number of bats using this flight path, the frequency of use, the significance in terms of connecting parts of the ranges of bats, the sensitivity of the species using it, and the variation in light tolerance of those species, means that at Year 1 the magnitude of the impacts on this flight route is predicted to remain Intermediate Negative, giving a Large Adverse overall effect. This means that the adverse effect here remains Significant.

8.6.117 By Year 15, the bat populations using this flight route are likely to have become far more habituated to the structure of the bridge, the baseline

disturbance associate with the traffic using the proposed Scheme and the general layout of the area. The landscaping and habitat creation are likely to be well established, both along the existing route of Marriott's Way, including over the bridge itself, and in those areas along the route where currently there is little existing connectivity. This would offer more potential routes through the wider landscape, in addition to or instead of along Marriott's Way.

- 8.6.118 The degree of habituation that would be expected to take place will again depend on the multiple factors already referred to, and the limited understanding as to the success, or otherwise, of structures such as the proposed Marriot's Way overbridge, as very few currently exist in the UK, and so very little scientific data is available on which to base conclusions. (Note that despite the absence of proven success of overbridges in connecting an otherwise severed bat flight route, it is the case that it is the most appropriate mitigation measure to put in place at this location). The magnitude of the impact on this flight route at Year 15 is predicted to be Neutral to Minor Negative, giving a Neutral to Slight Adverse impact at this time. The confidence in this prediction is, however, Uncertain.
- 8.6.119 All the same factors as described above relate to the other sensitive flight routes, to varying degrees. The habituation of the bats to the new crossing features at Year 1 will still be in its early stages, as would the establishment of the associated habitat creation.
- 8.6.120 The degree of indirect disturbance from vehicles using the proposed Scheme will depend on the crossing structure type and the general layout at each crossing location. The underpass, allowing bats to travel beneath the proposed Scheme, would be subject to the lowest levels of disturbance. Those adapted highway bridges, where tall, solid parapets would create dark flyways would also experience limited disturbance. The wire gantries offer less in terms of screening out illumination from vehicle headlights, however these gantries have generally been proposed to mitigation for the impacts on those more light-tolerant bat species.
- 8.6.121 The depth of the road in cutting or false cutting, combined with the proposed habitat planting, which will be planted as established trees and shrubs at certain, sensitive locations, mean that the risk of vehicles collision mortality is low.
- 8.6.122 The slightly reduced sensitivity of the other flight routes, in comparison to Marriott's Way, in terms of volume of bats, diversity of species, importance of the routes within bat ranges etc, mean that at Year 1 the magnitude of the

potential impacts are predicted to have lessened from those during the Construction phase to Neutral to Minor Negative, with Neutral to Slight Adverse overall effects. By Year 15, when habituation and habitat establishment have both taken effect, the magnitude of impacts is predicted to be Neutral, with a corresponding Neutral overall effect. The confidence in this prediction is Probable.

Other Areas of Activity

8.6.123 The vast majority of habitats used by bats have been considered in the above sections, so the assessment of impacts in these sections relates to small components of habitat and bat usage. All the factors described in prior sections remain the case, so other areas of activity would continue to be affected during the Operational Phase.

8.6.124 The magnitude of the impact at Year 1 is therefore likely to remain as during the Construction phase, Minor Negative, giving a Slight Adverse overall effect. The magnitude of the impacts on other areas of bat activity at Year 15 would be Neutral. The overall effect would therefore also be Neutral. The confidence in these predictions is Probable.

Badgers

8.6.125 Impacts on badger populations during the Operational phase would be minimal. The risk of vehicle collision mortality would remain very low, as the badger fencing would remain in place, preventing access to the carriageway.

8.6.126 Those areas of habitat temporarily lost to the proposed Scheme would return to their previous uses, predominantly arable land, partially compensating for the permanent loss of habitat, although this proportion is very small. The landscaping scheme would not, at Year 1, be established so is unlikely to offer much usable habitat. Even at Year 15, when it is likely to have become established, the disturbance from the carriageway and the proximity of most landscaped areas within 30 metres means that use by badgers would be infrequent.

8.6.127 At Year 1 the magnitude of the impacts on those occupied setts is likely to have reduced to become Neutral. This is primarily because of the mobility and flexibility of badgers in determining their home ranges, meaning that the loss of available habitat to the proposed Scheme would have quickly become

accounted and compensated for. This means that the overall effect on badgers at Year 1 would be Neutral.

8.6.128 The impact and overall effect at Year 15 are both likely to remain Neutral.

Great Crested Newts

8.6.129 The Dog Lane, Horsford meta-population would benefit from the slight increase in terrestrial habitat that the landscaping scheme would provide, although this is around 100 metres from the breeding ponds, and connected only by a small number of linear terrestrial habitat features. As with for most other valued ecological resources, at Year 1 the habitat would be too young to be of any viable use as it would be unlikely to provide sufficient shelter from predators to be used by the newts. The magnitude of the impact on this meta-population is therefore predicted to be Neutral, with a corresponding Neutral overall effect.

8.6.130 By Year 15 the habitat will have become well-established, as viable terrestrial habitat for great crested newts. Overall there should be a net gain in terrestrial habitat accessible to this meta-population, including the grassed and wooded banks to the northern approach ramps to the Bell Farm track bridge, as well as linear habitats along the proposed Scheme, which would provide connectivity to habitats to the east and west that currently are not easily accessed for newts. However, the connectivity from the breeding ponds would remain via the above linear terrestrial habitat features, which means that its potential utilisation would be limited. The magnitude of the impact, and the overall effect, would therefore remain Neutral at Year 15. The confidence in the above predictions is Probable.

8.6.131 Quaker Lane, Spixworth great crested newt meta-population would benefit from additional terrestrial habitat close to the breeding pond, which would serve to replace the habitats lost to severance due to the proposed Scheme. The provision of the drainage lagoon, in which breeding could potentially occur, would also be of potential benefit. However at Year 1 neither of these habitats is likely to be established, so the magnitude of the impact at Year 1 is predicted to be Neutral, giving a Neutral overall effect.

8.6.132 As with the above meta-populations, by Year 15 the terrestrial habitats would be well-established, offering foraging and sheltering opportunities, and connectivity to blocks of existing habitat. These impacts would be Neutral,

giving a Neutral overall effect. The confidence in the above predictions is Probable.

8.6.133 The great crested newt meta-population at Newman's Road, Rackheath would benefit from the provision of four ponds of optimal size for breeding, to replace the pond to be lost, and the provision of some replacement habitat. At Year 1 those newly created habitats would not yet be established and viable, although the sizeable areas of existing terrestrial habitat that would remain in place within the footprint of the wider proposed Scheme are still likely to be utilised. The new ponds, having been constructed before or in the early stages of the Construction phase, would be approaching an acceptable degree of establishment, offering a viable breeding habitat for the newts. It is therefore predicted that at Year 1 the magnitude of the impact on the Newman Road meta-population would be Neutral, giving a Neutral overall effect. The establishment and on-going management of the extensive areas of terrestrial habitat, and the continued maturing of the four ponds here would remain the case at Year 15, so a continued Neutral impacts is predicted, with a corresponding Neutral overall effect. The confidence in the above predictions is Probable.

8.6.134 No significant adverse effects on great crested newts are therefore anticipated during operation.

Breeding Birds

8.6.135 Throughout the operational phase of the proposed Scheme there are likely to be a number of impacts on breeding birds within the Zol. All of the impacts detailed below are predicted to be applicable to both Year 1 and Year 15.

8.6.136 The proposed road has the potential to cause disturbance and displacement from road traffic noise. The mechanism with which noise initiates a response in birds is not always clear, although there is evidence to suggest that there is a correlation between adverse behavioural and physiological effects in birds and road traffic noise. Scientific studies clearly indicate that maximum disturbance zones either side of the road for species assemblages in woodland could be between 100 and 300 metres, depending on traffic volumes. In open agricultural land these distances could be between 190 and 500 metres. It is likely that the proposed Scheme would therefore affect breeding density and bird presence over the above described distances.

- 8.6.137 Part of the disturbance mechanism relates to the disruption of acoustic communication, specifically the ability for one bird to hear another singing, a vital part of the establishment and maintenance of breeding territories, and of attracting a breeding partner. The reduced ability for singing males to attract females has been recorded for some species. In other species it is known that males in noisier environments sing at higher sound levels than males in quieter territories, with a resultant indirect increase in the rate of detection by predators.
- 8.6.138 It is also likely that the presence of people using the footways and cycleways, running loosely parallel to the carriageway, will have a partial deterrent effect on breeding birds in the adjacent habitats, giving an additional source of disturbance.
- 8.6.139 The proposed Scheme would have potential impacts associated with the risk of vehicle collision mortality, which would remove adults from breeding populations and contribute to a decline in the number of new birds recruited into the population by reducing the number of fledglings per breeding attempt. The design of the proposed Scheme, whereby large proportions are in cutting or false cutting, would serve to reduce this risk, although it would not be completely removed. Some stretches of the road would not be in cutting. Accident black spots are most likely to be where there is a relative change in elevation along the route i.e. between Fakenham Road and Fir Covert Road, and between Rackheath Park and the Wroxham Road.
- 8.6.140 The proposed Scheme would not include any street lighting, with the exception of the Postwick junction, which would be lit. Therefore, over the majority of the proposed Scheme the lighting impacts are likely to arise only from the headlights of vehicles using the road during the hours of darkness. At the Postwick junction due to the lighting, and to a far less extent on the rest of the proposed Scheme due to car headlights, the same impacts are likely during operation as during construction, namely disruption to feeding time during the day, with a disruption to the predator-prey equilibrium, premature breeding resulting in failed broods due to lack of food etc.
- 8.6.141 There would be limited indirect impacts on breeding bird populations through contamination of surface water in the wider landscape, via the presence of organic and inorganic materials from traffic. The drainage system has been designed to contain all storm water, allowing it to infiltrate into the substrate, rather than allowing it to flow into watercourses. The exception to this is around The Springs, where the topography and high water table do not permit infiltration to take place at a sufficiently high rate to satisfy system

requirements. In this location, outfall to the watercourse will be via filtration devices, to ensure that entry of contaminants to the water system is eliminated. Each drainage lagoon will include pollution control measures so that, should a spillage occur, it can easily and quickly be contained and removed.

- 8.6.142 Studies on diffuse source (traffic exhaust) pollution have found direct impacts on birds; however the level of the problem from traffic exhaust emissions in the UK is not well documented. It is likely that the alterations in air quality locally would have negligible effect on its own but is likely to contribute to the overall effect, in combination with the other indirect impacts already considered.
- 8.6.143 There is the potential for indirect impacts on breeding bird populations from the effects of heat radiation from road surfaces on birds. The use of roads to regulate body temperature by species of other taxa, e.g. reptiles and invertebrates, could lead to an indirect effect on birds as a result of the availability of carrion should the food species be killed by passing vehicles. The risk of impacts associated with heat radiation is considered to be very low.
- 8.6.144 The return of the habitats temporarily lost to the proposed Scheme will have a limited impact. The areas are comparatively small, in the context of the whole scheme, and the land will predominantly be returned to arable, which is of low utilisation by breeding birds.
- 8.6.145 The primary difference in the impacts on breeding birds between Year 1 and Year 15 relates to the establishment of the proposed landscaping scheme. At Year 1 the extensive landscaping/habitat creation scheme would not be established, with the exception of some of the grassland habitats that could be planted during early stages of the construction, as it would take a far shorter time for planted grassland to begin to become viable than woodland, scrub and hedgerows. The provision of larger trees and shrubs, which are planted to provide routes along which bats could fly from the earliest stages of the proposed Scheme, would also still only provide areas of partially established habitat.
- 8.6.146 This means that the benefits that these habitats would offer – providing potential new foraging and nesting opportunities, providing linear features to allow connectivity between existing habitats, encouraging birds to fly sufficiently high as to avoid vehicle collision mortality, and screening existing habitats adjacent to the proposed Scheme – would not yet be provided.

8.6.147 In considering the above, and the status of almost all breeding bird species within the ZOI as representing less than 1% of the county breeding population, it is therefore predicted that at Year 1 the impact on breeding birds would be of Minor Negative magnitude. The overall effect on breeding bird species of both High and Medium conservation value is therefore Slight Adverse. The confidence of this prediction is Probable.

8.6.148 By Year 15, most habitats will be approaching semi-maturity. The ongoing disturbance affecting those habitats close to the road is likely to preclude nesting and breeding activity to a notable degree, although those larger blocks of habitat that stretch back from the road, such that the disturbance is less marked, may offer viable nesting and breeding habitats.

8.6.149 Even those habitats not suitable for breeding will, by Year 15, offer a degree of screening, such that the disturbance and displacement would be less marked than at Year 1. The noise and light disturbance would be baffled and damped, allowing the species displaced from affected adjacent habitat to regain some of the habitat lost as an indirect result of the proposed Scheme. It is unlikely that full use of those habitats indirectly affected would be regained, however.

8.6.150 The risk of vehicle collision mortality would remain, although the establishment and growth of the landscaping would mean that the heights at which birds crossed the proposed Scheme would be higher than at Year 1. The frequency of mortalities is therefore likely to be less at Year 15 than at Year 1.

8.6.151 At Year 15, it is predicted that the impact on breeding birds would be Neutral. The overall effect on breeding bird species of both High and Medium conservation value is therefore Neutral. The confidence in these predictions is generally Probable, although some aspects remain Uncertain due to the timescales being considered.

Overwintering Birds

8.6.152 During the Operational phase, overwintering birds would be likely to experience the same direct and indirect impacts as breeding birds, described previously. At Year 1 the proposed landscaping/habitat recreation would not be established, so would offer only a partial benefit in terms of viable habitat or screening. This means that at Year 1 the impact on overwintering birds would be of Minor Negative magnitude. The overall effect on bird species of

both High and Medium conservation value is therefore Slight Adverse. The confidence of this prediction is Probable.

8.6.153 By Year 15 the habitats in the landscaping scheme would be well established, serving to mitigate for the losses during the Construction phase, and acting as screening, to reduce the visual disturbance. It is acknowledged that the screening capability of the landscaping over winter would be reduced, as the trees and shrubs, mostly deciduous, would lose their leaves during the time when overwintering birds would be affected.

8.6.154 Despite this, at Year 15, it is predicted that the impact on overwintering birds would be Neutral. The overall effect on overwintering bird species of both High and Medium conservation value is therefore Neutral. The confidence in these predictions is generally Probable.

Barn Owls

8.6.155 During the Operational phase of the proposed Scheme, the main potential direct impacts are associated with the risk of vehicle collision mortality. Although the proposed Scheme is designed to include cutting and/or earth banks, which would serve to reduce the risk of vehicle collisions by forcing the barn owls to fly over the majority of the traffic, the proposed planting which would reinforce this effect and force barn owls higher than the topography of the proposed Scheme on its own, would not have become established at Year 1, so this would not yet effectively be in place.

8.6.156 Indirect effects would also be likely, as major roads are known to have adverse effects on nesting density throughout the landscape due to the degree of disturbance, in terms of noise and lighting from vehicle headlights. This disturbance, combined with the loss of foraging habitat described in the Construction phase impacts, is likely to cause a slight decrease in barn owl populations within the ZoI. It is therefore predicted that the magnitude of the impact on barn owls within the ZoI would be Minor Negative, giving a Slight Adverse effect. The confidence in this prediction is Probable.

8.6.157 By Year 15, the landscaping would have become well-established. The likely height of the proposed planting at Year 15 means that barn owls would be forced to cross the proposed Scheme sufficiently high that the risk of vehicle collision mortality would be far less than at Year 1.

8.6.158 Further, there would be a marked increase in habitat suitable for hunting over. Although portions of this habitat would, in many cases be close

to the carriageway, reducing their beneficial effect, many of these would be some distance from the carriageway, for example those grassland habitats associated with the many drainage lagoons etc. The combined effect of these two above aspects mean that at Year 15 the magnitude of the impacts would have reduced to Neutral. This means that the overall effect would be Neutral. The confidence in this prediction is probable.

8.6.159 No significant adverse effects on barn owls are therefore anticipated during operation.

Aquatic Invertebrates

8.6.160 During the Operational Phase, there are not likely to be any differences in the impacts on aquatic invertebrates at The Springs, or the magnitudes of the impacts, between Year 1 and Year 15.

8.6.161 The inherent features of the drainage system for the proposed Scheme would all but eliminate changes to the hydrological and hydrogeological nature of The Springs, as storm water would be captured and attenuated, being released back into the watercourse at a rate equivalent to current scenarios. The quality of storm water would be addressed, such that water entering The Springs would be of equal, if not better, quality than is currently the case. There would also be the benefit that water from the existing Wroxham Road layout that currently drains into the watercourse untreated and unattenuated would also be included in the new system, and therefore subject to a higher level of treatment, and attenuated to reduce flashiness and therefore benefit the flood regime locally.

8.6.162 All of the above means that the habitats in which the aquatic invertebrates live, and the aquatic invertebrates themselves, would all be subject to an impact of Neutral magnitude during the Operational Phase, and therefore the overall effect would also be Neutral. The confidence in these predictions are Probable.

8.6.163 No significant adverse effects on aquatic Invertebrates are therefore anticipated.

Terrestrial Invertebrates

8.6.164 At Year 1, the immature woodland plantation at The Springs, as a habitat that offers an above average suitability for terrestrial invertebrates is

not likely to experience any direct adverse impacts. No further habitat loss is predicted, and changes in the surface and groundwater regime are unlikely, due to the overarching requirements on the proposed Scheme to provide a sustainable drainage system, which would mimic the existing localised water movement regime.

8.6.165 In this locality extensive areas of woodland and scrub are proposed, which would greatly increase the area of this habitat type. As with for other species already described above, the habitat is not likely to be viable at Year 1, so the magnitude of the impact at this time is predicted to be Neutral, giving a Neutral effect. It is acknowledged that a localised drop in air quality is likely, due to the volume of vehicles using the proposed Scheme, although the magnitude of this indirect impact is not likely to be sufficient to affect the results of this assessment.

8.6.166 By Year 15, the habitats would have become well-established in the landscape, and will have bedded in with the similar existing, surrounding habitats, providing much larger areas than currently exist, with a good level of connectivity to those existing habitats. This would afford terrestrial invertebrates a greater area in which to shelter and would mean that the potential populations would be less susceptible to localised variations than currently. This means that the magnitude of the impact at Year 15 is likely to be Positive. A Moderate Beneficial effect is therefore predicted. This would be a Significant positive effect. As with above, this is despite the potential adverse effect of a decrease in air quality locally, the impact of which is considered not to be of a sufficient magnitude to detract from this overall beneficial effect.

8.6.167 The confidence in these predictions is Probable.

8.6.168 No significant adverse effects on this habitat are therefore anticipated at Year 1, although by Year 15 there is predicted to be a Significant positive effect.

Assessment of Tolerances

8.6.169 The DCO for the proposed Scheme will have a set of tolerances inbuilt, which will provide a limit of variation in terms of vertical alignment that the finished Scheme will be required to fit within. These are to take account of the potential issues that may arise during the Construction phase, whereby the final height of various aspects of the proposed Scheme – carriageway and/or embankment heights, for example – may vary from those initially proposed.

8.6.170 Full descriptions of the tolerances are included in Volume 1, Chapter 2, The Scheme.

8.6.171 The tolerances, or variations within the constructed Scheme, will all be accommodated within the proposed DCO boundary. Any small scale, localised variations will be accommodated within the footprint, so would not require the loss of additional habitat loss. The minimal scope for variation means that no further impacts would be created; the impacts and the Significant effects already identified would not be affected by the very small scale variations that would be possible within the DCO boundary.

Assessment of Utilities Diversions

8.6.172 The suite of diversions to utilities – electricity, gas, water, sewerage, telephone and other communications – that would be required to facilitate the construction of the proposed Scheme, have also been considered in terms of the their impacts on Valued Ecological Receptors.

8.6.173 With the exception of the alterations to the high pressure gas main at the western end of the proposed Scheme, close to the junction with the existing Fakenham Road, it is predicted that all utilities diversions could take place with no Significant adverse impacts on Valued Ecological Receptors. The diversions would be very localised, over comparatively short distances, and with a degree of flexibility in terms of routing to avoid specific features of localised value, for example trees and, water courses.

8.6.174 The high pressure gas main diversion is sufficiently sizeable to have been included in the footprint of the proposed Scheme, so its impacts have already been assessed in this chapter.

Climate Change

8.6.175 The design life of the proposed Scheme means it is also necessary to consider the potential impacts of climate change on the Valued Ecological Receptors in the ZoI, and whether the proposed Scheme will have any influence on the resilience, or otherwise to the effects of climate change.

8.6.176 As indicated in the NDR Climate Change Risk Assessment report, the local climate is predicted to change in a number of ways:

- the annual mean temperature is predicted to increase;

- the annual mean daily maximum temperature is predicted to increase;
- the annual mean daily minimum temperature is predicted to increase; and
- the annual total precipitation is predicted to decrease;

8.6.177 The general increase in temperatures and the decrease in precipitation are likely to impact on semi-natural habitats.

8.6.178 Increases in daily and longer term temperatures are likely to alter the micro-climates that habitats create. The presence of trees and shrubs in hedgerows, tree belts and woodlands create shelter and shade, offer lower temperatures within woodland centres and reduce the impact of strong winds. The individual ecosystems within these blocks of habitats will have evolved and arrived at an approximate equilibrium according to the local conditions. Whilst climate change is likely to affect these habitats and alter these equilibria, the proposed Scheme, which would require the loss of parts of these habitats, would be likely to further reduce their resilience by creating a sudden change in conditions, rather than allow them to change slowly and progressively in reaction to the slowly altering local climate. Any short term, significant changes to habitats as a result of the scheme are expected to affect the vulnerability of the environment and its capacity to adapt to climate risks.

8.6.179 The establishment of new habitats, and therefore the take-up of mechanisms to address many instances of severance, is not likely to be affected by climate change. The length of time for habitats to establish to a point at which they become viable is far shorter than those timescales over which tangible, noticeable changes in the local climate are likely to occur. This means that the proposed Scheme is not likely to exacerbate any effects on indirectly affected habitats, or species affected by severance, to a greater extent than is likely to otherwise take place. The inclusion of the landscaping and habitat creation mean that the implications for habitats and species within and using the Zol due to climate change should remain unaffected to any great degree.

8.6.180 The reduction on water availability is likely to stress the habitats, and a gradual change in species composition is likely, from the current composition to one for tolerant of drier, more desiccated conditions. However, the proposed Scheme would not act to exacerbate the change in water availability or distribution locally. A drainage system based on infiltration to groundwater at rates comparable to those occurring naturally means that input to groundwater should remain unaffected.

8.6.181 The proposed Scheme design has also identified the routes of surface water and stormwater flows, and includes culverts and pipes, such that these flows should, in most instances, remain unimpeded. The proposed Scheme would therefore be unlikely to influence the changes to surface and groundwater availability that climate change is likely to have.

8.7 Conclusions

8.7.1 During the Construction phase, the proposed Scheme is predicted to have Significant adverse effects on:

- Fakenham Road RNR;
- Important Hedgerows (under the Hedgerow Regulations 1997);
- Bats, or more specifically directly affected roosts in buildings, directly affected roosts in trees and significant flight paths and areas of activity;
- Breeding bird species of both High and Medium conservation value;

8.7.2 A full summary of the predicted magnitude impacts and overall effects on all Valued Ecological Receptors during the Construction phase of the proposed Scheme is given in the table below:

Summary of Construction Phase Effects

Table 8.18: Summary of Construction Phase Effects on Valued Ecological Receptors

Valued Ecological Receptor	Conservation Value	Magnitude of Impact	Overall effect	Confidence
Statutory Designated Sites				
Broadland Ramsar Site	Very High	Neutral	Neutral	Certain
Broadland SPA	Very High	Neutral	Neutral	Certain

Terrestrial Invertebrate Habitat at the Springs	Medium	Minor Negative	Slight Adverse	Certain

Summary of Operational Phase Effects

8.7.3 During the Operational phase of the proposed Scheme, Significant adverse effects are predicted to remain in place only for the bats using the significant flight paths along Marriott's Way, at Year 1 only. By year 15 the effects on this flight route would no longer be Significant. No other Significant adverse effects are predicted during the Construction phase.

8.7.4 Significant beneficial effects are predicted on terrestrial invertebrate habitats at the Springs.

8.7.5 A full summary of the predicted magnitude impacts and overall effects on all Valued Ecological Receptors during the Operational phase of the proposed Scheme is given in Table 8.19 below. Note that predictions apply to both Year 1 (Opening Year) and Year 15 (Design Year) unless indicated otherwise.

Table 8.19: Summary of Operational Phase Effects on Valued Ecological Receptors

Valued Ecological Receptor	Conservation Value	Magnitude of Impact	Overall effect	Confidence

8.8.1 Main body text (heading 3)

9. Geology and Soils

9.1 Introduction

- 9.1.1 The soils and geology of an area play an important part in determining the environmental character, including influencing the landform and vegetation present, as well as the types of horticultural and agricultural practices that the area can support.
- 9.1.2 The development of the Norwich Northern Distributor Road (NDR) has the potential to impact on local geology and soils and constraints could also be imposed on the construction of the Scheme as a result of the existing ground conditions. This chapter describes the assessment of geology and soils, including contaminated land and unstable land which may impact, or be impacted by the NDR, both for the construction phase and the subsequent operational phase. It provides an overview of the baseline, geological and soil conditions in the area, the potential presence of land and groundwater conditions, Sites of Special Scientific Interest (SSSIs) and assessment of potential impacts of the Scheme relating to geology and soils.
- 9.1.3 Impacts on geology and soils may be adverse or beneficial; the assessment methodology used in this Chapter has been designed to identify both and subsequently seek appropriate mitigation measures to avoid or reduce significant adverse impacts.
- 9.1.4 Impacts on groundwater have been discussed in greater detail in Chapter 14: Road Drainage and Water Environment. Impacts on agricultural soils are covered in more detail in Chapter 13: Community and Private Assets: Impacts on Agriculture.
- 9.1.5 Geological and geomorphological features considered to be of national importance are designated Sites of Special Scientific Interest (SSSIs). They have some legal protection under the Wildlife and Countryside Act (1981) against operations which might damage their interest. Other sites of geological importance may be designated as Regionally Important Geological Sites (RIGS). RIGS are any geological or geomorphological sites, excluding SSSIs that have an educational, research, historical or aesthetic importance.
- 9.1.6 For ease of reference the NDR has been split into chainage (distance from the start of the Scheme at its junction with the A1067 in metres) sections as indicated on the NDR Engineering Layout and Profile Drawings R1C096-R1-

4003E to R1C096-R1-4014E located in the Contaminated Land Desk Study and Preliminary Interpretative Report (Report no. 233906/BSE/BNI/001/P3) presented in volume

9.2 Methodology

- 9.2.1 This section describes the methodology which has been used in the assessment of geology and soils, including contaminated land, which may impact, or be impacted, by the construction and operation of NDR.
- 9.2.2 The assessment has been carried out in accordance with the Highways Agency Design Manual for Roads and Bridges (DMRB) Volume 11.3.11 on Geology and Soils.
- 9.2.3 This assessment has consolidated information on nationally and locally important geological sites and map information on the agricultural quality of land. The potential for contaminated land along the route has also been reviewed. There is also an opportunity for environmental gain through remediation where proposed works impinge on contaminated land.
- 9.2.4 The study area is limited to 250m either side of the route as it is highly unlikely that geology or soils features further away will be impacted by construction or operation of the Scheme.

Consultation

- 9.2.5 A Scoping Report was submitted to the Secretary of State (SoS) on 22 February 2013 by Norfolk County Council under Regulation 8 of the Infrastructure Planning (Environmental Impact Assessment) Regulations 2009 in order to request a Scoping Opinion for the proposed NDR Scheme. Impact on soils or contaminated land during operation of the Scheme had been identified to be scoped out in the Scoping Report. The Scoping Opinion states:
- 9.2.6 “Impacts on soils or contaminated land during operation of the Scheme have also been identified to be scoped out in the Scoping report, given a low likelihood of significant effects following mitigation proposals. The SoS does not consider that enough information has been provided at this stage in order for this aspect to be scoped out and that it should therefore be considered within the EIA”.

Site survey

9.2.7 A site walkover was undertaken Mott MacDonald in July 2012, a summary of the findings is included within Mott MacDonald Desk Study.

Ground Investigations

9.2.8 A number of ground investigations have been carried out by Norfolk Partnership Laboratory for various schemes relating to NDR which were completed between January 2006 and September 2008 as presented in the Norfolk County Council, Site Investigation, Norwich Northern Distribution Route, Factual Report, PTPK1000, June 2008 and Norfolk County Council, Site Investigation, Norwich Northern Distribution Route, Supplementary Factual Report, PTPK1000, June 2009.

9.2.9 A ground investigation was undertaken by Norfolk Partnership Laboratories between August and October 2007 for the Broadland Gate development at Postwick. This is situated at the eastern end of the Scheme in November 2008, which was reported in the Mott MacDonald report 233894/ENV/01/B.

9.2.10 A supplementary ground investigation was undertaken by Norfolk Partnership Laboratory between May 2009 and October 2009. The ground investigation is presented within Norfolk County Council, Site Investigation, Postwick Interchange, Supplementary Factual Report, PK5072P1, December 2009.

Desk study and Preliminary Interpretative Report

9.2.11 A Contaminated Land Desk Study and Preliminary Interpretative Report were developed by Mott MacDonald in November 2013. This presented a summary of the ground conditions encountered and findings of the contamination testing carried out during the historical ground investigations outlined above.

Assessment criteria

9.2.12 The assessment approach for geology and soils follows the guidance presented in the Highways Agency Design Manual for Roads and Bridges (DMRB) Volume 11 Section 2 Part 5 HA (205/08) (Assessment and Management of Environmental Effects). With regards to contaminated land, sensitivity categories were derived based on standards and targets set by government authorities such as Natural England (NE), the Environment Agency (EA) and advisory bodies, such as the Construction Industry Research and Information Association (CIRIA).

9.2.13 The sensitivity of geological receptors is determined according to the methodology shown in Table 9.1.

Table 9.1 Scale for evaluating the Sensitivity of Receptors

Value (sensitivity)	Criteria	Typical Examples
Very High	Very high importance and rarity, international scale and very limited potential for substitution.	<p>Geology: World Heritage Sites.</p> <p>Soils: Agricultural land of Grade 1 quality.</p> <p>Controlled Water: Groundwater vulnerability is classified as high; Principal aquifer providing a regionally important resource or supporting site protected under wildlife legislation; or SPZ I.</p>
		<p>Future site users: Very sensitive land uses proposed such as residential housing with gardens, allotments.</p> <p>Built Environment :Sites of international Importance, World Heritage Sites.</p>
High	High importance and rarity, national scale, and limited potential for substitution	<p>Geology: Site protected under EU or UK wildlife legislation (SAC, SPA, SSSI, Ramsar site).</p> <p>Soils: Agricultural land of Grade 2 quality.</p> <p>Controlled Water: Groundwater vulnerability is classified as high; Principal aquifer providing locally important resource or supporting river ecosystem; SPZ II.</p>
		<p>Future site users: Sensitive land uses proposed such as schools, residential housing without gardens, open spaces.</p> <p>Built Environment :Listed buildings, Scheduled Monuments.</p>
Medium	Attribute has a medium quality and	<p>Geology: Regionally Important Geological Sites (RIGS).</p>

Value (sensitivity)	Criteria	Typical Examples
	rarity on local scale	<p>Soils: Agricultural land of Grade 3 quality.</p> <p>Controlled Water: Moderate classification of groundwater vulnerability; Secondary aquifer providing water for agricultural or industrial use with limited connection to surface water; SPZ III.</p>
		<p>Future site users: Moderately sensitive land uses such as commercial developments and open spaces.</p> <p>Built Environment : Sites with local interest for education or cultural appreciation.</p>
Low	Attribute has a low quality and rarity on local scale	<p>Geology: Rock exposures.</p> <p>Soils: Agricultural land of Grade 4&5 quality.</p> <p>Controlled Water: Deep Secondary aquifer with poor water quality not providing baseflow to rivers; Aquifer not used for water supplies (public or private).</p>
		<p>Future Site Users: Low sensitivity land use such as Industrial Sites, highways and rail .</p> <p>Built Environment : Infrastructure (e.g. Roads, railways, tramways).</p>
Negligible	Very low importance and rarity, local scale.	<p>Geology: No rock exposures.</p> <p>Soils: Urban classified soils.</p> <p>Controlled Water: Non-aquifer.</p>
		<p>Future Site Users: No sensitive land use proposed.</p>

9.2.14 Magnitude is determined by the predicted deviation from the baseline conditions and the scale of impact. Quantifiable assessment of magnitude has been undertaken where possible. In cases where only qualitative impact assessment is possible, magnitude has been defined as fully as possible. The methodology for determining the magnitude of an impact is shown in Table 9.2.

Table 9.2 Scale for Magnitude with Respect to Impacts on Geological/Soil Receptors

Magnitude	Description
Major	<p>Change in favourable condition status of geological SSSI;</p> <p>Generation of large volume of hazardous materials for disposal off site;</p> <p>Permanent impact on geological conditions;</p> <p>Physical removal or degradation (including loss of structure and contamination) of a large area of soil;</p> <p>Previous or on-going activities on or near to a site where severe harm to a defined receptor is very likely;</p> <p>Site investigation data indicating contamination on many sites impacted by current or former uses. Quantitative or qualitative risk assessment data estimating a significant likelihood of adverse impacts from exposure to pollutants in the environment; and</p> <p>Loss of special characteristics of a water resource. Change in GQA grade, pollution of potable source, severe flood risk, loss of fisheries. Any pollution inside Zone 1 or a groundwater protection zone of special interest.</p>
Moderate	<p>Generation of hazardous and non-hazardous materials for disposal off site;</p> <p>Temporary impact on geological conditions; and physical removal or degradation (including loss of structure and contamination) of a moderate area of soil.</p> <p>Previous or on-going activity where harm to a defined receptor is possible but severe harm is unlikely;</p>

Magnitude	Description
	<p>Site investigation data indicating moderate contamination. Quantitative or qualitative risk assessment data estimating medium risk of adverse impacts from exposure to pollutants in the environment; and</p> <p>Impact on water resources. Reduction in the production of fisheries, moderate changes insufficient to reduce water quality.</p>
Minor	<p>Generation of inert and non-hazardous waste materials which may be suitable for re-use on site;</p> <p>No permanent impact on geological conditions;</p> <p>Physical removal or degradation (including loss of structure and contamination) of a minor area of soil.</p> <p>Greenfield site or previous on-going activities where harm to a defined receptor is unlikely;</p> <p>Site investigation data indicating significant contamination is unlikely. Quantitative or qualitative risk assessment data estimating low likelihood of adverse impacts from exposure to pollutants in the environment; and</p> <p>Minor impact insufficient to impact on the use or characteristics of the water resource.</p>
Negligible	<p>Physical removal or degradation (including loss of structure and contamination) of a very minor area of soil; and</p> <p>Minimal impact on geological conditions.</p>
No change	<p>No loss or alteration of characteristics, features or elements; no observable impact in either direction.</p>

9.2.15 The likely severity of the impacts was assessed using the matrix in Table 9.3 in conjunction with professional judgement to consider site specific factors that may be of relevance.

Table 9.3 Severity of impact with regards to geology and soil receptors

Magnitude of Potential Impact	Value (importance) of attribute				
	Very high	High	Medium	Low	Negligible
Major	Very large	Large / Very large	Moderate / Large	Slight / Moderate	Slight
Moderate	Large / Very Large	Large / Moderate	Moderate	Slight	Neutral/ Slight
Minor	Moderate / Large	Slight / Moderate	Slight	Neutral/ Slight	Neutral/ Slight
Negligible	Slight	Slight	Neutral/ Slight	Neutral/ Slight	Neutral
No Change	Neutral	Neutral	Neutral	Neutral	Neutral

9.2.16 The significance of impact is predicted with reference to Table 2.2 in DMRB [8] as provided below in Table 9.4.

Table 9.4 Significance criteria for geology, soils and land contamination

Significance category	Description and examples		Significance
Neutral	-	Minimal impact on geological condition, minor loss of urban soils; and No discernible negative impact with regards to contaminated land.	Not Significant
Slight	Adverse	Changes to Made Ground deposits only, moderate/ major loss/ degradation of Grade 4 or 5 soils. minor or moderate	

Significance category	Description and examples		Significance
		<p>loss/ degradation of Grade 3 soils</p> <p>Easily preventable, non-permanent health impacts on humans;</p> <p>Minor low-level and localised contamination of on-site soils; and</p> <p>Easily repairable damage to buildings / infrastructure.</p>	
	Beneficial	<p>Remediation of localised low levels of contamination;</p> <p>Remediation of non-sensitive water resource contamination; and</p> <p>Minimal improvements to overall soil and water quality.</p>	
Moderate	Adverse	<p>Superficial disturbance to near surface deposits,</p> <p>Changes in geomorphology, large loss/ degradation of Grade 3 soils, minor loss/ degradation of Grade 1 or 2 soils.</p> <p>Sterilisation of low quality mineral resources.</p> <p>Easily preventable, permanent health impacts on humans;</p> <p>Pollution of non-sensitive water resource or Low long term risk of pollution to sensitive water resource; and</p> <p>Localised damage to buildings/ infrastructure (on or off site).</p>	
	Beneficial	Remediation of localised moderate levels	

Significance category	Description and examples		Significance
		of contamination; Remediation of moderate, localised sensitive water resource contamination; and Re-use of excavated soils on-site to avoid disposal to landfill.	
Large	Adverse	Substantial changes due to cuttings, moderate/ large loss/ Degradation of Grade 2 soils or moderate loss/ degradation of Grade 1 soils. Sterilisation of high quality mineral resource Medium / long-term (chronic) risk to human health; Medium long-term risk of pollution of sensitive water resources; Significant damage to buildings / infrastructure (on or off site); and Contamination of offsite soils.	Significant
	Beneficial	Remediation of localised high levels of contamination; Remediation of significant, localised sensitive water resource contamination; and Re-use of moderate quantities of excavated soils on-site to avoid disposal to landfill	
Very Large	Adverse	Loss of exposed designated geological feature or large loss/ degradation of	

Significance category	Description and examples		Significance
		Grade 1 soils. Short-term (acute) risk to human health; Short- term risk of pollution of sensitive water resources; Catastrophic damage to buildings / infrastructure; and Generation of significant quantities of waste sediment or soils for landfill	
	Beneficial	Remediation of significant, widespread elevated levels of soil contamination; Remediation of significant, widespread sensitive water resource contamination; and Re-use of significant quantities of excavated soils on-site to avoid disposal to landfill	

9.3 Context

Technical

- 9.3.1 The construction phase of the proposed Scheme has the potential to result in changes to the volume and quality of the soils in the study area from activities such as heavy machinery movements, excavations, re-profiling and piling.
- 9.3.2 Where there are major earthworks to be carried out, a cut and fill balance will be aimed for, as detailed in the Materials section of this report (Chapter 10). However surplus soils may be suitable for re-use elsewhere on the Scheme provided they meet defined criteria.
- 9.3.3 Construction may also disturb contaminated land, especially during ground works; this is more likely in areas which have historic industrial land use. However, remediation of any contaminated materials identified as part of the construction process may provide an overall benefit to the Scheme. During

construction, implementation of appropriate site management practices will control accidental spills and leakages of hazardous materials which could result in local contamination of soils with potential adverse implications for groundwater.

Regulatory and Policy Context

Relevant legislation

9.3.4 The main legislative framework regarding geology and soils (including contaminated land) is set by the following Acts and Regulations:

- Agriculture Act 1986;
- Construction (Design and Management Regulations) 2007;
- Contaminated Land (England) (Amendment) Regulations 2012;
- Control of Pollution (Oil Storage) (England) Regulations 2001;
- Control of Substances Hazardous to Human Health 2002 (as amended);
- Environmental Damage and Liability (Prevention and Remediation) Regulations 2009;
- Environmental Permitting Regulations (England and Wales) 2010;
- Environmental Protection Act 1990 (as amended by the Environment Act 1995);
- Environmental Protection (Duty of Care) Regulations 1991 (as amended 2003);
- Landfill Directive 1999/31/EC 1999;
- Hazardous Waste (England and Wales) Regulations 2005;
- Landfill (England and Wales) Regulations 2002;
- Town and Country Planning Act 1990;
- Water Act 2003;
- Water Resources Act 1991 (WRA 1991) and Amendment 2009; and

- Wildlife and Countryside Act 1981 and (Amendment) Act 1985 (as amended by the Countryside and Rights of Way Act 2000).
- 9.3.5 The Wildlife and Countryside Act 1981 (as amended) provides statutory protection of SSSIs in England, some of which are of geological importance. Special Protection Areas (SPAs) and Ramsar Sites, as well as Limestone pavements, are also protected under this act. Environmentally Sensitive Areas (ESAs) are agricultural areas benefiting from special protection. The importance of nature conservation, including areas with geological features, is also emphasised in the Environmental Protection Act 1990 (as amended).
- 9.3.6 The prevention of pollution is regulated by several pieces of legislation including the Environmental Permitting Regulations 2010, which regulates pollution control by requiring permits for emissions to, for example, air and water.
- 9.3.7 The statutory process for dealing with contaminated land in England and Wales is set out in Part IIA of the Environmental Protection Act 1990 (EPA 1990) (as amended by the Environment Act 1995 and the Water Act 2003). Part IIA sets in place a regime whereby contaminated land can be identified, a decision made as to how the land will be remediated and where responsibility for this will fall. The primary legislation is supported by a number of secondary legislative instruments including the Contaminated Land (England) (Amendment) Regulations 2012.
- 9.3.8 The need to consider contaminated land issues during the planning process is set out in the Town and Country Planning Act 1990 (Section 215). This Act gives the Local Authorities the ability to require developers to investigate contamination and, if necessary, remediate the land.
- 9.3.9 There are also a number of waste related regulations which serve to protect soils from contamination by waste management, such as the Hazardous Waste (England and Wales) Regulations 2005 (as amended by Hazardous Waste (England and Wales) Regulations 2009), Environmental Protection (Duty of care) Regulations 1991, Waste Management Licensing Regulations 1994 (as amended by Waste Management Licensing Regulations 1997), Landfill Directive 1999, Landfill Tax (Contaminated land) Order 1996 and Landfill (England and Wales) Regulations 2002 (as amended by The Landfill (England and Wales) Regulations 2004 and 2005).
- 9.3.10 Under the Control of Substances Hazardous to Health Regulations 2002 (COSHH) and the Construction and Design Management (CDM) Regulations 1994, where a developer knows or suspects the presence of contaminated

soil, provision will be made to ensure that risks to the public and site workers are minimised.

National planning policy

9.3.11 As the majority of sites impacted by historic contamination are not classed as “Contaminated Land” under Part IIA of the EPA, the remediation of any contamination present is generally managed by the planning regime. The National Planning Policy Framework (Department for Communities and Local Government) March 2012 provides guidance on contaminated land and protection from a planning perspective.

Local planning policy

9.3.12 Norwich City Council adopted the Joint Core Strategy (JCS) for Broadland, Norwich and South Norfolk in March 2011 and as submitted for examination in February 2013 . The plan forms part of the emerging Local Development Framework (LDF) for Norfolk. It contains strategic policies covering the period 2008-26 and replaces relevant parts of the City of Norwich Replacement Local Plan (RLP).

9.3.13 The JCS has to comply with national planning policies and demonstrate how required growth can be delivered. At the time of its adoption the JCS is required to be in conformity with the East of England Plan now revoked (EEP). However, the JCS is supported by an evidence base that demonstrates that it remains valid and its policies do not rely on the East of England Plan.

9.3.14 The Norfolk Minerals and Waste Development Framework, 2010-2026 [9], requires no allocation of chalk as it is considered to be abundant in Norfolk relative to demand. However, sands and gravels require a minimum total of 2.05million tonnes of sand and gravel aggregates to be allocated to the East of England from 2010 to 2026. The Core Strategy and supporting documents have been developed to ensure mineral extraction and associated development and waste management is done in a sustainable manner, for example the use of aggregate material from within the Scheme footprint for construction.

Area-Wide policies include:

9.3.15 Section 5.4 of Policy 1 of the Joint Core Strategy: Addressing climate change and protecting environmental assets. The area has a wealth of environmental assets ranging from international and national status, to those of local importance. These must be safeguarded and enhanced for the benefit of current and future generations. These assets include biodiversity (wildlife and habitats), built heritage and the wider historic environment, ancient monuments and archaeological assets, geodiversity (geological features), landscape and historic landscape character; as well as more general aspects such as the countryside and rural character, the setting of Norwich, towns and villages and the Broads. Assets of local importance, such as County Wildlife Sites are valuable in their own right, and in combination provide an important resource.

9.4 Baseline

Spatial scope

9.4.1 The proposed Scheme starts approximately 1km to the north-west of the village of Taverham, situated around 10km north-west of Norwich city centre, on the A1067 Fakenham Road (approximate National Grid Reference TG 147 154). The NDR continues broadly eastwards to the north of Norwich, before heading south to meet the existing A47 at Postwick and Broadland Park Business Development, which is located roughly 7km east of Norwich city centre at National Grid Reference TG 292 085.

9.4.2 The spatial scope was defined by the initial baseline desk study[1] which sought to identify these locations of likely geotechnical risk and contamination sources and where pathways and pollutant linkages could result from construction activities. In addition, the desk study identified where the geological conditions may impact on the Scheme.

Temporal scope

9.4.3 The baseline scenario considers the sub-surface conditions on site as they exist at the time of writing in 2013 and the current impacts on any particular resources or receptors. Assessment of the construction period considers the impacts and associated impacts of construction on areas of potentially contaminated land or geological resources within the spatial scope of the proposed Scheme and associated works, including the remediation of any contamination, if required.

9.4.4 The operational scenario considers the impact that any residual contamination could have on the general environment surrounding the proposed Scheme

and an assessment of the risks of ground pollution as a result of the operation of the proposed Scheme, and identification of mitigation measures to address these risks.

Data sources

9.4.5 Information has been gathered from the following sources for the identification and assessment of impacts on geology and soils:

- Norfolk County Council, Site Investigation, Norwich Northern Distribution Route, Factual Report, PTPK1000, June 2008.
- Norfolk County Council, Site Investigation, Norwich Northern Distribution Route, Supplementary Factual Report, PTPK1000, June 2009.
- Envirocheck Report Order Number 37669135_1_1 and historical maps from Landmark Information Group, obtained in February 2012.
- Norfolk Heritage Explorer archaeological search from <http://www.heritage.norfolk.gov.uk> accessed 7th May 2012.
- 1:50,000 Landranger Series, North East Norfolk, Sheet 133.
- 1:50,000 Landranger Series, Norwich and the Broads, Sheet 134.
- 1:25,000 Explorer Series, Norwich – Wymondham, Attleborough and Watton, Sheet 237.
- 1:25,000 Explorer Series, Dereham and Aylsham, Sheet 238.
- 1:25,000 Explorer Series, The Broads, Outdoor Leisure Map 40.
- Sheet 161, Norwich, Solid and Drift Edition, Geological Survey of Great Britain (England and Wales), 1975.
- Sheet 162, Great Yarmouth, Quaternary and Pre-Quaternary Geology, Geological Survey of Great Britain (England and Wales), 1991.
- Sheet 147, Aylsham, Quaternary and Pre-Quaternary Geology, Geological Survey of Great Britain (England and Wales), Digital map.
- Sheet TG 20 NE, Kirby Bedon, Trowse, Field Sheet, Geological Survey of Great Britain (England and Wales), 1976.

- Sheet TG 21 SE, Rackheath, Gt and Lt Plumstead, Field Sheet, Geological Survey of Great Britain (England and Wales), 1976.
- Associated Geological memoir for Sheet 161 is also available, by Cox, F C, Gallois, R W, and Wood C.J. (1989), Geology of the country around Norwich.
- Associated Geological memoir for Sheet 162 is by Arthurton R S, et al, Geology of the country around Great Yarmouth (1994).

Sensitive receptors

9.4.6 The following sensitive receptors which may be impacted by the construction and operation of the proposed Scheme have been identified in Table 9.5.

Table 9.5 Summary of Sensitive Receptors

Receptor	Description
Controlled waters, including the underlying aquifers	<p>Source Protection Zones around groundwater abstraction wells.</p> <p>Horizontal and vertical migration of contaminants through potentially permeable soils and variably permeable geological formations could lead to pollution of controlled waters from current and historic polluting activities, such as the use of pesticides and herbicides in farming.</p> <p>Surface runoff on hard standing sections of the route may also lead to contamination of surface waters.</p>
The Broads	Ecology and landscape sensitivity
Human Health, including construction workers and final end users	Human uptake pathways, airborne construction gas and vertical and lateral migration of volatile vapours and ground gas could cause harm to human health.
Fauna and flora	Root uptake of contaminants from current and historic polluting activities.
Buildings, structures and utilities	Chemical agents destructive to concrete may be found in natural materials and Made Ground.
Regionally important geology and soils	Cutting through important geological strata, excavation or sterilisation of valuable geological assets (mineral resources).

Source: Contaminated Land Desk Study and Preliminary Interpretative Report, Mott MacDonald, 2013 (Report no. 233906/BSE/BNI/001/P3)

9.4.7 A Phase 1 Contaminated Land Desk Study and Preliminary Interpretative Report was prepared in November 2013. Hazard plans and conceptual models were produced for the NDR and are presented as an appendix to the Contaminated Land Desk Study presented in Volume 2 and are summarised in Table 9.6 below.

Table 9.6 Hazard Plans and Conceptual Models

Chainage	Hazard plan reference	Conceptual model reference
0.00-3300.00	MMD-233906-DT-0050	MMD-233906-DT-0056
3300.00- 6800.00	MMD-233906-DT-0051	MMD-233906-DT-0056
6800.00-10900.00	MMD-233906-DT-0052	MMD-233906-DT-0057
10900.00-14600.00	MMD-233906-DT-0053	MMD-233906-DT-0057
14600.00-17800.00	MMD-233906-DT-0054	MMD-233906-DT-0058
17800.00-19500.00	MMD-233906-DT-0055	MMD-233906-DT-0058

9.4.8 Environmental hazards identified on the plans include

- Licenced Waste Management facilities;
- Pollution incidents and historical land use that could be considered contaminated;
- Discharge consents;
- Water abstractions; and
- Potentially contaminated land sites.

Geomorphology and Topography

9.4.9 The topography along the proposed Scheme consists of a gently undulating agricultural landscape. The topography at the start of the route at the existing

A1067 Fakenham Road is approximately 20m AOD gently rising and falling between approximately 30m and 20m AOD along the NDR and then gently sloping down to approximately 10m AOD at the end of the proposed Scheme at the A1042 road.

Regional Geology

- 9.4.10 The Norwich area is underlain by Cretaceous Upper Chalk, between approximately 19.50m and 33.50m below ground level. These beds are mostly covered by Pleistocene and Recent deposits which lie non-conformably on the Chalk surface. The Chalk generally outcrops in the river valleys.
- 9.4.11 The oldest Pleistocene formation is Crag, extensive to the east but gradually disappearing to the west of Costessey. Crag comprises interbedded sands and gravels with occasional lenticular clays. To the north of the River Wensum, the Crag is overlain by Brickearth (Corton Formation Till), Boulder Clay comprising glacial deposits of intercalated, mainly un-bedded clays and loamy sands.
- 9.4.12 Glacial Sands and Gravels overlie the Crag to the north and south of the River Wensum. These comprise fluvial gravels, incorporating quartz, white quartzite and volcanic pebbles. Valley Gravels occur sporadically, with recent alluvium, mainly silty or fine sand, occupying the valley centres and the recent river terraces.
- 9.4.13 No known mines are located within the area of the proposed Scheme; numerous flint mines are located outside this area in and around Norwich, but are highly unlikely to impact on any construction processes.

Regional Soils

- 9.4.14 Based on the maps published by the National Soil Resources Institute[10], the route of the proposed Scheme is predominantly over:
- Freely draining slightly acid sandy soils with low fertility;
 - Naturally wet very acid sandy and loamy soils with very low fertility;
 - Naturally wet very acid sandy and loamy soils with low to high fertility;

- Slowly permeable seasonally wet acid loamy and clayey soils with low fertility; and
- Freely draining slightly acid loamy soils – low fertility.

9.4.15 An agricultural soil survey was carried out to determine the quality of the soil according to the Agricultural Land Classification of England and Wales (Ministry of Agriculture, Fisheries and Food 1988)[11]. The survey can be found in Chapter 13. Land along the route of the NDR has been predominantly classed as Grades 2 and 3a and b.

9.4.16 Topsoil encountered is anticipated to be <1.45m thickness.

9.4.17 The National Soil Resources Institute indicates that the soils present at the site are vulnerable to leaching of nitrate and pesticides to groundwater.

Regionally Environmentally Sensitive Sites

9.4.18 There are no designated sites relating to geological interests beneath or in the vicinity of the proposed Scheme.

9.4.19 The Broads within the surrounding areas of the proposed Scheme have been classified as an Environmentally Sensitive Area and along with the River Wensum have been classified as Sites of Special Scientific Interest and Special Areas of Conservation. These Environmentally Sensitive Sites have been discussed further in Volume 2, Chapter 8: Ecology.

Chainage Specific Baseline Conditions

9.4.20 Table 9.7 below presents a summary of the findings of the Desk Study and Preliminary Interpretative Report split by chainage.

Table 9.7: Summary of Baseline Conditions by Chainage

Source: Contaminated Land Desk Study and Preliminary Interpretative Report, 2013 (Report no. 233906/BSE/BN/001/P3)[2]

Summary of Contamination Testing

9.4.21 Chemical analysis of soil and groundwater samples was undertaken during the 2006-2009 ground investigations. A preliminary assessment of the test results is presented in the Desk Study and Preliminary Interpretative Report, as summary of which is presented below.

Human Health

9.4.22 Chemical analysis of soil and groundwater samples was undertaken during the 2006-2009 ground investigations. A preliminary assessment of the test results is presented in the Desk Study and Preliminary Interpretative Report, as summary of which is presented below

9.4.23 Table 9.8 below presents a summary of those contaminants which exceeded the Generic Assessment Criteria for Industrial / Commercial Land Use. Further discussion of the results is presented in the Desk Study and Preliminary Interpretative Report.

Table 9.8 Soil Contamination Testing Summary by Chainage

Chainage	No of Samples Tested	Contaminants exceeding the Generic Assessment Criteria for Industrial / Commercial Land Use
0.00-3300.00	2	None
3300.00-6800.00	1	None
6800.00-10900.00	27	Naphthalene, Benz(a)anthracene, Chrysene, Benzo(b)fluoranthene, Benzo(a)pyrene, Indeno(123cd)pyrene, Dibenzo(ah)anthracene
10900.00-14600.00	No tests	-
14600.00-17800.00	3	None
17800.00-19500.00	6	None

19500.00-20403.16	No tests	-
-------------------	----------	---

Groundwater

9.4.24 Concentrations of contaminants in groundwater were compared to a variety of assessment criteria. Non-hazardous pollutants (e.g. boron, chloride, chromium, copper, nickel, lead, vanadium, zinc, sulphate, phenol, cyanide, magnesium and nitrate) can be discharged to groundwater under a permit, but must not cause pollution. The concentration level which is considered to cause pollution depends on the use of the receptor. For surface water receptors, a non-hazardous pollutant is considered to be non-compliant if the concentration exceeds the Environmental Quality Standard (EQS), while for groundwater the Drinking Water Standard (DWS) is used. For the NDR scheme the most sensitive receptors are considered to be the underlying Secondary A and Principal aquifers and therefore the DWS were used.

9.4.25 Hazardous substances (e.g. arsenic, cadmium, mercury, selenium, Polycyclic Aromatic Hydrocarbons (PAHs), benzene, toluene, ethylbenzene and xylene (BTEX)) are considered to be non-compliant if a concentration is found exceeding the EA's Minimum Reporting Value (MRV) or, where there is no published MRV the laboratory Method Detection Limit (MDL), is found in groundwater.

9.4.26 Table 9.9 summarises exceedences of non-hazardous and hazardous substances by chainage. Further, more detailed discussion of the results is presented in the Desk Study and Preliminary Interpretative Report.

Table 9.9: Contamination Testing Summary by Chainage

Chainage	No of Samples Tested	Exceedence of Non-hazardous substances above DWS	Exceedence of Hazardous Substances above the MRV / MDL
0.00-3300.00	41	Copper, Chromium, BOD, COD, Nitrate as NO ₃ , Ammoniacal Nitrogen	Fluorene
3300.00-6800.00	No tests	-	-

Chainage	No of Samples Tested	Exceedence of Non-hazardous substances above DWS	Exceedence of Hazardous Substances above the MRV / MDL

10900.00-14600.00	69	Chromium BOD, COD, Nitrate as NO ₃ , Ammoniacal Nitrogen,	Acenaphthylene, Acenaphthene, Fluorene, Phenanthrene, Anthracene, Fluoranthene, Pyrene, Benz(a)anthracene, Chrysene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Indeno(123cd)pyrene , Benzo(ghi)perylene, PAH total 16
14600.00-17800.00	146	Chromium, Nickel, Zinc, BOD, COD, Nitrate as NO ₃ , Ammoniacal Nitrogen,	Cadmium, Naphthalene, Acenaphthene, Flourene, Phenanthrene, Anthracene, Fluoranthene, Pyrene, Benz(a)anthracene, Chrysene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Indeno(123cd)pyrene ,

Chainage	No of Samples Tested	Exceedence of Non-hazardous substances above DWS	Exceedence of Hazardous Substances above the MRV / MDL
			Benzo(ghi)perylene, PAH total 16
17800.00-19500.00	2	Chromium, Nitrate as NO ₃ ,	Acenaphthene, Flourene Phenanthrene, Fluoranthene, Pyrene, Benzo(a)pyrene, PAH 16 total
19500.00-20403.16	12	Chromium, BOD, COD, Nitrate as NO ₃ ,	Anthracene

Source: Contaminated Land Desk Study and Preliminary Interpretative Report, 2013 (Report no. 233906/BSE/BNI/001/P3).

9.4.27 Soil and groundwater samples taken between Ch6800.00-10900.00 indicated elevated concentrations of PAHs exceeding human health assessment criteria and above the Minimum Reporting Values for groundwater. This is likely to be due to the presence of the Norwich Airport, associated training facilities airfield in this section of the Scheme.

9.4.28 Groundwater contamination has been identified as the result of leaching from the Attlebridge Landfill and Rackheath Landfill which were outside of the scope of the ground investigations reported in the Desk Study and Preliminary Interpretative Report. This is discussed in more detail in Chapter 14: Road Drainage and Water Environment.

Additional survey work to be carried out

9.4.29 The Scoping Opinion received from the SoS[3] indicated that there was not enough information to scope out the impacts of the Scheme. Therefore, given the limited nature of previous investigations it is recommended that additional ground investigation and contamination testing is carried out in order to comprehensively assess the potential risks to receptors from the proposed NDR Scheme. The contamination testing will be targeted at specific areas long the NDR route, taking into account where large structures are to be located, where earthworks are anticipated and where active sources of contamination are present beneath or adjacent to the Scheme.

9.5 Mitigation and Impacts

9.5.1 The following section describes the anticipated activities to be undertaken during the construction and operational phases of the NDR Scheme. Mitigation measures to be implemented are discussed and impacts predicted to occur as a result of the Scheme and post-mitigation are then outlined.

9.5.2 A additional ground investigation will need to take into account the NDR Engineering Layout and Profile Drawings R1C096-R1-4003E to R1C096-R1-4014E for both geotechnical and contamination assessment purposes. Following the interpretation of the ground investigation data, design specific mitigation measures can be defined.

Do Something Scenario

9.5.3 The Do-Something scenario considers the impact of developing the NDR on geology and soils.

Works Impacting on Geology and Soils

Construction Phase

9.5.4 The proposed Scheme may include a range of construction activities across different sections of the NDR. The main construction activities include:

- Shallow excavation works – areas where shallow excavation works will be undertaken will result in the permanent removal of made ground and soils;
- Earthworks – where major earthworks are required a cut and fill balance will be aimed for, however surplus soils may be suitable for re-use elsewhere on the Scheme depending on testing of the soils and providing the results fall within defined acceptability criteria;
- Potential piling and rock cuttings – permanent removal of rock;
- Potential retaining walls – permanent removal of soils and rock; and
- General Construction works – movement of materials, storage of hazardous chemicals leading to secondary impacts on soils and groundwater.

Operational Phase

- 9.5.5 Once the construction phase is complete, reinstatement and landscaping will be carried out in accordance with the Landscaping Chapter mitigation.
- 9.5.6 Table 9.10 summarises the features at each section of the Scheme and considers the potential receptors to the construction works

Construction Phase Mitigation

9.5.7 During the construction phase, mitigation measures will be implemented by the Contractor through a Construction Environmental Management Plan (CEMP).

Protection of Soil Structure and Quality

9.5.8 Chapter 10 (Materials) discusses the potential impacts of the Scheme on materials and introduces mitigation measures to be put in place with regards to materials. The Materials chapter incorporates a cut and fill balance to reduce the amount of soil permanently removed from the site.

9.5.9 Soils and rock will be permanently removed in areas where excavations are proposed. Where appropriate, any excavated material will be reused on site if acceptable. Where temporary works are proposed for the construction of the proposed Scheme, soils will also be stripped and then reinstated upon completion of the construction period.

9.5.10 Soils will be stripped, handled, stored and reinstated using best practice procedures, in accordance with appropriate guidelines, such as DEFRA's 2009 'Code of Practice for the Sustainable Use of Soils on Construction Sites'. Best practice procedures include topsoil and subsoil stripping, stockpiling and placing.

9.5.11 To minimise impacts on soil structure and quality, the topsoil will be sequentially stripped from the working areas. Topsoil and subsoil will be stockpiled separately so that they can be replaced in the same sequential layers, in-keeping with the existing soil profile. Soil stockpiles will be clearly defined. Tracked equipment will be used where possible, and traffic will be confined to designated routes to minimise compaction.

9.5.12 Other possible mitigation measures may include, but not be limited to, the use of a proprietary geotextile membrane to protect the existing ground condition, a layer of inert crushed granular material on the membrane to form temporary running surfaces for construction plant and reinforcement of access tracks.

Prevention of Contamination

9.5.13 Hazardous substances, including contaminated land, fuels, chemicals, waste and construction material, will be stored, handled, transported and disposed of in accordance with relevant legislation and best practice guidance for

mitigation of spillages and leaks. Measures to be applied include the appropriate use of storage containers, labelling of containers, the secure storage of containers and regular checks for leaks. The stockpiling of contaminated land will be avoided as far as possible. Where stockpiling is necessary, the contaminated material will be segregated and stockpiled on appropriately contained hardstanding and covered to prevent spreading.

9.5.14 Procedures will be put in place should contaminated land be encountered including contact details of the relevant consultees and regulators. Should any unexpected contamination be encountered during the construction works, all works will cease whilst an assessment of the level and extent of contamination is undertaken. In all cases where contamination is identified, risk assessment will be undertaken to determine if remediation is required. Any clean-up will be conducted as part of the construction works. Guidance regarding the correct procedure for storage, handling and disposal of contaminated soils will be detailed in the CEMP.

9.5.15 Emergency procedures will be in place to respond to potential accidental spillages and leaks. Particular consideration will be given to works around and displacement of the buried utilities.

9.5.16 Construction workers will be provided with appropriate personal protective equipment and direct contact with soil will be limited.

Dust Suppression

9.5.17 Dust will be suppressed using best practice methods to prevent spread of potentially contaminated windblown material. Dust suppression measures will include wheel washing for vehicles leaving the site and re-vegetation of earthworks and exposed areas. Further detail regarding dust suppressing measures can be found in the Air Quality Section of this report (Chapter 4).

Management of Waste

9.5.18 A Site Waste Management Plan (SWMP) has been developed for this Scheme and will be incorporated within the CEMP (Volume 2, Chapter 19: CEMP + SWMP). This document outlines the procedures for storage and disposal of waste, including hazardous and potentially contaminated wastes, to ensure appropriate disposal and minimal associated environmental impacts. For further information refer to the Materials section of this report (Chapter 10).

Deep Intrusive Works

9.5.19 Where piling or penetrative ground improvement is required through contaminated ground, especially in the vicinity of source protection zones, works will be carried out in accordance with the EA “Piling into contaminated sites” guidance and “Piling and Penetrative Ground Improvement Methods on Land Affected by Contamination: Guidance on Pollution Prevention” and a Foundation Works Risk Assessment will be undertaken.

Operational Phase Mitigation

Drainage

9.5.20 There is potential for contamination issues due to runoff from roads. This is addressed in Chapter 14: Road Drainage and Water Environment.

Assessment of effects – Do Something Scenario

9.5.21 The following sections provide details of the impacts predicted to occur during both construction and operational phases as a result of the NDR Scheme following implementation of the mitigation measures. A comparison has been carried out between the impacts to geology and soils due to the Scheme and a “Do Minimum” scenario where the NDR is not developed.

9.5.22 Table 9.11 summarises appropriate mitigation measures for the Scheme and anticipated impacts following the implementation of mitigation.

Table 9.11: Assessment of Effect after mitigation- Do-Something scenario

Project Phase	Receptor	Summary of impact:	Mitigation	When impact is encountered			Compliance mechanism	Action by	Sensitivity of receptor	Magnitude	Effect				
				Construction period	Opening year (2017)	Design year (2032)									
Construction	Soils	Permanent removal of soils where excavation works are carried out during earthworks and foundation construction.	The Materials section of this report (Chapter 10) incorporates a cut and fill balance to reduce the amount of material permanently removed from the area of the Scheme.	✓	x	x	Cut and fill balance, Materials chapter 10 of this report.	Designer	Medium-High	Minor	Slight- Moderate Adverse				
		Potential for excess material to be generated which could be suitable for re-use elsewhere.		✓	x	x						Designer	Medium-High	Minor	Slight- Moderate Beneficial
		Soil deterioration and consolidation may occur due to poor storage and handling or due to vehicle movements during construction and due to loading by the NDR.		✓	✓	x									
		Works will be undertaken in accordance with appropriate guidelines such as DEFRA's 2009 Code of Practice for the Sustainable Use of Soils on Construction Sites. Stripping of soils for temporary works, storage of materials and reinstatement upon completion using best practice procedures. Sequential stripping of topsoil and separate stockpiling of topsoil and subsoil. Stockpiles will be clearly defined. Tracked equipment will be used where possible, and traffic will be confined to				DEFRA 2009 Code of Practice for Sustainable Use of Soils on Construction Sites									

Operation	Controlled Waters	contaminated land be encountered including suitable management/ remediation.	✓	✓	*	DEFRA 2009 Code of Practice for Sustainable Use of Soils on Construction Sites	Contractor	Low	Minor	Slight Adverse
		Tracked equipment will be used where possible, and traffic will be confined to designated routes to minimise compaction	✓	✓	*	Materials chapter, cut and fill balance	Designer	Low	Minor	Slight Adverse
		Consolidation of soils due to construction work may hinder vegetation growth due to reduction of pore spaces containing oxygen.								
		Removal of topsoil in construction could impact on flora and fauna.	✓	✓	*					
		The Materials section of this report discusses mitigation measures to protect materials in the area of the Scheme. A cut and fill balance has been developed to ensure as much material as possible that is removed from the area of the Scheme is re-used in the Scheme.								
		The Ecology chapter of this report describes the re-use of excavated soil to create earth banks; this will mitigate the likely disturbance experienced by wildlife.								
		Contamination issues relating to surface water runoff from roads has been adequately addressed in the Road Drainage and the Water Environment Chapter XX and are therefore not reproduced here.								

9.5.23 The impacts of the Scheme have been considered during construction works, at Opening Year (2017) and at Design Year (2032).

9.5.24 The main impacts associated with the construction period are considered to include loss and deterioration of soils and geology due to construction works, contamination of water bodies, soils and flora and fauna through accidental spills or leakages and mobilisation of contaminants, contamination of the Principal Aquifer due to piling works and impact on human health due to uptake of contaminated materials.

9.5.25 The proposed works are not within any Environmentally Sensitive Areas, Sites of Special Scientific Interest or Special Areas of Conservation (the Broads are between 185m southwest and 215m northeast of the Scheme and the River Wensum is 219m southwest). Therefore there is not considered to be any risk to designated sites.

9.5.26 A new abstraction point has been installed at Brundall Low Road and Church Road. Therefore the Postwick Hub now falls within a Source Protection Zone 1. There is potential for construction work to impact on this protected zone, in particular due to piling works within the zone. The two main potential impacts on the SPZ are:

- Increase in turbidity, potentially leading to a deterioration of the supplies water quality; and
- Creation of new pathways between areas of contamination and the water table, potentially contaminating the supply.

9.5.27 An assessment of the impacts at Opening Year (2017) indicates that there may be continued deterioration and consolidation of the soils occurring due to loading of the ground by the NDR. Some of the soils are anticipated to consolidate slowly in response to loading due to low permeability. This may cause an indirect impact to flora and fauna. Vegetation often struggles to grow in consolidated soils due to the lack of pore spaces containing oxygen. Impacts to fauna and flora are further discussed in the Ecology chapter of this report.

9.5.28 In assessment of operation impacts of the Scheme, a contamination risk to controlled waters was determined due to runoff from roads. However, this has been adequately discussed in the Road Drainage and Water Environment Chapter of this report and is not covered here. There are therefore not anticipated to be any impacts to geology and soils at Design year (2032)

9.5.29 The significance of cumulative effects on a single receptor has also been considered. No significant cumulative effects were determined.

Alterations to the Scheme

9.5.30 The Scheme will potentially alter in elevation by a small amount. It is not anticipated that this will alter the assessment of Significant Effects relating to geology and soils.

Do-Minimum Scenario

9.5.31 The Do-Minimum scenario considers the impacts on the geology and soils if the NDR was not to be developed.

Activities Impacting on Geology and Soils

9.5.32 In the absence of the Scheme, the land is being used predominantly for agricultural activity; there is also some residential and commercial land use.

9.5.33 Due to the use of land for agricultural activity, there is currently likely to be disturbance of soils and there is potential for contamination of soils, flora and fauna, and controlled water bodies. Human uptake of contaminated material is currently a potential risk due to the nature of agricultural work.

9.5.34 The main impacts currently on geology and soils are anticipated to be disturbance and potential contamination of soils, controlled waters and fauna and flora due to farming activities and a risk to human health due to the nature of work carried out on site leading to exposure to potentially contaminated soils. It is anticipated that the current land use has little/ no impact on geology and there will be no risk to construction workers if the Scheme is not to be developed.

9.5.35 A significant effect was determined for groundwater due to potential contamination of the Principal Aquifer underlying the site by fertilisers, pesticides and other hazardous materials used for farming activities.

9.5.36 The assessment of impacts was carried out for the “period of construction” (when the NDR was being developed if it was going ahead), 2017 and 2032. Assuming that the land use remains the same for this period, the impacts on the geology and soils are anticipated to remain the same for the period until 2032.

Table 9.12: Assessment of Effect- Do Minimum Scenario

Receptor	Summary of impact:	When impact will be encountered			Sensitivity of receptor	Magnitude	Effect
		Baseline	2017	2032			
Soils	Disturbance of soils through farming activities. Soil deterioration and consolidation may occur.	✓	✓	✓	Medium-High	Moderate	Moderate Adverse
	Potential contamination of soils through use and accidental spills/ leaks of pesticides, fertilisers and other hazardous materials during farming activities.	✓	✓	✓	Medium- High	Moderate	Moderate Adverse
Geology	No impact on geology is anticipated as farming activities are generally limited to soils impacts.	✓	✓	✓	Low	No change	Neutral
Controlled waters	Potential for contamination of controlled waters due to use or accidental spills/leaks of fertilisers, pesticides and other hazardous materials during farming activities.	✓	✓	✓	High	Moderate	Large Adverse
Construction workers	No impact anticipated on construction workers.	✓	✓	✓	Negligible	No change	Neutral
General public	Risk to human health through uptake of contaminated materials. In particular farmers are at risk due to their greater exposure to potentially contaminated materials during farming activities.	✓	✓	✓	High	Minor	Slight Adverse
Fauna and flora	Potential impact on fauna and flora due to use or accidental spills/leaks of fertilisers, pesticides and other hazardous materials during farming activities.	✓	✓	✓	Medium	Minor	Slight Adverse

9.6 Climate Change

- 9.6.1 Table 9.13 considers the potential impacts of climate change on the identified receptors and considers mitigation measures that could be implemented into the design and construction of the Scheme to reduce the significance of effects relating to geology and soils. The impact of climate change on the Scheme itself, with respect to geology and soils, is also summarised.

Table 9.13: Impact of climate change on geology and soils and appropriate mitigation measures

Receptor	Impact relating to climate change	Mitigation measures to be implemented
Soils	<p>Drought conditions could lead to soil heave or subsidence affecting geomorphology.</p> <p>Weakening or wash out of soils in heavy rain may lead to landslides and undercutting</p>	Implementation of soil reinforcement structures and robust structural design to limit impacts to maintenance requirements.
Geology	<p>Drought conditions could lead to subsidence, impacting on geomorphology.</p> <p>Gravel and sands are classed as “water compatible” in PPS25: Development and Flood Risk, therefore the risk to underlying geology is not considered high.</p>	Design of the Scheme will account, and be able to cope with, any future anticipated subsidence.
Controlled waters	<p>Droughts or heavy precipitation can open pathways for contamination, increasing the risk of contamination to controlled waters.</p> <p>A rising groundwater table could bring the groundwater in closer proximity to shallow contamination following heavy rains.</p>	<p>Remediation of local contamination within the construction of the Scheme.</p> <p>No piling or intrusive works to be carried out during heavy rainfall/ drought.</p>
Human health	Changes in climate may alter the groundwater level, increasing/ decreasing the probability of human exposure to contaminated materials. For example, during construction works contaminated	Works not to be carried out in extremes of weather.

Receptor	Impact relating to climate change	Mitigation measures to be implemented
	water is more likely to be encountered if the groundwater is shallower.	
Fauna and flora	If groundwater levels rise due to heavy rainfall, contamination may occur at shallower levels and be taken up by roots of plants that would otherwise not have been exposed to contamination.	Remediation of local contamination within the construction of the Scheme. Hardy species to be incorporated in landscape design.
The Scheme	<p>Alteration of groundwater levels may lead to it being necessary to change the design and construction of works.</p> <p>If groundwater levels were to rise, contaminants within groundwater could provide a risk to structures.</p> <p>Climate impacts have the potential to increase the risk of contamination, for example a rising groundwater level may lead to increased mobilisation of contaminants. This will have financial implications due to the need for remediation of greater quantities of material.</p> <p>The integrity of the Scheme could be compromised due to potential for subsidence, landslides, earthwork failures and undercutting of materials supporting the Scheme infrastructure.</p>	<p>Material selection and design standards will consider the capacity to respond to the risks presented by climate variability. The Materials section (Chapter 10) of this report discusses the necessary adaptation of materials to climate change in more detail.</p> <p>Flexibility in response, for example allowing within the budget for necessary treatment of unexpected ground conditions/ the need to change the design to ensure that the Scheme is built to a standard best able to cope with climate change.</p>

- 9.6.2 The main impact identified is alteration to the groundwater table due to changes in weather conditions. This has been identified to increase contamination risk and risk to the integrity of structures.
- 9.6.3 Incorporation of mitigation measures into the design and construction of the NDR could increase the resilience and adaptability of the Scheme to climate change.

9.7 Conclusions

Do Something Scenario

Significant Effects

Construction Phase

- 9.7.1 It is considered that, with appropriate implementation of the incorporated mitigation measures identified above, there will be no significant effects relating to geology and soils during the construction phase of the proposed Scheme.
- 9.7.2 The impacts of the Scheme are anticipated to be predominantly limited to the period of construction, with the exception of potential longer term consolidation occurring due to loading of soils. This may indirectly impact on fauna and flora.
- 9.7.3 By the Design Year, 2032, no impacts on geology and soils are anticipated.
- 9.7.4 Any potential alteration to the elevation of the Scheme is not anticipated to change the assessment of significant effects relating to geology and soils.

Operational Phase

- 9.7.5 There are considered to be no impacts during the operational phase of the Scheme (with the exception of some accident scenarios which are outside the scope of this EIA).

Cumulative Effects

- 9.7.6 No significant cumulative effects have been determined for the Scheme.

Summary of Predicted impacts

- 9.7.7 See Table 9.14 below.

Table 9.14: Summary of predicted impacts - Do Something Scenario

Project Phase	Receptor	Summary of impact:	Effect	Significance of Effect
Construction	Soils	Permanent removal of soils where excavation works are carried out during earthworks and foundation construction.	Slight-Moderate Adverse	Not Significant
		Potential for excess material to be generated which could be suitable for re-use elsewhere.	Slight-Moderate Beneficial	Not Significant
		Soil deterioration and consolidation may occur due to poor storage and handling or due to vehicle movements during construction and due to loading by the NDR.	Moderate Adverse	Not Significant
		Construction is likely to involve digging new trenches for utilities and potentially diverting existing utilities which will result in the temporary loss of soil and may impact on soil structure.	Slight Adverse	Not Significant
		Potential opportunity for remediation of contaminated soils	Moderate Beneficial	Not Significant
		Potential contamination of soils through contaminant mobilisation during excavations or accidental spills and leakages of hazardous substances.	Slight Adverse	Not Significant

Project Phase	Receptor	Summary of impact:	Effect	Significance of Effect
	Geology	Potential for permanent removal of rock forming deep piles or where retaining walls are to be constructed, for example the new overbridge at Postwick and Rackheath Road and Rail Bridge.	Slight Adverse	Not Significant
	Surface water	There is potential for contaminants to mobilise and sediments to reach surface water receptors.	Slight Adverse	Not Significant
	Groundwater	Piling through soils into the Principal Aquifer or Source Protection Zone 1 at the new overbridge at Postwick may promote migration of any potentially contaminated groundwater.	Moderate to Large Adverse	Not Significant
		Accidental spills or leakages of hazardous substances and migration into underlying groundwater.	Slight Adverse	Not Significant
		Removal of topsoil can decrease retardation of contaminants, increasing the risk of contaminants leaching into groundwater.	Moderate Adverse	Not Significant
		Mobilisation of contaminants in the vicinity of Norwich airport (Ch6800.00-10900.00)	Moderate Adverse	Not Significant
		Construction workers	Harm to human health by ingestion/ inhalation/ dermal contact with contaminated soils, asphyxiation or explosion due to hazardous	Slight Adverse

Project Phase	Receptor	Summary of impact:	Effect	Significance of Effect
		gases from contaminated land during construction activities.		
	General public	Harm to human health by ingestion/ inhalation/ dermal contact with contaminated soils.	Slight Adverse	Not Significant
	Fauna and flora	Harm to fauna and flora by contaminants mobilised during excavations or through accidental spills/ leakages of hazardous materials.	Slight Adverse	Not Significant
		Consolidation of soils due to construction work may hinder vegetation growth due to reduction of pore spaces containing oxygen.	Slight Adverse	Not Significant
Operation		Removal of topsoil in construction could impact on flora and fauna.	Slight Adverse	Not Significant
	Controlled waters	Contamination issues relating to surface water runoff are adequately discussed in Road Drainage and the Water Environment Chapter 14.		

Do Minimum scenario

9.7.8 The impacts on geology and soils are anticipated to remain the same until 2032, assuming that the land use remains the same.

Significant Effects

9.7.9 A significant effect on groundwater was identified due to the potential for contamination of the Principal Aquifer underlying the site by hazardous materials used in farming activities.

Cumulative Effects

9.7.10 No significant cumulative effects were identified for the Do Minimum Scenario

Summary of predicted impacts

9.7.11 See Table 9.15 below.

Table 9.15: Summary of predicted impacts - Do Minimum Scenario

Receptor	Summary of impact:	Effect	Significance of Effect
Soils	Disturbance of soils through farming activities. Soil deterioration and consolidation may occur.	Moderate Adverse	Not Significant
	Potential contamination of soils through use and accidental spills/leaks of pesticides, fertilisers and other hazardous materials during farming activities.	Moderate Adverse	Not Significant
Geology	No impact on geology is anticipated as farming activities are generally limited to soils.	Neutral	Not Significant
Controlled waters	Potential for contamination of controlled waters due to use or accidental spills/leaks of fertilisers, pesticides and other hazardous materials during farming activities.	Large Adverse	Significant
Construction workers	No impact anticipated on construction workers	Neutral	Not Significant
General public	Risk to human health through uptake of contaminated materials. In particular farmers are at risk due to their greater exposure to potentially contaminated materials during farming activities.	Slight Adverse	Not Significant

Receptor	Summary of impact:	Effect	Significance of Effect
Fauna and flora	Potential impact on fauna and flora due to use or accidental spills/leaks of fertilisers, pesticides and other hazardous materials during farming activities.	Slight Adverse	Not Significant

Climate Change

9.7.12 Climate change impacts relating to geology and soils have been assessed for this Scheme. The main impact identified is alteration to the groundwater table due to changes in weather conditions. A rising groundwater table could affect the stability of the ground conditions, impacting on construction works and design. It could also allow for greater contaminant migration and could bring contaminants closer to the surface, causing a risk to concrete structures, human health, fauna and flora. In addition climate change could lead to subsidence of soils or soil heave and undercutting.

9.7.13 Mitigation measures will be incorporated into the design of the Scheme in order to increase the resilience and adaptability of the NDR to climate change.

Compliance with Planning Policy

9.7.14 The proposed Scheme will be implemented in accordance with National Planning Policy Framework 2012. The proposed Scheme will also be implemented in accordance with the corresponding policies ENV4 and WM7 and local policies within Norwich City Council adopted the Joint Core Strategy (JCS) for Broadland,

9.7.15 Where construction does interact with soils the 'Code of Practice for the Sustainable Use of soils on Construction Sites' (DEFRA, 2009) will be followed.

9.7.16 Contaminated land assessments will be undertaken or have already been undertaken as part of the planning for the proposed Scheme, in accordance with UK legislation and best practice UK guidance including CLR11 and CIRIA C552.

10. Materials

10.1 Introduction

10.1.1 In this chapter the term materials is used to describe all minerals and recycled products used by the construction industry for road making and bridge building. The largest component of construction minerals and the most voluminous materials extracted from the UK landmass are ‘aggregates’ – a term used to describe granular or particulate material which is suitable for use on its own, or with a binder such as cement, lime or bitumen (in construction). Aggregates are used in concrete, mortar, roadstone or asphalt (drainage courses), or for constructional fill and railway ballast. The two principal types of natural aggregate are crushed rock (limestone, igneous rock and sandstone) and sand and gravel. In addition to land-won sand and gravel, significant quantities are produced by marine dredging. Recycled materials used in road building are typically recycled concrete aggregate, asphalt, and light-weight fill materials such as shredded tires and glass.

10.1.2 For material resource use, the potential environmental effects are associated with the extraction and transport of primary raw materials, the manufacture of products, and their subsequent transport to and use on construction sites. Projects, such as the NDR, consume large quantities of materials and hence may have permanent and direct effects on the environment. For example, effects may occur as a result of the depletion of natural resources and the embodied energy associated with the manufacture and transport of materials.

10.1.3 However some impacts occur off site and may possibly occur outside the UK. They include the depletion of non-renewable resources and the production of waste at the point of extraction and during manufacturing. It is outside the scope of this assessment to assess the environmental impacts associated with the extraction of raw materials and the manufacture of products. This chapter concentrates on the assessment of the impacts and effects that will occur as a result of the use of primary, secondary and recycled raw materials and manufactured construction products on the NDR.

10.1.4 For surplus materials and waste, the potential environmental effects are associated with the production, movement, transport, processing, and disposal of arisings from the NDR. Major new road construction projects or large-scale maintenance schemes might result in large quantities of surplus materials and waste leading to effects on the available waste management infrastructure. The basis of any assessment of the effects of waste will be to

identify the quantities and type of waste firstly, and then try to establish the impacts.

10.1.5 The use of materials including the management of waste may also give rise to other impacts, which might include, for example, detrimental impacts on air quality and increased noise; these aspects will be covered, if appropriate by the other assessments included in the ES.

10.2 Study Area

10.2.1 The study area comprises the NDR scheme boundary but will also take into account locations of waste management facilities that can be utilised by the project within Norfolk. Many materials will originate on-site such as excavated soil and rock; these are included within the scheme boundary. Other material resources will be sourced from off-site, their environmental impact will also be taken into account.

10.3 Methodology

Overall Methodology

10.3.1 The assessment process is aligned with the assessment levels in DMRB Volume 11 Section 2, Part 1, and Chapter 2: Project Development and Environmental Impact Assessment Levels:

10.3.2 The objective of the Detailed Assessment is to gain an in-depth appreciation of the environmental consequences of the project (both adverse and beneficial) to inform project decisions on whether the project proceeds in its proposed design, taking account of the key issues. The guidance in this Standard is not prescriptive or exhaustive in order to provide a flexible approach enabling those undertaking the assessment to tailor their approach to the specific characteristics of each project.

10.3.3 For the purposes of assessing the effects associated with materials use and waste the Detailed Assessment is a quantitative exercise which should aim to identify and quantify the following:

- The types and quantities of materials required for the project;
- The cut and fill balance;
- The types and quantities of forecast waste arisings from the project, including the identification of any forecast hazardous wastes;
- Surplus materials and waste falling under regulatory controls;

- Waste that requires storage on site prior to re-use, recycling or disposal;
- Waste to be pre-treated on site for re-use within the project;
- Wastes requiring treatment and/or disposal off site;
- The impacts that will arise from the issues identified in relation to materials and waste;
- A conclusion about the magnitude and nature of the impacts; and
- The identification of measures to mitigate the identified impacts.

10.3.4 There are no specific significance criteria used in the DMRB for assessment of materials and waste. The sensitivity of a receptor is dependent on the capacity of the local environment to provide the required materials and deal with the waste produced.

10.3.5 This assessment will identify whether the impacts are positive/negative, permanent/temporary and direct/indirect. Permanent impacts are likely to be significant in terms of their effect and so projects should aim to identify these. Equally it is clear that identifying quantities of materials to be used and waste forecast to be produce provides the basis for an assessment of the magnitude of change.

10.3.6 Calculations of waste arisings undertaken (for instance for the earth works balance) will be developed further by the construction contractor. At this time additional material requirements or waste streams may be identified. Conversely further waste management or resource efficiency measures may be identified. Nonetheless, the assessment in this chapter does provide sufficient information to determine the magnitude of impacts from materials use and waste generated, to determine effects at a County level.

10.4 Regulatory / Policy Framework Context

Planning and Legislative

10.4.1 An assessment has been undertaken of how the use of materials conforms to the high level policy and strategy targets influencing materials resource use.

10.4.2 The impacts of the waste forecast to be generated has been assessed in the context of the impacts on the waste management infrastructure (the receptor with regards to waste) and the legislation, policy and strategy targets influencing waste management.

National Planning Policy Framework (NPPF)

10.4.3 The National Planning Policy Framework sets out the Government's planning policies for England and how these are expected to be applied. It sets out the Government's requirements for the planning system only to the extent that it is relevant, proportionate and necessary to do so. It provides a framework within which local people and their accountable councils can produce their own distinctive local and neighbourhood plans, which reflect the needs and priorities of their communities.

10.4.4 This Framework does not contain specific policies for nationally significant infrastructure projects for which particular considerations apply. These are determined in accordance with the decision-making framework set out in the Planning Act 2008 and relevant national policy statements for major infrastructure, as well as any other matters that are considered both important and relevant (which may include the National Planning Policy Framework). National policy statements form part of the overall framework of national planning policy, and are a material consideration in decisions on planning applications.

10.4.5 NPPF Section 13 Facilitating the sustainable use of minerals: "Minerals are essential to support sustainable economic growth and our quality of life. It is therefore important that there is a sufficient supply of material to provide the infrastructure, buildings, energy and goods that the country needs. However, since minerals are a finite natural resource, and can only be worked where they are found, it is important to make best use of them to secure their long-term conservation."

Design Manual for Roads and Bridges

10.4.6 Design Manual for Roads and Bridges DMRB Volume 7 Design and Maintenance, Part 2 (HD 35/04) considers the conservation and use of secondary and recycled materials. Table 2.1 in this section summarises the permitted uses of secondary aggregates in the Specification for Highway Works. All the types of recycled and secondary aggregates that can be used in earthworks are listed.

10.4.7 In addition to the DMRB, Interim Advice Notes (IANs) are issued by the HA for specific guidance. IAN 73/06 (Revision1 2009) Design Guidance for Road Pavement Foundations gives one of the main objectives of design as the facilitation of the efficient use of a wide range of resources, incorporating natural, secondary and recycled materials as both binders and aggregates.

Other relevant IANs include the HA's carbon accounting framework (IAN114) and the HA's Environmental Information Systems (EnvIS) (IAN84). The quantities and nature of materials used and waste generated in earthworks are required for reporting under these IANs.

Local Policy

10.4.8 Norfolk Minerals and Waste Development Framework: Core Strategy and Minerals and Waste Management Policies Development Plan Document 2010-2026: Core Strategy Policy CS17 states that *“The County Council will promote the use of secondary and recycled aggregates in all developments and encourages all local authorities within Norfolk to require, as part of their own Local Development Frameworks, the use of recycled and secondary aggregates in development (where practicable). Applicants will be required to demonstrate the consideration of the use, where practicable, of secondary and recycled aggregates. Although a ‘target’ figure cannot be set for the production of secondary and recycled aggregates, the County Council will aim to achieve a year-on-year increase in the percentage of inert and construction and demolition waste managed in Norfolk that is recycled, starting with the baseline of 70%.”*

10.4.9 The scheme should aim to follow the Minerals and Waste Development Framework, which aims to promote the efficient consumption of minerals and the hierarchical approach to safeguarding and sustainable use of mineral resources, through re-use, recycling and secondary aggregates. Policy options for waste are recommended to include waste minimisation, re-use, recycling and recovery of resources.

Technical

10.4.10 The construction value for the NDR exceeds the £300,000 threshold in England, over which a Site Waste Management Plan (SWMP) is required (IAN 153/11). The SWMP is used to ensure that the waste management provisions are adequate for the construction activities planned and that wastes produced from the scheme are dealt with in an appropriate manner, following the waste hierarchy. The SWMP produced for this scheme can be found in Volume 2, Chapter 19: CEMP + SWMP, it is the responsibility of the client and principal contractor to review the SWMP at regular intervals so that it remains aligned with the progress of the project. The SWMP should outline

all waste types that are predicted to arise from the scheme and identify the methods of treatment, recovery or disposal.

10.5 Baseline

Minerals

10.5.1 Norfolk has significant permitted reserves of sand and gravel natural aggregates, estimated at 2.6million tonnes in 2001 (BGS). Norfolk's Minerals Site Specific Allocations Local Plan identified twenty-nine sites across the County, allocated for the abstraction of sand and gravel, silica sand and carstone, these are Norfolk's. However, Norfolk's demand for mineral resources is increasing, with the need for sand and gravel to the end of 2026 being calculated at 2.05 million tonnes (mt), currently there are twenty-six sand and gravel sites allocated in Norfolk, with their reserves standing at 27,591,000 tonnes. The demand for sand and gravel in the region amounts to 2.57 million tonnes per annum (mtpa) although, by contrast, the rolling average 10 years' sales are at 1.99 mtpa. Three sites have been allocated that have the potential to yield a total of approximately 6.4 million tonnes of silica sand. This figure is likely to fall with allocation of two of the sites coming into question. Norfolk represents 10% of the UK's total output. Norfolk's third resource, Carstone, has a current landbank reserve of approximately 8.6 years, another abstraction site is currently waiting to be added to this and has the potential to add a further seven years to this estimate.

10.5.2 The Scheme is located over areas of sand and gravels, it is therefore anticipated that much of the aggregate material required for construction will be taken from within the Scheme footprint. The overall earthworks strategy has been based on a cut to fill balance with excavated material from the cuttings, structures, balancing ponds and other drainage operations being utilised to satisfy all of the fill areas, bunds, landscape areas and also provide the aggregate for the CBGM A sub-base. Where possible the requirement to import Type 1 sub-base will be substituted by utilising crushed concrete or road planings from the works or other local contracts.

Waste

10.5.3 The policy document for waste in Europe, The Revised Waste Framework Directive (EU 2008), sets a target for recycling/reuse of 70% for construction, demolition and excavation wastes by 2020. This is enforced at a national level within The Waste (England and Wales) Regulations 2011.

- 10.5.4 Since the banning of co-disposal of hazardous waste in landfills in July 2004, Norfolk does not landfill any hazardous waste, with the exception of asbestos in Attlebridge landfill. This means that Norfolk exports its hazardous waste to other counties, in 2007 figures show that of 95,000 tonnes produced 60,000 tonnes were exported.
- 10.5.5 In 2008/2009 the Annual Monitoring Report figures show that Norfolk had five non-hazardous landfills, receiving over 482,000 tonnes of waste and had a permitted void space capacity of approximately 8.5 million m³.
- 10.5.6 The main waste type that is assumed to be associated with the scheme is Inert Waste, currently recycling levels of inert waste are high. The NDR project supports the Revised Waste Framework Directives and aims to use a cut to fill balance for material. Only two inert only landfills in Norfolk accepted waste in 2008/9, totalling 42,000 tonnes. Norfolk also uses inert waste to restore quarries and closed non-hazardous landfills (168,000 tonnes), whilst 31,000 tonnes of inert waste was disposed of too non-hazardous landfill sites. Between 2004 and 2007 approximately 60% of waste was recycled, 10% was used for engineering purposes on landfills and 25% for backfilling/restoring quarries, the remaining 5% went to landfill.
- 10.5.7 If materials are available but immediate usage is not possible then they will be stored at the main compound at Norwich Airport. The intention is to, whenever possible, deposit excavated material in its final location, in many cases temporary soil storage will have to be used, the locations of these sites are displayed on the plan drawings.

10.6 Mitigation

- 10.6.1 To limit the potential impacts upon resources in the region and increase the projects resource efficiency with regards to materials and waste have been considered. Approaches to mitigation are recommended for the scheme (table 1.3). It is important to note that the validity of the assessment forecasts are dependent on proper management of impacts and effects. Which is why projects should only include mitigation they know they can deliver and subsequently manage to fulfil their purpose. Assessments should describe how this process will be implemented.
- 10.6.2 The current project design aims to reduce the waste produced by maximising the use of materials available within the Schemes footprint, such as a cut and fill policy for soil, sands and gravels.

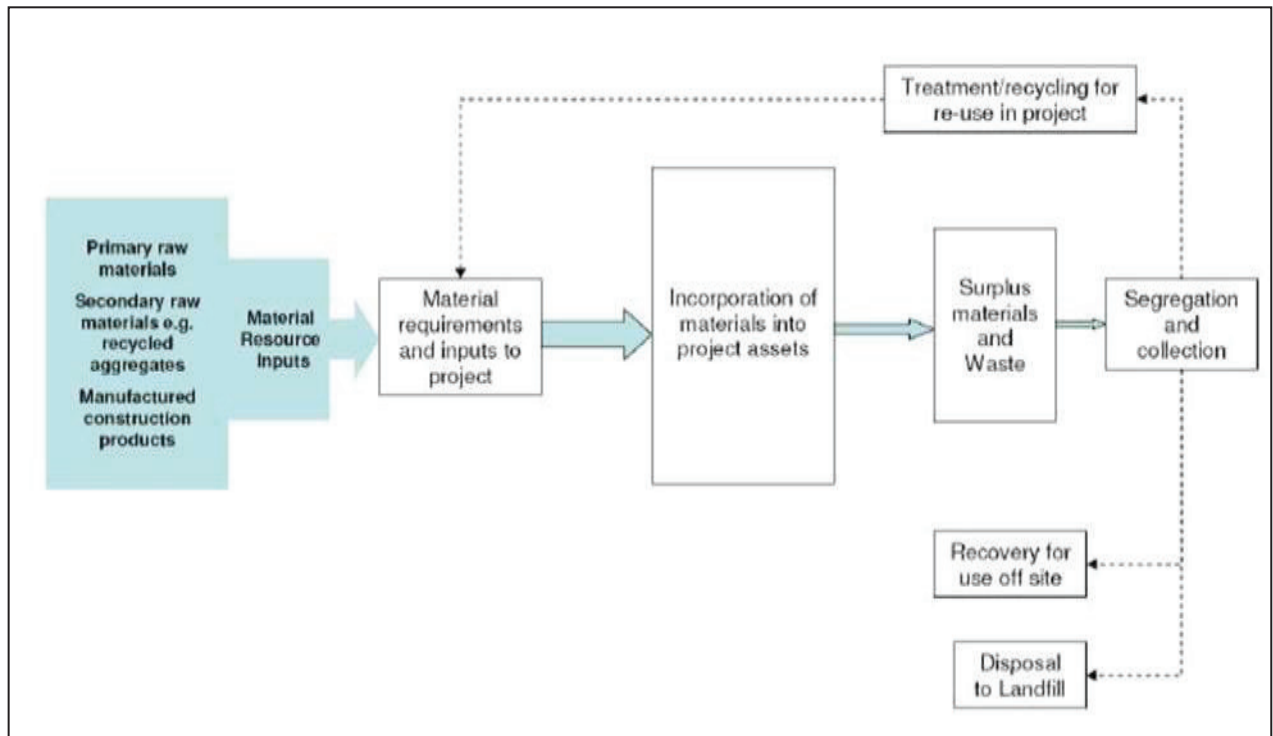

10.6.3 A preliminary draft Site Waste Management Plan (SWMP) has been prepared for the scheme and is included in Volume II. The agreement of, and compliance with the SWMP will be secured by requirements in the Development Consent Order (DCO). The SWMP aims to ensure that the waste produced in the construction phase, and other phases of the project is dealt with in accordance with the Duty of Care Provisions under the EPA and the duty of care provisions, the Waste Strategy (2007) and principles outlined within the Waste Hierarchy. The mitigation measures discussed in this chapter are incorporated into the SWMP. The contractor uses a WRAP system to achieve efficiency in waste management.

10.7 Assessment of Impacts

10.7.1 The potential environmental effects are associated with the extraction and transport of primary materials, the manufacturing and transportation of products. Many material resources will originate on site, with the overall aim being a cut to fill balance. Other materials will be purchased as construction products and others will originate off site from decommissioned sites.

10.7.2 Waste will arise as a result of the Scheme, due to a surplus of materials from excavation and materials brought to site but not used for the original purpose e.g. damages, off-cuts and surplus. The environmental implications of waste are associated with production, movement, transport, processing and disposal. Figure 10.1 illustrates how materials and waste are used in the process.

Figure 10.1: Project Material Flow Diagram (Source: IAN 153/11)

Construction

Materials Required

10.7.3 Estimated resource use during construction is shown in Table 10.1. This table is open to alterations from the construction contractor. Quantities are likely to change during the schemes construction as alterations are made. The percentage values in the recycled/reused and Recyclable on Decommission columns are only indicative of the likely percentages and should not be taken as confirmed. Cells are left blank if the material’s recyclable capability is unknown. This table can be updated when the scheme progresses and materials are purchased.

Waste Arisings

10.7.4 Information on the likely waste arising is presented in Table 10.1. Quantities of waste material are based on the current cut and fill calculations; these quantities are subject to change during the scheme construction and should therefore be considered as estimates.

Table 10.1 Summary of anticipated waste arisings (Table B within IAN 153/11)

Waste arisings from the project	Quantity	Unit	Additional information on waste arisings
Excavation			
Topsoil	502297	m ³	Retained on site for reuse
Win CBGM A Agg	67212	m ³	Retained on site for reuse
Class 1	629676	m ³	Retained on site for reuse
Class 2	390909	m ³	Retained on site for reuse
Class 4	350786	m ³	Retained on site for reuse
Acceptable	1371371	m ³	Retained on site for reuse
Excavation of class U1B	2000	m ³	Disposal
Excavation of class U2	500	m ³	Disposal
Ground Preparation and Cultivation			
Vegetation clearance	1421926	m ²	Disposal to landfill or green waste
Re-depositing in Scheme			
General	705273	m ³	-
Landscaping	748764	m ³	-
Fill	1454037	m ³	-
Resoil	360518	m ³	-
Disposal			
Excess Soil Material	8099	m ³	Disposal to selected landfill
Vegetation Disposal	1421926	m ²	Recycle or dispose to landfill or green waste
Excavation of unacceptable material (Japanese	1000	m ³	Treat on site over a number of years and then bury within the

Knotweed)			scheme boundary.
Class U1B Material	2000	m ³	Dispose to approved landfill site.
Class U2 Material	500	m ³	When toxic or other hazardous waste material is to be removed, the regulations covering excavation, transportation and deposition into a registered tip are closely governed. The local Environmental Health Officer (EHO) must be contacted and consulted regarding the treatment of any toxic waste material located within or affected by the scheme.
Site Accommodation – municipal waste	TBC		Recycle or to landfill

Climate Change Risk Assessment

10.7.5 Materials have the potential to be influence by climate change, therefore it is imperative that careful material selection should take place. Materials will be fit for purpose but also robust and resilient to a changing climate. The main risk highlighted by the NDR CCRA road surfaces should be resilient to extreme temperatures, with future risk to operation of the NDR likely to increase due to heatwaves.

10.7.6 Other material considerations are earthworks; ensuring their capability to endure weakening or washing out due to high rainfall events. Drainage systems have been designed to minimise the potential of flooding on the scheme.

10.7.7 The transportation of materials for construction and waste will give rise to carbon emissions therefore the Scheme will minimise the transportation of minerals through the cut fill balance.

Operation

10.7.8 Currently no alterations to the scheme are expected after the commencement of operation. If during the operation of the scheme material adjustments are made then the SWMP should be adjusted accordingly.

Maintenance

10.7.9 Currently there are limited maintenance plans for the scheme. Some considerations have been made to the maintenance of scheme ecology. These considerations are summarised in table 10.2:

Table 10.2: Planned maintenance for the NDR

Planned Maintenance	Quantity	Sum
Maintenance of Established Trees and Shrubs		
Pruning shrubs and climbers	12	Sum
Thinning and coppicing	12	Sum
Tree surgery	12	Sum
Control of Rabbits and Deer		
Rabbit / deer control within the highway boundary	12	Item
Management of Established Waterbodies		
Inspection of existing waterbodies and removal of debris / silt where required	1	Sum
Maintenance Period (Assumed 5 years)		
Grass cutting	851881	m ²
Inspection of waterbodies (swales/ditches/lagoons/containment lagoons) and removal of debris / silt where required	1	Sum
Maintenance of wildflower areas	272109	m ²
Total weed control if required	1061643	m ²

Hedge cutting	13696	m
Maintenance of trees	68939	Nr

10.7.10 Maintenance activities identified in table 10.4 will produce waste, for example grass cutting. The waste anticipated from these activities can either be recycled or disposed of in green waste landfills.

10.7.11 Maintenance of constructed elements within the scheme e.g. road surface, bridges, landscaping, should try and use materials already present in the scheme.

Significant Effects:

10.7.12 Volume2, Chapter 2: Materials, Section A shows the estimated materials that will be required for the project from the BOQ. The main materials required are for use in the schemes earthworks and surfacing. This is where the scheme aims to fulfil its cut and fill proposal. With a total of 1,873,668m³ of topsoil, CBGM A. aggregate and other acceptable materials being excavated, with 1,814,555m³ of this material being reused within the scheme. Leaving 10,599m³ of material left for disposal.

10.7.13 The main requirement from the supplier will be for; concrete 8,283.1m³ and precast concrete items such as; kerbs and drainage channels. A total of 1,736,622m² of sub-base and bitumen macadam will also be required for the surfacing of the schemes main carriageway. This will be provided by the schemes provider Tarmac.

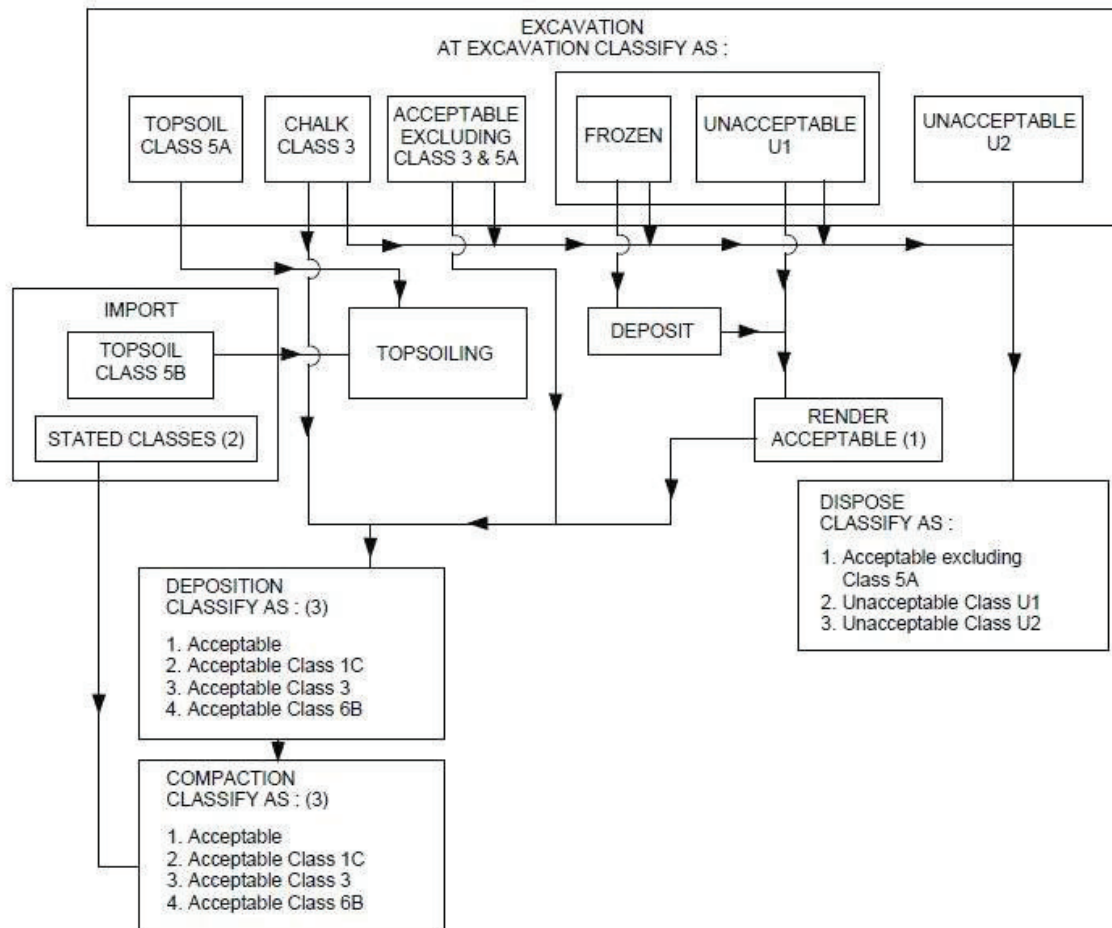

10.7.14 Many other materials will be required for the scheme. These new/virgin materials, for example; fencing, drainage, road signs/markings, waterproofing, vehicle parapets and ecological installations, will be required to have a recycled element and/or a recyclable potential upon decommission.

10.7.15 The majority of waste will either be retained for reuse on site (Table 10.1), and the amount of material taken off site is therefore minimised. This will be achieved by ensuring that topsoil and geological arisings from excavations will be reinstated for both use as aggregate and embankments/earthworks. There are three main site compounds for the scheme; these will have adequate space for storage of materials on site. Each bridge construction will also have a small storage site available during the construction process. It is not anticipated that any further storage will be

required. Earthworks and materials used during the construction process will be available when required to limit stockpiling of resources, which would lead to increased waste. Tarmac, the schemes provider, will supply materials when required via haulage.

- 10.7.16 The majority of waste that will go to landfill comprises 2,500m³ of unacceptable material; classes U1 and U2. The excavation and disposal classification outlined by the Highways Agency is displayed in figure 10.2. The volume of soil values are currently just estimates as the Agricultural land survey land classification map (Volume II) classifies the soils within the scheme to be either Grade 2 or Grade 3a and b and Grade 3; very good quality – moderate quality agricultural land. Therefore unacceptable materials are not anticipated. Other wastes that could go to landfill (table 10.2) should be quantified throughout the construction process. Japanese Knotweed will be treated on site and then subsequently buried within the scheme boundary. The project SWMP (attached in Volume II) will also be further developed by the construction contractor. There will therefore be opportunities throughout the project to improve the amount of reused or recycled materials and waste generated. Table 10.2 sets out the main impacts arising from waste and materials, it also outlines the mitigation that can be applied through the project and how measures will be implemented.

Figure 10.2: Excavation of soil classifications for Highway Works (Source: Chapter 3: Specification and Method of Measurement for Highway Works. Volume 4, Section 1, part 1 HA 44/91)

NOTES :

- (1) If the Contractor opts to render unacceptable material acceptable for use in the Works, then he will be paid as though he had disposed and then imported the class of material he rendered acceptable. If the contract requires material to be so treated then payment will be at rates in the BoQ.
- (2) For Import, only Stated Classes have to be classified (Group I, Feature 2)
- (3) Deposition and Compaction of Class 1C and 6B materials shall be measured separately only where Class 1C or 6B material as such is specifically stated by the Contract to be required to be placed and compacted in a particular location.

Table 10.3 Detailed Assessment and Mitigation Measures Reporting Matrix (Tables C and D within IAN 153/11)

Potential impacts associated with material resources/ waste arisings	Description for the impact	Description of mitigation measures	How the measures will be implemented, measured and monitored
Use of imported aggregates from quarry	Minor adverse. Indirect, permanent impact.	Quarry materials are only to be used as a back-up if site won materials are not adequate. Therefore effective use of excavated site materials is essential	The material management plan for the site will be updated throughout the construction process, allowing for improved estimates for the cut and fill balance.
Re-use of imported materials from decommissioned site	Minor positive. Indirect/direct permanent impact.	Avoid damage of materials when decommissioning and transporting to the scheme, will maximise their usability. Use materials instead of new materials	Assess the potential of materials on the planned decommissioning site, gaining an effective grasp on the quantities available will reduce the need for new materials and wastage of them.
Use of new/virgin materials e.g. signs, fencing, drainage etc.	Minor adverse. Indirect, permanent impact.	The recycled content in the new material should be maximised. Materials should be ordered for when they are required; this will reduce stockpiling and reduce excess materials that will increase wastage. Where possible materials should be sourced as locally as	Supply and procurement documentation. CEEQUAL assessment if being used. Site best practise in accordance with CEMP.

Potential impacts associated with material resources/ waste arisings	Description for the impact	Description of mitigation measures	How the measures will be implemented, measured and monitored
		possible to reduce the transport distance.	
Re-use of waste materials on site including topsoil, subsoil and aggregates.	Minor positive. Direct permanent impact.	Segregation of waste materials and correct storage to avoid damage.	Use of CEMP to set out correct storage methods.
Recycling of materials off-site including; concrete, planings and green waste.	Minor positive. Indirect, permanent impact.	Segregation of waste materials in the storage sites to maximise the opportunities for recycling any waste material. This can be helped by storing materials with best practise to avoid damage.	Monitor waste off-site using the SWMP. Identify appropriate waste and recycling sites to streamline recycling and disposal efficiency.
Landfill of waste including; unsuitable soils, damaged or unused new materials e.g. concrete.	Minor adverse. Indirect, permanent impact.	Waste to landfill should be minimised through waste management (described above). When required the landfills chosen should be in close proximity to the scheme to reduce the transport distance of waste.	Waste should be constantly monitored using the SWMP. CEEQUAL could be used or targets set for construction.

10.8 Conclusion

- 10.8.1 The NDR scheme has the potential to use large amounts of raw materials and generate quantities of waste. This consumption of material resources and the management of waste, results in environmental impacts that need to be managed and mitigated.
- 10.8.2 The bulk of the material requirements in the scheme are for the earthworks. It is currently estimated that 1,814,555m³ of soil, sub-soil, sub base and granular capping material is needed for the scheme; this is less than the estimated excavations of 1,873,668m³. Therefore it is currently expected that the scheme will work on a cut and fill basis. The significance of the effect is assessed as minor positive.
- 10.8.3 A considerable quantity of raw/virgin materials will be required, predominantly for surfacing, including 8,283m³ of concrete and precast concrete items such as; kerbs and drainage channels, and 1,736,622m² of sub-base and bitumen macadam. These will be provided by the schemes provider, Tarmac. The significance of the effect is assessed as minor adverse.
- 10.8.4 However, some materials, including concrete and bitumen macadam, are to be sourced from a decommissioned site, this will reduce the reliance on raw materials. The significance of this effect is assessed as minor positive.
- 10.8.5 Other materials will be used for new signage, fences and barriers. These will have a smaller recycled component and will have to be sourced off site from a supplier. The significance of this is considered to be minor adverse.
- 10.8.6 It is currently predicted that 10,599m³ of excavated material will be disposed of in landfill, the majority of which is excess soil material. If this can be used on other schemes then it will be. Unacceptable or excess material must go to landfill. An estimated 1,421,926m² of vegetation is to be removed during the schemes construction, the percentage of this recycled will be maximised, the remaining waste will be disposed of in green waste sites.
- 10.8.7 The NDR scheme is in the early stages of resource use and estimation of waste generated. There will be opportunities throughout the planning and construction processes to improve the results of this assessment and reduce the waste produced. This assessment is based on current information and only confirmed practices have been taken into account.
- 10.8.8 The detailed impact assessment anticipates that as a result of the materials used and the waste produced from the scheme that there will only be no

significant effects as a result of the Scheme. Mitigation measures suggested to reduce the impact of the scheme include; maximisation of usage of materials won from the schemes footprint, maximisation of recycled content of virgin materials sourced for the scheme and segregation of waste to maximise the recycling of materials, source materials from as close as possible to the scheme to reduce transport distance and select landfills in close proximity to the scheme to reduce waste haulage distance. This can be achieved through a constantly evolving Materials Management plan and Site Waste Management Plan. CEEQUAL scheme could be engaged for the project to set targets for construction.

11. Noise and Vibration

11.1 Introduction

11.1.1 The proposed route of the NDR will reduce the volume of through traffic in and around Norwich city centre but will introduce traffic into a relatively quiet rural corridor to the north and east of the city. This is likely to result in positive noise impacts in the former area but negative impacts in the latter - the purpose of this Chapter of the ES is to quantify and assess any such effects and to assess whether there are any likely significant environmental noise impacts.

11.1.2 Two phases of the development are considered: temporary impacts resulting from the construction activities and permanent impacts due to noise and vibration from road traffic using the NDR and the local highway network. This chapter sets out the following in relation to the assessment of noise effects:

- Methodology;
- Policy;
- Mitigation;
- Assessment; and
- Identification of any significant effects.

11.2 Methodology

Overview

11.2.1 An environmental impact assessment of the impact of noise and vibration requires a comparison of the predicted impacts of noise resulting from the proposed Scheme with the pre-existing (baseline) levels. The predicted increases/decreases (impacts) and the resulting effects on people and resources are then quantified (resulting in an assessment) which enables likely significant adverse impacts of the Scheme to be identified and reduced or eliminated where possible, and the design of additional mitigation measures where appropriate.

Scope of Assessment

Spatial Scope

11.2.2 The study area and hence spatial scope can be expressed in terms of both temporary and permanent impacts (detailed below). For the baseline noise survey, the broad study area includes the area surrounding the extents of the on-line route of the Scheme, as shown on the General Arrangement plans in the ES (Volume 1, Appendix 1).

11.2.3 In general, for the spatial scope of the survey, monitoring positions were selected to represent residential receptors and primarily front-line properties facing existing roads or the proposed NDR route. This is discussed in more detail in ensuing sections.

Temporary Impacts

11.2.4 In terms of construction noise, the extent of the assessment is limited to areas where the calculated total noise (construction noise plus baseline noise) exceeds the baseline noise level by 5 dB or more, subject to threshold values of 65 dB(A) for daytime (weekdays 07:00 – 19:00; Saturdays 07:00 – 13:00), 55 dB(A) for evenings and weekends (weekdays 19:00 – 23:00; Saturdays 13:00 – 23:00; Sundays 07:00 – 23:00), and 45 dB(A) for night periods (23:00 – 07:00). This is largely restricted to the proposed Scheme envelope, although could extend along elements of the existing road network, depending on haul routes and the quantity of construction-related traffic.

Operational Impacts

11.2.5 The Design Manual for Roads and Bridges (DMRB) Volume 11 Section 3 Part 7 HD213/11 Noise and Vibration (2011) describes a methodology for the assessment of road projects in the UK. The methodology requires that the study area is identified as an area within 1km of the physical works associated with the Scheme. Within this study area, road traffic noise predictions are performed at any sensitive receptor within 600m of a road where there is the possibility of a change of 1 dB LA10,18hr upon Scheme opening, or 3 dB LA10,18hr in the long term.

11.2.6 For potential effects due to road traffic noise outside of the 1km area, the methodology requires that sensitive receptors are identified adjacent to roads where the change in received road traffic noise level would, as a result of the proposed Scheme, increase or decrease by at least 1 dB LA10,18hr on opening or 3 dB in the long term. Consequently, the spatial extents of the assessment extend beyond the physical works associated with the Scheme.

Temporal Scope

Temporary Impacts

11.2.7 The baseline for noise and vibration with respect to temporary impacts during construction is represented by the conditions immediately prior to construction of the Scheme. However, measurements made to describe the baseline are required for the purposes of the present assessment. Comprehensive baseline noise measurements were carried out during September and October 2006 and in March, October and November 2008. In order to ensure a robust baseline for the construction year, further measurements were carried out in June and September 2013. The description of the baseline refers to the results of all of these measurements in order to indicate variations that occur over the day, week and throughout the year, especially with the season. Construction of the Scheme is due to begin in January 2015 with completion of construction works in October 2017. The assessment of noise and vibration impacts during construction applies to all the periods (time of day, days of the week etc.) that works are expected to take place.

Operational Impacts

11.2.8 The assessment of operational noise and vibration impacts considers the conditions in the year of Scheme opening and in the Scheme design year. The assessment methodology described in DMRB HD213/11 includes an estimation of nuisance. This is based on a 'steady-state' relationship between noise exposure and noise nuisance 15 years after Scheme opening, which is assumed here as the Scheme design year. In the case of the NDR the opening year is 2017 and the Scheme design year is 2032.

Sensitive Receptors

11.2.9 Key sensitive receptors were identified by site walkovers, OS mapping and aerial photography. Examples of sensitive receptors include dwellings, schools, hospitals, community facilities and designated areas such as Sites of Special Scientific Interest (SSSIs).

11.3 Methodology

Consultation

11.3.1 The Secretary of State's response to the Scoping Report notes the following:

- The methodology should be agreed with the Environment Agency;

- Noise and vibration along access routes during construction should be considered;
- Information on the types of vehicles and plant used during construction should be identified;
- Operational noise sources should be identified and assessed; and
- Consideration should be given to non-designated features which may be sensitive to noise and vibration.

11.3.2 With respect to the second point above, the Environment Agency has been consulted and had no comment to make.

11.3.3 Norwich City Council identified that cumulative effects should include development within Norwich Airport and the effect of aircraft noise.

11.3.4 South Norfolk Council noted that the impact on local residents would need to be considered carefully.

11.3.5 No comments from other Local Authorities have been received.

Desk Study

11.3.6 DMRB HD213/11 provides guidance on three levels of noise and vibration assessment: Scoping, Simple and Detailed. As an aid to deciding the relevant level of assessment a flowchart is provided in Annex 1 of HD213/11.

11.3.7 It was considered that a 'Detailed Assessment' would be appropriate as:

- There are changes to infrastructure that may cause a change in noise level;
- There are sensitive receptors within 1km that may be subject to change in noise level; and
- It is evident that the project will result in changes greater than the threshold levels stated within HD213/11.

11.3.8 Desk-based studies and site walkovers prior to baseline surveys and assessment have been carried out to inform the assessment process. The main sources of information that are relevant to the assessment of potential noise and vibration effects of the proposed Scheme include:

- Review of the proposed Scheme drawings and information;

- Review of previous work that has been undertaken. This included previous iterations of the Environmental Statement and noise input to the Major Scheme Business Case (MSBC);
- Forecasted traffic flows;
- Ordnance Survey mapping; and
- Consultation with Norfolk County Council (NCC).

Site Survey

11.3.9 Following guidance within DMRB HD213/11 that a 'Detailed Assessment' 'should include a noise measurement survey if not already undertaken' (i.e. at earlier stages of the DMRB assessment), a noise measurement survey was undertaken. Baseline noise measurements were conducted during September and October 2006 and in March, October and November 2008. In order to ensure a robust baseline for the construction year, further measurements were carried out in June and September 2013.

11.3.10 Guidance on undertaking noise measurements is given in Annex 7 of DMRB HD213/11. The description of the baseline is presented in Section 10.4.

11.3.11 Ground-borne vibration may arise due to certain types of construction activities and due to road traffic where there are irregularities in the carriageway surface. A baseline survey of ground-borne vibration was not considered necessary because:

- The assessment of construction-generated vibration and any consideration of mitigation is not affected by the exposure of receptors to existing sources of vibration; and
- Vibration generated by irregularities in the road surface of the Scheme is unlikely to be of significant magnitude as it would be newly-surfaced, and any subsequent irregularities in the surface could be rectified by maintenance of the carriageway surface (see DMRB HD213/11 clause A5.26).

Assessment Methodology

Approach

11.3.12 For the purposes of this Chapter of the ES, 'impact' is defined as a physical change to the baseline environment resulting from the proposed Scheme. For example, an impact can be an increase in the level of road traffic noise due to an expected increase in traffic volumes. The consequence of the change to the baseline environment on any environmental receptor is defined as the 'effect'. For example, the impact of an increased level of road traffic noise may produce the effect of increased disturbance in the community.

11.3.13 The significance of effects due to noise and vibration is a function of the magnitude of impact and the sensitivity of the receptor.

11.3.14 The assessment of the effects on receptors arising from changes to levels of noise or vibration comprises the following elements:

- Identification of potential sources and prediction of noise and vibration impacts likely to be received at nearby sensitive receptors, including dwellings;
- Comparison of the predicted impacts with the baseline conditions;
- Evaluation of the receptor sensitivity and the significance of effects; and
- The consideration of noise mitigation measures incorporated within the design and an assessment of any residual effects.

Evaluation of Effects

Construction Effects

Construction Noise

11.3.15 British Standard (BS) 5228 'Code of construction practice for noise and vibration control on construction and open sites – Part 1: Noise' (2009) provides a methodology for calculating noise levels generated by fixed and mobile plant used for a range of typical construction operations. The Standard set out in BS 5228 includes a database of equivalent continuous noise levels (LAeq dB) at a reference distance of 10m and a simple noise propagation model that can be used to make allowances for source-receiver distances, ground properties, utilisation time etc.

11.3.16 The Standard does not define strict criteria to determine the significance of noise impacts, although examples of how limits of acceptability have been applied historically and some examples of assessing significance

are presented. 'Example Method 2 – 5dB(A) change' (Annex E 'Significance of Noise Effects' Section E.3.3) has been adopted for the assessment of effects at residential receptors as the approach considers the expected changes in ambient noise levels and better reflects conventional EIA methodologies compared with the use of fixed/absolute noise limits.

11.3.17 Example Method 2 deems noise levels generated by construction activities to be significant if the total noise (pre-construction baseline noise plus construction noise) exceeds the pre-construction baseline noise by 5 dB or more, subject to lower cut-off values of 65 dB LAeq (daytime), 55 dB LAeq (evening) and 45 dB LAeq (night-time) from construction noise alone; and a duration of one month or more, unless works of a shorter duration are likely to result in significant impact.

11.3.18 The day-time period is defined as 07:00 to 19:00; the evening period as 19:00 to 23:00 and the night-time period as 23:00 to 07:00.

11.3.19 BS 5228 – 1:2009 does not define what might constitute a significant noise impact from works of shorter duration, however the Standard does provide an example of criteria for the significance of noise effects which might be used to determine whether a Scheme for installation of noise insulation or temporary rehousing of occupants is appropriate. This example cites the occurrence of the trigger noise levels reproduced below in Table 11.1 subject to the following conditions:

- Predicted noise level exceeds the noise trigger level in Table 11.3;
- The total noise (baseline plus construction noise) is 5 dB above the existing baseline noise level (from Example Method 2 above); and
- The noise level exceeds the trigger level for ten or more days of working in any fifteen or for a total of days exceeding 40 in any 6 month period.

Table 11.1: Examples of time periods, averaging times and noise levels associated with the determination of eligibility for noise insulation.

Time	Relevant time period	Averaging time, T	Noise insulation trigger level dB $L_{Aeq,T}$
Monday to Friday	07:00 – 08:00	1h	70
	08:00 – 18:00	10h	75
	18:00 – 19:00	1h	70
	19:00 – 22:00	3h	65
	22:00 – 07:00	1h	55
Saturday	07:00 – 08:00	1h	70
	08:00 – 13:00	5h	75
	13:00 – 14:00	1h	70
	14:00 – 22:00	3h	65
	22:00 – 07:00	1h	55
Sunday and Public Holidays	07:00 – 21:00	1h	65
	21:00 – 07:00	1h	55

11.3.20 Where construction involves large scale and long-term earth-moving activities which are more akin to surface mineral extraction than to conventional construction activity, BS 8233 *'Sound Insulation and Noise Reduction for Buildings'* states that advice within ODPM document *'Minerals policy statement 2 Controlling and mitigating the environmental effects of mineral extraction in England, 2005'* (MPS2) should be taken into account. MPS2 has been superseded, in relation to mineral extraction, by the NPPF and its Technical Guidance, which cites similar noise advice to MPS2. MPS2 is therefore referred to in this document, given its focus is activities that would typically occur in road construction, and as MPS2 is in turn referred to within the current version of BS 5228 – 1:2009.

11.3.21 It is assumed that the majority of construction work will be undertaken during the daytime. Noise increases of 5 dB or more above existing baseline are deemed to be significant subject to a lower cut-off value for the construction noise component alone of 65 dB LAeq,T during the day-time, and a duration of one month or more, unless works of a shorter duration are likely to result in significant impact.

11.3.22 Based upon the guidance in MPS2 (and the National Planning Policy Framework), BS 5228 – 1:2009 suggests a limit of 55 dB LAeq,1h for day-time construction of earthworks, but only where these works are likely to occur for a period in excess of 6 months.

Construction Vibration

11.3.23 In general, vibration arising from construction activities is ground-borne and, for example in the case of typical earthworks schemes, may be generated by operations such as ground compaction, piling and the movement of vehicles over irregular surfaces. The Transport Research Laboratory (TRL) has published the results of a series of measurements of vibration levels at distances from a range of construction works. Although the ground conditions in the area of the source and receiver position and of the intervening ground are not specified in that report, the data is considered to be adequate for the purpose of providing an indication of potential magnitudes of impact for this assessment. The data is reproduced in Table 11.2 with vibration levels expressed as peak particle velocity (PPV). PPV is defined as the instantaneous maximum velocity reached by a vibrating element as it oscillates about its rest position and can be used in the assessment of vibration impacts with respect to disturbance and building damage.

Table 11.2: Estimated peak particle velocities at distances between construction plant and vibration measurement positions

Construction plant	Distance between construction site and vibration measurement position in m	Peak particle velocity at measurement position in mm/s
General construction traffic including haul routes	1	0.60
	2	0.24
	4	0.14
	6	0.10
	≥8	<0.10
Heavy lorry on poor road surface	1	2.20
	2	0.80
	4	0.24
	6	0.16
	8	0.10
	≥10	<0.10

11.3.24 BS 5228 ‘Code of construction practice for noise and vibration control on construction and open sites – Part 2: Vibration’ (2009) provides guidance on the effect of vibration and the likelihood they will cause complaint and cosmetic damage to buildings. BS 5228 – 2:2009 does not indicate whether particular vibrations are significant. The standard states:

11.3.25 “Vibrations above these levels [0.14mm/s to 0.3mm/s] can disturb, startle, cause annoyance or interfere with work activities. At higher levels they can be described as unpleasant or even painful. In residential accommodation, vibrations can promote anxiety.”.

11.3.26 In addition BS 5228 – 2:2009 provides the following guidance on effects:

- At a vibration level of 0.14mm/s vibration might be just perceptible in the most sensitive situations for most vibration frequencies associated with construction;
- At a vibration level of 0.3mm/s vibration might be just perceptible in residential environments;
- At a vibration level of 1.0mm/s “It is likely that vibration of this level in residential environments will cause complaint, but can be tolerated if prior warning and explanation has been given to residents”; and
- At a vibration level

11.3.27 Generally, vibration from construction activities will be temporary and intermittent in nature. On this basis, in this assessment a PPV of 1.0 mm/s or more, lasting for a minimum of one hour during the normal hours of working, is considered to have a major adverse impact and deemed to produce a significant adverse effect in terms of annoyance to the occupiers of affected buildings. Lower vibration magnitudes would have progressively less significant effects. Table 11.3 presents the criteria adopted within this assessment for receptors having high environmental sensitivity. It should be noted that moderate and major impacts are considered to be significant.

Table 11.3: Criteria for the assessment of the significance of transient vibration effects for receptors having high environmental sensitivity.

		Continuous peak particle velocity (1 hour minimum) [mm/s]	Magnitude of impact	Significance of effect
Sensitivity	High	0	None	Neutral
		>0 and <0.14	Negligible adverse	Slight adverse
		≥0.14 and <0.3	Minor adverse	Slight or moderate adverse
		≥0.3 and <1.0	Moderate adverse	Moderate or Large adverse
		≥1.0	Major adverse	Large or Very Large adverse

11.3.28 To put the values in Table 11.3 into context, the BS 7385 ‘Evaluation and measurement for vibration in buildings Part 2: Guide to damage levels from ground-borne vibration’ (1993) provides guidance on the levels of vibration that would be necessary to cause structural damage to different types of buildings. BS 7385 – 2:1993 indicates that:

- In industrial and heavy commercial buildings, continuous PPVs of more than about 25 mm/s would be required to cause structural damage; and
- In residential buildings and light commercial buildings, continuous PPVs of more than about 7 mm/s would be required to cause structural damage.

Operational Effects

Day-time Road Traffic Noise Impacts

11.3.29 DMRB HD213/11 describes the impacts of road traffic noise in terms of the noise descriptors conventionally used for assessing the impact of road traffic in the UK, i.e. the statistical noise level LA10,18 hr over an 18-hour period between 06:00 and 24:00 (the traffic noise index). The Calculation of Road Traffic Noise (CRTN) methodology was followed in the traffic noise

calculations below, which have provided input to the DMRB assessment carried out in this chapter.

11.3.30 In order to predict the level of road traffic noise from the road network, traffic data has been provided in terms of 18-hour Annual Average Weekday Traffic (AAWT) flow between the hours of 06:00 to 24:00, along with average vehicle speed and percentage heavy vehicles.

11.3.31 Calculations of the road traffic noise level have been carried out for four scenarios:

- Do Minimum option in the baseline year;
- Do Minimum option in the future assessment year;
- Do Something option in the baseline year; and
- Do Something option in the future assessment year.

11.3.32 In the above scenarios, 'Do Minimum' means traffic growth with committed development only. 'Do Something' means committed growth with the NDR. More specific details are contained within the Transport Assessment Summary in the ES Volume 2, Chapter 2).

11.3.33 In accordance with HD213/11 the assessment of road traffic noise impacts requires the following comparisons:

- The **short-term change** in road traffic noise upon proposed Scheme opening (Do Minimum option in the baseline year vs. Do Something option in the baseline year).
- The **long-term change** in road traffic noise assuming the proposed Scheme is built (Do Minimum option in the baseline year vs. Do Something option in the future assessment year); and,
- The **long-term change** in road traffic noise assuming the proposed Scheme is not built (Do Minimum option in the baseline year vs. Do Minimum option in the future assessment year).

11.3.34 DMRB HD213/11 states that "in terms of road traffic noise, a methodology has not yet been developed to assign significance according to both the value of a resource and the magnitude of the impact." (paragraph 3.36). For this reason the magnitude of the road traffic noise impact is reported rather than the significance of the impact. However, environmental assessment regulations do require the reporting of any significant effects, and

DMRB does provide guidance on significance for other environmental disciplines, based upon sensitivity of receptor and magnitude of impacts, as have been outlined in preceding and following text.

11.3.35 For short-term changes in road traffic noise the smallest change in road traffic noise level that is considered perceptible is 1 dB LA10,18hr. In the long-term a 3 dB LA10,18hr change in road traffic noise is considered to the smallest perceptible change. For this reason the magnitude of short-term and long-term impacts are expressed differently as shown in Table 11.4 below.

Table 11.4: Magnitude of impact due to changes in road traffic noise in the short-term and long-term

Noise change dB L _{A10,18h}	Magnitude of impact for a short-term change in road traffic noise	Magnitude of impact for a long-term change in road traffic noise
≤ -10	Major beneficial	Major beneficial
> -10 and ≤ -5		Moderate beneficial
> -5 and ≤ -3	Moderate beneficial	Minor beneficial
> -3 and ≤ -1	Minor beneficial	Negligible beneficial
> -1 and ≤ -0.1	Negligible beneficial	
0	No change	No change
≥ 0.1 and < +1	Negligible adverse	Negligible adverse
≥ 1 and < +3	Minor adverse	
≥ 3 and < +5	Moderate adverse	Minor adverse
≥ +5 and < +10	Major adverse	Moderate adverse
≥ +10		Major adverse

Night-time Road Traffic Noise Impacts

11.3.36 In addition to the day-time impact of the proposed Scheme, it is recognised within DMRB HD213/11 that there is potential for a road scheme

to result in increased levels of road traffic noise during the night-time. Whilst traffic levels during the night-time are generally lower than during the day-time, there is still a potential impact due to the heightened sensitivity of receptors during the night. The World Health Organization (WHO) Night Noise Guidelines for Europe propose an Interim Target Level of 55 dB $L_{night, outside}$ and the assessment in this chapter considers where the proposed Scheme would result in night-time levels above this target.

11.3.37 Predictions of night-time noise level, expressed in terms of dB $L_{night, outside}$, have been carried out following the method within the TRL report ‘*Converting the UK traffic noise index $L_{A10, 18hr}$ to EU noise indices for noise mapping*’. Receptors have been identified where:

- The introduction of the proposed Scheme could result in a receptor being exposed to night-time road traffic noise levels above the Interim Target level, where current exposure is below this level; and
- A receptor already exposed to night-time road traffic levels in excess of the Interim Target Level and where exposure is predicted to increase.

Airborne Vibration Impacts Due to Road Traffic

11.3.38 Vibration due to road traffic may occur in two forms: ground-borne and airborne.

11.3.39 Ground-borne vibration may be generated by the dynamic interaction of vehicle wheels on road surface irregularities and may be transmitted to adjacent buildings (generally at low frequencies, typically 8 to 20 Hz). The level of vibration is a complex function of road surface profile, vehicle speed, weight and suspension characteristics, pavement construction, underlying geology etc. and there exists no simple model for predicting such impacts. With reference to DMRB HD213/11 clause A5.26, it is expected that newly constructed carriageways are unlikely to generate significant levels of such vibration as they may be assumed to be free of irregularities. Therefore this impact has not been considered further.

11.3.40 Airborne-induced vibration may be generated by high levels of low-frequency noise (20 – 100 Hz) from vehicle exhausts, which can induce vibration in nearby building elements. This may be perceptible and/or in turn generate noise at different frequencies (window-rattle etc.). DMRB HD213/11 clauses A1.33 and A6.21 present a methodology to assess airborne vibration nuisance at dwellings within 40m of the carriageway. This is based on the

same approach for the assessment of nuisance associated with airborne noise but the percentages of people annoyed are reduced by 10%.

Effects on Fauna

11.3.41 DMRB HD213/11 acknowledges the potential for traffic noise to affect animal behaviour, particularly breeding behaviour and predator-prey interactions. DMRB also cites research indicating that the “effects of traffic noise show an increasing impact with increasing noise levels above about 45 dB LAeq for a range of woodland, marsh and grassland species in certain circumstances”. Predicted noise contours indicate that the 45 dB LAeq impact threshold would be exceeded in areas close to the road. Based on the limited guidance within DMRB HD213/11, it is therefore likely that some impact on fauna would result.

Sensitivity of Receptors

11.3.42 Noise affects people in a number of different ways. This may include factors such as annoyance and sleep disturbance, enjoyment of quiet spaces, ability to communicate with others, ability to concentrate at home or at work, participation in social and community activities. As a consequence it is not appropriate to consider a single criterion when assessing the value of an existing noise environment.

11.3.43 Table 11.5 sets out criteria used in this assessment to determine the sensitivity of a receptor. It should be noted that, generally, the variation in the sensitivity of receptors in terms of noise impact is taken into account by applying different scales to classify magnitude of impact (e.g. by using different scales for daytime and night-time) rather than by varying the assignment of sensitivity to specific types of receptors.

Table 11.5: Criteria to define the sensitivity of receptors (Source:Based on CIRIA C693 Noise and Vibration from Road and Rail (13))

Sensitivity	Description	Examples of receptors
High	Receptors where occupants or activities are particularly susceptible to noise	Residential Quiet outdoor areas used for recreation Conference facilities Auditoria/studios Schools in daytime Hospitals/residential care homes Religious institutions e.g. churches or mosques
Medium	Receptors moderately sensitive to noise, where it may cause some distraction or disturbance	Offices Restaurants Sports grounds where spectator noise is not a normal part of the event and where quiet conditions are necessary (e.g. golf or tennis)
Low	Receptors where distraction or disturbance from noise is minimal	Residences and other buildings not occupied during working hours Factories and working environments with existing high noise levels Sports grounds where spectator noise is a normal part of the event

11.3.44 The majority of the receptors that are expected to be affected by noise and vibration impacts arising due to the proposed Scheme would be dwellings. Therefore, the tables below that set out scales for magnitude of impact apply to receptors having high sensitivity.

Significance

11.3.45 The significance of the effect of any noise and vibration impacts is determined as a function of the sensitivity of the receptor and the magnitude of the impact to which it is exposed. Using the definition of receptor sensitivity and the magnitudes of impact (defined below), significance of any effects are identified using the matrix presented in Table 11.6.

Table 11.6: Matrix for determining significance of effect

	Sensitivity of receptor		
Magnitude of impact (beneficial or adverse)	Low	Medium	High
Major	Slight or Moderate	Moderate or Large	Large or Very Large
Moderate	Slight	Moderate	Moderate or Large
Minor	Neutral or Slight	Slight	Slight or Moderate
Negligible	Neutral or Slight	Neutral or Slight	Slight
No impact	Neutral	Neutral	Neutral

11.3.46 Effects are considered to be significant when identified as likely to have a Moderate, Large or Very large effect.

11.4 Context

Technical

Scheme Design

11.4.1 The Scheme details are based on the General Arrangement in the ES (Volume 1. Appendix 1) the General Arrangement of the Scheme design.

Road Traffic Flows

11.4.2 The assessment below uses traffic parameters provided by Mott MacDonald, which were derived using the software Simulation and Assignment of Traffic to Urban Road Networks (SATURN). The sources of assumptions and limitations of the traffic data are described within the Transport Assessment DCO document 5.5 Ref (10).

Construction Activities

11.4.3 Information on construction activities at this stage of a project is given in the Birse Civils document 'Norwich Northern Distributor Road (NDR) Construction Methodology' and is limited to a high-level description of construction sequences and provisional inventory of likely plant to be used. Limited noise data is available on plant used for earthworks. Therefore, the prediction of potential noise impacts arising from construction activities is carried out with reference noise levels for plant items given in Annex C of BS 5228 – 1:2009 where information is not otherwise available from the Contractor. Assumptions on the utilisation of plant and plan distance between sources and receptors are stated below.

11.4.4 With regards to road traffic associated with construction, the Construction Methodology states that:

11.4.5 “During peak periods it is envisaged that there will be up to 75 deliveries per day predominantly in 20 tonne eight wheeled wagons. This of course is in addition to staff and workforce transport. We will endeavour to restrict any deliveries until after 07:00.”

11.4.6 It is not possible to make a meaningful, quantitative assessment of potential noise impacts attributable to construction traffic using the available information without additional details on the routing and timing of movements etc. However, the management of potential noise and vibration from traffic during construction will be addressed as part of the Section 61 process.

Planning and Legislative

National Planning Policy Framework

11.4.7 The NPPF came into force in March 2012 and forms the main national planning policy document within England. The NPPF replaced Planning Policy 24 (PPG24) 'Planning and Noise'.

11.4.8 Paragraph 123 of the NPPF states that:

11.4.9 "Planning policies and decisions should aim to:

- avoid noise from giving rise to significant adverse impacts on health and quality of life as a result of new development [Note that the NPPF provides a footnote referencing the Noise Policy Statement – this document is discussed in the following section];
- mitigate and reduce to a minimum other adverse impacts on health and quality of life arising from noise from new development, including through the use of conditions;
- recognise that development will often create some noise and existing businesses wanting to develop in continuance of their business should not have unreasonable restrictions put on them because of changes in nearby land uses since they were established; and
- identify and protect areas of tranquillity which have remained relatively undisturbed by noise and are prized for their recreational and amenity value for this reason."

11.4.10 The NPPF does not refer directly to vibration, other than in the context of mineral extraction in paragraph 144.

11.4.11 In considering decision making, paragraph 186 of the NPPF states that:

11.4.12 "Local planning authorities should approach decision-taking in a positive way to foster the delivery of sustainable development. The relationship between decision-taking and plan-making should be seamless, translating plans into high quality development on the ground."

The Noise Policy Statement for England

11.4.13 The Noise Policy Statement for England (NPSE) was issued by DEFRA in 2010. Its purpose is to promote "good health and a good quality of life through the effective management of noise within the context of

Government policy on sustainable development.” The Noise Policy Aims of the NPSE are to:

- “avoid significant adverse impacts on health and quality of life from environmental, neighbour and neighbourhood noise within the context of Government policy on sustainable development;
- mitigate and minimise adverse impacts on health and quality of life from environmental, neighbour and neighbourhood noise within the context of Government policy on sustainable development; and,
- where possible, contribute to the improvement of health and quality of life through the effective management and control of environmental, neighbour and neighbourhood noise within the context of Government policy on sustainable development.” (paragraph 1.7).

11.4.14 These aims are required to be interpreted having regard to the guiding principles of sustainable development, set out at paragraph 1.8 of the NPSE. Paragraph 2.18 explains what is meant by this:

11.4.15 “There is a need to integrate consideration of the economic and social benefit of the activity or policy under examination with proper consideration of the adverse environmental effects, including the impact of noise on health and quality of life. This should avoid noise being treated in isolation in any particular situation, i.e. not focussing solely on the noise impact without taking into account other related factors.”

11.4.16 The NPSE refers to established concepts from toxicology that are currently being applied to noise impacts:

- NOEL – No Observed Effect Level: this is the level below which no effect can be detected. In simple terms, below this level, there is no detectable effect on health and quality of life due to the noise.
- LOAEL – Lowest Observed Adverse Effect Level: this is the level above which adverse effects on health and quality of life can be detected.
- SOAEL – Significant Observed Adverse Effect Level: this is the level above which significant adverse effects on health and quality of life occur

11.4.17 The NPSE states that noise levels above the SOAEL should be avoided, while also taking into account the guiding principles on sustainable development (paragraph 2.23). If noise levels fall between the LOAEL and SOAEL, the NPSE requires that all reasonable steps should be taken to

minimise and mitigate adverse effects, again taking into account the guiding principles of sustainable development (paragraph 2.24). The NPSE makes it clear that this does not mean that such adverse effects cannot occur (paragraph 2.24).

- 11.4.18 In paragraph 2.22, the NPSE states that: “it is not possible to have a single objective noise-based measure that defines SOAEL that is applicable to all sources of noise in all situations. Consequently, the SOAEL is likely to be different for different noise sources, for different receptors and at different times... However, not having specific SOAEL values in the NPSE provides the necessary policy flexibility until further evidence and suitable guidance is available”.

The Land Compensation Act 1973 Part 1

- 11.4.19 The Land Compensation Act 1973 Part 1 includes provision for compensation for loss in property value resulting from physical agents, including noise and vibration, resulting from the use of public works, such as new or improved roads.

The Noise Insulation Regulations 1975 (amended 1988)

- 11.4.20 The Noise Insulation Regulations 1975 (amended 1988) were made under Part 2 of the Land Compensation Act for the obligatory and discretionary provision of noise mitigation measures for dwellings adjacent to new highways.

Sections 60 and 61 of the Control of Pollution Act 1974 and the Environmental Protection Act 1990

- 11.4.21 Local Authorities have other statutory controls on noise and vibration. Sections 60 and 61 of the Control of Pollution Act 1974 concern impacts relating to construction sites; and the Environmental Protection Act 1990 places a duty on local authorities to serve abatement notices where noise from premises, vehicles and machinery are judged to constitute a statutory nuisance. Compliance with these controls is required, although the requirements fall outside the planning system.

BS 5228 'Code of practice for noise and vibration control on construction and open sites – Part 1: Noise', British Standards Institution, 2009.

11.4.22 BS 5228 – 1:2009 provides a methodology for calculating noise levels generated by fixed and mobile plant used for a range of typical construction operations. The standard includes a database of equivalent continuous noise levels (LAeq dB) at a reference distance of 10m and a simple noise propagation model that can be used to make allowances for source-receiver distances, ground properties, utilisation time etc.

BS 5228 'Code of practice for noise and vibration control on construction and open sites – Part 2: Vibration'

11.4.23 BS 5228 – 2:2009 provides guidance on the effect of vibration and the likelihood they will cause complaint and cosmetic damage to buildings.

World Health Organization Night Noise Guidelines for Europe 2009

11.4.24 These guidelines reviewed available evidence of health effects of night-time noise across Europe, and derived health-based guideline values. The guidelines recommended an interim target of 55 dB LNight, outside to protect the public. This target value is an annual average LAeq,8h dB from 23:00 to 07:00.

11.5 Baseline

General Observations

11.4.1 The proposed route passes through a primarily rural area which may be described as generally tranquil except for local areas close to the airport and the major roads leading into the city. There are no major industrial noise sources in the area.

11.4.2 General descriptions are given below along with indicative traffic flows expressed as 2-way Annual Average Daily Traffic (AADT) flows.

A1067 Attlebridge to A140 Cromer Road

11.5.1 This section of the proposed route is primarily rural, but affected locally by noise from road traffic, particularly that using:

- A1067 Fakenham Road (9,100 AADT 2012);

- B1149 Holt Road (9,900 AADT 2012); and
- A140 Cromer Road (11,700 AADT 2012)

11.5.2 Norwich Airport is also a significant source at the east end of this section. Daytime noise levels varied between 40 and 60 dB LAeq.

A140 Cromer Road to A1151 Wroxham Road

11.5.3 This section of the proposed route is primarily rural, but affected locally by noise from road traffic, particularly that using:

- A140 Cromer Road (11,700 AADT 2012);
- B1150 North Walsham Road (10,600 AADT 2012); and
- A1151 Wroxham Road (11,800 AADT 2012).

11.5.4 This area is also affected by noise from aircraft using Norwich Airport and the associated engine test facilities. Between these areas, daytime levels fall to about 45 dB LAeq in the quietest parts.

A1151 Wroxham Road to the A47

11.5.5 This section of the proposed route is primarily rural but affected locally by noise from road traffic, particularly that using:

- A1151 (11,700 AADT 2012) at the north end; and
- A47 (37,200 AADT 2012).

11.5.6 Between these areas, levels fall to about 40 dB LAeq in the quietest parts.

11.5.7 Noise from the trains on the Norwich to Cromer Railway is also a feature of the noise climate on the east side of Thorpe End and Rackheath.

Survey Results

11.5.8 Measurements were made at the sites shown in drawings MMD-233906-DT-0861 to MMD-233906-DT-0865 [Volume 1A, Figure 10.2] on various occasions between September 2006 and September 2013. The measurement results are summarised in the Table 11.7 to Table 11.11.

11.5.9 The following acoustic parameters are presented in the tables:

- LAeq dB(A) The A-weighted equivalent continuous noise level in decibels;
- LA10 dB(A) The A-weighted noise level exceeded for 10% of the measurement interval and represents the highest noise levels measured during the interval. It is often used to describe contributors such as passing road traffic; and
- LA90 dB(A) The A-weighted noise level exceeded for 90% of the measurement interval and represents the lowest noise levels measured during the interval. It is often used to describe background noise level.

11.5.10 A review of Table 2 of The Statistical Release for the DfT's Transport Statistics Great Britain indicates that traffic flows have not increased significantly (> 25%) over the period during which the various baseline noise surveys were undertaken. This would indicate that in areas where traffic noise predominates, ambient noise levels would not have changed significantly over the period of the noise surveys.

11.5.11 A review of Table 2 of The Statistical Release for the DfT's Transport Statistics Great Britain indicates that traffic flows have not increased significantly (> 25%) over the period during which the various baseline noise surveys were undertaken. This would indicate that in areas where traffic noise predominates, ambient noise levels would not have changed significantly over the period of the noise surveys.

11.6 Mitigation

Traffic Noise

Primary Measures: Reduction at Source

11.6.1 A thin surface course (TSC) will be applied to the new carriageways along the length of the NDR Scheme. This material reduces the generation of tyre noise relative to that for hot-rolled asphalt (HRA), but has little effect on engine/transmission/exhaust noise. The beneficial effect from TSC increases with traffic speed, but reduces with time and wear.

11.6.2 DMRB HD213/11 clause A4.29 advises a correction of -3.5 dB where speeds are greater than 75 km/h, and this has been applied in the assessment where appropriate.

Secondary Measures: Barriers and Bunds

11.6.3 A number of bunds, false cuttings and barriers have been included in the Scheme design (Volume 1. Appendix 1), which reduce noise impacts and which are summarised in the Table 11.12.

Table 11.12: Summary of noise mitigation measures

	Chainage (approx)	Length (approx)
South (city) side	m	m

11.6.4 The performance of a bund or noise barrier varies with height, distance from the carriageway edge and distance to the receptor. The screening effect of these measures has been included in the traffic noise prediction model.

Sound Insulation

11.6.5 Any dwellings at which the predicted traffic noise is found to satisfy the criteria for sound insulation measures in accordance with the Noise Insulation

Regulations 1975 (i.e. a design year level > 68 dB and an increase of at least 1 dB etc.) will be offered either sound insulation measures or a grant instead. Eligible dwellings are required to be shown on a map or list produced by the Highway Authority, and made available for public inspection no later than six months after the opening of the NDR. It is likely that very few properties would qualify for insulation – calculations for this assessment indicate 2 properties would qualify.

Construction Noise

- 11.6.6 Noise from construction operations is generally regarded as acceptable at sensitive receptors, provided that it is restricted to reasonable times and kept to a minimum.
- 11.6.7 Limits for normal working hours and levels of noise at nearby properties will be agreed in advance with the Local Authority and incorporated into the contract specification for the Scheme. The contract will also include a clause requiring that the best practicable means for noise control (BPM) be applied at all times.
- 11.6.8 These would include the selection of the most appropriate method and plant for the job, adequate maintenance of plant, optimum siting of stationary plant, local screening and the education of the workforce. Restrictions may also be placed on the off-site haul routes and early/late delivery times. Potentially affected residents would be kept informed in advance of the works and a telephone complaint hotline be provided.
- 11.6.9 Where the existing noise from traffic or other sources exceeds these levels, the total noise may be permitted to exceed the background by up to 3 dB. A relaxation of these limits may be permitted in exceptional circumstances.
- 11.6.10 Incorporated mitigation related to construction noise and vibration is documented within the Construction Methodology which will be implemented alongside the Construction Environmental Management Plan (CEMP) throughout the construction period. The Construction Methodology identifies a series of measures to reduce the environmental effects during the construction period and covers environmental and safety aspects affecting the interests of residents, businesses, all road users and the general public in the vicinity of the works.
- 11.6.11 The effects of potential noise and vibration impacts on affected communities can also be mitigated by effective communication between the

Promoter, contractors and the public. The Construction Methodology describes specific measures for the management of community relations that contractors must apply including the establishing of local liaison groups, information and complaints hotline, information centre and website, weekly newsletter. Specific provisions for the notification of affected residents ahead of noisy works and the arrangements for the investigation and remediation of noise issues that may arise during construction are also required.

- 11.6.12 Where potentially significant construction noise and vibration effects have been predicted, the Contractor will be required to minimise the impacts to levels lower than those classed as significant impacts. Amongst others, this may include the erection of temporary noise barriers around working areas or alternative methods of working. The Contractor will additionally be required to seek prior consent under Section 61 of the Control of Pollution Act 1974 for its works in advance of commencing works, which will require 'best practicable means' to be adopted at all times.

Climate Change

- 11.6.13 Climate change may have direct and indirect influences on noise within the study area. For example, increases in ambient temperatures would have a direct influence on the mechanism of sound propagation because it results in a reduction in the attenuation of sound due to air absorption, as well as other factors such as temperature inversions. Climate change also influences trends in rainfall with a gradual change emerging of drier summers and winters with increased rainfall. The presence of moisture on the carriageway surface results in a significant increase in noise from road traffic.
- 11.6.14 Notwithstanding the above, the influence of climate change on the magnitudes of noise impact is gradual and is not expected to have any significant influence on the results of the assessment of potential effects of the Scheme in terms of noise and vibration.

11.7 Assessment of Effects

Construction

Predicted Noise and Vibration Effects During Construction

- 11.7.1 An inventory of construction plant which is likely to be deployed for various construction activities along the NDR route has been provided by BIRSE Civils, along with limited information on emitted noise levels from some plant and a preliminary construction programme. Each activity has been provided

with a percentage operating time for any given hour of construction activity. In the absence of detailed contractor's information at this stage in the project, professional judgement has been used in the assignment of this percentage. The assumed operating times should be regarded as conservative. Where plant noise levels have not been provided, reference noise from Annex C of BS 5228-1:2009 have been assigned to the plant. This inventory, broken down by construction activity, is reproduced in.

Table 11.13: Construction plant information used for assessment of construction noise. Construction activity

	Item of plant	Number of plant items operating concurrently	Noise level at 10 m (dBA)	BS 5228 – 1:2009 reference	% on-time
Earthworks	Volvo A30 Dumptruck	2	70 at 8m	NA	25
	Cat D6 Dozer	1	90 at 8m	NA	50
	Cat CP76 Roller	1	91 at 8m	NA	25
Drainage	15 Tonne Excavator	1	73	C2. 24	50

	40 Tonne Mobile Crane	1	68	C4. 47	25
	Hiab lorry	1	77	C4. 53	25

	Item of plant	Number of plant items operating concurrently	Noise level at 10 m (dBA)	BS 5228 – 1:2009 reference	% on-time
	Telehandler Forklift	1	71	C2.35	25
	Vibrodisplacement and compaction of stone columns (Rackheath Only)	1	80	C3.27	50
	Construction flight auger piling – cast in situ	1	80	C3.22	80

11.7.2 Noise levels from construction activities have been predicted at the façades of representative sensitive receptors along the NDR route, as set out below. The predicted construction noise level, combined with the measured baseline level representative of the receptor, provides the overall noise level at the receptor during construction. The increase in noise level above the existing baseline due to construction has been determined.

11.7.3 Predictions have been carried out for standard working hours of Monday to Friday 07:00 – 19:00 and Saturday 09:00 – 13:00.

11.7.4 Due to the generally rural nature of the terrain, soft-ground conditions are assumed between the construction noise source and the receptor. As a worst case, no screening effect is assumed for intervening structures such as garden fences and walls. The baseline measurement selected for calculations is generally the lowest $L_{Aeq,T}$ recorded during standard working hours and is corrected to a façade level if the measurement was carried out in free field.

11.7.5 Table 11.14, Table 11.15 and Table 11.17 below present the predicted noise levels at representative receptors. It is important to note that whilst the construction works may take several months, the duration over which noise will be produced in the vicinity of any given receptor will be for shorter periods. Work generating peak levels of noise will be carried out intermittently over this time and will not be constant for these periods. While the details of localised construction durations will be determined by the Contractor, reference to the

preliminary construction programme indicates that for any given section of the route, works will be complete during a three year period. During this time, however, individual phases of the work will progress along the route and most individual receptors will be subject to elevated noise levels for relatively short durations.

11.7.6 The transient nature of construction works, in conjunction with the construction phase mitigation measures described above, will ensure that residual effects of construction noise are not significant. Of particular importance is the requirement for the Contractor to seek prior consent for works under Section 61 of the Control of Pollution Act 1974 where construction noise is predicted to be 65 dB or greater and an increase in noise level of 5 dB or more over baseline is predicted for works with a duration of over one month. This ensures that best practicable means will be employed to limit noise effects from construction activities. The detailed assessment of construction noise below predicts where noise increases for the various construction activities will exceed this threshold and would therefore trigger the Section 61 process.

Whole route linear works

11.7.7 The main works which will take place throughout the length of the route will comprise drainage, earthworks, and new carriageway construction. For the purpose of this assessment the various linear works have been broken down into the following categories based upon advice from the Contractor regarding activities that are likely to occur simultaneously at any given location:

- Earthworks and Drainage
- Carriageway Paving

11.7.8 Details of the construction activities occurring within these categories are presented in above. As these work categories are likely to follow on from one another during the construction process, a noise prediction has been carried out for each category at a series of representative receptors along the route.

11.7.9 Table 11.14 and Table 11.15 present the predicted construction noise level at the facades of a representative sample of sensitive receptors along the route along with the relevant baseline noise measurement, corrected to façade level. The tables also show the predicted increase in noise level above baseline due to the combined baseline and construction noise level. **Shaded**

cells of the tables indicate where predicted construction noise levels exceed 65 dB(A).

11.7.10 For the purposes of these predictions the construction noise source location is assumed to be the centre-line of the NDR route.

11.7.11 Noise increases of 5 dB or more above existing baseline are deemed to be significant subject to a lower cut-off value for the construction noise component alone of 65 dB $L_{Aeq,T}$ during the day-time, and a duration of one month or more, unless works of a shorter duration are likely to result in significant impact.

11.7.12 For the majority of receptors for works along the length of the route, the predicted noise level from construction alone is not predicted to reach 65 dB(A).

11.7.13 During earthworks and drainage work, the noise level from construction alone is predicted to exceed 65 dB(A) and the overall noise level is predicted to increase by 5 dB or more for a limited number of representative receptors close to the route.

11.7.14 Noise levels are predicted to reach 68 dB(A) at New Holme Farm which is situated very close to the route at the junction with Cromer Road. Due to the close approach of the main carriageway works to the farm, which is also relatively close to roundabout and bridgeworks and will have a works compound located nearby, additional mitigation in the form of temporary noise

barriers or earth bunds will be required to control noise impact. The details of these measures will be agreed with the Local Authority as part of the Section 61 consent process for this site.

- 11.7.15 Noise levels at the Airport Control Tower and Airport Training Centre are predicted to exceed 68 dB(A). These receptors lie along the section of the route between Cromer Roundabout and the Airport Roundabout. The draft construction programme indicates that the earthworks and drainage works along this section of the route will last for 54 days and 80 days respectively. As these works will progress along the route, it is unlikely that either of these receptors will experience high noise levels from these activities for durations of over a month. It should also be noted that these receptors are not residential and that the Control Tower in particular has been subject to a separate assessment of construction noise impact. The conclusions of that report will be taken into account when agreeing mitigation measures with the Local Authority as part of the Section 61 consent process for this site.
- 11.7.16 Quaker Cottages and Oakwood House are sufficiently close to the works for construction noise to exceed 65 dB(A) with an increase in overall noise level of 5 dB or more above baseline. The draft construction programme indicates that drainage and earthworks on the adjacent sections of road may exceed one month, however it is unlikely that these works at the closest approach to the receptors will reach this duration. Additional mitigation in the form of temporary noise barriers will be agreed with the Local Authority as part of the Section 61 consent process for this site.
- 11.7.17 Railway Crossing is predicted to be subject to construction noise levels from earthworks and drainage of 68 dB(A), with an increase above baseline level of 24 dB(A). The dwelling is located at the site of the proposed road and rail bridges near Rackheath and will be close to earthworks which are scheduled to last for a period in excess of 6 months. As such the more stringent noise limit of 55 dB LAeq,1h recommended by MPS2 is applicable here and will be taken into considered during the process of agreeing details of the Section 61 consent process with the Local Authority. Additional mitigation in the form of temporary noise barriers or earth bunds will be required to control noise impact.
- 11.7.18 During carriageway paving work, the noise level from construction alone is not predicted to exceed 65 dB(A) at any of the receptors assessed.

Bridge Construction Sites

11.7.19 There are 8 new bridges to construct on the NDR Scheme. The bridge locations are listed in Table 11.16 along with the form that the bridge will take. The bridges at Rackheath have been regarded as a single construction for the purpose of this assessment. The bridgeworks at Rackheath, Newman Road and Middle Road will include Continuous Flight Auger (CFA) piling. Vibrated stone columns may be incorporated on the approach embankments at Rackheath. These piling operations have been taken into account in the prediction of construction noise for receptors close to these sites.

Table 11.16: Summary of bridges on the proposed NDR route

Bridge	Bridge Form
Marriott's Way	Two span precast concrete deck with reinforced earth abutments
Bell Farm	Two span precast concrete deck with reinforced earth abutments
Cromer Road	Two span precast concrete deck with reinforced earth abutments
Buxton Road	Two span precast concrete deck with reinforced earth abutments
Newman Road	Two span precast concrete deck with reinforced earth abutments
Rackheath Rail	Three span composite deck with steel beams with in-situ concrete abutments
Rackheath Road	Single span precast concrete deck with reinforced earth abutments
Middle Road	Two span precast concrete deck with reinforced earth abutments

11.7.20 Table 11.17 presents the construction noise level at the facades of a representative sample of sensitive receptors located close to bridge works, with the relevant baseline noise level and predicted increase in noise level above baseline with construction.

11.7.21 For the purposes of these predictions, as a worst case, the construction noise source location is assumed to be the closest approach of the bridgeworks to the receptor.

Table 11.17: Predicted worst case increase in façade noise levels due to noise from bridge works at representative sensitive receptors LAeq,07:00 – 19:00 hours during normal working hours

Receptor	Distance to works (m)	Measured baseline noise level LAeq,T (dB)	Predicted construction noise level LAeq,T (dB)	Predicted increase in façade noise level LAeq,T (dB)

Village Hall	436	44	45	4
Greenacre	317	44	49	6

Receptor	Distance to works (m)	Measured baseline noise level $L_{Aeq,T}$ (dB)	Predicted construction noise level $L_{Aeq,T}$ (dB)	Predicted increase in façade noise level $L_{Aeq,T}$ (dB)
Middle Road Bridge				
Oaks farm	50	54	67	13
Beechcroft	41	54	69	15
Oak House	63	54	64	10
Land farm Cottages	256	54	55	1

11.7.22 During structural bridgeworks, the noise level from construction alone is predicted to exceed 65dB at Gazebo Farm close to Newman Road bridge and at Oaks Farm and Beechcroft close to Middle Road bridge. The elevated levels are largely related to piling activities which are predicted to last more than one month at each site. Additional mitigation in the form of temporary noise barriers or earth bunds will be required to control noise impact. The details of these measures will be agreed with the Local Authority as part of the Section 61 consent process for these sites.

Effects of Construction Traffic

11.7.23 With the exception of roads required for direct site access which are identified in the Construction Methodology, and peak daily flows, the details of construction traffic routes and construction traffic frequency have not been determined at this stage. It has not therefore been possible to carry out a quantitative prediction of associated noise and vibration impacts from construction traffic.

11.7.24 It is unlikely that construction traffic will increase overall traffic flows on public highways by 20% or more, which would result in a perceptible increase in traffic noise levels. However, it is conceivable that the community response to noise from construction traffic could be adversely affected by noise from a small number of movements occurring in close proximity to sensitive receptors especially if movements occur at sensitive times of the day.

Therefore, it is important that measures are put in place to minimise potential adverse effects including:

- Direct traffic accessing the site along less exposed routes and limit times vehicles can access to avoid sensitive times of the day;
- Manage deliveries to prevent queuing of site traffic at access points and the need for vehicles to reverse;
- Avoid unnecessary revving of engines and reducing speed of vehicle movement to avoid body slap from empty vehicles, designing and maintaining access routes to minimise noise; and
- Avoid the need for vehicles to reverse and use adjustable or directional audible vehicle-reversing alarms or use white noise alarms.

11.7.25 A more comprehensive review will be included within a separate assessment of construction traffic impacts when the relevant information is available in order to inform the Section 61 consent process undertaken with the Local Authority.

Effects of Temporary Construction Compounds

11.7.26 Construction compounds will be used at a number of locations along the route for storage of plant, equipment and materials as well as for temporary administrative facilities and parking for construction personnel. Locations for compounds are identified in the Construction Methodology and are summarised in Table 11.18.

Table 11.18: Locations of proposed site compounds

Compound Location	Description
Airport Land north of the NDR	Main site compound incorporating welfare facilities and adequate parking for both staff and operatives' accommodation for travelling staff, offices, plant storage and maintenance compound and a recycling yard.
Gazebo Farm	Administrative office
Drayton Lane, Buxton Road, Plumstead Road	office, parking, plant storage facilities and sub-base batching plant
Bridge sites	Small compounds with welfare facilities, parking and material storage.

11.7.27 Detailed information has not been defined for the compounds at this stage, so quantitative prediction of likely noise impacts has not been carried out. Such a level of information is not anticipated to be available until the detailed design stage of the Scheme. It is likely that equipment such as heavy vehicles, cranes and forklift trucks will access the compounds, which will generate noise on an intermittent basis. Compounds with welfare facilities may require the use of a generator. There is the potential for sensitive receptors located nearby to experience noise impacts.

11.7.28 Each of these sites will be assessed in more detail and discussed as part of the Section 61 process with the Local Authority as and when further details become available. Likely noise mitigation will include:

- Acoustic enclosure of external plant;
- Temporary noise barriers where there are sensitive receptors close by;
- Restrictions on delivery times; and
- Appropriate location of ingress and egress point.

Effects of Construction Vibration

11.7.29 BS 5228 – Part 2: Vibration (2009) provides empirical relationships between various construction operations and vibration levels. Some of these values and those from the TRL Report 53 have been plotted – see Figure 10.1.

Figure 10.1: Vibration levels for construction plant using data in BS 5228 and TRL Report 53

11.7.30 From the above figure it can be seen that with the exception of vibratory and percussive piling, other activities attenuate rapidly with distance.

11.7.31 With respect to vibration impacts for the general construction plant and traffic which will be used for the majority of works along the NDR route, reference to Table 11.2 and Table 11.3 shows that peak particle velocities

(PPV) deemed to have a moderate adverse impact on sensitive receptors (PPV 0.3 – 1.0 mm/s) are unlikely to occur at distances from works of greater than 2m and PPVs deemed to have a minor adverse impact (0.14 to 0.3 mm/s) are unlikely to occur at distances from works of greater than 8m.

- 11.7.32 All sensitive receptors are located more than 8m from the works. It should be noted that any vibration impacts from NDR construction would be transient and unlikely to last for 1 hour or more, further reducing the likelihood of significant adverse effects. Construction vibration is likely to be at least an order of magnitude lower than the PPVs needed to cause cosmetic damage to properties.

Summary of Construction Noise and Vibration Impacts

- 11.7.33 The potential for significant construction noise effects has been identified at a number of receptor locations along the route where the predicted noise levels from construction of earthworks and drainage exceed 65 dB(A) during normal construction hours (07:00 – 19:00) and the predicted increase of the overall noise level with construction is 5 dB or more above the measured baseline noise. In these cases as the basis of incorporated mitigation, the Contractor will be required to seek prior consent under Section 61 of the Control of Pollution Act 1974 in advance of commencing works, which will require 'best practicable means'. Measures will include erection of temporary noise barriers, selection of quieter plant options, alternative methods of working or avoiding times when works would be most disruptive to the receptor.
- 11.7.34 For receptors such as Railway Crossing (residence) located close to the site of the proposed road and rail bridges near Rackheath, where earthworks are scheduled to last for a period of over six months, the more stringent noise limit of 55 dB LAeq,1h recommended by MPS2 may be applicable and should be taken into consideration during the process of agreeing details of the Section 61 consent process with the Local Authority.
- 11.7.35 No significant noise impacts or effects are predicted from carriageway paving or structural bridge construction.
- 11.7.36 No significant vibration impacts are anticipated from construction works.

Operation

Airborne Noise from Road Traffic

- 11.7.37 The results of the traffic noise calculations at potentially affected dwellings are presented in accordance with the DMRB HD 213/11 procedure in the following tables. Calculation results presented represent noise changes at the worst-affected façade of each property, at a height equivalent to first floor level. Property counts have been refined to include dwelling numbers within each housing block indicated on Ordnance Survey mapping
- 11.7.38 The results for noise impacts at dwellings within 600m of affected routes within 1km of the proposed Scheme, and adjacent to affected routes beyond 1km are presented in the Assessment Summary Tables in Table 11.19, Table 11.20 and Table 11.21. In terms of night time impacts, traffic noise impacts are only assessed in the long-term.
- 11.7.39 The result for change in nuisance from noise is given in Assessment Summary Table 11.22 and Table 11.23.
- 11.7.40 The impacts are illustrated graphically in the form of contours of traffic noise in the opening year and contours of difference with respect to the baseline on opening in MMD-233906-DT-0919 – MMD-233906-DT-0936 Volume 2, Chapter 11 Section B.
- 11.7.41 With reference to Table 11.6 (Matrix for determining significance of effect) and Table 11.4 (Magnitude of impact due to changes in road traffic noise in the short-term and long term) the results may be viewed in terms of significance. Effects are considered significant where the magnitude of noise impacts are expected to be Moderate, Large or Very Large.
- 11.7.42 From Table 11.19 below, significant effects occur where adverse or beneficial impacts exceed 3dB. This is a lower threshold than that applicable to subsequent tables, reflecting the fact that short-term impacts have a greater impact than when considered over a longer period. From Figure 1A.10.3 series: DM2017-DS2017 Difference Contours the distribution of noise changes can be seen and the observations in the following paragraphs noted.
- 11.7.43 Of the 2658 dwellings which would experience significant adverse effects, the majority are in New Rackheath (441); Old Catton (188); Spixworth (669); Thorpe Marriott (240); and Thorpe End (322). Major adverse effects would occur at the periphery of the aforementioned locations. There are corresponding significant adverse effects at 24 other sensitive receptors (i.e.

non-residential). In total 84% of dwellings where significant adverse effects are predicted are located within the calculation area.

11.7.44 Some 718 dwellings would experience significant beneficial effects. In general, the majority of dwellings where these effects occur (98% of all dwellings with a significant beneficial effect) are adjacent to existing roads outside the main calculation area (600m from affected routes within the 1km corridor) where traffic flows are forecast to reduce. Locations within the calculation area where traffic flows and hence noise levels reduce can be seen in DM2017-DS2017 Difference Contours, for example at locations near A1067 Fakenham Road, Fir Covert Road, Reepham Road etc.

Table 11.19: Short term change in noise levels, Do Minimum 2017 - Do Something 2017

Project/Option: NDR			
Short term change in noise levels (DM 2017 - Scenario/Comparison: DS2017)			
		Daytime	
Change in noise level		Number of dwellings	Number of other sensitive receptors
Increase in noise level, $L_{A10,18hr}$	0.1 - 0.9	1579	29
	1.0 - 2.9	3248	45
	3 - 4.9	1807	12
	5+	851	12
No change	0	738	13
Decrease in noise level, $L_{A10,18hr}$	0.1 - 0.9	672	18
	1.0 - 2.9	3976	47
	3 - 4.9	423	10
	5+	295	5

11.7.45 With respect to Table 11.20 below, significant effects occur where adverse or beneficial impacts exceed 5dB. From Figure 1A.10.3 series: DM2017-DS2032 Difference the distribution of noise changes can be seen and the observations in the following paragraphs noted .

- 11.7.46 Of the 1984 dwellings which would experience significant adverse effects, the majority are in Horsham St. Faith (63); New Rackheath (432); Old Catton (70); Spixworth (497); Thorpe Marriott (58); and Thorpe End (258). There are corresponding significant effects at 14 other sensitive receptors (i.e. non-residential). In total 81% of dwellings where significant adverse effects are predicted are located within the calculation area.
- 11.7.47 Some 494 dwellings would experience significant beneficial effects. In general, the majority of dwellings where these effects occur (99% of all dwellings with a significant beneficial effect) are adjacent to existing roads outside the main calculation area (600m from affected routes within a 1km corridor) where traffic flows are forecast to reduce. Locations within the calculation area where traffic flows and hence noise levels reduce can be seen in DM2017-DS2017 Difference Contours, for example at locations near A1067 Fakenham Road, Fir Covert Road, Reepham Road etc.
- 11.7.48 Considering night-time noise, a total of 422 additional residential properties would receive noise levels in excess of the World Health Organization's Interim Target level of 55 dB(A).

Table 11.20: Long term change in noise levels, Do Minimum 2017 - Do Something 2032

Project/Option: NDR				
Scenario/Comparison: Long term change in noise levels (DM 2017 – DS 2032)				
		Daytime		Night-time
Change in noise level		Number of dwellings	Number of other sensitive receptors	Number of dwellings
Increase in noise level, L _{A10,18hr}	0.1 - 2.9	3766	64	125
	3 - 4.9	2828	24	291
	5 - 9.9	1911	21	4
	10+	73	4	2
No change	0	46	0	0
Decrease in noise level, L _{A10,18hr}	0.1 - 2.9	3924	52	0
	3 - 4.9	547	12	0
	5 - 9.9	223	9	0
	10+	271	5	0

11.7.49 With respect to Table 11.21 below, long term effects arising from the Do Minimum case would cause significant adverse effects at 187 residential properties, and significant beneficial effects at 53 residential properties. There are corresponding significant effects at two other sensitive receptors (i.e. non-residential). Impacts associated with the Do Minimum case would clearly be associated predominantly with changes on the existing road network.

11.7.50 Considering night-time noise, the World Health Organisation’s Interim Target level of 55 dB would be exceeded at an additional 473 residential properties.

Table 11.21: Long term change in noise levels, Do Minimum 2017 - Do Minimum 2032

Project/Option: NDR				
Scenario/Comparison: Long term change in noise levels (DM 2017 – DM 2032)				
		Daytime		Night-time
Change in Noise Level		Number of dwellings	Number of other sensitive receptors	Number of dwellings
Increase in noise level, L _{A10,18hr}	0.1 - 2.9	11465	163	296
	3 - 4.9	807	8	176
	5 - 9.9	173	0	1
	10+	14	2	0
No change	0	211	4	0
Decrease in noise level, L _{A10,18hr}	0.1 - 2.9	866	14	0
	3 - 4.9	0	0	0
	5 - 9.9	0	0	0
	10+	53	0	0

11.7.51 HD213/11 clause A1.27 includes an assessment of nuisance and provides a relationship for noise level against change in people bothered very much, or quite a lot by noise. The relationship differs depending on whether short term or long term changes are considered, the former giving rise to greater changes in nuisance. Thus short term changes in noise, as would be experienced on scheme opening, generally determine reported nuisance increases. For assessment the worst-case change is considered and results are shown in Table 11.22 below. DMRB advises caution in interpretation of results as surveys underpinning the relationship between noise and nuisance were conducted at locations within 18m of the carriageway edge, at noise exposure levels of 65 – 78dB and noise changes of up to 10dB. It should also be borne in mind that results represent change in percentage of people bothered very much, or quite a lot by noise. Thus total numbers are in effect a percentage of a percentage as the degree of nuisance felt towards traffic noise varies amongst the population.

Table 11.22: Summary of nuisance calculations for road traffic noise

Project/Option:		NDR	
Scenario/Comparison:			
		Do-Minimum	Do-Something
Change in nuisance level		Number of dwellings	Number of dwellings
Increase in nuisance level	<10%	481	135
	10<20%	0	1076
	20<30%	0	2807
	30<40%	0	2063
	>40%	0	164
No change	0%	6444	647
Decrease in nuisance level	<10%	3	34
	10<20%	0	2
	20<30%	0	0
	30<40%	0	0
	>40%	0	0

Airborne Vibration from Road Traffic

11.7.52 The results of the airborne noise calculations are used to compare the estimate percentages of people annoyed in the Scheme design year with and without the Scheme. Table 11.23 presents the results within the calculation area of 1km. Figures in brackets indicate dwellings within 40m of the NDR which is the cut-off distance recommended within HD 213/11. The remainder of dwellings are associated with traffic changes on the existing road network,

but within the calculation area. There are 7 residential receptors within 40m of the proposed NDR. The results show that without the Scheme, 2 dwellings are expected to experience an increase in airborne vibration whereas there will be no change at the other 5 dwellings. With the Scheme in place, the assessment shows an increase of up to 10% in the number of people annoyed at 4 dwellings, an increase of between 10% and 20% at one dwelling and between 20 and 30% at one dwelling. One dwelling will experience no change.

Table 11.23: Summary of nuisance calculations for airborne vibration from road traffic

Project/Option:		NDR	
Scenario/Comparison:			
		Do-Minimum	Do-Something
Change in nuisance level		Number of dwellings	Number of dwellings
Increase in nuisance level	<10%	73 (2)	114 (4)
	10<20%	0	2 (1)
	20<30%	0	1 (1)
	30<40%	0	0
	>40%	0	0
No change	0%	1497 (5)	1439 (1)
Decrease in nuisance level	<10%	3	17
	10<20%	0	0
	20<30%	0	0
	30<40%	0	0
	>40%	0	0

Summary of Predicted Noise and Vibration Effects

Vibration

11.7.53 Newly constructed carriageways are unlikely to generate significant levels of such vibration as they may be assumed to be free of irregularities. Therefore any impact due to ground-borne vibration has been assumed to be negligible and was not considered further.

11.7.54 The assessment of potential effects due to airborne vibration has considered all residential receptors within the study area and those within 40 metres of the Scheme (which includes seven dwellings in total).

Noise

11.7.55 Table 11.24 and Table 11.25 below summarise effects at residential dwellings and non-residential receptors. These figures include those dwellings outside the 1km study area, adjacent to the existing road network. At these locations, changes in noise levels are primarily determined by changes in traffic flows and speed.

11.7.56 From the tables below it may be observed that significant adverse effects reduce with time, between opening and design year, and significant beneficial effects increase over the same time. This is likely to be a consequence of the adjustment in significance threshold between long term and short term effects to take into account different perceptions of noise change. The least amount of significant effects are observed in the Do Minimum case.

11.7.57 Calculations have indicated that two properties would qualify for noise insulation under the Noise Insulation Regulations. Predicted noise levels for the majority of properties in the vicinity of the Scheme are therefore less than 67.5dB, since, in order to qualify, calculated noise levels in the design year have to be at least 67.5dB, have an increase of 1dB from the new scheme and be within 300m of the new scheme.

Table 11.24: Significance of effects at residential receptors

	Adverse	Beneficial
Effect in Opening year (with Scheme)		
Slight	4827	4648
Significant	2658	718
Effect with scheme in the Long Term (Do Scheme)		
Slight	6594	4471
Significant	1984	494
Effect without scheme in the Long Term (Do Minimum)		
Slight	12272	866
Significant	187	53

Table 11.25: Significance of effects at non-residential receptors

	Adverse	Beneficial
Effect in Opening Year (with Scheme)		
Slight	74	65
Significant	24	15
Effect with scheme in the Long Term (Do Scheme)		
Slight	88	64
Significant	25	14
Effect without scheme in the Long Term (Do Minimum)		
Slight	171	14
Significant	2	0

11.8 Conclusions

11.8.1 A noise and vibration assessment has been undertaken to establish significant effects associated with construction and operation of the proposed NDR.

11.8.2 Two phases of the development have been considered: temporary impacts resulting from the construction activities and permanent impacts due to noise and vibration from road traffic using the NDR and the local highway network.

11.8.3 Methodology adopted for traffic noise and vibration was the Highways Agency's Design Manual for Roads and Bridges, and for construction noise and vibration the methodology was BS 5228 'Code of practice for noise and

vibration control on construction and open sites'. In both cases, the approach was:

- Identification of potential sources and prediction of noise and vibration impacts likely to be received at nearby sensitive receptors including dwellings;
- Comparison of the predicted impacts with the baseline conditions;
- Evaluation of the receptor sensitivity and the significance of effects; and
- The consideration of noise mitigation measures incorporated within the design and an assessment of any residual effects.

11.8.4 Prior to assessment baseline noise monitoring was undertaken across the area.

11.8.5 Mitigation measures incorporated into the Scheme include a thin surface course for the proposed NDR, three lengths of acoustic barrier and extensive bunding and false cuttings. Temporary barriers will be required during construction at some locations.

11.8.6 Both short term and long term effects have been predicted across the Scheme associated with operational noise. No significant effects are expected due to airborne vibration arising from road traffic.

11.8.7 Construction noise has been predicted to generate temporary significant effects at some locations. Further construction noise calculations will be carried out as sufficient construction-related information becomes available. This will be required as the Contractor will apply for Section 61 consent under the Control of Pollution Act 1974.

11.8.8 Calculations for this assessment indicate 2 properties would qualify for insulation under the Noise Insulation Regulations.

Table 11.26 provides a summary of the significant operational noise effects.

	Residential receptors			Non-residential receptors	
	Adverse	Beneficial		Adverse	Beneficial
Effect in Opening Year (with Scheme)	2658	718		24	15
Effect with scheme in the Long Term (Do Scheme)	1984	494		25	14
Effect without scheme in the Long Term (Do Minimum)	187	53		2	0

12. Effects On All Travellers

12.1 Introduction

12.1.1 Effects on All Travellers is identified as a DMRB Topic within Interim Advice Note 125/09 Supplementary guidance for users of DMRB Volume 11 'Environmental Assessment'. However, the guidance contained within DMRB Volume 11, Section 3 has not yet been updated. As a result, the Effects on All Travellers assessment incorporates two of the "old" DMRB Topics. These are:

- Volume 11, Section 3, Part 8: Pedestrians, Cyclists, Equestrians and Community Effects; and,
- Volume 11, Section 3, Part 9: Vehicle Travellers.

12.1.2 Following the guidance contained within these two DMRB chapters, the overall approach for the assessment of Effects on All Travellers will consider the following:

- The impact of the NDR on vehicle travellers that are not included in the cost-benefit economic analysis as quantifiable effects. The two impacts considered in the assessment are changes in the view from the road for drivers and passengers, and driver stress.
- The impact of the NDR for Non-Motorised Users (NMUs) as a result of changes to the network of Public Rights of Way (PRoW) and minor roads. NMUs include pedestrians, equestrians and cyclists, as well as users with mobility issues. The assessment considers changes in journey length and times, the provision of amenities such as PRoW, and connectivity between communities and community facilities (community severance) as a result of the Scheme and associated traffic changes on affected routes.

12.1.3 A separate Transport Assessment Report (DCO Document 5.5) document has been prepared and will be submitted as part of the DCO Application for the proposed Scheme.

12.1.4 A brief discussion of the potential impacts that may result for All Travellers due to Climate Change has also been included within this assessment.
Methodology

12.1.5 DMRB does not provide guidance for the Effects on All Traveller's topic, as it has only recently been introduced to the EIA process. Therefore the assessment of impacts of the proposed NDR on all travellers has been carried

out using professional judgement, drawing on older guidance for superseded topics in DMRB. Pending publication of new DMRB guidance, there is no agreed method of measuring the value or sensitivity of effects on all travellers, and there is no agreed scale against which they can be measured. The assessment makes use of the established significance criteria presented within DMRB Volume 11, Section 2, Part 5, as well as that contained within DMRB Volume 11, Section 3, Parts 8 and 9 (where relevant). By applying this criteria, the significance of the effect is formulated as a function of the receptor or resource environmental value (or sensitivity) and the magnitude of project impact (change). The following significance categories have been used for motorised and non-motorised users:

- Large Beneficial;
- Moderate Beneficial;
- Slight Beneficial;
- Neutral;
- Slight Adverse;
- Moderate Adverse; and,
- Large Adverse.

Motorised Users

12.1.6 The assessment of impacts of the proposed Scheme on motorised users has been carried out using professional judgement and drawing on guidance contained within DMRB Volume 11, Section 3, Part 9: Vehicle Travellers. This guidance document considers changes in the view from the road for drivers and passengers, and driver stress (including delay and road safety).

Views from the Road

12.1.7 The view from the road is assessed by considering wide differences between, landscape character and quality and especially good or bad potential views along the route. It is defined in DMRB as the extent to which travellers, including drivers, are exposed to the different types of scenery through which a route passes.

12.1.8 There are four categories which should be used in assessing travellers' ability to see the surrounding landscape:

- No view – road in deep cutting or contained by bunds, environmental barriers or structures;
- Restricted view – frequent cuttings or structures;
- Intermittent view – road generally at ground level but with barriers at intervals; and,
- Open view – view extending over many miles, or only restricted by existing landscape features.

12.1.9 The assessment of views from the road draws primarily on the landscape and visual impact assessment that has been undertaken for the Scheme (refer to Volume 2, Chapter 7: Landscape). It considers the predicted changes in the quality of views that travellers would experience during construction, and after the opening of the new road, taking account of travellers who transfer to the new road and those that continue to use the local road network.

12.1.10 The nature and extent of future views have been assessed for the Scheme when operational, and has been assessed for both the first year after opening (2017) and at a 15 year period following completion of the Scheme (2032) to take account of the establishment of the soft landscape mitigation measures. The assessment of future views is consistent with the Zone of Visual Influence (ZVI) of the Scheme, which is identified as part of the visual impact assessment described in Chapter 7: Landscape. The ZVI is the approximate area from within which views of the NDR (i.e. the road and its associated infrastructure, and traffic upon it) would be possible, and is shown in Volume 2, Chapter 7, Drawings MMD-233906-DT-0953 to MMD-233906-DT-0955. Routes that would be affected by the proposals are identified within this zone, and are therefore assessed as part of the Views from the Road assessment. The assessment of the view from vehicles is based upon a 120 degrees arc of view which approximates to the view that a traveller can generally appreciate whilst seated in a vehicle. Whilst in reality the situation is more complex, particularly for passengers who may have a wider range of view such as users of Public Transport (coaches and buses), this approach recognises that travellers tend to appreciate their surroundings in a general sense rather than focusing in detail upon any one feature or direction. The assessment will include a consideration of the changes in traffic levels on affected routes.

Significance Criteria

12.1.11 Significance criteria for the effects of the NDR on Views from Affected routes (within the ZVI), and the proposed NDR alignment, have been established with reference to Chapter 7: Landscape. This indicates that with regards to visual sensitivity and motorised users, the users of main roads (e.g. trunk roads) or passengers in public transport on main arterial routes, are considered to be of low sensitivity with regards to visual impacts. Users of scenic roads or designated tourist routes are considered to be of Moderate sensitivity. Vehicle travellers are not considered to be of High sensitivity in any situation since the focus of a vehicle traveller’s attention and the enjoyment of their experience is unlikely to be wholly dependent on the surrounding landscape.

12.1.12 The magnitude of change is determined by the above mentioned categories of no view, restricted view, intermittent view and open view. These categories have been considered in relation to the descriptors given within Table 7.5 of Chapter 7, with the following classification described in Table 12.1:

Table 12.1 View from the Road – Magnitude of Effects

Magnitude	Description
Major	No view - the Scheme or a part of it, would become the dominant feature or focal point of the view from the road.
Moderate	Restricted view - the Scheme or a part of it, would form a noticeable feature or element of the view which is readily apparent to the motorised user.
Minor	Intermittent view - the project, or a part of it, would be perceptible but not alter the overall balance of features and elements that comprise the existing view for motorised users.
Negligible	Open view - only a very small part of the project would be discernible, or it is at such a distance that it would form a barely noticeable feature or element of the view.
No change	No part of the project, or work or activity associated with it, is discernible for motorised users.

12.1.13 In determining the significance of effects, the sensitivity of potential visual receptors (i.e. motorised users/ viewers) within the ZVI is combined with the magnitude of change. The following table represents this combination using descriptors for significance categories, and has been adapted from Table 7.5 of Chapter 7 to be applicable for motorised users of affected routes and the proposed NDR only. Note that for motorised users, receptors are not considered to be of High sensitivity.

Table 12.2 View from the Road: Typical Descriptors of the Significance of Effect Categories

Significance	Typical Descriptors of Effect
Large Beneficial	The project would lead to the creation of an open view and a major improvement for a highly sensitive receptor.
Moderate Beneficial	The project would lead to the creation of an open view or obvious improvement for a moderately sensitive receptor.
Slight Beneficial	The project would lead to the creation of an open view or obvious improvement for a receptor of low sensitivity, or the creation of an intermittent view and obvious improvement for a moderately sensitive receptor.
Neutral	No perceptible change in the view for all receptors.
Slight Adverse	The project would create an intermittent view or obvious deterioration for a receptor of moderate sensitivity, or restricted view for a receptor of low sensitivity.
Moderate Adverse	The project would create an intermittent view or obvious deterioration for a receptor of high sensitivity, or a restricted view and obvious deterioration for a moderately sensitive receptor, or no view for a receptor of low sensitivity.
Large Adverse	The project would cause major deterioration/ loss of view for a highly sensitive receptor.

Driver Stress (including road safety)

- 12.1.14 The introduction of the proposed Scheme would alter the number of vehicles and pattern of traffic movements on the local road network, which could influence Driver Stress through road safety impacts (including fear and intimidation), and changes in traffic flows and congestion (which would influence driver delay and stress). Driver Stress is defined for the purposes of the environmental assessment as the adverse mental and physiological effects experienced by a driver traversing a road network. Factors influencing the level of stress include road layout and geometry, junction frequency, and speed and flow per lane. Taken together, these factors can induce in drivers the feelings of discomfort, annoyance, frustration or fear culminating in physical and emotional tension that detracts from the value and safety of a journey.
- 12.1.15 DMRB considers that driver stress has three components, which are frustration, fear of potential accidents and uncertainty relating to the route being followed. Frustration is caused by a driver's inability to drive at a speed consistent with his or her own wishes in relation to the general standard of the road. It increases as speed falls in relation to roadworks, or to difficulties in overtaking slower moving traffic. Congestion can lead to frustration by creating a situation in which the driver does not feel in control.
- 12.1.16 The main factors leading to fear are presence of other vehicles, inadequate sight distances and the likelihood of pedestrians, particularly children, stepping into the road. Other factors include inadequate lighting, narrow roads, roadworks and poorly maintained road surfaces. Fear is highest when speeds, flows and the proportion of heavy goods vehicles (HGVs) are all high.
- 12.1.17 Route uncertainty is caused primarily by signing that is inadequate for the individual's purposes. It will not normally be possible to assess the size of this factor unless a consensus has already appeared on the adequacy of existing signing practice at a specific site. Good design and layout of signs can go a long way towards eliminating this cause of stress from new road schemes.
- 12.1.18 The study area and affected routes for Driver Stress and Safety/Accidents is illustrated on Drawing MMD-233906-DT-0795 (Volume 2, Chapter 12: Effects on All Travellers, Section A). This is consistent with the study area that is included within the Transport Assessment for the Scheme. It includes all routes that intersect with the proposed NDR, and local routes

within the wider study area, to include routes between local communities and routes within Norwich centre which would be affected by the proposed Scheme.

Significance Criteria

12.1.19 DMRB Volume 11, Section 3, Part 9 states that available research evidence does not permit the use of finely graded assessment of driver stress, and therefore a three point descriptive scale (Low, Moderate or High) should be used. It is useful to consider how the operation of the existing and new routes and associated changes in traffic flows and accident rates can influence vehicle travellers in terms of driver stress. As a result, the criteria included within the Institution of Highways and Transportation Guidelines for Traffic Impact Assessment and the Institute of Environmental Assessment (now Institute of Environmental Management and Assessment), Guidelines for the Assessment of Road Traffic can be applied to determine the magnitude of potential safety impacts. This would be as a result of traffic changes between the Do Minimum (Design Year (2032); no NDR), and Do Something (Design Year (2032); with NDR) on affected routes.

12.1.20 Table 12.3 below illustrates the magnitude of these changes which will be applied to affected routes.

Table 12.3 Impact magnitude

Magnitude	Percentage Flow Change*
Negligible	None
Slight	Up to +/- 5% flow change
Moderate	+/- 5 –10% flow change
Major	>10% flow change
Note: These criteria apply to changes in total flows. * Flow changes are changes in 2-way 24 Hour Annual Average Daily Flows (AADT) for all vehicles	

12.1.21 The significance of impacts is determined based on the magnitude of impacts as illustrated above, and a degree of professional judgement. For traffic flow changes, the percentage change is formed from a change in Annual Average Daily Traffic (AADT), as this represents the Total Flow changes for Affected Routes. Table 12.4 provides the definitions:

Table 12.4 Significance of impact for Vehicle Travellers (Driver Stress)

Significance	Definition
Large Beneficial	<p>Elements of the highway network where congestion is relieved by the magnitude of impact predicted.</p> <p>Major positive changes in total traffic flow on parts of the network with a poor accident record.</p> <p>Moderate or major change to total flows at locations and at times when there are a high number of vulnerable road users (cyclists, pedestrians, equestrians) at several locations on the route, or in the vicinity of hospitals or schools combined.</p>
Moderate Beneficial	<p>Moderate total flow changes on parts of the network with a poor accident record.</p> <p>Moderate or major total flow changes in locations with some vulnerable road users, or that are near schools or hospitals, or have direct residential frontages.</p>
Slight Beneficial	<p>The network operates within capacity and flow changes on the network are slight.</p> <p>Slight total flow changes on parts of the network with a poor accident record.</p> <p>Slight total flow changes in locations with some vulnerable road users, or that are near schools or hospitals, or have direct residential frontages.</p>
Neutral	<p>No or negligible changes to traffic flows.</p> <p>Low vulnerable road user activity, with no large settlements or sensitive receptors on route</p>

	<p>Accident rates are at or below average.</p> <p>No changes to local infrastructure or services.</p>
Slight Adverse	<p>The network operates within capacity and flow changes on the network are slight.</p> <p>Slight total flow changes on parts of the network with a poor accident record.</p> <p>Slight total flow changes in locations with some vulnerable road users, or that are near schools or hospitals, or have direct residential frontages.</p>
Moderate Adverse	<p>Isolated parts of the highway network taken over operational capacity for periods of the day.</p> <p>Moderate total flow changes on parts of the network with a poor accident record.</p> <p>Moderate or major total flow changes in locations with some vulnerable road users, or that are near schools or hospitals, or have direct residential frontages.</p>
Large Adverse	<p>Elements of the highway network taken over operational capacity by the magnitude of impact predicted.</p> <p>Major changes in total traffic flow on parts of the network with a poor accident record.</p> <p>Moderate or major change to total flows at locations and at times when there are a high number of vulnerable road users (cyclists, pedestrians, equestrians) at several locations on the route, or in the vicinity of hospitals or schools combined with a lack of footways or large sections of road with direct residential frontages.</p>

Non-Motorised Users

12.1.22 The assessment of impacts of the proposed Scheme on non-motorised users (NMUs) has been carried out using professional judgement and guidance contained within DMRB Volume 11, Section 3, Part 8:

- 12.1.23 Pedestrians, Cyclists, Equestrians and Community Effects. This guidance document considers changes in journey length, changes in amenity and community severance. This chapter, therefore, examines the NDR's impact on communities and their journeys as pedestrians, cyclists and equestrians on the local network. This includes communities which although not lying immediately adjacent to the proposed road are within the extents of the Study Area, as defined within the TA and applied to the Driver Stress element of this chapter (Volume 2, Chapter 12: Effects on All Travellers, Section A)).
- 12.1.24 Following the traffic flow analysis and the determination of the impact magnitude for affected communities and key routes in terms of highway operation/ traffic flow changes, a review of the study area has been undertaken to determine the impact magnitude in terms of NMUs. It examines the likely detriment or improvement to amenity, such as the provision of new NMU routes, and the likely effect of temporary closures and diversions during the NDR's construction, such as changes to journey length. It assesses what effect the NDR will have on community connectivity and existing journeys; whether the amenity value of these journeys will be increased, diminished or people deterred from making them.

Significance Criteria

- 12.1.25 A beneficial impact is defined as the enhancement of a NMU recreational or utility experience due to the implementation of the proposed NDR, such as through reduced community severance, improved access or improved amenity. A neutral impact is defined as a negligible change in the NMUs experience as a result of changes implemented or caused by the Scheme. A neutral impact may also result where beneficial and adverse impacts are considered to balance. An adverse impact is defined as the degradation of the NMU experience as a result of the NDR. Examples of this may include an increase in community severance as a result of increased traffic or physical barriers, an increase in journey time or a reduction in amenity, such as the removal of dedicated footpaths and cycleways. These broad categories are described in more detail in Table 12.5 below:

Table 12.5 Significance criteria for NMUs

Significance	Typical examples
Large Beneficial	<p>Total removal or major reductions in traffic, where NMUs are present.</p> <p>Substantially improve NMU network through the provision of new amenities for pedestrians, equestrians and cyclists where none existed previously.</p>
Moderate Beneficial	<p>Moderate reductions in traffic, where NMUs are present.</p> <p>Improve existing NMU network through the provision of new amenities for pedestrians, equestrians and cyclists where few or none existed previously.</p>
Slight Beneficial	<p>Slight reduction in traffic, where NMUs are present.</p> <p>Improve existing NMU network through the upgrading of existing amenities or provision of new amenities for pedestrians, equestrians and cyclists where some already exist.</p>
Neutral	<p>Negligible or no change to traffic flow where NMUs are present.</p> <p>Negligible changes for recreational or utility users or where beneficial and adverse impacts balance.</p>
Slight Adverse	<p>Slight increase in traffic where NMUs are present and where improvements to the pedestrian / cycle facilities are not provided.</p> <p>Close a PRoW or desire line, thus increasing journey times for users.</p>
Moderate Adverse	<p>Moderate or major increase in traffic, where NMUs are present and where improvements to the pedestrian / cycle facilities are not provided.</p> <p>Close a well-used PRoW with links to community facilities.</p>
Large Adverse	<p>Moderate or major increase in traffic, where NMUs are present and where pedestrian / cycle facilities are</p>

	<p>degraded.</p> <p>Close a network of PRow with highly convenient crossing points.</p> <p>Increase journey times for NMUs between facilities by closing amenities or increasing traffic/ introducing traffic.</p>
--	--

12.2 Context

Technical

12.2.1 The information used in this chapter was obtained through a desk-based study and surveys of non-motorised traffic. Key sources of information for the desk-based study included the online version of the Definitive Map of PRow, planning policy documents, relevant ordnance survey maps, and the results of the public consultation undertaken between 2006 and 2008. In addition, the report takes into account work carried out to date with respect to NMU's, primarily as a result of the severance of existing routes to adjacent communities, and of the suggested mitigation measures following sensitivity testing and significant consultation with user groups, Broadland District Council and Norfolk County Council Environment Team. It draws on the information contained within the NDR NMU Context Report and NMU Audit that was completed in March 2013. Finally, the assessment of construction stage impacts draws upon information contained within the Construction Methodology document, prepared by Birse Civils (April 2013; refer to Volume 2, Chapter 24: CEMP), as well as Schedule 8 of the Construction Methodology which was updated by Birse in November 2013. Schedule 8 details the Contractor's access requirements from public roads during construction, and has been re-produced within (Volume 2, Chapter 12: Effects on All Travellers, Section B).

Scoping and Consultation

12.2.2 Between 2006 – 2008 all the parishes directly affected by the Scheme were invited to a scoping workshop and asked to identify possible severance problems that may be caused by the construction of the NDR. The following relevant issues were raised:

- Impact on buses including school buses;

- Impact on journeys to and from schools; and,
- Severance between villages (in particular between Drayton and Horsford).

12.2.3 The Scheme alignment and associated mitigation for impacts upon All Travellers has been revised since this date to take account of many of the concerns raised by the parishes. Further consultation has subsequently been undertaken for the current Scheme design and as part of the Environmental Impact Assessment process for the DCO Application. The Environmental Scoping Report was submitted by Norfolk County Council to the Secretary of State for Transport (SoS) in February 2013 in order to request a scoping opinion for the proposed NDR. So as to inform the Scoping Opinion, the SoS has a duty under Regulation 8(6) of the Infrastructure Planning (Environmental Impact Assessment) Regulations 2009 (SI 2263) (as amended) (the EIA Regulations) to consult widely. Consequently, all parishes were given the opportunity to pass comment on the proposed content and structure and potential impacts of the proposed NDR prior to the formation of a Scoping opinion and the submission of this ES.

12.2.4 12.2.4 The Scoping Opinion identifies effects on the local road network as one of the main potential concerns. The comments raised by Norfolk County Council, South Norfolk Council, Salhouse Parish Council, Rackheath Parish Council, Ringland Parish Council, and Frettenham Parish Council in respect to impacts upon the local road network have been considered within this Chapter; refer to the Scoping Opinion within Volume 1, Appendix 5 of this ES for further details. As requested within the Scoping Opinion, the potential impacts on the local road network, both adverse and beneficial, have been fully assessed within this Chapter, as well as the recommendation to take account of the location of footpaths, cycleways, and any PRow including bridleways and byways.

Limitations

12.2.5 This chapter draws on a separate 'Non-Motorised Users Context Report' prepared for the Scheme, which presents the baseline information in more detail. Surveys of pedestrian, equestrian and cyclist traffic for roads that would intersect the NDR were undertaken in April 2013. However, to date, surveys of Non-Motorised Users (NMUs) of Public Rights of Way (PRow) such as bridleways and footpaths within the vicinity of the Scheme have not been undertaken.

12.2.6 Construction stage traffic movement assumptions have been based on the Construction Methodology document, prepared by Birse Civils (April 2013), as well as the Schedule 8 document prepared by Birse in November 2013 (Volume 2, Chapter 12: Effects on All Travellers, Section B). However, this document and Schedule does not include the likely level of construction traffic for each of those roads identified, and whether the presence of construction plant is likely to be during peak hours, which could impact upon vehicle travellers and NMU journeys. Consequently, no quantifiable assessment of construction traffic movement has been undertaken, and the construction stage impacts upon Driver Stress are qualitative. The document does state that during peak periods it is envisaged that there will be up to 75 deliveries per day predominantly in 20 tonne eight wheeled wagons. This is in addition to staff and workforce transport.

12.2.7 Finally, the Traffic Model for the proposed Scheme includes a number of confirmed developments for the Norwich area for which new roads are proposed. These developments do not form the baseline for the Effects on All Travellers assessment, as they have not yet been built out. However, the inclusion of these developments does mean that some traffic increases or decreases for certain roads may not be fully attributed to the proposed NDR. Consequently, for some locations where impacts have been identified as a result of changes to traffic flows for Driver Stress and for NMUs, the impact (beneficial or adverse) may not be entirely as a result of the proposed NDR.

Planning and Legislative

National Planning Policy

12.2.8 On the 27th March 2012 national planning guidance in the form of topic-based PPGs and PPSs was superseded by the National Planning Policy Framework (NPPF). The NPPF contains topic-based advice to help achieve sustainable development. The paragraphs relevant to this topic fall within core planning principles, promoting sustainable transport and healthy communities and Plan-making. The NPPF provides advice on how the Scheme can be considered in relation to sustainable development, including:

- Supporting the transition to a low carbon future, and consideration of whether the opportunities for sustainable transport modes have been taken up.
- Protecting and exploiting opportunities for the use of sustainable modes for the movement of goods or people, including the protection and enhancement of PRoW and access. The Scheme should consider pedestrian and cycle

movements, access to high quality public transport, creation of safe crossing points and the needs of people with disabilities.

- A Scheme that reflects the vision and aspirations of local communities.

Local Planning Policy

Norfolk 3rd Transport Plan 2011 – 2026

12.2.9 NCC's Third Transport Plan "Connecting Norfolk" describes the county's strategy and policy framework for delivery up to 2026. It is used as a guide for transport investment when determining planning or delivery decisions. It reflects the views of local people and stakeholders and identifies six priorities for transportation:

- Maintaining and managing the highway network;
- Delivering sustainable growth;
- Enhancing strategic connections;
- Reducing emissions;
- Improving road safety; and,
- Improving accessibility.

The Norfolk Rights of Way Improvement Plan 2007-2017

12.2.10 The Norfolk Rights of Way Improvement Plan sets out NCC's aspirations for improving the network of PRow. The Plan provides an assessment of the needs of the county's residents and visitors, and of Norfolk's existing local rights of way network. The objectives of the Plan are to:

- Develop a well signed, maintained and easily accessible network.
- Develop and maintain an integrated network that provides for the requirements of all users.
- Improve promotion, understanding and use of the network.
- Encourage community involvement in improving and maintaining local rights of way.

- Develop a safe network of local rights of way.
- Prepare and make publicly available an up to date digitised Definitive Map.
- Protect and enhance biodiversity associated with the network of public rights of way.

12.2.11 In autumn 2010 Norfolk County Council initiated “The Big Conversation” with the public to decide what the spending priorities should be. Following, this NCC agreed that the Public Rights of Way Service would focus on its statutory duties to maintain paths. Furthermore, a network of these paths would be created to support Norfolk’s leisure/tourism economy and would be known as “Norfolk Trails”. Policy guiding this Service is contained in the Norfolk Rights of Way Improvement Plan 2007-2017, which sets out Norfolk County Council’s goal, aims and objectives to improve its network of local rights of way.

Transport for Norwich Consultation Document 2009

12.2.12 The Transport Strategy has been designed to help deliver growth within the Norwich area. It intends to improve walking and cycling facilities as part of an appropriately designed wider transport infrastructure, and to promote sustainable transport choices, reduce congestion and improve air quality. The strategy has already delivered key improvements such as Norwich Bus Station, St Augustine’s Gyratory and the network of Park and Ride facilities.

The Joint Core Strategy Submission Document February 2013

12.2.13 The Joint Core Strategy for Broadland, Norwich and South Norfolk was adopted in March 2011. Following a legal challenge, parts of the text, and some associated maps and diagrams, were remitted by High Court Order and taken back to the Regulation 19: Publication of a Local Plan Stage, to be treated as not having been subject to examination and adoption. The remainder of the Joint Core Strategy remains adopted.

12.2.14 Further work has been carried out to address the High Court ruling and an updated version of the JCS was submitted for Examination in Public (February 2013). The examination closed on Thursday 25th July 2013, and on Monday 9th September the Councils published a number of Main Modifications to the Joint Core Strategy. The six week consultation period for

this closed on Monday 21st October, and on 13th November 2013 the Planning Inspector issued his final report. The report concludes that, subject to a number of Main Modifications, the Joint Core Strategy for Broadland, Norwich and South Norfolk, the Broadland part of the Norwich Policy Area Local Plan is sound and is an appropriate basis for the future planning of the area. The Inspector's report and the Main Modifications Appendix are available to view at <http://www.gndp.org.uk/our-work/joint-core-strategy/> and it is expected that councillors will consider formal adoption by their individual local authorities early in 2014.

- 12.2.15 The adopted Joint Cores Strategy (March 2011) refers to the construction of the NDR, and specifically states that the NDR will provide improved access to the north of the city, to enhance the living conditions for those residents who live in the northern suburbs and to enable improvements to be made to buses, cycling and walking routes. However, in Policy 6: Access and Transportation it states that the levels of growth in the Joint Core Strategy will require that the need to travel is managed. As part of this process, travel planning and smarter choices will be promoted to ensure that all residents have good access to local jobs, services and other facilities, preferably by walking and cycling, thus reducing the need to travel and to promote healthier lifestyles.

12.3 Baseline

Motorised Users

View from the road

- 12.3.1 The NDR would be a new road set within a rural setting, so a baseline scenario cannot be taken for users of the road. However, routes that are identified within the ZVI for the proposed Scheme (Volume 2, Chapter 7: Landscape, Drawing MMD-233906-DT-0953 to MMD-233906-DT-0955) are considered within the assessment presented, as the views from the road are likely to be affected by the proposed NDR. For those routes that are situated within the main residential or light industrial areas, within the urban area of northern Norwich, the views from the road are dominated by the adjacent semi-urban townscape, which affords few attractive views for vehicle travellers. Where existing routes would intersect with the NDR, the existing view is one of an attractive, rural setting, and intensively farmed agricultural fields. Users of the main roads within the ZVI or passengers in public transport on these main arterial routes are considered to be of low sensitivity to change, whereas users of more scenic roads are considered to be of

moderate sensitivity. All routes included within the assessment are identified below:

Table 12.6 Affected Routes for Views from the Road (west to east)

Route	Classification	Sensitivity to Change for Vehicle Travellers
A1067 Fakenham Road – intersects with proposed NDR	Main Road	Low
Fir Covert Road – intersects with proposed NDR	Main Road	Low
Breck Farm Lane/ Furze Lane – intersects with the proposed NDR; closed to all traffic at intersection	Main Road	Low
Reepham Road – intersects with the proposed NDR; runs parallel with proposed NDR within the ZVI	Main Road	Low
Dog Lane – within ZVI, to the north of the proposed NDR	Scenic Road	Moderate
Drayton Lane – intersects with the proposed NDR	Main Road	Low
B1149 Holt Road - intersects with the proposed NDR; closed to all traffic at intersection (proposed cycleway)	Main Road	Low
A140 Cromer Road – intersects with the proposed NDR	Main Road	Low
Hall Lane – within ZVI; intersects with Holt Road to the south of the Scheme and closed to all traffic at intersection (proposed cycleway)	Scenic Road	Moderate
Old Norwich Road – stops before intersection with the proposed NDR	Scenic Road	Moderate
Bullock Hill – intersects with the proposed NDR; closed to all traffic at intersection (proposed cycleway)	Scenic Road	Moderate
Spixworth Road – within ZVI, to the north of the proposed NDR	Main Road	Low

Route	Classification	Sensitivity to Change for Vehicle Travellers
St Faith's Road - intersects with the proposed NDR; closed to all traffic at intersection (proposed cycleway)	Scenic Road	Moderate
Quaker Lane - intersects with the proposed NDR; closed to all traffic at intersection (proposed cycleway)	Scenic Road	Moderate
Buxton Road – intersects with the proposed NDR; closed to all motorised traffic at intersection	Main Road	Low
Beeston Lane – Within ZVI to the south of the proposed NDR; closed to all traffic (proposed cycleway)	Scenic Road	Moderate
B1150 North Walsham Road – Intersects with the proposed NDR	Main Road	Low
A1151 Wroxham Road – Intersects with the proposed NDR	Main Road	Low
Green Lane West – within ZVI to the east of the proposed NDR	Main Road	Low
Green Lane East – within ZVI to the east of the proposed NDR	Main Road	Low
Salhouse Road – intersects with the proposed NDR	Main Road	Low
Broad Lane – within ZVI to the north-east of the proposed NDR	Scenic Road	Moderate
Plumstead Road – intersects with the proposed NDR	Main Road	Low
Middle Road – intersects with the proposed NDR (carried over on new overbridge)	Main Road	Low
Toad Lane – within ZVI to the east of the proposed NDR	Main Road	Low
Low Road - intersects with the proposed NDR; closed to all traffic at intersection	Scenic Road	Moderate

Route	Classification	Sensitivity to Change for Vehicle Travellers
Green Lane South – within ZVI, to the west of the proposed NDR	Main Road	Low
Smee Lane - intersects with the proposed NDR; closed to all traffic at intersection	Scenic Road	Moderate
A47 – on edge of ZVI to the south of the proposed NDR	Main Road	Low

Driver Stress

12.3.2 In respect of vehicle travellers, driver stress is currently a key issue for the Norwich area as a result of severe congestion and high HGV use, resulting in significant delays and unreliable journey times. The “Norwich Area Transportation Strategy Options Report” (produced for Norfolk County Council by Mott MacDonald, August 2005) concluded that there is currently a high adverse impact on driver stress arising from congestion on the existing road network in the northern suburbs of Norwich. This situation has been exacerbated through rising traffic levels in recent years.

12.3.3 The assessment of Driver Stress relies on forecasts of traffic flows for the with and without Scheme scenario for the 15th year after Scheme opening (2032), as predicted by the Traffic Model for the Scheme. The traffic model splits the road network up into different links, principally where a change in the road occurs. This may be at a junction between two main roads, or where a side road joins a main road, or where the road goes from a single lane to two lanes. The meeting point of any two links is a ‘node’. Each node is assigned a number, and each link is assigned a label. For the purposes of assessing Driver Stress associated with the proposed NDR, the change in traffic flows is presented as a percentage change. Drawing MMD-233906-DT-0882 of Volume 2, Chapter 12. Effects on All Travellers, Section C, illustrates the full list of all links included within the traffic model, and the associated percentage change in Annual Average Daily Traffic (AADT) flows between the Do Minimum (without Scheme) and Do Something (with Scheme) scenarios for 2032.

Accident Data (Personal Injury Collision)

12.3.4 The Transport Assessment for the Scheme provides a high level analysis of Personal Injury Collision (PIC) data relating to the proposed NDR. This analysis provides information on PICs and accident cluster sites to inform the Transport Assessment with regards to safety aspects relating to the NDR. The information has also been used within this chapter to inform the assessment of Driver Stress.

12.3.5 As part of the initial desk top study, the following tasks were completed:

- Production of an overview of PICs that have occurred in the Driver Stress defined study area and over the last five years (between 01/07/2008 and 30/06/2013); and,
- Analysis of the PIC data to identify individual accident cluster sites, within the defined study area/period.

12.3.6 The analysis was completed using the KeyACCIDENT analysis software package, with Police STATS 19 data. These statistics refer to personal injury records on public roads which became known to the police.

12.3.7 The PIC data has been obtained from Norfolk County Council (NCC, the local Highway Authority), who are provided with a copy of the Police data for their own analysis. The geographical area of the data provided, has been specified by Mott MacDonald, and occupies an area consistent with the Transport Assessment (which is the same study area used for Driver Stress).

12.3.8 Cluster sites for accidents have been identified by interrogating the PIC data using the Cluster Site Analysis function in the KeyACCIDENT software package. Analysis of the data has shown that within the principal routes study area, between 01/07/2008 and 30/06/2013, a total of 2,068 collisions have been recorded, resulting in 3,281 casualties. Of these, 28 PICs have been classified as Fatal, 231 as Serious and 1,809 as Slight.

12.3.9 Full details of the Cluster sites and analysis can be found within Volume 2, Chapter 12: Effects on All Travellers, Section D,

Non-Motorised Users

12.3.10 NCC manages approximately 2,400 miles of Public Rights of Way consisting of footpaths, bridleways, restricted byways and byways open to all traffic. In 2011 20% of adults in Norwich City Council's area cycled at least

once per week, the fifth highest of any Local Authority in England. In 2011 6% per cent of adults usually travelled to work by bicycle, the sixth highest local authority percentage. NCC want to build on these high levels and are committed to providing a good quality network of cycle routes in and around Norwich. In addition, the Norwich Transport Strategy includes a commitment to upgrade and provide additional measures to improve the environment for pedestrians, such as the provision of new zebra crossings, traffic lights, and central islands. Currently, a network of existing PRow that can be used by pedestrians, cyclists, equestrians and other non-motorised vehicles exist within the study area for the proposed Scheme, and are identified on Drawings MMD-233906-DT-0592-0597 and the Norwich Cycle Map (Volume 2, Chapter 12: Effects on All Travellers, Section E and F respectively). Existing rights of way that will be intersected by the NDR are described in Table 12.7 below.

Table 12.7: Existing Public Rights of Way affected by NDR

Definitive Map Ref.	Type	Description
Attlebridge RB3	Restricted By-way	Track passable by vehicles linking A1067 to Deighton Hills. It then continues as a restricted by way to Broad Lane, Attlebridge.
Marriott's Way	Long Distance Cycle Route and Permissive Path	Marriott's Way is a footpath, bridleway and cycle route, which follows the routes of two disused railway lines. Runs between the historic market town of Aylsham and the medieval city of Norwich. Forms part of National Cycle Route 1, which is a long distance cycle route connecting Dover and the Shetland Islands.
Drayton RB6	Restricted By-way	Track links Reepham Road to Dog Lane, Horsford and also links to footpath no.6 to Drayton Drewray.
Horsford RB5	Restricted By-way	Track links Reepham Road to Dog Lane, Horsford and also links with CRF3 to Horsford village.
Horsford RB7	Restricted By-	Track links B1149 Holt Road to Drayton Lane.

Definitive Map Ref.	Type	Description
	way	
Spixworth BR1/ Horsham St Faith and Newton St Faith BR6	Bridleway	Bridleway crosses parish boundary and runs from Quaker Lane to the perimeter fence of Norwich Airport
Great & Little Plumstead FP4	Footpath	Track links Low Road with Middle Road.
Great & Little Plumstead FP5	Footpath	Footpath links Low Road to Smee Lane. Forms part of a Broadland Great and Little Plumstead Circular walk no.8
Postwick FP2	Footpath	Footpath links Smee Lane to A1042 Yarmouth Road

12.3.11 A number of these existing PRoW and tracks, as well as some additional NMU amenities that do not intersect the proposed NDR but are within the footprint of works, would be closed or diverted with the proposed Scheme in place. All of these closures and diversions, as well as new and replacement NMU amenities included within the proposed Scheme design are illustrated on Drawings MMD-233906-DT-0592-0597 (Volume 2, Chapter 12: Effects on All Travellers, Section E.). The following tables identify the locations of all Public Rights of Way and tracks that would be stopped up or diverted as a result of the Scheme:

Table 12.8: Locations of Rights of Way to be stopped up or diverted

Private Means of Access	Chainage
Private means of access leading from Old Norwich Road to the northern entrance to Norwich airport to the north of the NDR)	7880
Diversions	Chainage
Attlebridge RB3 (to the north of the NDR) diverted adjacent to the NDR to the proposed A1067 Fakenham Road Roundabout	760
Horsford RB 7 between the proposed Drayton Lane and the existing Drayton Lane	5300
Postwick FP2 to be stopped up between Smee Lane and A47 Trunk Road and replaced with Footway/ Cycleway adjacent to NDR	19000
Tracks and Rights of Way	Chainage
Private: Access Track running north-south between the A1067 Fakenham Road and Attlebridge Restricted Byway No.3, to the north of the NDR).	700
Public: A 386 metre length of Attlebridge Restricted Byway No. 3, north westwards from its junction with the A1067 Fakenham Road (a diverted route from the northern side of the A1067 Fakenham Road Roundabout to be provided).	760
Private: A length of Access Track running along a co-existent route with Attlebridge Restricted Byway No.3, to the north of the NDR.	760
Private: Track running from the C261 Reepham Road to Glebe Farm on B1149 Holt Road, to the north and south of the NDR.	5150
Public: Horsford Restricted Byway No.7 – a 60 metre length from its junction with the C282 Drayton Lane.	5300
Private: Track at the southern termination point of C250 Old Norwich Road, to Norwich International Airport Control Tower and Airport curtilage, to the north of the NDR.	7900

Public: Spixworth Bridleway No.1, to the east of the NDR.	9800
Public: Horsham St. Faith and the Newton St. Faith Bridleway No.6, to the west of the NDR.	8900
Private: Track leading north of Red Hall Farm, Beeston Lane (U57186), to the north and south of the NDR.	11730
Private: Track leading north off Beeston Lane (U57186), approximately 400 metres east of Park Farm, to the north and south of the NDR.	13150
Private: Track leading south west from the C258 Green Lane West, to the pumping station, to the north and south of the NDR.	14800
Private: Track leading from the existing Newman Track west of Gazebo Farm in the northerly direction for approximately 250m.	15200
Private: Track leading from the realigned Newman Track on the east of overbridge leading northwards for approximately 80m.	15500
Private: Track leading southwards from Newman Road (U57490)/Long's Crescent (U57852) junction, over its length to the circulatory track around March Farm and Park Gardens.	15500
Private: Track leading from C258 Green Lane West to Hall Farm, west of the NDR.	15800
Public: Great and Little Plumstead Footpath No.5, to the north and south of the NDR.	18750
Public: Postwick Footpath No.2 – a 700 metre length from its junction with the A1042 Yarmouth Road.	19000
Diversions	Chainage
Public: Drayton Restricted Byway No. 6 diverted north of Reepham Road roundabout to join the roundabout.	3000
Public: Horsford Restricted Byway No. 5 diverted over the new Bell Farm Overbridge.	3950

12.3.12 There are also a number of unofficial footpaths and tracks that are regularly utilised by NMUs in the local area that constitute desirable routes or desire lines. Due to the scale of the proposed NDR, it has not been possible to identify every one of these desire lines within the study area (extents of the traffic model). However, those that would be directly affected by the Scheme through either a closure or diversion have been identified. The only identified route is a track that runs from the northern extents of Thorpe Mariott, along Long Dale, and connecting with Dog Lane to the north (Chainage 3750).

Pedestrian and Cyclist Counts

12.3.13 Counts of pedestrian and cyclist activity have been undertaken for the main radial routes to the North of Norwich City at locations where the proposed NDR would intersect these routes. These have been undertaken so as to ascertain the level of NMU activity on these main access routes into and out of the City. A high volume of cyclists have been recorded along these radial routes, which supports the statement that Norwich has the 5th highest cyclist activity of any local authority in England. Pedestrian counts are low as these radial routes do not have pavements or footways (cyclist counts are for road cyclists). The surveys were undertaken on Tuesday 30th April 2013.

Table 12.9: Pedestrian and cyclist counts: April 2013

Location	North bound/ East bound		South bound/ West bound	
	Pedestrians	Cyclists	Pedestrians	Cyclists
Fakenham Road	0	6	0	4
Fir Covert Road	19	5	9	24
Reepham Road	0	24	0	32
Holt Road	0	35	0	32
Cromer Road	1	33	2	44
North Walsham Road	0	31	1	19
Wroxham Road	0	26	0	26
Salhouse Road	2	30	1	31

Location	North bound/ East bound		South bound/ West bound	
	Pedestrians	Cyclists	Pedestrians	Cyclists
Plumstead Road	0	41	0	35

Communities

12.3.14 There are 19 parishes within the immediate influence of the NDR (Broadland (Greater Norwich)). Community facilities that constitute sensitive receptors for the assessment of Driver Stress and for Non-Motorised Users are identified within Table 12.10 for each of these parishes. The presence of sensitive receptors influences the overall impact assessment by affecting the level of Driver Stress or the impact upon community severance. For example, where a school is present, it is expected that there would be school children, which could influence Driver Stress. In addition, the relief of traffic from roads with sensitive receptors such as schools and medical facilities may result in some relief of existing community severance.

12.3.15 Drawing MMD-233906-DT-0716 of Volume 2, Chapter 12: Effects on All Travellers, Section G, identifies the location of schools and medical facilities. Drawing MMD-233906-DT-0716 also maps the percentage of the population that do not own a vehicle and are therefore reliant on non-motorised travel or use of public transport (percentage of non-motorised population).

Table 12.10: List of Parishes immediately affected by the proposed NDR

Parishes	Schools	Medical centre/ doctors surgery	Church/ Religious centre	Local shops	Home for the elderly	Recreational and other
Attlebridge	Attlebridge Nursery School, Old Fakenham Road	N/A	N/A	N/A	N/A	N/A

Thorpe End ²	N/A	Norwich Histopathologists, (Norwich/ Plumstead)	St. Davids, St David's Drive	Thorpe End Post Office (Norwich / Plumstead	N/A	Community Hall (Norwich/ Plumstead Road)

Parishes	Schools	Medical centre/ doctors surgery	Church/ Religious centre	Local shops	Home for the elderly	Recreational and other
Postwick	N/A	Road) N/A	All Saints Church, Postwick	Road) N/A	Heron Lee (Mill Lane, Witton)	Sports ground, Postwick
<p>1 Beeston St. Andrew is a small parish comprising scattered properties. There is no defined village centre.</p> <p>2 Thorpe End is part of the Great and Little Plumstead Parish. This Garden Village would be separated from the rest of the parish by the proposed NDR, although the continuity of Plumstead Road would be maintained. In terms of distance, Thorpe End lies closer to the facilities of Thorpe St. Andrew than those in the Great and Little Plumstead parish</p>						

Public Transport

- 12.3.16 Norwich is well served by bus services with a range of service providers including Anglianbus, First Norfolk & Suffolk, Konectbus, Norfolk Green and Sanders.
- 12.3.17 Most bus and coach services run from Norwich bus station and/or from Castle Meadow. Norwich also has six Park & Ride sites run by Norfolk County Council using colour-coded buses, making Norwich's Park & Ride scheme one of the larger UK operations, providing over 5000 parking spaces.
- 12.3.18 The majority of public bus services operate in the urban areas and run mainly on the radial routes in and out of Norwich City. These offer good frequency services within the built-up areas during the day and in the evenings, although these can be hampered by traffic congestion in peak periods. The bus route linking the Norfolk and Norwich University Hospital and the University of East Anglia (UEA) to the railway station via Norwich city centre operates 24 hours a day.
- 12.3.19 There are a number of interchange points for onward bus or pedestrian journeys within the City centre (Castle Meadow, St Stephens Street and at Anglia Square, as well as the bus and rail stations and at the Park & Ride sites). Interchange points are also present at the airport, the hospital and UEA.
- 12.3.20 Rail routes and services would not be affected by the proposed NDR, and as a result, have not been considered within this assessment.

12.4 Mitigation

Construction

- 12.4.1 During construction, all diversion routes for PRoW and road closures will be sign posted clearly, with the intention of minimising construction delays and driver frustration. Since the road would be a new road passing across a predominantly agricultural landscape, the majority of the route will be built off-line with no interference to existing roads, reducing the disruption and consequent driver stress caused during construction. In addition, the construction programme will be developed to ensure that disruption to motorised and non-motorised users is minimised wherever possible. The following measures have already been agreed with regards to the construction programme, so as to ensure that disruption is minimised:

- Breck Farm Way will remain open until the new Marriott's Way structure is completed.
- A new roundabout is created where the NDR crosses Reepham Road. This will be constructed in phases using traffic signals to control the traffic.
- A new roundabout is created where the NDR crosses Drayton Lane. This will be constructed in phases using traffic signals to control the traffic.
- The construction of the new roundabout on Holt Road will be constructed in phases using traffic signals. This will be constructed before the permanent diversion of Drayton Lane is undertaken.
- A new roundabout is created where the NDR crosses Reepham Road. This will be constructed in phases using traffic signals to control the traffic.
- A new roundabout is created where the NDR crosses Drayton Lane. This will be constructed in phases using traffic signals to control the traffic.
- A new interchange is created where the NDR crosses Cromer Road. This will be constructed in multiple phases using traffic signals to control the traffic. As part of these works Holt Road, Hall Lane (Holly Lane) and New Home Lane will all be stopped up at the interchange. No closure will be applied for on this important county road.
- The emergency access to the airport from Old Norwich Road will be closed. Alternative emergency access through the site compound will be discussed with the Airport Authority.
- A new roundabout is created where the NDR crosses North Walsham Road. This will be constructed in phases using traffic signals to control the traffic.
- The construction of the tie-ins at Buxton Road will be undertaken in phases using traffic signals to control the traffic.
- A new roundabout is created where the NDR crosses North Walsham Road. This will be constructed in phases using traffic signals to control the traffic.
- A new roundabout is created where the NDR crosses Wroxham Road. This will be constructed in phases using traffic signals to control the traffic.
- A new roundabout is created where the NDR crosses Salhouse Road. This will be constructed in phases using traffic signals to control the traffic in order to construct the tie-ins.

- At Newman Road access to the park will be maintained at all times necessitating the use of traffic signals to construct the tie-ins.
- Plumstead Road will only be closed off peak to facilitate the delivery and placing of the bridge beams. At other times traffic will be controlled with signals to allow the abutments to be constructed.

Operation

12.4.2 Impacts for motorised and non-motorised users of the existing network have been taken into account with regards to severance and changes to journey length and amenity in developing the Scheme design. As a result, the Scheme incorporates several roundabout junctions along the route to give direct access to the following radial routes and the communities they link with. Where individual or joint access to properties would be severed by the proposed NDR, arrangements would be made to provide new access points to existing roads.

12.4.3 In addition, a grade separated junction would be provided at the crossing with the A140 Cromer Road, which would also give access to the B1149 Holt Road. The new junctions would be designed to meet the joint objectives of minimising delay for vehicles passing through the junction whilst maintaining a safe passage of all road users.

12.4.4 Visibility standards for the proposed NDR will be in accordance with DMRB Volume 6, thus providing good sight distances to junctions, across verges, and around obstacles such as safety barriers. The junctions at the A140 Cromer road and the A47 at Postwick would be grade separated, with the remaining junctions as roundabouts, although some may require traffic signal control to optimise traffic movements and enable safe crossing for non-motorised users. All junctions would have appropriate advance signing to assist drivers to make route choices in good time. Together with the inclusion of a series of dedicated cycle ways and footpaths, these measures would ensure that vehicle travellers' fear of potential accidents is low, thus resulting in a positive benefit for Driver Stress once the Scheme is open.

12.4.5 Approximately 25km of new links suitable for use by NMUs would be provided along the route, together with improved surfacing on some existing rights of way (refer to Drawings MMD-0592-0597 of Volume 2, Chapter 12: Effects on All Travellers, Section E). The new routes would link to existing facilities, and would be screened from the road by a combination of low mounds and/or hedge and tree planting. They include the following (approximate lengths):

- Bridleways = 11487m;
- Cycle Track = 2140m;
- Cycle Track (with right of way on foot) = 288m;
- Shared Use Footway Cycleway = 7039m;
- Private Means of Access (PMA) = 5848m;
- PMA combined with Cycle Track (with right of way on foot) = 425m;
- PMA combined with diverted Restricted Byways = 966m (RB6 93m + RB5 646m + RB3 227m);
- PMA combined with Bridleway = 2497m;
- PMA combined with Cycle Track = 1140m; and,
- Restricted Byway (RB7) = 73m.

12.5 Assessment of Impacts - Construction

12.5.1 Construction of new highways can have short-term impacts, which are defined as those that cease at the latest by the beginning of the design year. Beneficial and adverse impacts have been included within this assessment, and are detailed below.

Motorised Users

Views from the road

12.5.2 Since the proposed NDR is a new road set within a rural setting, the changes to views that vehicle travellers in private vehicles or users of public transport (coaches and buses) would experience during construction would be limited to those existing routes that intersect with the new road and construction footprint.

12.5.3 There would be no views of construction works for vehicle travellers using the Scheme as the road would not be open to vehicle travellers until the day of opening. Therefore the impact of the construction on views from the proposed Scheme is not relevant to this assessment.

12.5.4 A temporary adverse impact is likely to be experienced by those motorised users passing along routes within the ZVI and which intersect with the NDR

as a result of changes from a rural, high quality outlook to that of a temporary construction site. The location of construction compounds, storage areas and borrow pits outside the road corridor are defined in outline. Views for vehicle travellers within the ZVI may be restricted by construction plant, stock-piles and construction infrastructure. However, the construction sequence has been optimised to avoid double handling of material and excessive vehicle movements (e.g. the earthworks balance is designed such that only localised movement of material will be necessary along individual stretches of the new road). Intermittent views may be afforded for some affected routes for a temporary period, where the proposed Scheme or associated construction activities would be perceptible, but would not alter the overall balance of features and elements that comprise the existing view for motorised users. In some key locations, such as intersections with the proposed Scheme, the construction stage may result in a restricted view for a temporary period. In these instances, the proposed Scheme and associated construction plant and stockpiles/ earthworks would form a noticeable feature or element of the view which is readily apparent to the motorised user.

12.5.5 Impacts at each of the key locations within the study area are identified in Table 12.11 below.

Table 12.11 Construction stage impacts for the View from the Road for Affected Routes within the ZVI

Location	Sensitivity of receptor	Change in view from the road during construction	Significance of Impact
Fakenham Road	Low	To the north of Fakenham Road, an area of temporary topsoil storage has been allocated, in the vicinity of the proposed Fakenham Road Roundabout. In addition, two areas for the temporary diversion of traffic are included to the south-east and north-west of the proposed roundabout. Vehicle travellers would experience restricted or intermittent views as a result of the construction activities for the duration of the construction period, due to the presence of construction vehicles, stock-piles and equipment.	Slight Adverse
Fir Covert Road	Low	A temporary topsoil storage area has been allocated to the west of the Fir Covert Road roundabout. An area for the temporary diversion of traffic whilst the Fir Covert Road tie-in is completed is also identified on the northern approach to the proposed NDR. Combined with the presence of construction plant and materials storage, there would be a temporary restriction in views for vehicle travellers throughout the construction period.	Slight Adverse
Breck Farm Lane/ Furze Lane	Moderate	Breck Farm Lane/ Furze Lane would remain open until the Marriott's Lane structure is completed. A temporary topsoil storage area has been allocated to the west of the intersection with the proposed NDR and a compound area to the east of Marriott's Way (adjacent to Breck Farm Lane). The presence of construction plant, materials stockpiles, and welfare facilities for construction activities would result in intermittent and restricted views for vehicle travellers on	Slight Adverse

Location	Sensitivity of receptor	Change in view from the road during construction	Significance of Impact
Reepham Road	Low	<p>Breck Farm Lane for a temporary period, until the diversion of Breck Farm Lane is complete.</p> <p>At the intersection with the proposed NDR, vehicle travellers along the Reepham Road would experience restricted views due to the presence of two temporary topsoil storage areas, and temporary diversion areas to the east and west of the junction whilst the tie-ins are constructed. A haul road crossing point has been identified for off-peak times at the Reepham Road roundabout. The presence of construction plant crossing the Reepham Road would also result in a restricted view for a temporary period.</p>	Slight Adverse
Drayton Lane	Low	<p>A site compound is proposed to the west of the Drayton Lane roundabout, as well as a temporary topsoil storage area. The presence of construction plant, materials storage and welfare facilities would restrict views to the west for vehicle travellers on this route.</p>	Slight Adverse
Holt Road	Low	<p>Vehicle travellers along Holt Road would experience intermittent and restricted views at the tie-ins with the Holt Road/ Drayton Lane roundabout for a temporary period. However, for the majority of the route, views would be open, with no perceptible change in the view towards the proposed NDR since it is at such a distance that the road construction would be a barely noticeable feature.</p>	Neutral

Location	Sensitivity of receptor	Change in view from the road during construction	Significance of Impact
Cromer Road	Low	Cromer Road intersection would involve much construction activity, for a long duration. Temporary topsoil storage areas have been allocated within close proximity to Cromer Road, but these are likely to be at such a distance as to be barely perceptible for vehicle travellers. However, the main site compound is proposed to the east of the Cromer Road intersection, and the presence of construction plant and machinery, as well as site hoardings would be likely to result in restricted or no views for vehicle travellers for a temporary period.	Moderate Adverse
Hall Lane	Moderate	Hall Lane would be stopped up during the construction period for the proposed NDR. Prior to this commencing, vehicle travellers on this route would experience restricted or the complete loss of view to the north due to the presence of an extensive topsoil storage area.	Moderate Adverse
Old Norwich Road	Moderate	Old Norwich Road provides access to the Norwich Aviation Museum and some residential properties. Vehicle travellers using this route would experience intermittent views of construction activities within the close to middle distance.	Slight Adverse
Bullock Hill	Moderate	Bullock Hill would be stopped up during the construction period for the proposed NDR. Prior to this commencing, vehicle travellers on this route would experience intermittent views of construction activities to the south, for a temporary period.	Slight Adverse
Spixworth	Low	For the majority of Spixworth Road, views would be open, with no perceptible change in the view towards the NDR as it is at such a distance that the road	Neutral

Location	Sensitivity of receptor	Change in view from the road during construction	Significance of Impact
Road		construction would be a barely noticeable feature.	
St Faith's Road	Moderate	Vehicle travellers along St Faith's Road would experience intermittent or open views to the north, with no restriction in view to the south as a result of construction plant and activities until such time as the road is stopped up.	Neutral/ Slight Adverse
Quaker Lane	Moderate	Open views to the south would remain intact on the whole for Quaker Lane, although some intermittent views of construction plant and earthworks would be anticipated, particularly at the intersection with the proposed NDR. This would be until such a time as Quaker Lane is stopped up, where it currently meets with St Faiths Road.	Slight Adverse
Buxton Road	Low	Views to the east and west of Buxton Road for vehicle travellers would be restricted during the construction stage of the proposed NDR due to the presence of areas of topsoil storage, and a compound location and batching plant to the east of the intersection with the NDR. In addition, the construction of the proposed bridge over the NDR would result in restricted or no view for a temporary period whilst materials storage, site hoardings and significant construction plant are in situ. A temporary diversion strip would also be required to the west of Buxton Road.	Slight Adverse
Beeston	Moderate	Beeston Lane is currently used for access only, and would remain this way following completion of the Scheme. For the majority of Beeston Lane, views	Neutral

Location	Sensitivity of receptor	Change in view from the road during construction	Significance of Impact
Lane		would be open, with no perceptible change in the view towards the proposed NDR as it is at such a distance that the road construction would be a barely noticeable feature.	
North Walsham Road	Low	A large site compound area would be located to the west of North Walsham Road, with temporary topsoil storage areas situated to the east in the middle distance. Construction plant would make use of North Walsham Road to access the Haul Road (east and west bound access along the proposed NDR), and combined with the presence of welfare facilities and materials storage areas, vehicle travellers would experience restricted and in some cases no view during the construction period.	Moderate Adverse
Wroxham Road	Low	An off peak haul road crossing point is proposed at Wroxham Road, with two temporary diversions to enable the tie-ins to the proposed junction identified to the north and south of the proposed NDR. Intermittent views of construction activities would be afforded for vehicle travellers for the majority of the construction period, with some restricted views during peak activity.	Slight Adverse
Green Lane West	Low	For the majority of the construction period, views for vehicle travellers on Green Lane West would remain unchanged, as there are a number of residential and light industrial properties between Green Lane West and the location of construction activities. It is unlikely that there would be a perceptible change in	Neutral

Location	Sensitivity of receptor	Change in view from the road during construction	Significance of Impact
Green Lane East	Low	<p>views for vehicle travellers along this route.</p> <p>Some intermittent far reaching views of construction activities may be apparent for vehicle travellers passing along Green Lane East during the construction period. This is largely due to the presence of temporary topsoil storage areas, and also a site compound at a point adjacent to the railway line, in the middle distance from Green Lane East. On the whole, the distance from the proposed Scheme does mean that these activities are not likely to dominate the view for vehicle travellers.</p>	Slight Adverse
Salhouse Road	Low	<p>The presence of an area of topsoil storage to the west of Salhouse Road, when combined with the presence of construction plant and an off peak haul road crossing point means that views for vehicle travellers on Salhouse Road would be interrupted. Intermittent and restricted views for a temporary period are likely to occur throughout the construction period.</p>	Slight Adverse
Broad Lane	Moderate	<p>Some intermittent far reaching views of construction activities may be apparent for vehicle travellers passing along Broad Lane, particularly of the temporary compound that is located adjacent to the railway line. However, on the whole, the distance from the proposed Scheme does mean that these activities are not likely to dominate the view for vehicle travellers. Impacts upon views would be for a temporary period, until Broad Lane is stopped up at its junction with Plumstead</p>	Slight Adverse

Location	Sensitivity of receptor	Change in view from the road during construction	Significance of Impact
Plumstead Road	Low	<p>Road.</p> <p>Major earthworks to accommodate two new roundabouts, a site compound, batching plant and also topsoil storage areas are proposed at the intersection with Plumstead Road, with the NDR being carried over Plumstead Road on a bridge. The presence of construction plant, materials storage, welfare facilities and major earthworks does mean that the views from the road for vehicle travellers would be restricted, and in some instances completely blocked during the construction period.</p>	Slight Adverse
Middle Road	Low	<p>Middle Road would be carried over the proposed NDR on a bridge. As a result of these works, it is likely that there would be substantial earthworks, as well as presence of construction machinery and plant. Views for vehicle travellers would be restricted at the intersection with the proposed NDR for a temporary period.</p>	Slight Adverse
Toad Lane	Moderate	<p>For the majority of Toad Lane, any views of construction activities, earthworks and plant would be intermittent or in the middle to far distance. It is unlikely that views would be perceptible, with the exception of at the junction with Middle Road, where construction plant accessing the Middle Road bridge construction site may be present. Open views would be maintained for the majority of this route.</p>	Neutral

Location	Sensitivity of receptor	Change in view from the road during construction	Significance of Impact
Low Road	Moderate	A temporary topsoil storage area and compound location would be situated adjacent to Low Road. This road would be closed to vehicle traffic with the opening of the proposed NDR. However, until this point, views from the road would be interrupted for vehicle travellers, as a result of earthworks, materials storage and welfare facilities.	Slight Adverse
Green Lane South	Low	Some intermittent far reaching views of construction activities may be apparent for vehicle travellers passing along Green Lane South during the construction period. This is largely due to the presence of temporary topsoil storage areas to the north of Green Lane South, and major earthworks activities. However, the distance from the proposed Scheme and presence of agricultural structures between the road and construction site does mean that these activities are not likely to dominate the view for vehicle travellers.	Neutral
Smees Lane	Moderate	A temporary topsoil storage area would be situated within the middle distance to the east of Smees Lane. This road would be closed to vehicle traffic with the opening of the proposed NDR. However, until this point, views from the road would be interrupted for vehicle travellers, as a result of earthworks along the proposed Scheme.	Slight Adverse
A47	Low	The A47 is in cutting at the location where the majority of works associated with the proposed NDR would occur. As a result, there would be little or no change in	Neutral

Location	Sensitivity of receptor	Change in view from the road during construction	Significance of Impact
		the view from the road for vehicle travellers.	

12.5.6 Overall, the construction stage is unlikely to result in the total loss of view for any affected route, and all vehicle traveller receptors would be of low to moderate sensitivity to change (users of main roads or passengers in public transport on main arterial route, and users of scenic roads). On balance, it is considered that during the construction stage, there would be Slight Adverse impacts on the view from the road for all vehicle travellers for a temporary period.

Driver Stress

- 12.5.7 During the construction phase, the need to travel through road-works is likely to result in temporary short-term delays which may lead to driver frustration and route uncertainty due to the provision of traffic management and construction plant movement. On the whole, this would be limited to locations where existing roads would be stopped up during construction, but where the new route (the NDR) has not yet been opened, although there may also be disruption for motorised users in locations where utilities require upgrades or additional services to be installed as a result of the proposed NDR. In addition, construction traffic and route diversions may result in additional congestion on existing routes, through volume of traffic or the addition of HGVs on popular and rural routes.
- 12.5.8 The construction works would be for a temporary period only, but may result in potentially significant (temporary) impacts for some vehicle travellers due to route uncertainty and changes in journey length from traffic diversions. This is particularly likely to be the case for locations where sensitive receptors are present, such as school children or elderly people, and in locations with a poor accident record.
- 12.5.9 Table 12.12 discusses affected routes (as identified within the study area for Driver Stress; refer to Drawing MMD-233906-DT-0795, Volume 2, Chapter 12: Effects on All Travellers, Section A,) where temporary construction impacts for vehicle travellers are likely to occur. The current construction programme identifies locations where there would be substantial construction traffic and roadworks (refer to the NDR Construction Methodology prepared by Birse Civils in April 2013 for full details of public roads that construction plant would require access to in order to facilitate construction, as well as Volume 2, Chapter 12: Effects on All Travellers, Section B,, of this ES. This document also identifies the location of all construction plant crossing points). The proposed construction programme and suggested routes for construction

plant has been used to inform this assessment of construction stage Driver Stress.

Table 12.12 Construction stage impacts for motorised users (Driver Stress)

Route	Commentary	Presence of sensitive receptors/ Accident Record	Significance of Impact
A1067 Fakenham Road	The proposed NDR would commence with the construction of a new roundabout on the Fakenham Road. Traffic would be temporarily diverted at two locations adjacent to the existing road to enable the tie-ins to be completed. Construction plant would utilise this route (eastbound access required from the existing highway). Temporary adverse impacts as a result of driver frustration related to congestion, caused by slow moving plant is likely to occur.	Attlebridge nursery school located on the A1067. Accident Cluster E-005 at the junction with Breck Farm Way as the A1067 passes through Taverham.	Moderate Adverse during diversions, reducing to Slight Adverse for the remainder of the construction period.
Fir Covert Road	A new roundabout at Fir Covert Road is proposed. Temporary traffic diversions would be in place so as to enable the tie-ins to be completed at this location. Construction plant would utilise this route to access the proposed NDR.	No sensitive receptors. No accident records.	Moderate Adverse during diversions, reducing to Slight Adverse for the remainder of the construction period.
Breck Farm Way	Breck Farm Way would remain open until the new Marriots Way structure is completed. It is then intended to apply for a short term closure to allow all of the tie-ins to	No sensitive receptors. Accident cluster E-005 at the	Moderate Adverse during the closure of Breck Farm Way;

Route	Commentary	Presence of sensitive receptors/ Accident Record	Significance of Impact
Reepham Road	<p>be completed. Temporary adverse impacts are anticipated for motorised users of this route due to increased journey times, and from the presence of construction plant.</p> <p>A new roundabout would be created where the NDR crosses Reepham Road. This would be constructed in phases using traffic signals to control the traffic. A temporary closure may also be applied for to facilitate the final tie-ins. Adverse impacts for vehicle travellers are anticipated due to route uncertainty caused by diversions, leading to increased driver stress for a temporary period. In addition, construction plant will utilise this route, resulting in low to medium level driver frustration due to slow moving plant.</p>	<p>junction with Breck Farm Way and the A1067.</p> <p>Several schools, medical facilities and elderly care homes within Taverham – likely to use Reepham Road for access.</p> <p>Cluster V-002 and V-003 at the junction with Hall Lane and Drayton Lane.</p>	<p>Slight Adverse for the remainder of the construction period.</p> <p>Moderate Adverse throughout the construction period, at the intersection with the proposed NDR. Slight Adverse for other locations along the Reepham Road</p>
B1149 Holt Road	<p>The construction of the proposed new roundabout on Holt Road would be undertaken in phases using traffic signals to control the traffic. This would be completed prior to the permanent diversion of Drayton Lane. Holt Road would then also be stopped up at the intersection with the new NDR near to the Cromer Road roundabout. Adverse</p>	<p>Horsford Medical centre.</p> <p>Horsford junior and infant schools.</p> <p>Cluster N-001 at the Manor</p>	<p>Moderate Adverse whilst the construction of the roundabout is undertaken and construction vehicles</p>

Route	Commentary	Presence of sensitive receptors/ Accident Record	Significance of Impact
	<p>impacts (low level) for vehicle travellers are anticipated as a result of signalised traffic leading to increased journey times and driver frustration. In addition, construction plant will utilise this route, resulting in low to medium level driver frustration due to slow moving plant.</p>	<p>Farm Junction.</p>	<p>utilise this route. Slight Adverse for the remainder of the construction period.</p>
Drayton Lane	<p>A new roundabout is created where the NDR crosses Drayton Lane. This would be constructed in phases using traffic signals to control the traffic. A temporary closure may also be applied for to facilitate the final tie-ins, and construction plant will utilise this route to access the haul road. Adverse impacts are anticipated due to route uncertainty and increased journey times, leading to increased driver frustration and stress for a temporary period.</p>	<p>Drayton infant and junior school; Drayton medical centre. No accident records.</p>	<p>Large Adverse impact during the closure of Drayton Lane; Slight Adverse for the remainder of the construction period.</p>
Church Street	<p>No construction activities or diversions on this road. Construction plant not anticipated to use this route.</p>	<p>No sensitive receptors. No accident records.</p>	<p>Neutral</p>
A140 Cromer Road	<p>A new interchange would be constructed where the NDR crosses Cromer Road. This would be constructed in multiple phases using traffic signals to control the traffic.</p>	<p>No sensitive receptors. Cluster record I-001 at the</p>	<p>Moderate Adverse</p>

Route	Commentary	Presence of sensitive receptors/ Accident Record	Significance of Impact
	<p>No closure would be applied on this important county road, but construction plant will use this route (eastbound access to the main compound). Adverse impacts for vehicle travellers are anticipated as a result of signalised traffic leading to increased journey times and driver frustration, as well as slow moving construction plant leading to additional driver frustration.</p>	<p>junction with Horsham St Faith.</p>	
<p>Spixworth Road/ Church lane</p>	<p>No construction activities or diversions on this road. Construction plant not anticipated to use this route.</p>	<p>No sensitive receptors on this rural lane. No accident records.</p>	<p>Neutral</p>
<p>Buxton Road</p>	<p>There would be a temporary closure to construct the new Buxton Road tie-ins. This would result in a temporary low level adverse impact for vehicle travellers due to route uncertainty caused by diversions. In addition, construction plant access is required along this route, and as a result, there may be low level impacts for vehicle travellers due to increased driver frustration from slow moving construction plant.</p>	<p>Spixworth Infant School and Woodlands View Junior School – both on Ivy Road; access from Buxton Road. No accident records.</p>	<p>Large Adverse during the temporary closure of Buxton Road; Slight Adverse for the remainder of the construction period.</p>

Route	Commentary	Presence of sensitive receptors/ Accident Record	Significance of Impact
Croswick Lane	No construction activities or diversions on this road. Construction plant not anticipated to use this route.	No sensitive receptors, but lane passes directly through residential areas of Spixworth. No accident records.	Neutral
B1150 North Walsham Road	A new roundabout would be created where the NDR crosses this road. This would be constructed in phases using traffic signals to control the traffic. Adverse impacts for vehicle travellers are anticipated as a result of signalised traffic leading to increased journey times and driver frustration. Off peak use of this route would be required by construction plant, resulting in some low level, temporary impacts (driver frustration).	No sensitive receptors. No accident records at the intersection with the proposed NDR.	Slight Adverse
A1151 Wroxham Road	A new roundabout would be constructed at this location. This would be constructed in phases using traffic signals to control the traffic. Adverse impacts (low level) for vehicle travellers are anticipated as a result of signalised traffic leading to increased journey times and driver frustration. In addition, construction plant will utilise this route, resulting in low to medium level driver frustration	The Warren Home for the elderly; numerous schools within Sprowston with access from Wroxham Road, but no other sensitive receptors on the A1151. No accident records at the	Slight Adverse

Route	Commentary	Presence of sensitive receptors/ Accident Record	Significance of Impact
	due to slow moving plant.	intersection of the proposed NDR.	
Green Lane West	Green Lane West remains open to all traffic through the construction period. Construction plant are anticipated to utilise this road to access Plumstead Road and the temporary compounds located here, which would be likely to result in increased driver frustration from slow moving plant.	Village hall and recreation ground. Cluster T-001 at the junction with Salhouse Lane.	Slight Adverse
Salhouse Road	A new roundabout would be created where the NDR crosses Salhouse Road. This would be constructed in phases utilising a road closure to construct the tie-ins. Low level adverse impacts for vehicle travellers are anticipated due to route uncertainty caused by diversions, and increased journey times, leading to increased driver stress for a temporary period.	Holy Trinity Church and Ashfields Home for the elderly. Cluster T-001 at the junction with Green Lane West.	Moderate Adverse during closures, reducing to Slight Adverse for the remainder of the construction period.
Plumstead Road	Plumstead Road would only be closed off peak to facilitate the delivery and placing of the bridge beams. At other times traffic would be controlled with signals to	Sensitive receptors within Thorpe End – post office, community hall and medical	Large Adverse during closures (off peak only), reducing to

Route	Commentary	Presence of sensitive receptors/ Accident Record	Significance of Impact
	<p>allow the abutments to be constructed. This would result in low to moderate adverse impacts for vehicle travellers due to route uncertainty caused by diversions, as well as increased journey times, leading to increased driver stress for a temporary period. Access to site compounds and bridge construction sites for heavy plant would also be required, which may lead to increased driver frustration.</p>	<p>centre. Cluster U-004 at the junction with Broad Lane.</p>	<p>Slight Adverse for the remainder of the construction period</p>
Middle Road	<p>Middle Road would be closed to allow the bridge and side road to be constructed. This would result in adverse impacts for motorised users as a result of route uncertainty caused by the diversion.</p>	<p>No sensitive receptors. No accident records.</p>	<p>Moderate Adverse during the closure of Middle Road, reducing to Neutral once the road is re-opened</p>
Low Road	<p>Low Road would remain open until the Middle Road bridge has been constructed and is open for use. Traffic that has been temporarily diverted from Middle Road would be likely to utilise this route, resulting in increased Driver Frustration and Driver Stress for those existing users of this route.</p>	<p>No sensitive receptors. No accident records.</p>	<p>Slight Adverse</p>

Route	Commentary	Presence of sensitive receptors/ Accident Record	Significance of Impact
Smee Lane	Smee Lane would remain open until the Middle Road bridge has been constructed and is open for use. Traffic that has been temporarily diverted from Middle Road would be likely to utilise this route, resulting in increased Driver Frustration and Driver Stress for those existing users of this route.	No sensitive receptors. No accident records.	Slight Adverse
A1042/ A140 Outer Ring Road	No construction activities or diversions on this road. Construction plant not anticipated to use this route.	Sensitive receptors within close proximity of this road. Numerous accident clusters.	Neutral
A47	No construction activities on this road. Construction plant are anticipated to use the eastbound diverge.	No sensitive receptors. Several accident clusters at junctions.	Slight Adverse
A147 inner Ring Road	No construction activities on this road. Construction plant not anticipated to use this route.	Sensitive receptors within close proximity of this road. Numerous accident clusters.	Neutral
A1242 Yarmouth	No construction activities on this road. Construction plant	Sensitive receptors within close proximity of this road.	Neutral

Route	Commentary	Presence of sensitive receptors/ Accident Record	Significance of Impact
Road	not anticipated to use this route.	proximity of this road. Accident clusters at the junctions with the inner and outer ring-roads.	
A11	No construction activities on this road. Construction plant not anticipated to use this route.	No sensitive receptors. Accident clusters at junctions.	Neutral
A1074 Dereham Road	No construction activities on this road. Construction plant not anticipated to use this route.	Sensitive receptors within close proximity of this road. Several accident clusters.	Neutral
A1056 Ipswich Road	No construction activities on this road. Construction plant not anticipated to use this route.	Sensitive receptors within close proximity of this road. Accident clusters at the junction with the inner ring-road.	Neutral
B1108 Wotton/ Earlham	No construction activities on this road. Construction plant not anticipated to use this route.	Sensitive receptors within close proximity of this road.	Neutral

Route	Commentary	Presence of sensitive receptors/ Accident Record	Significance of Impact
Road		Several accident clusters.	

12.5.10 Large Adverse impacts have been identified for a number of locations where roads would be closed for a temporary period during the construction stage. These are:

- Large Adverse impacts during the closure of Drayton Lane. This would only be for the duration of the final tie-ins. All closures would be overnight with temporary diversion routes fully signposted so as to minimise impacts upon vehicle travellers and access;
- Large Adverse impacts during the closure of Buxton Road. This would only be for the duration of the final tie-ins. All closures would be overnight with temporary diversion routes fully signposted. This would minimise impacts upon vehicle travellers, and access to Spixworth and schools within this village; and,
- Large Adverse impacts during the closure of Plumstead Road. This would only be for the duration of the delivery and placement of the bridge. All closures would be off-peak with temporary diversion routes fully signposted.

12.5.11 Moderate Adverse impacts are anticipated at most of the intersections with the proposed NDR due to increased journey time from waiting at temporary signals and route uncertainty. Moderate Adverse effects are also likely for locations where temporary diversions, construction plant and congestion is likely and there are sensitive receptors and/ or a poor accident record. However, a Construction Environmental Management Plan (CEMP) would be implemented for the Scheme, which would incorporate the phasing strategy and measures to minimise impacts upon road users, such as through the use of signing and traffic signals. Adverse impacts as result of increased driver frustration due to the presence of construction plant and increased congestion would be minimised in many locations.

12.5.12 Several routes within the study area for Driver Stress would be unaffected by the proposed works during construction. A Neutral impact is anticipated for these routes.

12.5.13 Taken together, with the provision of temporary diversion routes immediately adjacent to the affected route, and construction sequencing so that the majority of road closures would occur outside of peak times, a Moderate to Slight Adverse impact for Driver Stress is anticipated for the duration of the construction period, with Large Adverse effects likely at only two locations for a temporary period.

Non-Motorised Users

12.5.14 It is anticipated that during the construction process, there would be increased movement of construction plant and associated road works. Together, this can lead to NMUs being deterred from making their usual routes, resulting in a temporary adverse impact for NMUs due to severance during construction. In addition, the construction stage is predicted to result in short term impacts upon NMUs as a result of the temporary closure or diversion of PRow, resulting in increased journey times due to diversions, or deterrence from making trips.

12.5.15 The current construction programme identifies the following locations (Table 12.13) where PRow used by NMUs would be closed or diverted for a temporary period only. Locations where there would be substantial construction traffic and roadworks that may result in NMUs being deterred from making journeys have also been assessed (refer to Volume 2, Chapter 42: CEMP for the NDR Construction Methodology prepared by Birse Civils in April 2013 which provides further details of public roads that construction plant would require access to in order to facilitate construction. This document also identifies the location of all construction plant crossing points).

Table 12.13 Construction stage impacts for Affected Roads

Location/ NMU Route	Commentary	Significance of Impact
A1067 Fakenham Road	A temporary diversion of this road for vehicle traffic (vehicles looped onto a 10m wide strip adjacent to the existing carriageway) would be required, but through access would be maintained. In addition, the haul road for the proposed Scheme would exit onto the A1067 and there would be construction plant associated with the temporary topsoil storage area at Chainage 0 to 1740. High cyclist activity has been recorded along the A1067 and this temporary diversion, plus the presence of construction plant may result in NMUs altering their journeys for a temporary period. NMUs, including school children, wishing to access facilities within Taverham such as Taverham High School, from north of the Fakenham Road may be deterred from making journeys on foot or bicycle due to increased congestion and construction traffic on the A1067.	Moderate Adverse
Attlebridge RB3	Temporarily diverted to the west at the point where it would cross the NDR, until the final diversion (to Fakenham Road Roundabout) is in place. Access would be maintained throughout the construction period.	Neutral
Marriott's Way	Temporarily closed to enable the new bridge over the NDR to be constructed. However, Breck Farm Way would remain open until the new structure is completed. A short term closure to allow all of the tie-ins to be completed would be required. This would result in a temporary Slight Adverse impact for NMUs accessing this route during the construction period.	Slight Adverse
Reepham	A temporary closure of Reepham Road for approximately 1 week is required to complete the tie-in to the new roundabout at this location. Long diversions for cyclists using this route may result,	Slight Adverse

Location/ NMU Route	Commentary	Significance of Impact
Road	<p>resulting in an adverse impact for 1 week. Construction plant would require access along this route, and an off-peak construction plant crossing point would also be required. NMU access to services to the south of Reepham Road would be maintained (within Thorpe Mariott and further south to Taverham and Drayton) since delays on Reepham Road would be unlikely to affect routes within these residential areas. To the north, access to services within Felthorpe and Horsford (such as Horsford Junior School) would also be maintained, with little or no disruption to local roads and NMU facilities. Delays for NMUs making medium to long distance journeys are likely on the Reepham Road, which will deter many from making their journey.</p>	
Bell Farm/ Horsford RB5	<p>To construct the side road to Bell Farm, a temporary closure would be required for the Bell Farm Track to construct the tie ins and also the Bell Farm overbridge. A temporary crossing point for construction plant would also be required. This temporary closure would result in a temporary severance for NMUs travelling between Horsford and Thorpe Mariott, particularly recreational walkers, cyclists and equestrians. Access to community facilities is unlikely to be affected since these are contained within the communities of Horsford to the north, and Taverham and Drayton to the south. Some school children travelling to Taverham High School from Horsford may be deterred from making their journeys, for a temporary period.</p>	<p>Slight Adverse, increasing to Moderate Adverse during the closure of Bell Farm Track</p>
Drayton Lane	<p>A temporary closure of Drayton Lane for approximately 1 week is required during construction of the new Drayton Lane roundabout. North/south access would be maintained via Cromer Road during this closure. This route will re-open as a cycle route only to the south of the NDR. However, long diversions for cyclists using this route for medium to long distance journeys may</p>	<p>Slight Adverse</p>

Location/ NMU Route	Commentary	Significance of Impact
Holt Road	<p>result during this construction timeframe, resulting in an adverse impact for 1 week. Construction plant will utilise this route for access to the haul road, and the presence of HGVs may deter some NMUs from making journeys during the construction period. It is unlikely that construction activities in this location would affect NMU journeys to community facilities, since facilities are contained within Horsford to the north and Drayton to the south.</p> <p>The construction of the new roundabout on Holt Road would be in phases, using traffic signals. Once the closure of Holt Road as a through road is complete, there would be a Moderate Beneficial impact for NMUs during construction due to reduced traffic volume. However, until this point, construction plant would utilise this route (east and westbound access), and as a result, impacts for NMUs would be adverse for a temporary period, particularly those making medium to long distance journeys by bicycle. NMU accesses to community facilities are unlikely to be affected.</p>	Slight Adverse
Cromer Road	<p>The new interchange at Cromer Road would be constructed in multiple phases, using traffic signals to control traffic. To facilitate the Cromer Road intersection and accommodate the proposed NDR, Hall/ Holly Lane and New Home Lane, along with Holt Road would be stopped up at this intersection. Cromer Road would remain open throughout the construction period, but the presence of construction plant (access along this route required), and the closure of minor through routes prior to new NMU routes (cycleways and footpaths) being in place, would result in a temporary adverse impact for NMUs. Some temporary severance of access to community facilities in Hellesdon to the south would be likely, particularly for school children travelling from</p>	Moderate Adverse

Location/ NMU Route	Commentary	Significance of Impact
Old Norwich Road	<p>Horsham St Faith to the north of the proposed NDR to Helleston High School. Other facilities (primary school and medical centre) are contained within Horsham St Faith.</p> <p>Old Norwich Road would be stopped up at the start of construction, removing the emergency access to the airport. An alternative emergency access will be provided (to be confirmed with the Airport Authority). This road does not have any through access, and therefore, NMUs are unlikely to be affected by this change.</p>	Neutral
Buxton Road	<p>A temporary closure of Buxton Road for approximately 1 week is required during construction of the new Buxton Road overbridge. North/ south access would be maintained via North Walsham Road during this period. Long diversions for cyclists using this route for middle to long distance journeys may result during this construction timeframe, resulting in an adverse impact for 1 week. Construction plant would utilise this route, which may further deter NMUs from making their journeys prior to and post closure of the road. Whilst the majority of community facilities can be found within Spixworth to the north of the proposed NDR, Buxton Road does provide a direct link for NMUs wishing to access the broader community facilities in Old Catton to the south, via the Spixworth cycleway. The closure of the Buxton Road would result in an adverse impact for NMUs accessing this route, with north/ south journeys curtailed for a temporary period.</p>	Slight Adverse, increasing to Moderate Adverse during the closure of Buxton Road
North Walsham Road	<p>A new roundabout would be created on North Walsham Road, with traffic signals to control the traffic alongside off-peak lane closures. This would temporarily affect cyclists accessing this route, during the construction period. In addition, the presence of construction plant on this route may deter some NMUs from making medium to long distance journeys on this route, for a</p>	Slight Adverse

Location/ NMU Route	Commentary	Significance of Impact
	temporary period. Shorter distance journeys by those on foot are unlikely to be made on this busy arterial road.	
Wroxham Road	A new roundabout would be created on Wroxham Road, with traffic signals to control the traffic alongside off-peak lane closures. Pedestrians and equestrians are unlikely to make use of this busy, main arterial road, and construction activities in this location are unlikely to affect NMU access to community facilities. However, the proposed works would temporarily affect cyclists accessing this route for middle to long distance journeys (such as commuters). In addition, the presence of construction plant on this route may deter some cyclists from making journeys on this route altogether, for a temporary period.	Slight Adverse
Newman Lane	A temporary crossing will be in place at the point that this track crosses the NDR while the site to the south is used as a temporary compound location. Access will be maintained throughout the construction period. No access to community facilities.	Neutral
Green Lane (east and west)	Construction plant would utilise this route so as to access the proposed NDR via Salhouse Lane, as well as the temporary works compounds off Plumstead Road. The presence of construction plant may deter some NMUs from using this route during the construction period, particularly those wishing to access community facilities within Rackheath.	Slight Adverse
Salhouse Road	A temporary closure of Salhouse Road for approximately 1 week is required during construction of the new Drayton Lane roundabout. Alternative east/ west access would be maintained along Plumstead Road during this period. Long diversions for cyclists using this route may result during	Slight Adverse, increasing to Moderate

Location/ NMU Route	Commentary	Significance of Impact
	<p>this construction timeframe, resulting in a significant adverse impact for 1 week only. Construction plant would use this route for access to the main haul road, and a construction plant crossing point would be required. Additional traffic would also be present on this route during the closure of Plumstead Road (see below). This may deter some NMUs from making their journeys. This could particularly influence NMU movement between Rackheath to the east of the proposed NDR and Sprowston to the west, which has a broader range of community facilities.</p>	<p>Adverse during the closure of Salhouse Lane.</p>
Plumstead Road	<p>Plumstead Road would be closed off-peak for a period of approximately 1 week to facilitate the construction of the bridge over Plumstead Road. Alternative east/ west access would be maintained via Salhouse Road during this period. When combined with the presence of construction plant (access for site compound and bridge construction sites required), and temporary traffic management for the remainder of the construction period, this would result in adverse impacts for cyclists and other NMUs passing between Thorpe End and Great and Little Plumstead.</p>	<p>Slight Adverse, increasing to Moderate Adverse during the closure of Plumstead Road.</p>
Middle Road	<p>Middle Road would be closed to all traffic for a temporary period during construction, to enable the new bridge to be constructed. This would result in a temporary adverse impact for NMUs using this route, particularly those gaining access to Great Plumstead. Low Road and Smea Lane would remain open during this period, allowing NMUs to move from east to west with only a minor diversion.</p>	<p>Moderate Adverse</p>
Low Road	<p>Construction plant would require access along this route whilst Middle Road is closed, and a construction plant crossing point would be required. The presence of construction vehicles may</p>	<p>Slight Adverse</p>

Location/ NMU Route	Commentary	Significance of Impact
	<p>deter some NMUs from making their journeys. Once Middle Road is open, Low Road would be permanently closed. Due to the nature of this narrow, rural road, it is unlikely that NMUs using this route would be accessing key community facilities within Great Plumstead or Thorpe St Andrew.</p>	
Smea Lane	<p>A construction plant crossing point at the junction with the proposed NDR (and haul road) would be required on this route. Once Middle Road is open, Smea Lane would be permanently closed. Until this point, impacts are only likely to be slight for NMUs as construction plant will not make use of this road (apart from at the crossing location).</p>	Slight Adverse
Pedestrian footpath within Thorpe End	<p>Construction of the proposed mini-roundabout at the Broadland Drive junction would result in temporary impacts for NMUs accessing the village shops in this location, due to the presence of construction plant and potential temporary diversions for existing footpaths. This would be for a temporary period only.</p>	Slight Adverse

12.5.16 Increased congestion and construction traffic on PRoW used by NMUs due to the proposed NDR construction period would result in adverse impacts for NMUs. When combined with potential increases in journey times, and temporary severance from community facilities for medium length trips due to road and rights of way closures, these impacts are likely to result in an adverse impact for pedestrians and cyclists for a temporary period.

12.5.17 Moderate Adverse impacts would arise during the temporary closure of some routes, for a maximum period of one week at any one location, such as at Buxton Road. However, when considered against the full construction timescale, and given that where a route would be temporarily closed, access would be maintained via an alternative route (albeit with increased journey times), it is not thought that the overall impact would be significant. Impacts upon equestrians would be minimal, since the majority of closures would be to existing motorised routes that are not suitable for equestrians. On balance, impacts at the construction stage for NMUs are considered to be Slight Adverse for a temporary period.

12.6 Assessment of Impacts – Operation

12.6.1 The predicted long-term impacts of the proposed NDR for both motorised and non-motorised users are identified below. This includes those impacts that will continue in or after the design year, with both beneficial and adverse impacts identified.

Motorised Users

View from the Road

12.6.2 The sections of the route identified accord with those sections identified within the Visual Impacts assessment of the Landscape and Visual Impact Chapter of this ES. In addition, existing routes that are within the boundaries of the ZVI for the NDR and are therefore considered to be affected by the proposals have been included within this assessment. It should also be noted that Motorised Users that make the change from the existing route network to the new NDR would expect to experience a change in the view from the road. Where the existing routes would intersect with the NDR, the view from the road for motorised users is likely to be restricted, changing from a rural setting to one of a dual carriageway corridor with associated landscape planting.

12.6.3 An assessment of views from the road for the proposed Scheme is presented within Table 12.14 below. This summarise the view from the road impacts

associated with the main links identified within the ZVI and for the NDR itself. In addition, Table 12.15 also provides an assessment of views from the road for vehicle travellers utilising the proposed Scheme.

Table 12.1 View from the road impacts for Affected Routes

Location	Sensitivity of receptor	Change in view from the road (2017/ 2032)	Significance of Impact
Fakenham Road	Low	There would be a change from open views over arable land from the Fakenham Road to restricted views in some locations due to the presence of the NDR and associated infrastructure. This is particularly true at the intersection with the NDR, where a new roundabout would be constructed. Existing and proposed planting along the proposed NDR would act to screen the road once it has matured at Year 15.	Slight Adverse visual impacts are reduced to Neutral by Year 15.
Fir Covert Road	Low	There would be little change from open views to the east and west of Fir Covert Road over arable land with the introduction of the proposed NDR, as Fir Covert Road runs north/south and the proposed NDR would be in cutting. Some intermittent and restricted views would be expected at the intersection with the NDR with the presence of a new roundabout and associated highways infrastructure.	Neutral.
Breck Farm Lane/ Furze Lane	Moderate	No views for vehicle travellers would be afforded on Scheme opening as these routes would be closed to all motorised traffic.	Receptor not applicable on Scheme opening.
Reepham Road	Low	Existing open views across arable land to the north or Reepham Road would be restricted due to the presence of the proposed NDR and associated planting. West of the intersection with the NDR, open views	Slight Adverse impacts would reduce to Neutral at

Location	Sensitivity of receptor	Change in view from the road (2017/ 2032)	Significance of Impact
		would be maintained with no change. In some locations, views towards the NDR from the Reephams Road would be screened by proposed woodland planting, and landscape mounding.	Year 15.
Dog Lane	Moderate	Existing open views to the north and east of Dog Lane would be maintained, as well as intermittent views through existing woodland to the west. Far reaching views of the Norwich urban fringe to the south of Dog Lane would be interrupted with the provision of the NDR and areas of associated woodland and grassland planting, affording an improvement for vehicle travellers on this rural route.	Views to the south are likely to be improved due to planting. Impacts are likely to be Slight Beneficial at Year 15.
Drayton Lane	Low	Drayton Lane would be re-aligned at the intersection with the proposed NDR. The realignment and provision of a new roundabout means that existing open views would be restricted as a result of new highways infrastructure, and due to the presence of the NDR. Open views over arable land to the west of the Scheme would be maintained.	Restricted views afforded in some locations due to the realignment of this road. Therefore, impacts are likely to be Slight Adverse at worst.
Holt Road	Low	The part of Holt Road that is within the ZVI for the Scheme would be closed to all motorised traffic on Scheme opening. No views for vehicle travellers	Receptor not applicable on

Location	Sensitivity of receptor	Change in view from the road (2017/ 2032)	Significance of Impact
Cromer Road	Low	<p>would therefore be afforded.</p> <p>Existing open views to the east and west of Cromer Road within the ZVI for the proposed NDR would become dominated by the proposed Scheme. This is because the Cromer Road would be carried over the NDR on an overbridge, and as such, views would be restricted by bridge parapets and the presence of two roundabouts to the north and south of the NDR, even from an elevated position.</p>	<p>Scheme opening.</p> <p>Due to the presence of highways infrastructure, impacts are considered to be Slight Adverse.</p>
Hall Lane	Moderate	<p>No views for vehicle travellers would be afforded on Scheme opening as this route would be closed to all motorised traffic.</p>	<p>Receptor not applicable on Scheme opening.</p>
Old Norwich Road	Moderate	<p>The Old Norwich Road does not provide a through route, but is stopped up prior to the intersection with the NDR. Vehicle travellers are likely to be restricted to those requiring access and recreational users. Open views over arable fields towards Norwich Airport would become intermittent as a result of the presence of the NDR and associated earthworks.</p>	<p>Slight Adverse impacts are anticipated for a small number of users of this rural route.</p>
Bullock Hill	Moderate	<p>No views for vehicle travellers would be afforded on Scheme opening as this route would be closed to all motorised traffic.</p>	<p>Receptor not applicable on</p>

Location	Sensitivity of receptor	Change in view from the road (2017/ 2032)	Significance of Impact
Spixworth Road	Low	Southern views from Spixworth Road are currently over open fields, towards Norwich Airport. Existing views would be interrupted by woodland planting that would be included along the northern edge of the proposed NDR, at the airport roundabout. This would improve views for vehicle travellers along this main, but rural route, as the airport would be screened from view.	Scheme opening Improvements in views to the south for vehicle travellers would result in Slight Beneficial impact at Year 15.
St Faith's Road	Moderate	The part of St Faith's Road that is within the ZVI for the Scheme would be closed to all motorised traffic on Scheme opening. No views for vehicle travellers would therefore be afforded.	Receptor not applicable on Scheme opening.
Quaker Lane	Moderate	The part of Quaker Lane that is within the ZVI for the Scheme would be closed to all motorised traffic on Scheme opening. No views for vehicle travellers would therefore be afforded.	Receptor not applicable on Scheme opening.
Buxton Road	Low	Buxton Road would be carried over the proposed NDR on an overbridge. Existing views to the east and west of Buxton Road are across open arable fields, and these views would be restricted by the presence of the NDR, associated highways infrastructure, and the extensive woodland planting that is proposed in this location.	Slight Adverse impacts on Scheme opening would be reduced to Neutral at Year 15.

Location	Sensitivity of receptor	Change in view from the road (2017/ 2032)	Significance of Impact
Beeston Lane	Moderate	No views for vehicle travellers would be afforded on Scheme opening as this route would be closed to all motorised traffic.	Receptor not applicable on Scheme opening
North Walsham Road	Low	Existing views from North Walsham Road are dominated by plantation woodland and arable fields, creating intermittent far reaching views for vehicle travellers. The NDR would restrict views at the intersection with the proposed Scheme, where a new roundabout would be constructed. A woodland belt would be provided to the north west of the Scheme, creating a visual barrier for those travelling north. For those moving in a southerly direction, views would be maintained due to the presence of existing plantation woodland.	Slight Adverse impacts would reduce to Neutral at Year 15.
Wroxham Road	Low	Existing views from Wroxham Road are intermittent due to the presence of existing woodland plots and agricultural buildings to the east and west of the road. Views would be restricted at the intersection of Wroxham Road with the NDR where a new roundabout is proposed. Woodland planting to the south of the NDR would screen views for those travelling north on the Wroxham Road.	The change to existing views is likely to be Neutral for the sections of Wroxham Road to the south of the Scheme.
Green Lane West	Low	Views to the north and south of Green Lane West are currently intermittent, with pockets of development (residential and light industrial) interspersed with arable fields. Far reaching views to the south towards the proposed	There would be little change to existing views as a result of

Location	Sensitivity of receptor	Change in view from the road (2017/ 2032)	Significance of Impact
		NDR are not likely to be substantially altered as a result of existing woodland which would be supplemented with new planting.	the NDR on Green Lane West. Impacts are likely to be Neutral.
Green Lane East	Low	No views for vehicle travellers would be afforded on Scheme opening as this route would be closed to all motorised traffic.	Receptor not applicable on Scheme opening.
Salhouse Road	Low	Existing views to the east of Salhouse Road are open and across arable fields, whilst restricted views are afforded to the west due to the presence of woodland plots. The suburban extension to Rackheath village is visible for vehicle travellers moving north along the route. Within the ZVI for the proposed NDR, views would be interrupted due to the presence of road infrastructure and a new roundabout with the NDR. Some woodland planting associated with the Scheme would screen the Scheme for vehicle travellers travelling north and south on this road.	The introduction of additional highways infrastructure would restrict and detract from some open views across a rural landscape for Salhouse Lane. Slight Adverse, reducing to Neutral at Year 15.
Broad Lane	Moderate	Far reaching open views are currently afforded for vehicle travellers along Broad Lane, across arable fields to the north and south towards the	A change from open views to the south to

Location	Sensitivity of receptor	Change in view from the road (2017/ 2032)	Significance of Impact
		suburban fringe of Thorpe End. Existing views to the south would be interrupted in the middle distance due to the presence of two roundabouts associated with the NDR and the presence of the road.	intermittent views would result in a Slight Adverse impact for receptors of moderate sensitivity along this route.
Plumstead Road	Low	Existing views on Plumstead Road are currently restricted and intermittent, due to the presence of agricultural building, some residential plots and woodland, interspersed with arable fields. The presence of highways infrastructure and the introduction of two new roundabouts within the visual envelope for vehicle travellers using Plumstead Road would further restrict this view. However, some woodland planting around the proposed roundabouts would provide a screening function for those moving along the Plumstead Road, providing some improvement to the view.	Changes to existing views for receptors of low sensitivity are likely to be Neutral since existing views are intermittent and restricted.
Middle Road	Low	Views are currently intermittent and open, across arable fields and scenes of a rural nature, with some farm and residential buildings and woodland plots. Great Plumstead to the north is screened by existing woodland, and views of the suburban fringe to the south are restricted due to the presence of the railway line. Middle Road would be carried over the proposed NDR	Restrictions to the view as a result of the proposed NDR would result in a Slight Adverse

Location	Sensitivity of receptor	Change in view from the road (2017/ 2032)	Significance of Impact
		on an overbridge, and the introduction of substantial woodland planting in this location would restrict potential far reaching views for vehicle travellers in an elevated position. The presence of the NDR would detract from the view from Middle Road.	impact for vehicle travellers on Middle Road.
Toad Lane	Moderate	Open views are currently afforded for vehicle travellers along Toad Lane, across arable fields to the north and south towards the suburban fringe of Thorpe End, but are restricted in the middle distance by the presence of the railway line. Existing views to the south would be interrupted and restricted due to the presence of the proposed NDR, although some woodland planting around the Middle Road junction would improve this view.	Interruptions to the view to the south from Toad Lane would result in a Slight Adverse impact for receptors of moderate sensitivity.
Low Road	Moderate	No views for vehicle travellers would be afforded on Scheme opening as this route would be closed to all motorised traffic.	Receptor not applicable on Scheme opening.
Green Lane South	Low	Existing views along Green Lane South are intermittent and restricted due to the presence of woodland along field boundaries, farm buildings to the north and south and the railway line to the south. Views to the north towards the NDR are unlikely to be substantially altered as screening vegetation along the southern boundary of the proposed NDR would not	Views are unlikely to be altered for receptors of low sensitivity. Impacts are therefore likely to

Location	Sensitivity of receptor	Change in view from the road (2017/ 2032)	Significance of Impact
		detract from the existing view.	be Neutral.
Smea Lane	Moderate	No views for vehicle travellers would be afforded on Scheme opening as this route would be closed to all motorised traffic.	Receptor not applicable on Scheme opening
A47	Low	No views are currently afforded from the A47 to the west within the ZVI of the proposed NDR as the A47 is in deep cutting at this location. No change is anticipated.	Neutral

12.6.4 The proposed alignment for the NDR would have an impact upon the view from the road for vehicle travellers using existing routes within the ZVI. The Scheme design includes extensive mitigation and screening planting, as well as landscape mounds which would help to blend the proposed Scheme into the landscape and screen it from affected receptors, including vehicle travellers. However, on Scheme opening, it is likely that views from the road for affected routes would be interrupted due to the presence of highways infrastructure, vehicles and earthworks. This would detract from existing views, which are predominantly of an open, arable landscape, with woodland plantations. It is therefore anticipated that views from affected routes for vehicle travellers would be Slight Adverse on Scheme opening. However, once the extensive screening planting has matured at Year 15, this impact would be substantially reduced, so that overall, views from affected routes would be Neutral in the longer term.

Table 12.15 View from the road impacts for the proposed NDR alignment

Location	Sensitivity of receptor	View from the NDR	Significance of Impact
A1067 to Fir Covert Road	Low	From the A1067, the NDR would swing north to follow a secluded shallow valley along the foot of the wooded Deighton Hills, before swinging east to cross Fir Covert Road. The NDR would pass through a currently undisturbed and attractive area of countryside, but would follow the topography with screening woodland to the north and south of the proposed road. Vehicle travellers would be afforded intermittent and restricted views of the surrounding countryside.	Neutral/ Slight Adverse
Fir Covert Road to Reepham Road	Low	From Fir Covert Road, the proposed Scheme would cross open fields to pass under the Marriots Way cycle path to join the Reepham Road at a roundabout junction. This section would be in cutting for much of its length, although the Marriots Way would be prominent. Views for vehicle travellers would be restricted, with no views where the road is in cutting.	Slight to Moderate Adverse
Reepham Road to A140	Low	From Reepham Road the proposed Scheme would cut through the corner of a coniferous plantation on the edge of Drayton Drewray before crossing open fields to the north of Thorpe Marriot. Beyond Drayton Drewray, the proposed Scheme would follow a low ridge across open arable land to the A140, running roughly parallel with the busy Reepham Road before crossing the A140 Cromer road. Much of this route would be screened by mounding, with restricted and	Slight Adverse

Location	Sensitivity of receptor	View from the NDR	Significance of Impact
A140 to Quaker Lane	Low	<p>views afforded for vehicle travellers along the length of the proposed Scheme.</p> <p>At this location, the proposed Scheme would follow the northern boundary of the airport, but views of the surrounding landscape for vehicle travellers would be restricted on the whole. Some open views to the south of the Scheme would be provided for some of the length.</p>	Neutral/ Slight Beneficial
Quaker Lane to B1150	Low	<p>The proposed Scheme would pass through an attractive well wooded landscape, with opportunities for large woodland belts to be provided to link with the existing vegetation, particularly around the coniferous shelterbelt near Spixworth. This woodland and associated planting plans would create intermittent and improved views for vehicle travellers at this locality. Some screening mounding would act to restrict views for vehicle travellers, so that overall, beneficial impacts are reduced.</p>	Neutral/ Slight Beneficial
B1150 to Salhouse Road	Low	<p>From the B1150 the proposed Scheme would cross the northern part of former parkland (now arable farmland) surrounding Beeston Hall, before crossing open fields to join the A1151 Wroxham Road at a roundabout. Mounding would be provided throughout the length of this section, which would result in restricted or no view for vehicle travellers to the south of the proposed Scheme. However, some intermittent views would be afforded to the north. The proposed Scheme would pass through woodland between the village of Rackheath and Rackheath Hall to join the Salhouse Road at a new roundabout. Extensive</p>	Neutral/ Slight Adverse

Location	Sensitivity of receptor	View from the NDR	Significance of Impact
Salhouse Road to Plumstead Road	Low	<p>woodland planting is proposed along this section of the route, which would result in intermittent and improved views for vehicle travellers.</p> <p>From Salhouse Road the landscape character changes to become flat, open and largely featureless. The proposed Scheme would be elevated at this location where it passes over the railway line and existing Plumstead Road, but a combination of earth shaping, fencing and planting would be used to screen the road from the surrounding landscape. Nonetheless, the view for vehicle travellers would be open for much of the route, with intermediate views to the urban fringe to the south and rural landscapes to the north afforded.</p>	Slight Beneficial
Plumstead Road to Smee Lane	Low	<p>The NDR crosses Plumstead Road at a new roundabout before passing through tranquil arable farmland, punctuated by farm buildings, mature woodland copses and country lanes. A combination of mounding and planting would be used over this length, resulting in restricted and intermittent views to the north and south of the proposed Scheme for vehicle travellers.</p>	Neutral/ Slight Adverse
Smee Lane to A47	Low	<p>From Smee Lane, the landscape becomes more open with urban influences of business parks on the edge of Norwich becoming more prominent. At this location, views for vehicle travellers would be on the whole open, but of medium to low quality due to the dominance of development and the A47 junction infrastructure.</p>	Neutral/ Slight Beneficial

12.6.5 For those users of existing routes who would transfer to the proposed NDR, it is likely that they would experience a change in views from the road from their existing routes to that of the dual carriageway corridor. Where the proposed Scheme would be in cutting or fully screened with landscape mounds, the view from the road would be partially or fully restricted, resulting in adverse impacts for vehicle travellers. However, for large stretches of the proposed route, open views of an arable landscape with woodland plantations would be afforded, resulting in a positive impact upon views for vehicle travellers. On the whole, it is considered that the view from the road for those vehicle travellers that switch to the proposed NDR on Scheme opening would be Neutral.

Driver Stress

12.6.6 Tables 12.16 below identifies the key routes within the study area that would be affected by changes to traffic flows as a result of the proposed NDR, and the effect of these changes on Driver Stress. The magnitude of impacts has been determined according to changes in traffic between the design year without the NDR and the design year with the NDR (refer to Table 12.3). The presence of sensitive receptors on these routes such as schools and medical facilities, and the safety (accident) record influences the overall significance of impacts (see Table 12.4). Routes that would be closed to vehicle users have been removed from this assessment. Full details of the traffic changes for all links, shown as a percentage difference between flows for Year 15 after opening for the Do Minimum (no NDR) and Do Something (with NDR) Scheme are provided within Volume 2 of this Environmental Statement.

Table 12.16: Driver stress during the operation of the Scheme

Route	Presence of sensitive receptors	Accident Record	Traffic Changes (Design Year Do Min/ Do Something)	Significance of Impact
A1067 Fakenham Road	Attlebridge Nursery School located on the A1067, to the north of the proposed NDR. Several schools, medical facilities and elderly care homes within Taverham (A1067 severs this settlement).	Accident Clusters E-004 and E-005 located at the junction with Drayton Lane/ Low Road and Breck Farm Way. Further Clusters on the approach to the outer ring-road.	8% to 57% decrease in traffic flows for all links on the Fakenham Road to the south of the NDR up until the Outer Ring Road – Moderate to Major decrease. Slight decrease between the Inner and Outer Ring Road within Norwich centre (2 to 8 %). 68% increase in traffic on the Fakenham Road link immediately to the north of the proposed NDR (link provides access to the NDR).	Moderate to Large Beneficial immediately to the south-east of the proposed NDR due to traffic changes on a route with sensitive receptors and a poor accident record, reducing to Slight Beneficial within Norwich City Centre. Slight Adverse immediately to the north-west of the NDR intersection due to traffic flow changes.
A1067 Fir Covert Road	No sensitive receptors.	No accident data available.	51% decrease at the intersection with the NDR - major decrease.	Slight Beneficial due to traffic changes, where no sensitive receptors and no accident record is present.
Reepham	Hellesdon recreation	Accident Clusters	Up to 80% decrease in traffic up until	Moderate Beneficial due to

Route	Presence of sensitive receptors	Accident Record	Traffic Changes (Design Year Do Min/ Do Something)	Significance of Impact
Road	ground.	V-001 and V-002 at the junctions with Hall Lane and Drayton Lane respectively.	the junction with the stopped up Hall Lane/ Holly Lane – major decrease in traffic adjacent to Thorpe Mariott. 7% to 24% increase in traffic flows on all links on the approach to the inner ring road – moderate to major increase.	substantial traffic changes on a route with a poor accident record. Slight Adverse on the approach to the inner ring road.
Church Street	No sensitive receptors on this rural lane.	No accident data available.	75% decrease in traffic on link connecting Horsford with the A140 Cromer Road.	Slight Beneficial due to traffic changes, where no sensitive receptors and no accident record is present.
A140 Cromer Road	No sensitive receptors.	Accident Cluster I-001 at the junction with Horsham St Faith. Cluster I-002 at the junction with the outer ring-road.	10% and moderate increase in traffic flows immediately to the north of the proposed NDR at the intersection with the new route. Moderate decreases on approach to outer ring road.	Moderate Beneficial on the approach to the outer ring-road due to traffic changes on a route with a poor accident record. Slight Adverse immediately to the north of the proposed NDR.

Route	Presence of sensitive receptors	Accident Record	Traffic Changes (Design Year Do Min/ Do Something)	Significance of Impact
Spixworth Road/ Church Lane	No sensitive receptors on this rural lane.	No accident data available.	Between 32% and 52% decrease in flows for all links – major decrease.	Slight Beneficial due to traffic changes, where no sensitive receptors and no accident record is present.
C246 Buxton Road	Spixworth infant school and Woodlands view junior School – both of Ivy road; access from Buxton Road	No accident data available.	30 to 41% decrease in flows on links located to the north of the proposed NDR – major decrease. Moderate increase in traffic flows immediately to the south and through Old Catton, until reaching the Outer Ring Road. Major decrease between the Inner and Outer ring road within Norwich centre.	Moderate Beneficial to the north of the proposed NDR (adjacent to Spixworth), and within Norwich City Centre. Moderate Adverse impact to the south of the Scheme within Old Catton.
Croswick Lane	Post-office; residential properties front onto the route.	No accident data.	Up to 31% decrease in traffic flows – major decrease.	Slight Beneficial due to traffic changes, where sensitive receptors are present.
B1150 North Walsham	No sensitive receptors	Accident Clusters O-001 and O-002 at the junction with	37% to 47% increase in traffic flows on links to the north of the proposed	Slight Adverse to the north of the proposed NDR due to traffic flow changes.

Route	Presence of sensitive receptors	Accident Record	Traffic Changes (Design Year Do Min/ Do Something)	Significance of Impact
Road		the outer ring-road and on the approach to the inner ring-road.	NDR. Major decreases in traffic flows to the south of the Scheme towards and within Norwich centre.	Moderate Beneficial on the approach to Norwich City Centre.
A1151 Wroxham Road	The Warren Home for the elderly; numerous schools within Sprowston with access from Wroxham Road, but no other sensitive receptors on the A1151.	Accident Cluster G-001 at the junction with the outer ring-road, and G-002 and G-003 as Wroxham Road passes through Sprowston.	Up to a 58% increase in traffic flows to the north-east of the intersection with the proposed NDR. Major decrease in traffic flows to the south-west of the intersection with the proposed NDR, through the built up area of Sprowston.	Slight Adverse impact to the north of the proposed NDR where the Wroxham Road passes through Sprowston on the approach to Norwich.
Green Lane West	Village hall and recreation ground.	Accident Cluster T-001 at the junction with Salhouse Lane.	Up to a 33% decrease in flows – major decrease.	Moderate Beneficial.

Route	Presence of sensitive receptors	Accident Record	Traffic Changes (Design Year Do Min/ Do Something)	Significance of Impact
Salhouse Road	Holy Trinity Church and Ashfields Home for the elderly.	Accident Cluster T-001 at the junction with Green Lane West. Accident Cluster W-001 at the junction with Blue Boar Lane on the edge of Sprowston.	Major increase to the east of the intersection with the proposed NDR (up to 11%). Major increase to the west of the intersection with the NDR, until the intersection with the outer ring road. Decrease in flows from this point towards Norwich centre.	Moderate Adverse.
Plumstead Road	Sensitive receptors within Thorpe End – post office, community hall and medical centre.	Accident Clusters U-001 and U-002 between the inner and outer ring-roads. Accident Cluster U-003 at the junction with the outer ring-road. Accident Cluster U-004 at the junction with Broad Lane.	Major increase in traffic flows immediately to the east and west of the intersection with the proposed NDR (up to 51% increase). Slight to moderate decrease in flows further west towards Norwich Centre, particularly between the inner and outer ring road.	Moderate Adverse immediately either side of the proposed NDR. Large Beneficial within Norwich City between the inner and outer ring road.

Route	Presence of sensitive receptors	Accident Record	Traffic Changes (Design Year Do Min/ Do Something)	Significance of Impact
Middle Road	No sensitive receptors	No accident data available.	35% decrease in flows on the link between Green Lane North (west of the NDR) and Great Plumstead – major decrease	Slight Beneficial due to traffic changes, where no sensitive receptors and no accident record is present.
A1042/ A140 outer ring road	Numerous sensitive receptors within close proximity of this road.	Numerous Cluster Records on outer ring road. The majority of these are at junctions.	Moderate to major decreases on all links between A1067 and A47. Slight to negligible change on links to the south of the A1067.	Moderate to Large Beneficial impacts due to substantial traffic changes on this road, with a poor accident record and sensitive receptors.
A47	No sensitive receptors.	Accident Cluster records for the majority of junctions on this road.	Variance between slight increase in traffic flows at the intersection with the proposed NDR (Postwick intersection), and slight to moderate decrease in flows to the west of Norwich centre.	Given that no sensitive receptors are present on this A-road, the change in traffic flows as a result of the proposed NDR would have an overall Neutral impact upon Driver Stress on the A47.
