A147 Inner	Numerous sensitive receptors within close	Cluster Records on inner ring road. The	Slight to moderate increases for the majority of links associated with the	Moderate Adverse due to traffic flow increases on this

Route	Presence of sensitive receptors	Accident Record	Traffic Changes (Design Year Do Min/ Do Something)	Significance of Impact
Ring Road	proximity of this road.	majority of these are at junctions.	inner ring road.	route with sensitive receptors and poor accident record.
A1242 Yarmouth Road	Sensitive receptors within close proximity of this road.	Accident Cluster H-001 at the junction with the outer ring-road.	Moderate to major decrease in traffic flows on the approach to Norwich centre (up to 14%).	Moderate Beneficial.
A11	No sensitive receptors.	Accident Clusters at the junction with the A47, outer and inner ring-road.	Negligible change in flows	Neutral.
A1074 Dereham Road	Sensitive receptors within close proximity of this road.	Several accident Clusters between the A47 and the outer ring road, and on the approach to the inner ring road.	Slight to moderate decrease in flows at the intersection with the A47. Negligible change further towards Norwich centre.	Slight Beneficial due to traffic changes on a road with a poor accident record.
A1056	Sensitive receptors within close proximity of	No accident	Negligible to slight decrease in flows	Neutral to Slight Beneficial.

Route	Presence of sensitive receptors	Accident Record	Traffic Changes (Design Year Do Min/ Do Something)	Significance of Impact
Ipswich Road	this road.	records.	(up to 2% decrease).	
B1108 Watton/ Earlham Road	Hospital and crematorium located adjacent to the B1108.	Several accident Clusters between the A47 and the inner ring road.	Negligible to slight decreases in flows for the majority of links from the A47 towards Norwich centre.	Slight Beneficial due to decreased flows on a road with sensitive receptors and a poor accident record.

12.6.7 It is considered that for the operational period, there would be a long-term beneficial effect on Driver Stress for vehicle travellers using affected routes, due to reduced frustration from reduced congestion and improved journey time reliability. Following the opening of the NDR, current traffic forecasts predict reductions in traffic flows for the majority of radial routes, and within a number of the suburbs to Norwich such as Taverham, Sprowston, and Thorpe St Andrew, as well as for some villages to the north of the proposed NDR such as Horsham St Faith, Spixworth and Rackheath.

12.6.8 Traffic reductions are also predicted for the majority of links along the outer ring road. These areas, which are predominantly residential with properties fronting onto roads and sensitive receptors present, are likely to experience a reduction in Driver Stress due to reduced congestion, a reduction in the fear of potential accidents brought about by lower traffic flows, and reduced driver frustration.

12.6.9 Some locations are likely to result in an increase in traffic on routes where there is already a poor accident record or high number of sensitive receptors. This includes some radial routes to the north of the proposed NDR (Wroxham Road, North Walsham Road, Salhouse Road and Plumstead Road), and for the inner ring road in Norwich City Centre. This may result in increased Driver Stress in some locations, particularly where pedestrians are likely to be and frequent accidents already occur (i.e. along the inner ring road).

12.6.10 Since the Driver Stress is likely to be substantially reduced for a large number of key and secondary routes with the NDR in place, it is likely that overall impacts for Driver Stress would be Moderate Beneficial across the Study Area.

Non-Motorised Users

12.6.11 The predicted permanent effects of the Scheme on the existing NMU network and on pedestrians, equestrians and cyclist activity within and between local communities are included within Tables 12.17 and 12.18 below. The description of effects takes account of the following factors:

- Effects of the new NDR, new junctions and new side roads;
- Changes to the existing highway infrastructure (stopping up of existing roads);
- New facilities provided for pedestrians, equestrians and/or cyclists;
- Changes to existing facilities for pedestrians, equestrians and/or cyclists;

- Changes in journey lengths by diverting existing footpaths, cycle routes and bridle ways which make these journeys less attractive;
- Changes in traffic flows (Design Year);
- Separation from essential services e.g. doctors' surgeries, schools, shops, leisure facilities etc.; and,
- Detriment to the amenity and severance of community routes which are used either for recreation or essential journeys to work or school.

Table 12.17 Permanent impact of the NDR for the NMU network

Community or specific NMU Route	Route Type	Impact of the NDR – Description of Effects	Significance of Impact
Attlebridge RB3	Restricted By-way	RB3 would be stopped up and diverted where it would intersect with the NDR. The diversion route would be along a private means of access, linking to the Fakenham Road roundabout and a shared cycleway/ footpath which would allow pedestrians and cyclists to cross the NDR. Overall, there would be an increase in journey length. However, this would be tempered with an improvement in amenities (provision of a dedicated cycle way/ footpath).	Neutral
Fir Covert Road	C-Road	High levels of pedestrian and cyclist activity have been recorded for the Fir Covert Road intersection. A new roundabout would be provided at this location, maintaining north south links and enabling NMUs to continue to use this route through the provisions of a combined footpath and cycleway around the roundabout, and bridleway links to the east and west along the northern boundary of the proposed NDR. There may be a slight increase in journey length as NMUs would need to navigate the Fir Covert Road roundabout. However, improvements to the existing amenities and the provision of additional bridleways would mean that this impact would be offset. No community severance issues identified. A 51% decrease in traffic flows in 2032 at the intersection with the NDR is anticipated.	Slight Beneficial

Community or specific NMU Route	Route Type	Impact of the NDR – Description of Effects	Significance of Impact
Marriott's Way	Footpath and cycle path	Marriott's Way would be carried over the NDR on a new Green Bridge. The proposals include the provision of a new bridleway at this location, ensuring that the existing use as part of National Cycle Route 1 is maintained. Overall, this is considered to be of little impact upon the NMU route once the Scheme has been opened, as the connection would be maintained. An improvement in amenity means that this is likely to be a beneficial impact.	Slight Beneficial
Drayton FP5/ Felthorpe FP21	Footpath	This existing footpath would not be altered by the proposed NDR Scheme. Connections to the Drayton Restricted By-Way 6 would be maintained. There may be some ancillary improvements to this amenity through the provision of a new cycleway along Dog Lane, which would connect with FP5/ 21. However, on balance, impacts are considered to be Neutral.	Neutral
Drayton RB6	Restricted By-way	RB6 would be diverted prior to its existing intersection with Reepham Road. The diversion would link the by way onto the new Reepham Road roundabout, and a proposed bridleway at this location. The current design incorporates an uncontrolled crossing point to the west of the Reepham Road roundabout. Despite the provision of a cycleway, footpath and bridleway at this location, there is potential for conflict between NMUs crossing at this point, and vehicles on the NDR, resulting in a potentially adverse impact.	Slight Adverse

Community or specific NMU Route	Route Type	Impact of the NDR – Description of Effects	Significance of Impact
Reepham Road	C-Road	High levels of cyclist activity have been recorded for Reepham Road where it would intersect the NDR. It is anticipated that there would be a slight increase in journey time as a result of the introduction of a roundabout at this location, and the provision of an uncontrolled crossing point. This would result in an adverse impact for NMUs, particularly cyclists. However, the 2013 traffic model predicts up to 80% decrease in traffic flows from the intersection with the proposed NDR to the junction with the stopped up Hall Lane/ Holly Lane, which represents a major decrease in traffic adjacent to Thorpe Mariott. This would be of benefit to NMUs using the Reepham Road.	Neutral
Long Dale	Track/ Desire Line	The Long Dale track would be stopped up where it intersects with the NDR, thus resulting in an increase in journey times for NMUs utilising this path between Thorpe Mariott and additional tracks to the north of the proposed NDR (which link to the Horsford RB5). However, Horsford RB5 is located less than 200m from this track, and this track would provide almost exactly the same access as the Long Dale track. As a result, whilst there is a slight loss of amenity for NMUs and slight increase in journey time for a small number of users (mostly dog and recreational walkers), the impact of closing the Long Dale track is not considered to be significant.	Slight Adverse
Horsford RB4	Restricted	Proposals for RB4 with the Scheme in place include improvements to the existing	Slight

Community or specific NMU Route	Route Type	Impact of the NDR – Description of Effects	Significance of Impact
(Dog Lane)	By-way	surface, to improve the suitability of this route for cyclists and pedestrians. This would be likely to provide benefits in terms of enhanced amenity and subsequent slight improvement in journey time for those already utilising the route.	Beneficial
Horsford RB5	Restricted By-way	RB5 would be carried over the NDR on an overbridge, with the private means of access maintained and improvements to the road surface to ensure that it meets appropriate bridleway standards. This will ensure that connectivity for NMUs is maintained between the villages of Horsford to the north, and the Thorpe Mariott estate to the south of the NDR. The By-way would be linked to a new cycle track with right of way on foot to the north of the NDR (which would link to the Horsford RB4), as well as to a proposed footway/ cycleway to the south of the NDR on Reepham Road. This would be likely to promote NMU activity for this route, and is considered to be a beneficial change as a result of the Scheme.	Moderate Beneficial
Horsford RB7	Restricted By way	RB 7 would be stopped up prior to where it currently meets Drayton Lane. This is so as to enable the by way to cross the new side road by means of a combined footpath/ cycleway, which would then continue south to the Drayton Lane roundabout. An uncontrolled crossing point would be provided across the Drayton Lane roundabout at this location, which may result in the potential for conflict between NMUs crossing at this point, and vehicles on the NDR. Whilst there would be an improvement in amenity with the provision of a dedicated cycle path	Slight Beneficial

Community or specific NMU Route	Route Type	Impact of the NDR – Description of Effects	Significance of Impact
		<p>and footway, and little change to journey length, there would still be a potentially adverse impact as a result of this conflict. However, the cycleway/ footpath would be extended to the south of the Scheme, providing a direct link onto Reepham Road, and ensuring continued connectivity between Holt Road to the north of the Scheme and Reepham Road to the South. Overall, this is considered to be of benefit.</p>	
Track running between Reepham Road and Glebe Farm	Track	<p>The existing track that would cross the NDR at Chainage 5150 would be closed. This would result in an adverse impact for NMUs, particularly dog and recreational walkers, wishing to gain access to Glebe Farm and areas of countryside to the north. However, several new NMU amenities, to include cycleways, bridleway and footways are proposed as part of the Scheme design within close proximity to this track, which would allow for north/ south access across the NDR, as well as access to the countryside. Nonetheless, the closure of this track would result in an adverse, albeit not significant, impact for some NMUs due to increased journey time and the closure of amenity.</p>	Slight Adverse
Drayton Lane	C-Road	<p>The existing Drayton Lane would intersect the proposed NDR alignment, with a new roundabout proposed to facilitate this junction. To the north and south of the NDR, the current Drayton Lane would be stopped up and replaced with a new carriageway. Where this occurs to the south of the Scheme, the replaced</p>	Slight Beneficial

Community or specific NMU Route	Route Type	Impact of the NDR – Description of Effects	Significance of Impact
		<p>sections of Drayton Lane would be reduced to a 3m wide cycle track, with right of way on foot. A refuge area would ensure that Drayton Lane is connected to Reepham Road for NMUs, and a proposed cycleway across the new roundabout would ensure that the north/ south connections are maintained. To the north of the Scheme, the cycleway would connect to the replaced Drayton Lane, which would be converted to a private means of access as well as providing rights of way for NMUs. Further north, this would connect with RB7, and on to Holt Road, which would be closed to all motorised traffic (see below), thus providing a continuous link to the existing and proposed NMU network. Such connectivity and the provision of additional and improved amenity for NMUs that is separated from motorised traffic would result in a beneficial impact for pedestrians and cyclists. However, the presence of the Drayton Lane roundabout would temper these benefits, as despite the provision of a refuge area, some NMUs are likely to be deterred from fully utilising this route as NMUs would be forced to interact with road traffic at the crossing.</p>	
Holt Road	C-B Road	<p>Holt Road would be closed to all motorised traffic to the east of the Drayton Lane roundabout once the Scheme is opened and after access is available to the NDR from Drayton Lane. Access for NMUs is maintained. Since high levels of cyclist activity have been recorded at Holt Road, this would result in a positive effect once the Scheme is operational for NMUs. There would be some adverse</p>	Moderate Beneficial

Community or specific NMU Route	Route Type	Impact of the NDR – Description of Effects	Significance of Impact
Hall Lane/ Holly Lane	C-Road	<p>changes as a result of increased journey times for those wishing to access Cromer Road to the south of the NDR via Holt Road as they would need to navigate the new Cromer Road roundabout, but on balance, the provision of a dedicated cycle track would be beneficial.</p> <p>Hall Lane would intersect with the proposed NDR at the Cromer Road roundabout. However, an additional junction tie in at this location has not been proposed, and as a result, Hall Lane would be stopped up and reduced to a 3m wide cycle track with rights of way on foot. Connections to Hall Lane from the east of the Cromer Road roundabout and to the North of the proposed NDR would be provided through the provision of a dedicated cycleway across the proposed NDR on the Cromer Road overbridge, and the widening of an existing cycleway/ footway on the existing Holt Road (south of the proposed NDR). Whilst this new arrangement may result in some increased journey times for NMUs wishing to continue on Holt Road to the north of the proposed NDR (see above), the new cycle track and right of way along Hall Lane would be of benefit to NMUs, particularly cyclists.</p>	Slight Beneficial
Cromer Road	A Road	High levels of cyclist activity have been recorded at the Cromer Road intersection. Cromer Road would be carried over the NDR by way of a new overbridge, with the provision of a dedicated cycleway/ footway passing along the	Moderate Beneficial

Community or specific NMU Route	Route Type	Impact of the NDR – Description of Effects	Significance of Impact
		<p>overbridge and maintaining the north/ south link. Whilst the change in amenity would be likely to result in a Neutral impact upon NMUs in terms of journey time, the provision of a dedicated path, and links to wider NMU network proposals, such as the stopped up Holt Road and a proposed cycle track along New Home Lane, would result in a Moderate Beneficial impact for NMUs at this location.</p>	
Cromer Road Roundabout/s	A Road	<p>Whilst new amenities for NMUs would be provided on either side of the roundabouts at the intersection of the proposed NDR with Cromer Road, and a cycleway would be provided across the NDR on the Cromer Road overbridge, NMUs would be required to navigate several crossings of live traffic lanes in order to access some of these amenities at this intersection. The benefits in terms of new amenity are associated with the closure of Hall Lane/ Holly Lane and New Home Lane. Potentially significant adverse effects as a result of the requirement to cross live traffic on Cromer Road at at least four locations for pedestrians and cyclists passing between Cromer Road to the south of the proposed NDR and Holt Road to the north are highlighted here.</p>	Moderate Adverse
New Home Lane	Un-classified road	<p>New Home Lane would be converted to a cycle track with right of way on foot, thus providing additional amenity and north/ south connections to Horsham St Faith for NMUs that is separated from motorised users. The removal of motorised traffic from New Home Lane would be of benefit for NMUs.</p>	Moderate Beneficial

Community or specific NMU Route	Route Type	Impact of the NDR – Description of Effects	Significance of Impact
Horsham St Faith and Newton St Faith FP5	Footpath	The proposed NDR Scheme would not alter the existing FP5. There may be some ancillary benefits to this amenity through the provision of a new cycleway along New Home Lane and Bullock Hill (see below), which would connect with FP5. However, on balance, impacts are considered to be Neutral.	Neutral
Bullock Hill	Un-classified road	Bullock Hill would be closed to all motorised traffic to the north and south of the proposed NDR. A bridleway is proposed to link the closed off Bullock Hill to the Airport roundabout that is proposed as part of the NDR, which would also include a footway and cycleway crossing point and link to the section of Bullock Hill that continues south of the NDR. Whilst NMUs would need to navigate the new roundabout, there would be an improvement in NMU amenity from the closure of Bullock Hill to motorised users. Access to the airport for pedestrians and cyclists would be maintained, and improved amenity for cyclists would be provided with the link to a combined private means of access and cycleway to the east of Bullock Hill.	Slight Beneficial
Quaker Lane/ St Faith's Road	Un-classified road	Quaker Lane and St Faith's Road would both be closed at the point where they intersect with the proposed NDR. Where Quaker Lane intersects with the NDR, a private means of access combined with a bridleway would be provided to the west of the Scheme, linking to the Airport roundabout. To the east, Quaker Lane would be passable by NMUs, and would provide non-motorised links to Buxton	Slight Beneficial

Community or specific NMU Route	Route Type	Impact of the NDR – Description of Effects	Significance of Impact
		<p>Road. Despite some potential for increased journey times as NMUs would only be able to pass north or south of the NDR at Buxton Lane or the Airport roundabout, the improvement in amenity for NMUs would result in a beneficial impact. The same situation would result from the closure of St Faith's Road to the south, where a link to a bridleway and private means of access combined with cycleway would provide connections to the Airport roundabout and Buxton Lane, where the NDR could be crossed. Some increase in journey time would reduce the beneficial impacts associated with improved amenity.</p>	
Spixworth BR1	Bridleway	<p>This bridleway would be severed between St Faiths Road and Quaker Lane, with no new crossing point proposed at this location. However, alternative NMU routes would be provided both to the north and south of the NDR, with the provision of cycleways, footpaths and a bridleway to link St Faiths Road and Quaker Lane to NDR crossing points at Buxton Road and the Airport roundabout, where the NDR can be crossed. A private means of access to the south of the Scheme, and the bridleway could be used by cyclists as well, and would link to the Spixworth Cyleway at Buxton Road. The improvement in amenity would be a beneficial impact of the Scheme. However, journey length would be increased for some NMUs, which would result in some adverse impacts for dog walkers and recreational walkers, and would reduce the beneficial impacts of this much</p>	Slight Beneficial

Community or specific NMU Route	Route Type	Impact of the NDR – Description of Effects	Significance of Impact
Beeston Lane	Un-classified road	<p>improved amenity.</p> <p>Beeston Lane is currently an un-classified road which is on the whole used as private access. This lane would be closed to all motorised users, except for access. NMUs would benefit from the removal of traffic on this route, providing an additional link from the Spixworth cycleway to Wroxham Road, and connections to the proposed bridleway to the south of the Scheme at Chainage 13150. The removal of motorised traffic from this road, and improvement in amenity links would result in an overall beneficial impact for NMUs, particularly cyclists.</p>	Moderate Beneficial
Spixworth cycleway	Cycleway	<p>The Spixworth cycleway currently runs north/ south along Buxton Road, connecting Spixworth with Old Catton. The proposed NDR would not affect this route, since Buxton Road would be carried over the proposed NDR on a new overbridge, and the cycleway would be reinstated. However, traffic predictions for the 15th year after opening (2032) indicate that there would be a moderate increase in traffic flows immediately to the south of the proposed NDR where the cycleway is present, and through Old Catton, until reaching the Outer Ring Road. Whilst cyclists are separated from motorised traffic, this increased in flows may deter some cyclists from using this route.</p>	Slight Adverse
North Walsham	B Road	<p>High levels of cyclist activity have been recorded for North Walsham Road where it would intersect the NDR. It is anticipated that there would be a slight increase</p>	Slight Adverse

Community or specific NMU Route	Route Type	Impact of the NDR – Description of Effects	Significance of Impact
Road		<p>in journey time as a result of the introduction of a roundabout at this location, and the provision of an uncontrolled crossing point. This would result in an adverse impact for NMUs, particularly cyclists. The traffic predictions for the 15th year after opening (2032) suggest that there would be a 37% to 47% increase in traffic flows to the north of the proposed NDR, but a major decrease in traffic flows to the south of the Scheme towards and within Norwich centre on the North Walsham Road. Overall, the provision of the roundabout and the increase in traffic to the north of the proposed NDR would be likely to deter some NMUs from making trips.</p>	
Track to the north of Beeston Lane	Track	<p>The existing track that would cross the NDR at Chainage 13150 would be closed. This would result in an adverse impact for NMUs, particularly dog and recreational walkers. However, a newly proposed bridleway would be included as part of the NDR, linking this track to Wroxham Road to the east. In addition, Beeston Lane would be closed to motorised users (except access), thus providing an additional NMU link to the west of the track location. The NDR could be crossed at both locations. Nonetheless, the closure of this track would result in an adverse impact for some NMUs due to increased journey time and the closure of amenity.</p>	Slight Adverse
Wroxham Road	A Road	High levels of cyclist activity have been recorded for Wroxham Road where it	Slight Adverse

Community or specific NMU Route	Route Type	Impact of the NDR – Description of Effects	Significance of Impact
Newman Track	Private access	<p>would intersect the NDR. It is anticipated that there would be a slight increase in journey time as a result of the introduction of a roundabout at this location, and the provision of an uncontrolled crossing point. This would result in an adverse impact for NMUs, particularly cyclists. In addition, traffic forecasts for 2032 suggest an increase in traffic for this link to the north of the NDR on Scheme opening, with up to a 58% increase in traffic flows to the north-east of the intersection with the proposed NDR. However, a major decrease in traffic flows to the south-west of the intersection with the proposed NDR, through the built up area of Sprowston is also anticipated, and the dedicated cycle links and footpaths would link to a newly proposed bridleway running to the east and west of the NDR (southern side), which would provide improved amenity for NMUs. This means that impacts are unlikely to be significant.</p>	
		<p>Newman Track currently provides a private means of access to Home Farm. The track is also used by NMUs for recreational walking and cycling, as well as horse riders. The access would be maintained through the provision of a new overbridge, to carry Newman Track over the proposed NDR. As a result, it is not considered that there would be any impact upon NMU use as a result of the NDR. However, the NDR proposals include the provision of a new bridleway link to the south of the alignment at this location, and connecting to the Newman Track. As a result, a beneficial impact for NMUs is likely to result through the</p>	Moderate Beneficial

Community or specific NMU Route	Route Type	Impact of the NDR – Description of Effects	Significance of Impact
Broad lane	C Road	<p>provision of new amenity.</p> <p>Broad Lane would be closed at the junction with Plumstead Road, thus reducing the traffic levels on this road as it would become access only. Access to the propped NDR would be via Salhouse Lane roundabout, and as such, it is expected that there would be a beneficial impact for NMUs using both Broad Lane and also Green Lane East. New bridleways would link Broad Lane with Plumstead Road both to the north and south of the NDR, as a bridleway combined with a private means of access would also run parallel with the railway line and pass under the NDR at this location. Overall, it is considered that the closure of this lane would result in an overall beneficial impact for NMU use.</p>	Slight Beneficial
Salhouse Road	C Road	<p>High levels of cyclist activity have been recorded for Salhouse Road where it would intersect the NDR. It is anticipated that there would be a slight increase in journey time as a result of the introduction of a roundabout at this location, and the provision of an uncontrolled crossing point. This would result in an adverse impact for NMUs, particularly cyclists. However, the dedicated cycle links and footpaths would link to a newly proposed bridleway running east of the NDR (southern side), and Green Lane to the north would also have a cycle track running its full length. These connections would provide improved amenity for NMUs. In addition, whilst traffic forecast flows predict an increase of 11% to the</p>	Slight Beneficial

Community or specific NMU Route	Route Type	Impact of the NDR – Description of Effects	Significance of Impact
Plumstead Road	C Road	<p>east of the intersection with the proposed NDR, a decrease in flows towards Norwich centre is predicted. These changes in traffic would be likely to result in little change to NMU activity.</p> <p>High levels of cyclist activity have been recorded for Plumstead Road where it would intersect the proposed NDR. However, the NDR would pass over the top of Plumstead road on an overbridge, and as a result, it is not anticipated that there would be any change to NMU activity with regard to pedestrians and cyclists. A bridleway would be incorporated into the Scheme design at this location (adjacent to the NDR to the east of the Plumstead Road roundabout, and along the railway line), linking with a wider network of bridleways to the north and south of the Scheme. This would be suitable for off-road cyclists as well. In addition, a segregated footway would be incorporated along the Plumstead Road where it passes under the proposed NDR. 2032 traffic forecasts suggest that traffic flows would increase on Scheme opening to the north and south of the Scheme at this location (up to 51%). Whilst the links would be maintained, some NMUs may be discouraged from making trips due to increased traffic, but this would be offset by the improvements to NMU amenities.</p>	Neutral
Great & Little Plumstead FP4	Footpath	<p>The NDR proposals would sever the existing Low Road where it would cross the NDR. FP4 connects to Low Road and Middle Lane, enabling NMUs to pass onto</p>	Neutral

Community or specific NMU Route	Route Type	Impact of the NDR – Description of Effects	Significance of Impact
and Great & Little Plumstead FP5 and Low Road		Low Road and transfer onto FP5 which also connects to Low Road. In addition, NMUs can pass along Low Road to the south of the proposed NDR to gain access. Whilst there would be some severance for NMUs, there would also be new amenity provided in the form of bridleways (which may also be used by mountain and hybrid pedal bikes, as well as pedestrians) to the north and south of the NDR which provide connections east/ west and enabling the NDR to be crossed at Middle Road. On balance, and with the provisions of this amenity, the impact upon the NMU network is not considered to be significant.	
Middle Road	C-Road	Middle Road would be carried over the proposed NDR on an overbridge, with the provision of a new cycleway on this bridge, and connections to a new bridleway running east/ west along the northern side of the NDR. This bridleway would connect to the closed Low Road, which would provide additional amenity for NMUs as traffic on Low Road would be for access only. A 35% decrease in traffic flows on Middle Road between Green Lane North (west of the NDR) and Great Plumstead is also predicted, which would be of benefit to NMUs utilising this route.	Moderate Beneficial
Smee Lane	C-Road	Smee Lane would intersect the proposed NDR, and as a result, would be stopped up at this intersection and closed to all traffic. The lane would remain as a private means of access to the north and south of the NDR, and would be	Slight Beneficial

Community or specific NMU Route	Route Type	Impact of the NDR – Description of Effects	Significance of Impact
Postwick FP2	Footpath	<p>combined with a bridleway. To the south of the proposed NDR, the existing Great and Little Plumstead FP5 would be upgraded to a bridleway, and would therefore provide east/ west links to Middle Road, where the NDR could be crossed by NMUs. To the north of the Scheme, there would also be a new bridleway provided, which would link Smee Lane to the Business Park roundabout and further east, as well as provide links to the west to Middle Road. However, there would be some north/ south severance as a result of this closure, resulting in an increase in journey times for some NMUs. Overall, the beneficial impacts realised as a result of improvements to amenity would be reduced by this north/ south severance effect, but beneficial impacts are still likely to arise.</p>	
		<p>FP2 would be closed at the point in which it intersects the existing A47 Norwich Southern Bypass. Access to the west would be maintained, but the eastern access across the A27 would be provided via new pedestrian, equestrian and cyclist links along the proposed NDR Scheme. A bridleway, which could be used by pedestrians and cyclists, would be provided between the Business Park roundabout and the Postwick North East roundabout, with a cycleway provided across the Postwick Bridge and connecting to the A1042 Yarmouth Road, as well as a southern connection to the Postwick Park and Ride and existing Postwick Bridge. As a result, whilst there would be a closure in NMU amenity, this is considered to be a significant beneficial impact for NMUs as the current</p>	Moderate Beneficial

Community or specific NMU Route	Route Type	Impact of the NDR – Description of Effects	Significance of Impact
		arrangement prevents east/ west movement due to the presence of the A47 high speed road.	

Table 12.18 Permanent impact of the NDR for NMUs within and between communities

Local Community	Impact of the NDR – description of effects	Significance of Impact
Attlebridge	<p>Attlebridge is a small settlement of a few properties, centred immediately north and adjacent to the A1067. Traffic forecasts for the year 2032 predict a 63% increase in flows where the Fakenham Road would pass through Attlebridge. In addition, a substantial increase in traffic flows (up to 85%) is predicted for year 2032 between Attlebridge and the A47 to the south, through the Wensum valley. There are no known routes that are regularly used within and between Attlebridge, and there would be no change to NMU amenity as a result of the proposed NDR within and connecting to Attlebridge. Traffic increases on the Fakenham Road would not directly impact upon Attlebridge centre, and non-motorised journeys to and from Attlebridge Nursery are unlikely to be affected as the increase in traffic would not introduce new severance.</p>	Neutral
Taverham	<p>In 2001, Taverham had a population of 10,233. It has seen recent population growth with the building of Thorpe Marriott, a new residential development that straddles the boundary with the neighboring village of Drayton. There are numerous local facilities, including the high and junior school, Taverham surgery and two churches. Numerous local NMU routes within and between these facilities have been identified. Traffic reductions are predicted with the Scheme in place on the Reepham Road as it passes Thorpe Marriott (up to 80% decrease in traffic flows from the intersection with the proposed NDR to the junction with the stopped up Hall Lane/ Holly Lane for the year 2032), and additional traffic reductions on roads within Taverham would result in a beneficial impact for NMUs within this predominantly residential location. In addition, the</p>	Slight Beneficial

Local Community	Impact of the NDR – description of effects	Significance of Impact
	<p>Scheme would incorporate new bridleway links to the north of Taverham, which could be used by pedestrians and off-road cyclists, and also link to Breck Farm Way to the north and south of the Scheme (connecting via the Marriott's Way which would be carried over the NDR). This would provide additional amenity for NMUs by use of Breck Farm Way, which would be closed to motorised traffic, linking to the new bridleways and maintaining connections to Marriott's Way and longer distance connections to Felthorpe to the north.</p>	
Felthorpe	<p>The village of Felthorpe is located to the north of Taverham, on the Taverham Road. Traffic flows on the Taverham Road are predicted to reduce by 28% in the year 2032 with the NDR, and by up to 42% on the Street. Whilst there are no additional amenities for NMUs included within the proposed Scheme design within or connecting to Felthorpe, this reduction in traffic would be of benefit for users, particularly those making journeys to and from the Felthorpe Church, as well as longer distance journeys towards Horsford, Taverham and central Norwich (cyclists).</p>	Slight Beneficial
Drayton	<p>Drayton is situated immediately to the east of Taverham. No additional amenity for NMUs is proposed within this community, but connections to the existing NMU network would be maintained and upgraded with improvements to the Marriott's Way. Traffic flows are predicted to reduce by 8 to 57% on Fakenham Road to the south of the NDR up until the Outer Ring Road, and where it passes through Drayton for the year 2032. This traffic reduction is likely to reduce existing community severance for NMUs accessing facilities within Drayton, and also those accessing facilities in Taverham and Hellesdon to the east. Particular relief from</p>	Moderate Beneficial

Local Community	Impact of the NDR – description of effects	Significance of Impact
Horsford	<p>severance is likely to be felt for school children travelling to the high school in Taverham, and elderly residents of the Home Instead Senior Care home.</p> <p>Horsford is a village situated 6 miles to the north of Norwich and to the north of the proposed NDR. Whilst there would be no additional amenity for NMUs proposed as part of the NDR Scheme, the closure of Holt Road to motorised users to the east of the new Holt Road roundabout would improve connections for NMUs between Horsford and Norwich. In addition, connections to Thorpe Marriott would be maintained as Horsford RB5 would be carried over the NDR. However, 8% to 12% traffic flow increases are predicted for the B1149 Holt Road as it passes through Horsford, which may deter some NMUs from making journeys. This may also slightly increase severance within the village as the Holt Road passes directly through the village, particularly for school children and parents wishing to access the pre and infant school located on one side of the Holt Road, or vulnerable users making journeys to the Horsford medical centre on the same side of Holt Road.</p>	Slight Adverse
Horsham St Faith	<p>Horsham St Faith lies immediately to the north of the proposed NDR and Norwich airport. Two newly proposed cycle tracks with rights of way on foot are included within the NDR design, which would provide connections to the Cromer Road roundabout and the proposed bridleways and cycleways at this location, and to the Airport roundabout. A proposed footpath and crossing point at the Airport roundabout would maintain NMU access from Horsham St Faith into the airport for users making this journey. Substantial reductions in the predicted traffic flows on the Spixworth Road and Church Road as they pass through Horsham (up to 75% for the year</p>	Moderate Beneficial

Local Community	Impact of the NDR – description of effects	Significance of Impact
	2032) would be of benefit for NMUs such as parents and school children making journeys to the primary school on the Manor Road, which would also see a reduction in traffic flows of 50%.	
Newton St Faith	Newton St Faith lies directly to the north of Horsham St Faith. No additional NMU amenities are proposed as part of the NDR Scheme for Newton St Faith. However, reductions in predicted traffic flows of 50% on Manor Road, which connects Newton St Faith with Horsham St Faith for the year 2032, would result in substantial relief of existing severance between the two villages for NMUs, particularly those making journeys to the primary school in Horsham St Faith.	Slight Beneficial
Hellesdon	Hellesdon is situated further to the east of Drayton towards Norwich centre. No additional amenity for NMUs is proposed within this community. Traffic flows are predicted to increase on the Reepham Road in the year 2032 where it passes through the centre of Hellesdon (7 to 24% increases in traffic flows on the approach to the inner ring road). This increase in traffic on Reepham Road would marginally increase severance within and between Hellesdon for school children making journeys to and from the numerous schools, as well as vulnerable users accessing the Hellesdon hospital and several residential care homes. However, this would be offset slightly by some decreases in predicted traffic flows on minor roads within Hellesdon, which are more likely to be used by pedestrians and cyclists.	Slight Adverse
Spixworth	Spixworth lies immediately to the north of the proposed NDR. Connections to communities to the south, and to Norwich would be maintained and enhanced thorough the provision of a footpath/ cycleway across Buxton Road, which would link to the existing Spixworth cycleway. Substantial reductions in traffic flows on the Crostwick Road as it passes through Spixworth for	Moderate Beneficial

Local Community	Impact of the NDR – description of effects	Significance of Impact
	<p>the year 2032 are predicted (up to 31%), which would result in relief from existing severance caused by high traffic flows on this road. This would be specifically beneficial for NMU journeys to and from the residential areas to the south of Crostwick Road to the infant and junior school on Ivy Road.</p>	
Crostwick	<p>Crostwick is a small settlement, focussed mostly on the North Walsham Road. There are no community facilities within the settlement, and there are no proposals within the NDR Scheme to provide additional amenities for NMUs. Traffic flow forecasts for the North Walsham Road show a 37% increase in flows for 2032, which may increase existing severance for NMUs making journeys to neighbouring parishes, particularly to the schools in Spixworth, and longer distance journeys to Norwich.</p>	Slight Adverse
Rackheath	<p>Rackheath lies immediately to the north of the proposed NDR, and would be connected to the NDR via Salhouse Road and also Plumstead Road (access from Green Lane East). The private means of access to Home Farm would be maintained with the Newman Track being carried over the NDR. This would provide links to new amenities for NMUs in the form of the proposed bridleway to the south of the NDR, which would also be used by pedestrians and off-road cyclists. In addition, traffic flows for Green Lane East and Broad Lane are predicted to substantially reduce as these roads are maintained as access only following the opening of the NDR, so that almost all traffic is reduced from this road, making this route highly suitable for NMU use. Traffic flows on Green Lane West would also substantially reduce for the year 2032 with the NDR in place by up to 33%. Whilst there would be some increase in flows on Salhouse</p>	Moderate Beneficial

Local Community	Impact of the NDR – description of effects	Significance of Impact
	<p>Road as it passes through Rackheath (up to 11% in 2032), the reduction in motorised users on other roads within the settlement would be of significant benefit to NMUs, particularly those making journeys to the primary school and recreation ground.</p>	
<p>Little Plumstead</p>	<p>Little Plumstead lies to the east of the proposed NDR, approximately 2500m away. There are no proposed amenities for NMUs included as part of the NDR Scheme, and the NDR is unlikely to affect NMU movements within and between the village from changes to amenity associated with the NDR. However, traffic flows on the Salhouse Road and Hospital Road as it passes through Little Plumstead are predicted to substantially reduce by the year 2032 with the proposed NDR in place (86% reduction, from 3369 vehicles a day to 468). These roads provide access between Little Plumstead Primary School and Little Plumstead Pre-school. Such a reduction in traffic flows would result in relief from existing severance for those wishing to access these key community facilities by non-motorised means, as well as those wishing to travel further afield such as Great Plumstead and on to Norwich.</p>	<p>Moderate Beneficial</p>
<p>Great Plumstead</p>	<p>Great Plumstead is located to the east of the proposed NDR within approximately 1200m. Connections to communities to the south would be maintained and enhanced for NMUs as a result of the inclusion of a network of bridleways, cycleways and footpaths running east/ west along the NDR in this location, and linking to Great Plumstead via the closed Low Road. In addition, traffic flows on all routes that converge in Great Plumstead are predicted to reduce by up to 86% with the NDR (for the year 2032), which would result in relief from some existing severance for NMUs within this village and making journeys between communities. This</p>	<p>Moderate Beneficial</p>

Local Community	Impact of the NDR – description of effects	Significance of Impact
Old Catton	<p>includes those wishing to access the primary and pre-school in Little Plumstead.</p> <p>There are no proposals as part of the NDR to increase or improve NMU amenities within Old Catton, but existing links with Spixworth would be maintained and enhanced through the provision of footpaths and bridleways centering on the Buxton Road overbridge. Traffic flows for the year 2032 with the NDR in place are predicted to increase by up to 13% on Buxton/ Spixworth Road where it passes through Old Catton, and there would be some increase on Lodge Lane with the infant and first school, as well as Old Catton Surgery. This would result in an increase in existing severance for local residents making non-motorised journeys to these community facilities. However, there would also be some traffic flow decreases along White Woman Road, where the junior school is located. In addition, traffic flows would decrease on routes moving further towards the outer ring road, and on the North Walsham Road to the east (which forms the village boundary with Sprowston).</p>	Slight Adverse
Sprowston	<p>Sprowston borders and expands the urban fringe of Norwich, to the north-east of the City, and sits between Old Catton and Thorpe St Andrew. No specific NMU amenities are included within the proposed NDR design for the Sprowston area. However, traffic flow reductions are predicted for the year 2032 for the majority of routes within the Sprowston area. In particular, a 63% reduction is predicted for the year 2032 with the NDR in place on Falcon Road, where the Falcon Junior School is located. Traffic reductions in this area would be of benefit for non-motorised journeys due to relief from existing severance caused by high traffic flows.</p>	Slight Beneficial
Thorpe St	Thorpe St Andrew borders Sprowston, and forms the eastern boundary of Norwich City. Links	Slight

Local Community	Impact of the NDR – description of effects	Significance of Impact
Andrew	<p>within this community would be maintained, with connections further afield also maintained or enhanced through the closure of Low Road and Smea Lane to motorised users, which would become suitable for NMUs. No additional amenities for NMUs would be provided as part of the proposed NDR within Thorpe St Andrew. However, the majority of links within Thorpe St Andrew are predicted to see a reduction in traffic flows for the year 2032 with the NDR in place, with increases in traffic flows localised around the Broadland Gate Business Park only. Traffic flow reductions are likely to result in some relief from existing severance caused by high traffic flows, particularly in the location of the numerous schools within Thorpe St Andrew.</p>	Beneficial
Thorpe End	<p>Thorpe End is a garden village on the outskirts of Norwich City. It is situated immediately to the west of the proposed NDR, adjacent to Thorpe St Andrew on the Plumstead Road. Whilst there would be some traffic increases on the Plumstead Road as it passes through Thorpe End (up to 11% on the approach from the proposed NDR to the village for the year 2032), the Scheme proposals include a mini-roundabout to be provided at the junction of Broadland Drive with Plumstead Road. Broadland Drive provides access to the Thorpe End local shops, including the Post Office. The existing junction causes localised congestion, and the provision of a mini-roundabout is anticipated to smooth flows. In addition, traffic flows to the south of this link are predicted to substantially reduce (27% reduction) by the year 2032 on the link between Plumstead Road. The existing zebra crossing and associated footways to the south of the Broadland Drive would be maintained, as well as the bus stop outside of the village shops, providing a dedicated crossing for NMUs in this location. An additional footway linking the Thorpe End village shops to St David's Drive to the south-west on the east-bound side of</p>	Slight Beneficial

Local Community	Impact of the NDR – description of effects	Significance of Impact
	<p>Plumstead Road would also be provided. This new amenity and the reduction in traffic on Plumstead Road adjacent to the village shops would mean that some relief from existing community severance would be expected for NMUs within Thorpe End. Movements between Thorpe End and local communities such as Thorpe St Andrew, Sprowston and central Norwich would be improved through traffic reductions on local roads.</p>	
Postwick	<p>Postwick is a village located to the south of the A47 on the outskirts of Norwich. It is separated from the proposed NDR by the A47. However, whilst no additional amenities for NMUs would be provided within the village itself, the Scheme proposals do include the provision of a network of footpaths and a cycleway to cross the A47 at the Postwick junction and which would connect up with Church Road and Oaks Lane leading into Postwick. This would improve NMU connections for the Postwick community, which is currently severed from Norwich by the A47 for NMUs.</p>	Slight Beneficial

12.6.12 Traffic increases for some rural and radial routes within the Norwich area would result in some localised adverse impacts for NMUs due to potential increases in community severance. This is because some NMUs may be deterred from making their existing journeys where roads with traffic increases would need to be crossed or where existing footways, cycleways and bridleways run adjacent to roads with traffic increases. Locations include:

- Traffic increases on Holt Road as it passes through Horsford;
- Traffic increases on North Walsham Road as it passes through Crostwick;
- Traffic increases on the Buxton Road where it passes through Old Catton (affecting the Spixworth cycleway); and,
- Traffic increases on Wroxham Road.

12.6.13 In addition, some slight increases in journey times for NMUs would be experienced as a result of the proposed junctions included within the NDR, such as at Cromer Road. This would be particularly relevant for cyclists, where navigating junctions may deter some users from making their journeys. However, these adverse impacts would be offset by approximately 25km of new links suitable for use by NMUs that would be provided along the proposed NDR and within adjacent communities, together with improved surfacing on some existing rights of way. In addition, the proposed NDR would incorporate seven locations with dedicated NMU crossings that are separated from traffic. These include:.

- Marriott's Way - cycleway and bridleway (no access for motorised vehicles);
- Bell Farm Track - Restricted By-Way and PMA;
- Cromer Road – dedicated cycleway adjacent to motorised traffic;
- Buxton Road – dedicated cycleway adjacent to motorised traffic;
- Newman Track – PMA;
- Plumstead Road - dedicated cycleway adjacent to motorised traffic; and,
- Middle Road - dedicated cycleway adjacent to motorised traffic.

12.6.14 Slight to Moderate Beneficial impacts would be experienced for NMUs in some locations where additional and new amenity would be provided, and

particularly where this would provide connections to essential community services such as schools and medical facilities. In addition, some relief from existing severance caused by high volumes of motorised traffic on rural and secondary routes, passing within residential communities, is to be expected for the year 2032, with the proposed NDR in place. This relief would be experienced for communities immediately adjacent to the new alignment, as well as for suburbs on the north-eastern fringe of Norwich, and would result in Moderate Beneficial impacts where access to key community services would be improved. On balance, the proposals would be expected to result in an overall Moderate Beneficial impact for NMUs by the year 2032 across the full study area for the Scheme.

Public Transport

12.6.15 Based on the current level of service provision, 18 public bus services would cross the route of the proposed NDR. These routes are illustrated on Drawing MMD-233906-DT-0938 of Volume 2, Chapter 12: Effects on All Travellers, Section H,. Of these, the majority would remain unaffected by the Scheme. Only a very small proportion of the existing bus services would have their route changed as a result of the proposed NDR. Impacts for these routes are described below.

- The bus services that currently use the A1067 Fakenham Road would continue to do so but would have to pass through the proposed Fakenham Road roundabout. The additional travel time is likely to be offset by reduced traffic congestion on the Fakenham Road (8% to 57% decrease in predicted traffic flows on Fakenham Road to the south of the NDR up until the Outer Ring Road for the year 2032).
- At Reepham Road, services intersecting the proposed NDR would be unaffected and would travel through the new at-grade junction with the NDR (Reepham Road roundabout).
- As Holt Lane would be converted to a restricted route between the proposed NDR and Horsford, services that currently run on Holt Road servicing Horsford would divert to the proposed NDR to travel between the Cromer Road and the Drayton Lane roundabouts, before re-joining Holt Road at the proposed Holt Road roundabout. This may result in an increase in journey times for those travelling to and from Horsford. However, it is anticipated that traffic flow reductions on the Cromer Road would also result in improved journey times for buses operating on this route.

-
- Services that currently use Cromer Road (A140) will pass through the dual roundabout junctions of the Cromer Road / NDR junction. This change to the route would be unlikely to impact upon journey times.
 - Services accessing Spixworth Road / Buxton Road would be unaffected as they would make use of the proposed bridge crossing over the NDR corridor.
 - Services that use North Walsham Road would make use of the proposed at-grade junction with NDR (North Walsham Road Roundabout). Any slight delay to journeys born from the requirement to navigate this roundabout would be offset by major decreases in traffic flows to the south of the Scheme towards and within Norwich centre on the north Walsham Road.
 - On Wroxham Road (A1151), services using this route would make use of the proposed at-grade junction with NDR (Wroxham Road roundabout). This minor change to the route would be offset by major decrease in traffic flows to the south-west of the intersection with the proposed NDR, through the built up area of Sprowston.
 - Services that use Salhouse Road at the point it intersects with the proposed NDR would make use of the proposed at-grade junction (Salhouse Road roundabout). However, predicted traffic flow increases on the Salhouse Road (up to 11% increase to the east of the intersection with the proposed NDR, and major increases to the west of the intersection with the NDR. Some decrease in flows from the Outer Ring Road to Norwich centre) may result in increased congestion affecting bus journeys.
 - On Plumstead Road, bus services using this route will pass under the NDR, but will travel through a new roundabout (off-set) junction linking to the proposed Plumstead Road roundabout. Journey times are unlikely to be affected.

12.6.16 Further information on the effects of the proposed NDR on Public Transport provision and journey times for Norwich is provided within the Transport Assessment for the Scheme (DCO Document 5.5). The Transport Assessment concludes that the proposed NDR and its associated complementary measures are predicted to reduce journey times overall. Bus services should achieve journey time savings due to reduced traffic flows on many of the key routes which currently experience congestion at peak times. Some increases to journey length and times would be offset by these improvements in traffic flows. On balance, impacts are considered to be de minimal for bus routes and bus users.

Climate Change mitigation and adaptation

12.6.17 Climate change is expected to have significant implications for infrastructure assets, particularly those with long operational lifetimes. This makes them sensitive not only to the existing climate at the time of their construction, but also to climate variations over the decades of their use.

12.6.18 With respect to All Travellers, there are a number of ways in which Climate Change can influence their behaviour and activities, and make an impact upon their journeys. For example, high and low temperature extremes may impact on thermal comfort for users of the road. However, this can easily be mitigated for users of private vehicles, through their heating and cooling facilities within the vehicle. Snow and ice build-up along the proposed NDR could affect vehicle travellers through reduced speeds and slower journey times, and also through an increase in risk and fear of road accidents. This could influence the levels of Driver Stress during times of adverse weather. In addition, an increasing number (in duration and intensity) of heavy precipitation events are predicted with Climate Change for the UK. Heavy precipitation events may result in standing water on the proposed NDR road surface, and reduced driving visibility for vehicle travellers, all of which may contribute towards enhanced levels of Driver Stress. Equally, adverse weather conditions may deter some NMUs from making their journeys.

12.6.19 Table 12.19 below provides a summary of potential impacts associated with Climate Change for All Travellers, and the broad measures that would be incorporated within the Scheme design to mitigate and adapt for Climate Change.

Table 12.19 Climate Change and Effects on All Travellers

Potential Impacts for All Travellers	Relationship to Climate Change Resilience	Proposed mitigation
Driver Stress - frustration, fear of potential accidents, and uncertainty relating to the route being followed.	Frustration from traffic jams or road closures/ diversions due to extreme weather events or flooding. Accidents due to poor driving conditions or flooding.	All proposed diversions and road closures will be sign posted clearly and diversions and closures are assessed as part of the Transport Assessment.
Stopping up and diversion of local road network and public rights of way.	Climate impacts can cause road closures and diversions due to inclement weather. The proposed Scheme would increase the area of hard standing, increasing surface run-off, which may increase flood risk for adjacent PRow. Climate impacts can affect pedestrians through direct exposure in open spaces as well as impacts such as spray from passing vehicles (pedestrians, people waiting in refuges or passengers waiting at bus stops).	All road closures to be fully sign-posted. Flood risk associated with the proposed road to be fully assessed within this ES and the FRA. This would account for Climate Change. A network of dedicated footpaths, bridleways and cycle routes that are segregated from vehicle traffic is included within the proposed NDR Scheme design.
Reduction of traffic levels on local roads, providing a better environment for pedestrians, equestrians and cycleways.	No significant climate change adaptation issues.	A network of dedicated footpaths, bridleways and cycle routes that are segregated from vehicle traffic is included within the proposed NDR Scheme design.

12.7 Conclusion

12.7.1 Impacts of the proposed NDR for Vehicle Travellers and NMUs have been fully considered within this assessment for a wide study area in relation to the proposed alignment. Following this assessment, it is considered that proposals for the NDR would result in an overall long term benefit for All Travellers, through the provision of a network of approximately 25km of new or improved routes suitable for NMUs, and by relieving some communities of high volumes of traffic which would transfer to the proposed NDR. However, some adverse impacts have been identified for some locations and some user groups.

12.7.2 Table 12.20 provides a summary of potential impacts for the construction and operational stage of the proposed NDR for All Travellers.

12.7.3 Overall, the assessment presented within this ES concludes that a Slight Adverse but not significant impact is anticipated for All Travellers during construction for a temporary period, as a result of construction delays, route diversions and the presence of construction plant. However, once the Scheme is operational, it is considered that there would be a Moderate Beneficial and therefore significant impact for All Travellers. This is as a result of reduced traffic and congestion on the majority of radial routes, improved amenity for NMUs and relief from existing severance within and between communities caused by existing high traffic levels.

Table 12.20 Summary of predicted impacts

Impact	Construction	Operation	Significance Construction/Operation
View from the Road	<p>During the construction stage, it is anticipated that there would be temporary Slight Adverse impacts on the view from the road for users of private vehicles and public transport passing along affected routes as a result of changes from a rural, high quality outlook to that of a temporary construction site. However, the construction stage is unlikely to result in the total loss of view for any affected route, and as a result, impacts are not considered to be significant.</p>	<p>The proposed alignment for the NDR would have an impact upon the view from the road for vehicle travellers using existing routes within the ZVI. The Landscape Design for the Scheme includes extensive mitigation and screening planting. By Year 15 when this screening planting has matured, it is expected that Slight Adverse impacts on Scheme opening for vehicle travellers would be substantially reduced, so that overall, long-term, views from affected routes would be Neutral. For those users of existing routes who would transfer to the proposed NDR, it is likely that they would experience a change in views from the road from their existing routes to that of the dual carriageway corridor. Where the proposed Scheme would be in a cutting or fully screened with landscape mounds, the view from the road would be partially or fully restricted. However, large stretches of the proposed route would provide open views of an</p>	<p>Slight Adverse/ Neutral (not significant)</p>

Impact	Construction	Operation	Significance Construction/Operation
		<p>arable nature and of woodland plantations for vehicle travellers. On the whole, it is considered that the view from the road for those vehicle travellers that switch to the proposed NDR on Scheme opening would be Neutral.</p>	
<p>Driver Stress</p>	<p>The need to travel through road-works for some motorised users, particularly at the intersections with the proposed NDR, is likely to result in temporary short-term delays which may lead to low to moderate level driver frustration and route uncertainty due to the provision of traffic management and construction plant movement. However, measures to minimise impacts, such as the phasing of works, and considering that the majority of the route would be constructed off line as it is a new road in a rural landscape, means that the</p>	<p>The appraisal of affected routes within the study area for Driver Stress which would experience traffic changes as a result of the NDR concludes that there would be a long-term Moderate Beneficial effect on Driver Stress for users of these routes due reduced congestion and improved flows on routes with sensitive receptors and a poor accident record. Traffic forecasts predict reductions in traffic flows for the majority of radial routes for the year 2032 with the NDR in place, as well as within a number of the suburbs to Norwich. However, some locations are likely to result in an increase in traffic on routes where there is already a poor accident record or high number of sensitive receptors. This includes some</p>	<p>Slight to Moderate Adverse/ Moderate Beneficial (significant long-term benefit)</p>

Impact	Construction	Operation	Significance Construction/Operation
	overall impact is likely to be Moderate to Slight Adverse , for a temporary period.	radial routes to the north of the proposed NDR (Wroxham Road, North Walsham Road and Plumstead Road), and for the inner ring road in Norwich City Centre.	
Non-Motorised Users	Overall, the construction stage is predicted to result in short term impacts upon NMUs as a result of the temporary closure or diversion of PRoW, resulting in an increase in journey times for some NMUs in a small number of locations. In addition, some NMUs may be deterred from making certain journeys during the construction stage due to the presence of construction plant and increased traffic on alternative routes due to diversions. However, some beneficial impacts are anticipated, where routes would be closed to motorised users during the	For NMUs, traffic increases for some rural and radial routes within the Norwich area would result in some localised adverse impacts due to potential increases in community severance, and journey time. This would be particularly relevant for cyclists, where navigating junctions may deter some users from making their journeys. However, adverse impacts would be mitigated by the provision of approximately 25km of new links suitable for use by NMUs that would be provided along the proposed NDR and within adjacent communities. In addition, the proposed NDR would incorporate seven locations with crossings that are suitable for NMUs and are separated from traffic. This provision, as well as some relief from existing severance within some communities, brought	Slight Adverse/ Moderate Beneficial (significant long-term benefit)

Impact	Construction	Operation	Significance Construction/Operation
	<p>construction stage (either temporary or permanent closures), thus enhancing the NMU environment. On balance, a Slight Adverse but not significant impact is anticipated during the construction stage.</p>	<p>about by a reduction in traffic flows in the Year 2032, particularly where key NMU routes have been identified (such as routes between schools), would result in an overall Moderate Beneficial impact for NMUs across the full study area for the Scheme.</p>	

13. Community and Private Assets

13.1 Introduction

13.1.1 Community and Private Assets is identified as a DMRB Topic within Interim Advice Note 125/09 Supplementary guidance for users of DMRB Volume 11 'Environmental Assessment'. However, the guidance contained within DMRB Volume 11, Section 3 has not yet been updated. As a result, the Community and Private Assets assessment incorporates the DMRB Topic of Land Use and includes a Socio- Economic assessment of the proposed Scheme in Section 15.5 of this chapter.

13.1.2 Following the guidance contained within DMRB Volume 11 part 6, the overall approach for the assessment of Community and Private Assets will consider the following impacts on:

- Private Property
- Land used by the Community
- Development Land
- Agricultural Land
- Proposed or existing waterway restoration projects
- Community Severance

13.1.3 The following are the overarching requirements set out in DMRB Volume 11. Section 3 Part 6 for the effects on Land Use.

13.1.4 DMRB Volume 11, Section 3 Part 6 states *"The increasing efficiency of agricultural producers and changes in agricultural policy mean that retaining as much land as possible in agricultural use is no longer a top priority"*.

13.1.5 In addition POSTnote 418 September 2012 states: *Achieving efficient and productive agriculture to ensure food security while conserving biodiversity is a key challenge considering predicted scenarios of rapid human population growth. Agriculture is highly dependent on benefits derived from nature, known as 'ecosystem services' (POSTnote 377). These include pollination, pest control and nutrient cycling. Although agriculture is dependent on biodiversity, agricultural intensification is also a major driver of biodiversity*

decline. Within this context, there is debate about the best way of balancing food production and wildlife protection.

13.1.6 The following are the overarching requirements set out in DMRB Volume 11. Section 3 Part 6 for the effects on Land Use.

Private Property

13.1.7 DMRB Volume 11, Section 3 Part 6 DMRB guidance states “Where properties need to be demolished for a scheme to be built, the environmental impact of their loss should be included in the assessment” and “Confirm the number of properties potentially affected by demolition or land take and categorise the impacts on affected land accordingly”.

13.1.8 The route of the NDR has been selected to minimise loss of private property.

13.1.9 Hall Farm is a derelict building currently owned by NCC, and will be demolished to enable the Scheme to be built. There are ecological impacts arising from the demolition of this property, these are fully assessed in Volume 1 of the ES Chapter 8: Nature Conservation, Section 8.5.

13.1.10 Gazebo Farm (Location) is owned by the Birse the contractor, and is currently being used as a site office. There are derelict outbuildings within the grounds that require demolition. The heritage and ecological effects of the demolition of these properties are covered in Volume 1 of the ES: Chapter 6. Cultural Heritage and Chapter 8 Nature Conservation Section 8.5 respectively.

13.1.11 The landuse effects on these derelict properties are not considered further.

13.1.12 There are 15 properties where a proportion of garden will be permanently lost to the Scheme or where a small percentage of land belonging to the property (but not used for agricultural purposes) will be permanently lost to the Scheme. These small areas are spread throughout the Scheme footprint and are detailed in the Land Plans. Individual negotiations with landowners are taking place regarding this land take and associated compensation.

13.1.13 These It should be noted that the areas of land take may be proportionally small or large however this is an inadequate indicator of value to the owner. Therefore individual consultations are being undertaken with each landowner so that the appropriate level of compensation can be arrived

at. These negotiations are necessarily confidential and therefore will not be reported within this chapter. However, compensation will represent the value of land lost and therefore effects are not considered significant.

Loss of Land Used by the Community

- 13.1.14 DMRB Volume 11. Section 3 Part 6 states “The Environmental Statement should set out the scheme's impact on land used by the public, taking account, where relevant, of exchange land to be provided in mitigation”.

Marriott's Way

- 13.1.15 Marriott's Way is a disused railway path which provided a green corridor for walkers, riders and cyclists from Norwich to Reepham. It is part of Sustran's National Cycle Route 1. The NDR crosses the Marriott's Way at chainage 2400. It is an important wildlife corridor and the ecological impacts of the NDR are discussed in Volume 1 Chapter 8: Nature Conservation, Section 8.5 of the ES and Chapter 12 Effects on All Travellers. Marriott's Way is a County Wildlife Site and as it is open to walkers, cyclists and horse riders it has considerable amenity value..

- 13.1.16 A green bridge will be provided at the location of land -take to provide for both amenity users and wildlife, only the footprint required for the NDR carriageway is being acquired from the owner Broadland District Council . Rights are being taken over other areas owned by the District Council to tie in to the new bridge, and the areas being acquired for new embankments to the Bridge from third parties are to be given to the District Council in exchange. Broadland District Council will also be granted replacement rights over the bridge itself. Temporary provision to provide safe crossing places to users will be provided during construction.

- 13.1.17 Therefore the effects of land take on Marriott's Way are not considered further.

Fuel Allotments

- 13.1.18 Fuel and Field Garden Allotments consist of land that was allotted for public or semi-public purposes under the Enclosure Acts. It is not technically common land but is held in trust by its owner and generally falls within the jurisdiction of the Charity Commissioners.

13.1.19 A 2800m² area is being acquired from the Great Plumstead Fuel Allotment Charity land to provide a link road for agricultural vehicles that bypasses the local road that is closed by the NDR. The area of land falls below the requirement to provide exchange land, however an adjoining, larger, area of agricultural land is to be given in exchange to the Charity.

13.1.20 There will be no loss of amenity or use associated with this land take and therefore it is not considered further in this chapter.

Development Land

13.1.21 DMRB Volume 11. Section 3 Part 6 states *“The environmental assessment should take authorities’ development designations. account of, as far as is practicable, future changes in land use due to new development which would be likely to occur in the absence of a scheme”* .

13.1.22 The NDR passes over an area of development land at Norwich International Airport (Norwich City Council planning reference 13/00520/0). Provision for the NDR crossing this area is provided within the application.

13.1.23 The NDR is part of the Greater Norwich Development Partnerships Joint Core Strategy, so consideration to future development has been developed with the possibility of the construction of the proposed Scheme. The economic effects of the NDR with regard to future development are assessed within the second section of this chapter: Socio – economic effects section.

13.1.24 The effects on development land take are therefore not considered further.

Proposed or Existing Waterway Projects

13.1.25 There are no proposed or existing waterway restoration projects within the study area and therefore these were scoped out of this assessment.

Community Severance

13.1.26 This is considered within Chapter 12. Volume 1 Effects on All Travellers and within the Socio-Economic Assessment Section 13.5 of this chapter.

Effects on Agricultural Land

13.1.27 DMRB Volume 11. Section 3 Part 6 states “*The report should assess the impact of the preferred route on land use and assess boundary arrangements for individual farm units, using maps where necessary, and comment on the likely future viability of affected units, should the preferred route be constructed*”.

13.1.28 The proposed Norwich Northern Distributor Road (NDR) will have a total spatial footprint of 354 hectares. The majority of the land within this footprint is currently used for agriculture (329.40 ha). Farming is a major source of income and employment for the area and agricultural land can therefore be considered an important community and private asset.

13.1.29 The two aspects assessed further within this chapter are:

- The effects of the NDR on agricultural land as a national resource;
- and the effects on the viability of individual farm units.

13.2 Agricultural Land

Introduction

13.2.1 The proposed route could have a range of potential impacts on agricultural land, including the temporary and permanent loss to the scheme, changes in land quality, and modifications to the access of fields. All of these changes have the potential to affect the commercial viability of individual farms within or near the scheme boundary and the long term use of the land for agricultural purposes..

13.2.2 The impacts likely to arise from the proposed route have been identified, and how they might affect the commercial viability of individual farms have been assessed as part of the EIA process.

Methodology

13.2.3 In accordance with the Highways Agency Design Manual for Roads and Bridges (DMRB Volume 11. Section 3 Part 6), this study was based on an assessment of the land-take (permanent and temporary), changes in land quality, alterations in farm husbandry, field severance, and changes in farm access likely to be imposed on individual farm businesses as a result of the proposed NDR.

- 13.2.4 No methodological guidance exists for assessing forestry, equestrian or game shooting operations and the impacts identified for these land uses therefore followed the above guidance on agriculture. Climate change and flooding impacts were also considered in light of the NDR Climate Change Risk Assessment (CCRA) and the Flood Risk Assessment (FRA).
- 13.2.5 A technical definition of the terms “farm”, “individual farm holding”, and “farm business” were developed for this project to provide a basic unit of assessment for the purposes of this study. This was because of the complex tenancy and family arrangements which surround land ownership in the area.
- 13.2.6 Therefore, these farms are defined as “an area of land that consists of one or more land parcels or group of fields that are managed by a named person or named business entity as an owner, tenant or in any other commercial agricultural capacity, for the production of food, forage or fibre”.
- 13.2.7 This definition grouped land parcels according to individuals or companies who have commercial interests in that land which provided the unit of assessment on which this study was based. Under this definition, forestry, equestrian, and game shooting operations were included because of the land based dependence of their activities.
- 13.2.8 Within 250 m of the proposed route, land parcels used for agricultural and other purposes identified above were assessed, and land not used for these purposes were excluded from this study. The existing condition (i.e. baseline) of farm businesses within the NDR’s area of influence were compared with those expected as a result of impacts arising during the construction period and subsequent land restoration (temporary), and those expected once the scheme is operational (permanent).
- 13.2.9 Along the proposed NDR route, 66 individual farm businesses were identified within its area of influence. Direct communications were established with land users to discuss farm-specific operations, husbandry requirements and mitigation options. An agricultural soil survey was also conducted to determine the quality of agricultural land, which was predominantly Grade 2 and 3a, “the best and most versatile” by DEFRA standards. This information was combined with land registry data on the location and size of land holdings to construct a profile of baseline agricultural conditions on each farm.
- 13.2.10 These data were then plotted within a GIS in tandem with the NDR DCO boundary. The areas of permanent and temporary land-take were then calculated for each farm business. These modifications to farm sizes were

mapped for individual businesses showing land wholly or partially overlapping the 250m buffer zone, including their planned changes in farm access.

13.2.11 These classifications were based on the predicted effects of the road balanced with the range of mitigation measures designed to limit them, such as financial compensation, land restoration, field access provision, and maintenance of private irrigation systems (see below section).

Table 13.1: Impacts on Agricultural Land as a Resource and Agricultural Holdings

Magnitude of Impact	Criteria
Major adverse	Where the Scheme would lead to the direct loss of over 50 ha of the best and most versatile agricultural land (grades 1, 2 and 3a), and/or the impact of the proposal would be likely to render the whole farm unviable.
Moderate adverse	Where the Scheme would lead to the loss of between 20 and 50 ha of the best and most versatile land, and/or require significant day-to-day changes in management of the business but not threaten its viability.
Minor adverse	Where the Scheme would lead to the loss of less than 20 ha of the best and most versatile agricultural land, and/or slight changes in business practices would be required but the viability of the business will not be affected.
Negligible	The scheme would have no impact on the viability of the business.
Beneficial	The scheme would improve the commercial viability of this farm business.

Table 13.2: Impacts on Rural Based Businesses

Magnitude of Impact	Criteria
Major adverse	Above 25% permanent land loss and/or the impact of the proposal would be likely to render the operation unviable.
Moderate adverse	10-25% permanent land loss and/or the impact of the proposal would require significant day-to-day changes in management of the business but not threaten its viability.
Minor adverse	1-10% permanent land loss and/or slight changes in business practices would be required but the viability of the business will not be affected.
Negligible	The scheme would have no significant impacts.
Beneficial	Landscaping would enhance woodland areas and/or the scheme would improve the commercial viability of this business.

13.2.12 An impact may be ‘positive’ or ‘negative’. The significance of the predicted impacts on agriculture and soil has been assessed as either ‘Large’, ‘moderate’, ‘minor’ or ‘negligible’ according to the magnitude of the effect and sensitivity of the receptor.

13.2.13 These classifications were based on the predicted effects of the road balanced with the range of mitigation measures designed to limit them, such as financial compensation, land restoration, field access provision, and maintenance of private irrigation systems.

13.3 Context

Legislation

13.3.1 The NDR requires an Environmental Impact Assessment (EIA) defined by EC Directive 85/337/EEC which states that, among other factors, soils, material assets, human beings and the broader landscape likely to be impacted upon

by a proposed development should be identified and their impacts described and assessed.

13.3.2 No legislation or planning guidance exists at EU level which is concerned specifically with maintaining the commercial viability of individual farm holdings affected by major new developments. Each of the factors outlined above contribute to the functioning of agricultural systems and thereby the commercial viability of individual farms. Maintaining the financial integrity of agricultural businesses is also a key priority of the long-standing European Common Agricultural Policy (CAP). Within the context of EU policy it is therefore important that impacts on agricultural holdings arising from major developments are assessed during the EIA process and that the commercial viability of individual farms are maintained as far as possible.

13.3.3 The NDR will interact with a large area of commercial farmland. Individual farm holdings can therefore be identified as important impact receptors whose viability is of deserved interest when evaluating the environmental impacts of the proposed development.

Policy

13.3.4 A core principle of UK planning policy, as stated in the National Planning Policy Framework (NPPF), is to support thriving rural communities. This document also recognises agriculture and other land-based enterprises as being central to delivering sustainable development in the UK countryside. This guidance thus provides the broader policy context for this study because maintaining the viability of existing agricultural enterprises can be considered an important prerequisite for the success of rural communities. Therefore, from a national perspective, it is important that any potential impacts of a proposed road scheme on the viability of farming enterprises are assessed, and that the commercial integrity of the affected farms be maintained as far as possible.

13.3.5 Another key principle of UK planning policy regarding agriculture also stated in the NPPF (and further elaborated upon in the Natural England Technical Information Note TIN049) is to protect the “best and most versatile” agricultural land. This land is defined as “the land which is most flexible, productive and efficient in response to inputs and which can best deliver future crops for food and non-food uses”. This land falls within the land classification categories 1, 2 and 3a according to the Agricultural Land Classification (ALC) of England and Wales (Ministry of Agriculture Fisheries

and Food, 1988) and can be considered highly valuable not only in a national context, but also from the perspective of individual farm holdings. Land quality therefore needs to be assessed when evaluating the potential impacts of a proposed road scheme on the viability of individual farm holdings.

- 13.3.6 Related to the quality of agricultural land, the “Construction Code of Practice for the Sustainable Use of Soils on Construction Sites” Department for Environment, Food and Rural Affairs (DEFRA) details how soils should be handled during construction operations in the UK. This document provides guidance on producing Soil Resource Plans for construction sites to ensure soil quality is considered as part of operations planning. In addition, the Environmental Liability Directive (2004) imposes obligations on developers to ensure damaged soils are returned to their baseline condition. Major road schemes which require areas of farmland to be temporarily taken out of production to facilitate construction works should therefore restore this land to its baseline (i.e. original) grade in order to meet these obligations and to mitigate the effects of the scheme on agricultural viability.
- 13.3.7 Local planning and development policy guidance for the Greater Norwich area does not specifically refer to maintaining the commercial viability of local agricultural holdings as a key priority. However, viable farming enterprises in the surrounding region would nevertheless make an invaluable contribution to developing a sustainable local economy, a goal to which the local authorities claim to be working towards. Revitalising rural economies is one of the spatial planning objectives in the Joint Core Strategy for Broadland, Norwich and South Norfolk devised by the Greater Norwich Development Partnership. This strategy also refers to expanding farm shops and farmers’ markets within Norwich which – presumably – are to be supplied by viable farming enterprises in the locality. That local agricultural holdings are commercially viable is thus an unstated assumption of local policy and development objectives. The impacts of a proposed road scheme on agricultural holdings in this region therefore have been assessed and mitigation put in place.
- 13.3.8 In addition POSTnote 418 September 2012 states: *Achieving efficient and productive agriculture to ensure food security while conserving biodiversity is a key challenge considering predicted scenarios of rapid human population growth. Agriculture is highly dependent on benefits derived from nature, known as ‘ecosystem services’ (POSTnote 377). These include pollination, pest control and nutrient cycling. Although agriculture is dependent on biodiversity, agricultural intensification is also a major driver of biodiversity decline. Within this context, there is debate about the best way of balancing food production and wildlife protection.*

Baseline

13.3.9 The majority of the land the NDR passes over is under intensive arable cultivation with smaller areas of permanent pasture, poultry rearing, horse paddocks and woodland. Agricultural land to the west of the airport is mainly Grade 3a while to the west it is mainly grade 2. Therefore the majority of the land under these agricultural holdings is considered “the best and most versatile” by DEFRA standards. The total areas of land in each ALC category are shown in Table 3.1.

13.3.10 Along the proposed NDR route, 66 individual farm businesses were identified as being within the area of influence of the NDR and were therefore included in this assessment. The area of land managed by each business was highly variable ranging between 0.52 ha and 2063 ha.(please refer to Volume 2 Chapter 13 Sec A for the Agricultural Impact Assessment .

Table 13.3

ALC land grade	Total area across scheme (ha)
2	168.30
3a	114.20
3b	46.90
Non-agricultural land	24.62
Total	354.02

Mitigation

13.3.11 The only practical mitigation available for agricultural soils is to restore as much as possible back to pre-construction condition once construction is complete. This will involve the careful stripping and storage of soils (Volume 2, Chapter 19: CEMP + SWMP, Section 10 Contaminated Land and Soil Plan). This will be managed through the CEMP.

13.3.12 The following table shows that 45.64 ha will be returned to agricultural use post construction.

Table 13.4

Land class	Baseline	Permanent LT (ha)	Temporary LT (ha)
Grade 2	168.30	142.53	23.28
Grade 3A	114.20	99.95	15.84
Grade 3B	46.90	44.15	2.61
Non-agri land	24.62	20.94	4.72
Total	354.02	307.57	45.64

13.3.13 Included in the NDR design, a number of mitigation measures are to be applied to many farm businesses throughout the scheme's area of influence but within the context of each individual farm. These are summarised in Table 13.5 and information regarding the parties responsible and compliance mechanism are also included.

Table 13.5: Table summarising impacts on farm viability and mitigation

Mitigation measure	Description	Action taken by	Compliance mechanism
Land user consultation	Persons or companies with commercial interests (owners, tenants, etc) in agricultural land inside the scheme's area of influence were identified through the Land Registry records. Throughout the design process, negotiations were conducted with these businesses to determine their individual agricultural requirements, how the scheme may impact upon their operations, and what measures the scheme could include to mitigate these impacts. The consultation process	NCC	Compensation Code, agreements with individual land users

Mitigation measure	Description	Action taken by	Compliance mechanism
	therefore enabled the design to take account of the needs of individual land users.		
Financial compensation	Farm businesses with the potential to be impacted upon by the NDR will be compensated financially. The price that Norfolk County Council will pay for the Parties interests in the Land will be calculated in accordance with the Compensation Code, including the Land Compensation Act 1961, Compulsory Purchase Act 1965, Land Compensation Act 1973, Planning and Compensation Act 1991, Planning and Compensation Act 2004 and any other related legislation and case law (unless specifically altered under the Development Consent Order). This compensation will generally be provided as a lump sum and will be designed to cover land-taken, severance, injurious affection and disturbance (e.g. crop loss). This compensation will be provided differently depending on whether the affected party is a freeholder farming their own land (Option 1), a freeholder whose land is farmed by a tenant (Option 2), or a tenant farming a freeholder's land (Option 3).	NCC	Compensation Code, agreements with individual land users
Field access provision	Farms severed by the proposed NDR route or whose existing field access arrangements are to be	NCC, contractor	Scheme design, Compensation

Mitigation measure	Description	Action taken by	Compliance mechanism
	<p>removed by the scheme will have new field access points installed according to the land user's wishes. Such access points could take the form of new gateways leading off existing or new highways, or farm access tracks also used for highway maintenance purposes.</p>		<p>Code, agreements with individual land users</p>
Irrigation	<p>Water pipes used for irrigation purposes will be maintained wherever possible during the construction and operational phases of the scheme according to land users' wishes.</p>	Contractor	<p>Scheme design, Compensation Code, agreements with individual land users</p>
Land restoration	<p>Developers are obliged to return land used to accommodate construction workings – that is, land considered under “temporary land-take” – to its baseline condition. Agricultural land temporarily taken out of production will therefore be returned to its original land grade throughout the scheme. According to the developer's construction plans, soil will be excavated, stored and re-spread according to best practice as outlined in DEFRA's “Construction Code of Practice for the Sustainable Use of Soils on Construction Sites”. For certain holdings the developers have also agreed for the land to be sown in accordance with each land user's</p>	Contractor	<p>Soil Management Plan, agreements with individual land users</p>

Mitigation measure	Description	Action taken by	Compliance mechanism
	wishes.		
Tenancy agreements	Where tenant farmers are renting land from Norfolk County Council their tenancy agreements will be terminated and, where possible, new agreements arranged on other areas of land.	NCC	Tenancy contracts, agreements with individual land users
Flooding and climate change	The measures designed into the scheme to mitigate flooding and climate change impacts are outlined in detail in the NDR CCRA and the FRA. These measures include the provision of infiltration lagoons and culverts to minimise impacts on existing drainage impacts. Landscaping measures will also help to provide ecosystem services to surrounding farmland which will help farms to adapt to climate change, such as providing habitats for pollinating species and the use of woodland for sheltering.	Contractor	Scheme design

13.4 Assessment of Effects

Construction

13.4.1 The effects on agricultural land as a national resource is considered through the operational assessment.

13.4.2 The only temporary effects that were identified for individual farm businesses was that of temporary land-take during construction and severance of fields and irrigation systems. This land will be fully restored to agricultural use once construction is completed and the mitigation put in place for construction is similar to mitigation for the operational phase of the Scheme. Where possible, access to fields and water systems will be maintained. Compensation will be

paid for any loss of revenue from severance and temporary land-take and therefore the impacts during construction are not considered significant.

Operation

13.4.3 The majority of the land lost to the Scheme is considered “Best and Most Versatile” Table 13.6

13.4.4 It is not possible to replace agricultural land permanently taken as a result of the Scheme and therefore there would be a significant effect from the loss this good quality land.

13.4.5 In addition Defra have indicated in REF that:

“In examining the economic performance of farms, a key issue that has stimulated much debate over many decades is the degree of association between performance and farm size. Clearly there are potential economies of scale that mean that larger farms may be, on average, more efficient than smaller ones. However, some have argued that there are also diseconomies of scale that may counteract these”.

13.4.6 An “Ecosystems Services Assessment” was undertaken by Cranfield University to understand the overall effects of the loss of this agricultural land. This is somewhat limited as it is a new type of assessment with no established commonly used methodology,. The assessment was undertaken to explore and add value to the assessment on agricultural land. (Volume 2 Chapter 13 Sec A)

Table 13.6: Loss of Agricultural Land as a National Resource

ALC Land Grade	Mitigation	Impact magnitude	Effect significance
Loss of approximately 142.53 ha (low magnitude) of Grade 2 (high sensitivity)	Restore post construction Safeguard soil resources following approach of Defra Code of Practice for	Major adverse	Significant

ALC Land Grade	Mitigation	Impact magnitude	Effect significance
	Sustainable Use of Soil on Construction Sites (2009)		
Loss of approximately 99.95 ha (medium magnitude) of Subgrade 3a (medium sensitivity)	Restore post construction Safeguard soil resources following approach of Defra Code of Practice for Sustainable Use of Soil on Construction Sites (2009)	Major adverse	Significant
Effect of developing 44.15 ha (medium magnitude) on soil resources (medium sensitivity)	Restore post construction Safeguard soil resources following approach of Defra Code of Practice for Sustainable Use of Soil on Construction Sites (2009)	Major adverse	Significant

13.4.7 When the DMRB criteria for assessment are applied there is a significant effect resulting from the loss agricultural land as a resource. However, this assessment must be considered in relation to current farming practices and the benefits arising from a potential increase in biodiversity from intensively farmed land lost to habitat creation. Increases in biodiversity are known to be beneficial to farming practices by increasing numbers of pollinators. See this chapter. Sec 5 Conclusion.

Impact on Agricultural Holdings

13.4.8 This study indicates (Volume 2 Chapter 13 Sec A) that the impact of the NDR on the viability of individual farm businesses was dependent on the unique prevailing conditions on each individual farm, such as it size, choice of husbandry, diversity of operations, the nature of potential impacts, and which mitigation measures will be applied. The table 13.7 below summarises these results.

Table 13.7

Farm I.D.	Mitigation	Impact magnitude	Effect significance
1	Financial compensation, land restoration, field access provision	Minor adverse	Not significant

53	Financial compensation	Minor adverse	Not significant
55	Financial compensation	Minor adverse	Not significant
56	Financial compensation, land restoration	Negligible	Not significant
57	Financial compensation, land restoration, field access provision	Minor adverse	Not significant
58	None	Negligible	Not significant

Farm I.D.	Mitigation	Impact magnitude	Effect significance
59	None	Negligible	Not significant
60	Financial compensation, field access provision	Minor adverse	Not significant
61	Financial compensation, field access provision	Minor adverse	Not significant
62	None	Negligible	Not significant
64	None	Negligible	Not significant
65	None	Beneficial	Not significant
66	None	Negligible	Not significant
67	Financial compensation	Negligible	Not significant
68	Financial compensation	Minor adverse	Not significant
69	Financial compensation, land restoration, field access provision	Minor adverse	Not significant
70	Land restoration	Beneficial	Not significant
71	Financial compensation, land restoration	Minor adverse	Not significant

13.4.9 The Agricultural Impact Assessment Volume 2 Chapter 13 of the ES predicted “minor adverse” impacts for 40 farm businesses, “negligible” impacts for 22 farms, and “beneficial” impacts for 4 farms. No farms were predicted to suffer “moderate adverse” or “major adverse” impacts. The overall effect on farm viability is not significant.

13.5 Socio-economic Assessment

Introduction to socio-economics

13.5.1 This technical appendix presents the technical assessment of the socio-economic effects of the development of the Norwich Northern Distributor

Road (NDR) scheme, as part of the Environmental Statement (ES) for the scheme. The assessment addresses the potential effects detailed below.

13.5.2 During construction of the NDR scheme, potential socio-economic effects include the following:

- Direct employment through construction;
- Short-term increase in economic activity due to construction process;
- Temporary disruption to local businesses and reduced or disrupted access to businesses; and
- Land-take from existing businesses, disrupting business operations.

13.5.3 During operation of the NDR scheme, potential socio-economic effects include the following:

- Improved access to employment and other strategically important economic sites;
- Improved access to strategically important new housing sites;
- Supporting job creation and Gross Value Added (GVA) growth;
- Supporting development and housing growth; and
- Supporting tourism.

13.5.4 The assessment comprises the following sections:

- Legislative and policy framework: identifying the socio-economic and planning framework relevant to the development of the NDR scheme;
- Methodology: explaining the assessment methodology including the spatial and temporal scope, the identification of receptors, the criteria used to assess the significance of the impacts and relevant study assumptions and limitations;
- Baseline: presenting the baseline demographic, social and economic conditions for the impact area;
- Mitigation and prediction of effects: providing a high level description of key construction and operational activities which have socio-economic implications, setting out likely socio-economic effects during construction and operation, together with identification of mitigation measures;

- Conclusions: describing the predicted impacts following the implementation of mitigation measures, and the extent to which the development complies with planning and relevant socio-economic policy; and
- References: containing the references and source materials relating to the socio-economic assessment.

13.6 Scheme design in the context of socio-economics

Introduction

13.6.1 The Scheme (the Norwich Northern Distributor Road, known as the NDR) is a dual carriageway all-purpose strategic distributor road, to be classified as the A1270 Principal Road, which would link the A1067 Fakenham Road, near Attlebridge to the A47 Trunk Road (T) at Postwick,. This will be over a length of approximately 20.4km. See the scheme General Arrangement Plans in document number 2.6 for further information on the scheme.

General Description: Scheme Route

13.6.2 From west to east, the NDR is proposes to start at a new at-grade roundabout junction on the A1067 Fakenham Road, located to the west of Taverham. It would then continue eastwards as a dual carriageway to its new at-grade roundabout junction with the C262 Fir Covert Road. From this roundabout, the NDR would then cross the Marriott's Way (a permissive path providing a pedestrian, cycling and horse riding facility along the route of a disused railway) which will be taken across the NDR via a new bridge), to a new at-grade roundabout junction with the C261 Reepham Road. The NDR would then continue south eastwards, crossing Bell Farm Track/Horsford Restricted Byway No. 5 (which will be taken up over the NDR via a new Restricted Byway and private access accommodation bridge) before connecting with a new at-grade roundabout junction, just west of the existing C282 Drayton Lane, and which new roundabout will have two new link road connections, one with the C261 Reepham Road and one with the B1149 Holt Road, to replace the existing Drayton Lane.

13.6.3 From here, the NDR would then continue south eastwards to a new grade-separated junction (provision of a bridge over the NDR with slip roads to/from the NDR) with the A140 Cromer Road, located close to and just northwest of Norwich International Airport. The provision of this grade-separated junction will require the stopping up of lengths of the B1149 Holt Road and Holly Lane (U57142), as well as a length of of the A140 Cromer Road, which will be replaced by a new highway west of its existing position, which will be taken

over the NDR and provide the connection for its four connecting slip roads. East of the A140, the NDR would continue as a dual carriageway, turning north eastwards around the northern boundary of the airport to a further new at-grade roundabout junction at the northern tip of the airport. The primary purpose of this roundabout is to allow the NDR to undertake a roughly 90 degree change of direction around the Airport site. From this roundabout, the NDR would continue south eastwards, skirting the north east boundary of the airport, before turning eastwards and passing under a new highway, which be carried by bridge over the NDR, immediately to the east of the existing C246 Buxton Road, and which would provide the new connection for its realignment sections north and south of the NDR. The route of the dual carriageway NDR would then continue eastwards through the north of Beeston Park. It would then connect with both the B1150 North Walsham Road and the A1151 Wroxham Road via a new at-grade roundabout at each location, before turning south eastwards and entering the north eastern section of Rackheath Park approximately 250 metres from the western end of Sir Edward Stracey Road (U57538). It would then continue south eastwards, passing under a new bridleway and access bridge across the NDR, some 200 metres south west of the junction of Newman Road (U57490) with Long's Crescent (U57852).

13.6.4 The NDR would then connect with the C283 Salhouse Road via a new at-grade roundabout, before rising up on an embankment (maximum height approximately 8.5 metres), to cross both the Norwich to Cromer & Sheringham rail line and the C874 Plumstead Road on individual bridges in close proximity, prior to a new at-grade roundabout on the NDR, which would connect it via a new link road to a further small at-grade roundabout on the C874 Plumstead Road.

13.6.5 The NDR route would then continue southwards, crossing under the C442 Middle Road (which would be raised to pass over the NDR, on its existing alignment, via a new bridge) before connecting with a new at-grade roundabout known as the Business Park Roundabout.

13.6.6 At this point a single carriageway link is provided westwards to the existing C829/C830 Broadland Way/C831 Peachman Way roundabout and includes an at-grade roundabout on the link road to the proposed Broadland Gate Business Park.

13.6.7 From the Business Park roundabout the NDR proceeds southwards as a dual carriageway to a new Postwick North East at-grade roundabout immediately north of the A47(T) Norwich Southern Bypass. This roundabout has links from

a new A47(T) eastbound diverge slip road and a new A47(T) eastbound merge slip road. The NDR continues over the A47(T) as a four lane carriageway, one lane north and three south, on a new bridge and terminates at its southernmost point at a signalised junction, which replaces the existing Park and Ride roundabout with the A1042 Yarmouth Road.

13.6.8 This signalised junction provides further links:

- Directly to and from the park and ride site for buses;
- West to the existing Postwick North West roundabout, via the existing Postwick bridge over the A47(T);
- East to the proposed park and ride site entrance at the proposed Oak's Lane roundabout and further east to the Brundall Low Road junction with the A1042 Yarmouth Road to Postwick village; and
- West to the A47(T) via an existing westbound merge slip road.

13.6.9 The works at Postwick Junction, will include modifications to the existing Postwick North West roundabout (as a result of closing the existing eastbound diverge slip road) and to the existing A1042 Yarmouth Road overbridge of the A47(T), to provide revised traffic lanes and the provision of a shared use cycle/footway.

13.6.10 The route of the NDR that has been described above is, for the majority of its length, within Broadland District. It does, however, for a short stretch close to Norwich International Airport, fall within the administrative area of Norwich City Council. A very small part of the works at Postwick falls within the administrative area of The Broads Authority. The new road from west to east runs through the following parishes:

- Attlebridge;
- Taverham;
- Drayton;
- Horsford;
- Horsham St. Faith and Newton St.Faith;
- Spixworth;
- Beeston St. Andrew;

- Sprowston;
- Rackheath;
- Great and Little Plumstead; and
- Postwick with Witton.

Overview of scheme features

13.6.11 As described above, the scheme consists of a number of different features which are detailed further below. The location of the proposed Scheme features is measured by reference to the “chainage”, which is the distance from the start of the scheme, at its junction with the A1067 Fakenham Road, in metres.

13.6.12 There will be ten new highway structures, which consist of six overbridges and four underbridges carrying the following existing routes, or new routes as necessary, either under or over the NDR.

Socio-economic context

13.6.13 Norwich is the largest city in East Anglia and the economic centre of Norfolk. The success of ‘Greater Norwich’ – which includes the city and two surrounding districts (Broadland and South Norfolk) – is vital to the economic success of Norfolk and of the East Anglian sub-region.

13.6.14 The Scheme (the Norwich Northern Distributor Road, known as the NDR) is a dual carriageway all-purpose strategic distributor road, which would link the A1067 Fakenham Road, near Attlebridge to the A47 Trunk Road (T) at Postwick. This will be over a length of approximately 20.4km. A full description of the NDR can be found in in the Scheme Description within Chapter 2 :, Volume 1 of the Environmental Statement. See also General Arrangement Plans within Appendix A :, Volume 1 of the Environmental Statement.

13.6.15 The scheme objectives which are most relevant in terms of socio-economics are:

- To provide access to and help to deliver, planned and potential areas of growth, and enable those areas to be free of the need to incorporate provision for extraneous traffic and provide improved transport connectivity, including

with the national strategic road network, for existing and future areas of residential and employment development, Norwich International Airport and the wider area of north and north-east Norfolk.

- To increase the opportunities for improving provision for public transport and other sustainable forms of transport and for improving traffic management within the City Centre, thereby encouraging modal shift.
- To improve traffic related environmental conditions for residents in the northern suburbs of Norwich and outlying villages, whilst minimising the adverse environmental impacts of the NDR.

13.7 Legislation and policy

13.7.1 The following section presents the key planning, transport and economic policy documents which relate to the socio-economic assessment of the NDR scheme.

National Policy

13.7.2 In 2010, The Cabinet Office White Paper 'Local growth realising every place's potential' introduced its vision of a fairer and more balanced economy. At the heart of this vision lies a commitment to achieving sustainable growth for all areas of the country including a new approach to local growth. As part of this vision, Regional Development Agencies (RDAs) were replaced by Local Enterprise Partnerships (LEPs). Subsequently, 39 LEPs have been created, one of which is the New Anglia LEP, which covers Norfolk and Suffolk (see below).

13.7.3 The Localism Act 2011 further reinforced the policy commitment to local growth, by introducing a wider range of measures that devolved more powers to councils and neighbourhoods, giving local communities more control over local decisions. Of specific relevance, was the Core Cities Amendment, now to be found in section 15 to 20 of the Localism Act 2011, which allowed Local Authorities in cities such as Norwich to make the case for new powers to promote economic growth and to set their own distinct policies.

13.7.4 In support of this, the Cabinet Office's White Paper 'Unlocking growth' in cities introduced the City Deal initiatives. 'City Deals' agreements have since been established between government and key national cities in England. Selected cities, including the city of Norwich, will be granted new powers and freedoms

in exchange for taking on responsibility for creating economic growth. The deal is currently being negotiated with central government.

13.7.5 The fusion of sustainable growth and localism have also proved central to the Department for Transport's (DfT) vision of local transport as demonstrated in its White Paper 'Creating Growth Cutting Carbon: Making Sustainable Local Transport Happen' published in 2011. Sustainable growth was identified within the White Paper as one of the country's biggest tests, with transport playing an essential role in meeting this challenge. As both an engine for growth and key to improved, safer and greener living standards, the report presented a number of provisions that enable sustainable transport choices; make public transport more attractive; support more active travel (shifting from the car to walking and cycling); and facilitate traffic management that reduces carbon emission and tackles congestion. Provisions also focused on 'decentralising power' through the local delivery of transport. This included the establishment of Local Transport Bodies in 2012 (DfT (2012) Local frameworks for funding major transport schemes: guidance of local transport bodies) and increased 'decentralised planning' through the establishment of the 'New Planning Policy Framework' (NPPF) and powers provided by the Localism Act (2011).

13.7.6 In 2012, the DCLG published the NPPF which simplified and consolidated national planning guidance and replaced the existing DCLG 'Planning Policy Statements'. The delivery of sustainable development is central to the NPPF. Thirteen headings are included that aim to meet this challenge, with the following headings of particular relevance to the NDR:

- 1) Building a strong, competitive economy
- 2) Ensuring the vitality of town centres
- 3) Supporting a prosperous rural economy
- 4) Promoting sustainable transport; and
- 5) Delivering a wide choice of high quality homes.

13.7.7 The NPPF continues to demonstrate a commitment to localism. Under the NPPF, local authorities are now granted greater control over local planning, alongside a new statutory duty to cooperate (as public bodies involved in plan-making). In addition, the 'Local Plan', the keystone of the planning system, is also produced local by community partners working together. In Greater Norwich, following the publication of the NPPF this has resulted in

‘Emerging Local Plans’ in Norwich, Broadland and South Norfolk, which feed into and correspond with the JCS for the Greater Norwich area.

Sub-national policy

13.7.8 LEPs, established in 2011, are seeing increasing resources and responsibilities devolved to them by Government. The New Anglia LEP (New Anglia LEP (2013): ‘New Anglia LEP: Operating Plan 2013-14 – 2014/15’) is regarded by the Government as one of the best performing LEPS. It has so far secured more than £22m in Government funding, has been awarded an Enterprise Zone and is a national leader in green economy initiatives. It has published three key policy documents of relevance to the NDR – ‘Towards a Growth Plan’, the accompanying Operating Plan (2013) and the Green Economy Pathfinder.

13.7.9 ‘Towards a Growth Plan’ and the ‘Operating Plan for 2013/14 – 2014/15’ form the wider strategic plan for growth for the New Anglia area and set out the key challenges and aims identified by the LEP. The plan sets out the path for sustainable development within the region and identifies the priority areas of tourism, energy, business support and the green economy as sectors for immediate growth and private sector job creation. The LEP’s aims for development reflect Norfolk County Council’s (NCC) economic growth strategy, identifying the NDR as a key element of transport infrastructure which will help to facilitate the current and forecasted rates of economic, employment and housing growth by creating links to key employment and strategic development sites. The NDR also complements the plan’s six overlapping themes, in particular: (1) the green economy, (2) sector groups with reference to energy and (3) business support specifically rural businesses.

13.7.10 The New Anglia ‘Green Economy Pathfinder Manifesto 2012–15’ sets out a vision to build a green economy in a sustainable way and to lead the transition towards a green economy. The overall ambition of the pathfinder is to achieve sustainable low-carbon growth, skills development and employment in Norfolk and Suffolk, and to contribute to the better positioning the UK in the competitive global marketplace. Of relevance to the NDR, is the role that the manifesto envisages transport as playing in the green economy and specifically, investment in transport infrastructure and public transport are recognised as essential to promoting environmentally efficient economic growth. The NDR objectives of reducing congestion in Norwich and the rat running communities in North and East Norfolk, and the freeing up of road

space for improvements to public transport and cycling and pedestrian facilities complement these goals.

13.7.11 The other key regional policy documents of significance to the NDR are produced by NCC – ‘Delivering Economic Growth in Norfolk – The Strategic Role for Norfolk County 2012–17’ and Connecting Norfolk- Norfolk’s Transport Plan for 2026’

13.7.12 NCC has produced its economic growth strategy to support the area’s development for 2012-2017. The strategy identifies a number of key challenges including infrastructure constraints; securing infrastructure funding; encouraging business start-ups; securing investment from key growth sectors and tackling the mismatch between skills and employability. To meet these challenges, the strategy has identified five priority themes; the aims and objectives of the NDR complement these aims, in particular themes 1, 2 and 3 which make reference to the contribution the NDR and its role in contributing to the Infrastructure Plan (1) business growth (2) and support for the key sector of off shore energy (3). In addition, the NDR is recognised as a key infrastructure priority and considered by the strategy as vital to the continued economic success of the Greater Norwich area and also beneficial to the surrounding areas of North Norfolk and Great Yarmouth.

13.7.13 NCC’s Third Local Transport Plan ‘Connecting Norfolk’, sets the longer term strategy for transport delivery up to 2026. The transport vision put forward within the plan is ‘a transport system that allows residents and visitors a range of low carbon options to meet their transport needs and attracts and retains business investment in the county’. The implementation of the NDR is considered as central to the aims of sustainable growth and strategic connections within the plan and to the achievement of policy 6: ‘Transport Infrastructure to Support Growth’ and policy 7: ‘Strategic Connections’.

Local policy

13.7.14 NATS was originally introduced in the 1980s, with the present NATS4 strategy adopted in 2004. NATS4 sets out a transportation and implementation strategy until 2021, covering the city of Norwich, its suburbs and immediate surrounding villages. It is a strategy prepared by Norfolk County Council, in partnership with Norwich City Council, Broadland District Council and South Norfolk Council. NATS4 recognises the need for essential infrastructure to accommodate growth within Norwich and the major urban extension to the north east of Norwich. Norwich is also envisioned as a

sustainable community, which requires policies that will help to reduce the impact of traffic on the city, whilst extending the pedestrian dominance of the city centre. The strategy identifies the NDR as essential to achieving both.

13.7.15 In addition to being a specific NATS4 policy area (policy 2), the NDR is also identified as critical to a number of other NATS4 polices including:

- Policy 1 - Development and growth – this focuses on the implementation of transport improvements that support and enhance the local economy and role of the Norwich Area as a regional centre; the NDR is identified as a key part of this strategy.
- Policy 6: Residential streets and minor rural roads around the north of Norwich - the NDR is recognised as a solution to the use of unsuitable routes by traffic travelling around the north of the city.
- Policy 46: Congestion – tackling congestion on the primary distributors is targeted for action, where this is consistent with environment and air quality, road safety, economic regeneration or other community benefit aims.

13.7.16 The Greater Norwich Economic Strategy is prepared by the Greater Norwich Development Partnership (GNDP) . The Greater Norwich Development Partnership is composed of Broadland District Council, Norwich City Council, and South Norfolk Council working together with Norfolk County Council and the Broads Authority. The Partnership is responsible for the local growth strategy for the area and has recently produced the Joint Core Strategy for Broadland, Norwich and South Norfolk. It defines the priorities in Greater Norwich for 2009 – 2014 and the strategy for sustainable growth within the region. The strategy includes a vision of Greater Norwich as one of England’s major city regions with a rapidly growing diverse and sustainable economy’ that provides ‘all its residents with opportunities and a great quality of life’. The NDR is recognised as a key component of this vision.

13.7.17 The strategy highlights a number of key challenges for Greater Norwich that include the need to improve ‘international, national and regional connectivity through air rail and roads and [to] promote sustainable transport”. Objective 3 of the strategy ‘ Infrastructure for Business’ aims at ensuring that Norwich has the necessary infrastructure and quality of environment to attract and retain investment and support business’ growth. Central to achieving this objective is priority 1: the development of an improved and sustainable transport and communications infrastructure to support planned growth and development. The NDR is explicitly identified within the strategy as an

essential action for achieving objective 3 and developing and supporting local business infrastructure.

13.7.18 As part of wave two of the 'City Deals' negotiations in February 2013 to the Cabinet Office, Greater Norwich was granted City Deal status (though the deal itself is still being negotiated) following the submission prepared by NCC, Norwich City Council, Broadland District Council, and South Norfolk Council. The importance of infrastructure in supporting economic growth in Greater Norwich is reiterated through the City Deal objectives. A key aim is to catch up on the 'lost decade' of lost jobs and output. Specific emphasis is put on planned growth at the Norwich Research Park (NRP), which will act as a catalyst to deliver for economic growth and releasing private sector investment and jobs to support business and employment development. The City Deal aims to deliver

- 40,000 new jobs;
- 37,000 new homes for greater Norwich;
- 50 per cent increase in knowledge based businesses;
- 30 per cent increase in GVA above trend; and
- An international flagship for life sciences enterprises.

13.7.19 The NDR is a key piece of infrastructure to assist in the realisation of these aims.

13.7.20 The JCS for Broadland, Norwich and South Norfolk has been prepared by the three councils of Broadland, Norwich and South Norfolk, working together with NCC as the GNDP, as described above. The JCS sets out an over-arching strategy for growth across the three districts, identifies key locations for growth and sets out policies for future sustainable development. It contains twelve over-riding objectives, which underpin the spatial vision for housing and employment in the area. It aims to create some 36,000 new homes and 27,000 new jobs between 2008 and 2026 in the Norwich urban area, as well as mixed use urban extension into the Old Catton, Sprowston, Rackheath and Thorpe St Andrew growth triangle. It should be recognised that the housing and employment figures will not match for each strategy due to contrasting ambitions, geographical areas and the rapidly changing economic environment.

13.7.21 The NDR has a strategic role in supporting development and growth in the area and is identified as important to the following spatial planning objectives:

- Allocating enough land for housing, and affordable housing, in the most sustainable settlements.
- Promoting economic growth and diversity, and providing a wide range of jobs
- Promoting regeneration and reduce deprivation.
- Making sure people have ready access to services - wherever new homes and jobs are developed there will be a need to provide adequate supporting services.
- Enhancing transport provision to meet the needs of existing and future populations while reducing travel need and impact.
- Encouraging the development of healthy and active lifestyles - giving people better opportunities to make healthy travel choices as part of their daily lives.

13.7.22 The JCS also provides the overarching vision for the Local Development Frameworks (LDFs) at district and city level. LDF include a suite of planning policy documents that guide and manage new developments in the area and replaces the local plan and is constituted by the JCS, the Site Allocations Plan, the Development Management Policies (DMP) specific area action plans, and the remaining local plan policies consistent with the NPPF. Each of the three local councils have prepared DMPs, with a number of specific area action plans for the Growth Triangle (Broadland), Long Stratton (South Norfolk) and Wymondham (South Norfolk).

13.7.23 The NDR will support and complement a number of policy objectives included within the local DMPs. For example the 'Development Management Policies Development Plan' for Norwich submitted in April 2013, includes a number of policy areas of where the implementation of the NDR is relevant – this includes sustainable development (DM1), housing development (DM12), employment and business development (DM18 and DM19), development and the airport (DM27) and sustainable transport (DM28). This is also reflected within the DMP for Broadland, where the NDR will also support policies for employment sites (E1, E2 and E3), transport including the protection of land for transport infrastructure (TS1), airport development (TS4) and access to principal and main distributor routes (TS6). In addition to this, the DMP for South Norfolk – specifically policies addressing sustainable development (DM

1.1), infrastructure requirements (DM 1.2), economic development and growth (DM 2.1.1), rural tourism development (DM 2.9) and the promotion of sustainable transport (3.11) will also be supported by the scheme.

13.7.24 In addition, the aims and objectives of the NDR will also be of key relevance for areas covered by area action plans. The Area Action Plans for Long Stratton and Wymondham in South Norfolk for example, show that the NDR may help to support the policy objectives related to housing and employment. The NDR is of particular relevance to the Area Action Plan for the Growth Triangle in Broadland, where the implementation of the NDR is identified as critical to the growth strategy for the area and the policy areas related to housing (6.3), employment (6.4), transport and accessibility (6.7) and sustainable development of the overall area (6.2) including the development of the new urban quarter and villages within the growth triangle.

Policy summary

13.7.25 The policy context for the NDR has, within recent years, experienced a great of change – as the policy drivers of localism and sustainable development have transformed the shape of national, regional and local level. It is evident that the objectives and aims of the NDR complement the aims and objectives found across the different policy levels. It is also clear that scheme is regarded as critical to the achievement of county and local sustainable transport policy and sustainable economic growth.

13.8 Approach and methodology

Introduction

13.8.1 This chapter explains the approach that has been used to produce this socio-economic assessment. It is structured as follows:

- identification of the spatial scope of the assessment;
- identification of temporal scope of the assessment;
- identification of sensitive receptors;
- methodology – which sets out the different research stages undertaken;
- development of assessment criteria; and
- assumptions and limitations.

13.8.2 It should be noted that the methodology set out below has been updated from that set out in the scoping document. The approach remains consistent but expands on the assessment process in order to make the assessment more quantitative and robust.

13.8.3 In addition, the methodology used to undertake this socio-economic assessment differs from the approach used within the 'Land-use and economic development report' for NDR, published separately. The purpose and as such the assessment criteria of each assessment is different and as such the predicted effects (see chapter four) are also different.

Spatial scope

13.8.4 Socio-economic effects have been assessed according to two key impact areas:

- The Local Area of Influence (LAI) for socio-economic effects (such as impact on local businesses and improved accessibility) within the study area that covers the 500m buffer zone either side of the NDR route.
- The Wider Area of Influence (WAI) for socio-economic effects on the areas of 'Greater Norwich; for the purposes of this assessment Greater Norwich is defined as the three districts of Norwich, Broadland and South Norfolk

13.8.5 Figure F.1 in Appendix F illustrates the location of the proposed NDR scheme, the LAI and the WAI,

13.8.6 For comparative purposes (i.e. to compare the LAI and WAI to wider geographies), where available, baseline socio-demographic data has also been compiled for the county of Norfolk and for New Anglia LEP, where available and appropriate.

Temporal scope

13.8.7 The baseline for this assessment is 2011, with Census 2011 data being the most reliable and up to date data available.

13.8.8 The current construction programme assumes that construction would commence in May 2015 and preliminary work in relation to the construction methodology indicates that construction works would last for approximately 24 months. This provides the timescales in which immediate impacts as a result

of construction will be felt – though for all identified impacts in this technical appendix, more specific timescales are provided where possible.

13.8.9 The scheme will be operational by 2017 and long-term operational impacts are assessed over a period of 15 years.

Sensitive receptors

13.8.10 Socio-economic receptors are individuals, groups or entities whose access to, and control over, socio-economic assets, resources and opportunities may be affected by the proposed development. These include people using the route, living in the LAI and WAI as well as local businesses.

Whilst this socio-economic assessment will also consider the effects on receptors within the WAI, sensitive receptors are considered to be those within the LAI.

Methodology

13.8.11 This assessment considers both direct and indirect socio-economic effects of the NDR scheme. It should be noted that EIA Regulations do not prescribe in detail the types of issues that should be considered within a socio-economic assessment, nor do they set out a precise methodology. The approach within this assessment is based on EIA best practice, the requirements of Volume 11, Section 2, Chapter 3 of the Design Manual for Roads and bridges (DMRB), and tailored to specifically reflect the proposed development. The steps undertaken are set out below:

- 1) Review of policy to identify local, sub-national and national planning and economic development objectives.
- 2) Identification of socio-economic resources and receptors along the route and within the LAI and WAI, through site visits and analysis of maps of the route.
- 3) Development of a baseline of the socio-economic conditions in the LAI and WAI together with county, LEP and England comparators to enable an analysis of the wider socio-economic effects including jobs created and wider economic effects. This is supported by wider economic impact work assessing multiplier effects and uplift in GVA.
- 4) Identification of components of the scheme that could have an effect on those receptors and resources (including, for example, employment uplift, economic

activity, access to housing and employment land), through examination of the planned route and its supporting documentation; and

- 5) Assessment of the significance of those effects on the receptors and resources in question, incorporating any mitigation measures included within the scheme design as well as any further mitigation measures identified as part of this assessment, and assessing any residual effects.

13.8.12 The following additional processes were used to support the findings of the assessment:

- Consultation: While there is no statutory consultation process required specifically for the purposes of a socio-economic assessment, public consultation has been undertaken as part of the Development Consent Order (DCO) processes and the Environmental Statement. Where relevant, this has been captured in the sections that follow. No additional consultation with local businesses or local residents has been undertaken specifically for this part of the assessment.

13.9 Assessment criteria

13.9.1 The significance of the socio-economic effects associated with the proposed NDR scheme is assessed using the approach described in the following sections.

Construction

13.9.2 For the construction period, the direct and indirect effects on the following have been considered:

- economic conditions – temporary employment for construction workers and short-term increases in economic activity due to construction;
- existing local businesses – temporary disruption to local businesses and reduced or disrupted access to businesses during construction works; and
- local people – temporary disruption to residents during construction works, including community severance; reduced residential amenity; and loss of community services / facilities.

Operation

13.9.3 For the operation, the direct and indirect effects on the following have been considered:

13.9.4 economic conditions – any permanent changes to employment or economic activity as a result of the scheme; attraction of new businesses;

13.9.5 existing local businesses – any changes in trade likely to result from operation of the trolleybus routes, and impacts on journey times;

13.9.6 local people – impacts on journey times and economic inclusion; and

13.9.7 regeneration – contribution to wider local and sub-national regeneration, economic development and social inclusion objectives.

Determining significance

Magnitude of effect

13.9.8 Each effect identified will be assessed in terms of the following indicators:

- beneficial or adverse – whether the development will benefit or dis-benefit socio-economic receptors;
- spatial scope – whether impacts will be felt in the LAI or more widely;
- extent – how many socio-economic receptors are likely to be affected;
- duration – whether the impacts will be short or long-term; and
- reversibility – whether the effects are permanent or temporary.

13.9.9 Taking these indicators into consideration, and also mitigation measures that can be applied to overcome any adverse effects, the criteria will be used as guidelines to assess the magnitude and significance of each effect. This is described in more detail in Table 13.8.

Table 13.8: Socio-economic magnitude

Magnitude	Criteria Guidelines
Major	A probable effect that either affects the well-being of many receptors within a widespread area or continues beyond the project life and is effectively permanent, requiring considerable intervention to return to the baseline. Alternatively, a probable effect that affects a high value socio-economic resources or processes that services large areas (e.g. at a district -level.)
Moderate	A possible effect that will likely affect either the well-being of receptors beyond the site boundary into the local area or continue beyond the project life so that the baseline is re-established within a year or so, perhaps with some intervention. Alternatively, a possible effect that affects a medium value socio-economic resource that services areas at a ward level.
Minor	An effect that may affect the well-being of a small number of receptors, or occurs exceptionally, mostly within the site boundary and does not extend to beyond the life of the project so that the baseline returns naturally or with limited intervention within a few months. Alternatively, an effect that affects a lower value community resource that provides a local service.
Negligible	An effect that is localised to a specific location within the project site and is temporary or unlikely to occur with no detectable effect on the well-being of people or a socio-economic resource so that the baseline remains consistent.

13.9.10 The magnitude of both beneficial and adverse effects is recorded for the assessment.

Sensitivity of receptors

13.9.11 Receptors relevant to the socio-economic assessment are set out above. The sensitivity of receptors is governed by their capacity to cope with

changes that ultimately reflect their vulnerability; that is their access to, or control over, additional or alternative resources of a similar nature.

Table 13.9: Sensitivity criteria

Sensitivity	
High	An already vulnerable receptor with very little capacity and means to absorb changes
Medium	A non- vulnerable receptor with limited capacity and means to absorb changes
Low	A non-vulnerable receptor with sufficient capacity and means to absorb changes.

Level of significance

13.9.12 Significance is a product the magnitude of an effect and the sensitivity (importance) of the receptor that is experiencing the impact. Each type of effect will be allocated a level of significance as shown in Table 13.10 below.

Table 13.10: Evaluation of significance

		Sensitivity		
		Low	Medium	High
Magnitude	Negligible	Not significant	Not significant	Not significant
	Minor	Not significant	Not significant	Significant
	Moderate	Not significant	Significant	Significant
	Major	Significant	Significant	Significant

13.10 Assumptions and limitations

Assumptions

13.10.1 This assessment has been based on the following assumptions:

- The majority of the data used to define the baseline economy and social conditions is compiled from existing published sources (including Census 2011 data, mid-year population estimates, Neighbourhood Statistics, Nomis and the Department for Communities and Local Government).
- The assessment of certain effects including those concerning jobs created, journey times and wider economic impact are based on modelling undertaken as part of the scheme development.
- The assessment includes no references to community resources or facilities, such as education, health or Public Right of Ways (PRoWs). These are covered in the relevant chapters of the ES Report – including ‘Effects on All Travellers’, ‘Noise and Vibration’ and ‘Air Quality’.

Limitations

13.10.2 The following limitations should be taken into account when considering of the findings of this assessment:

- The assessment was undertaken primarily through the review and analysis of available secondary data such as publicly available reports, policies, published data and the scheme design details.
- The baseline used is 2011, although wherever possible assessments are based on the most recent data available for the LAI and wider areas covered by the assessment. The currency of data varies from dataset to dataset depending on how frequently information is collected; dates for each dataset are highlighted in the baseline section.
- Only limited information is available regarding from where the construction workforce will be drawn, making attribution of local employment effects more challenging.
- Impacts and effects relating to other environmental topics such as noise, visual, traffic and air quality that could also affect socio-economic receptors will be addressed in the respective sections and only be raised in the socio-economic assessment if there is a particular effect likely to arise beyond any

individual impacts on resources and receptors. This will avoid double counting of significant effects.

- Qualitative assessments of the impacts to socio-economic receptors (i.e. in terms of disruption, access and quality of life) have been based upon best practice.
- This assessment does not serve as a cost benefit analysis or a financial analysis of the proposed development. These are provided in other assessments of the scheme.

13.11 Baseline

Introduction

13.11.1 This chapter sets out the socio-economic baseline data that has been collated to inform the assessment. This section is not intended to be a full socio-economic profile of the impact areas; the data focuses on baseline data that is relevant to the scope of the potential effects of the development of the scheme. The baseline provides the social and economic context for the scheme and presents a snapshot of the relevant surrounding socio-economic receptors that are likely to experience any effects.

13.11.2 Greater Norwich has the largest economy in East Anglia and the highest ranking retail centre (GNDP (2012): 'GNDP Annual Monitoring Report 2011-12'). Outside of Norwich the area retains a largely rural character but with an urban fringe. Large parts of Broadland fall within the urban area and areas close to the city centre maintain a strong relationship to Norwich. Away from the urban area the district extends into a rural landscape distinguished by market towns and small villages. South Norfolk has a smaller urban fringe and large parts of the district are rural and remote, making use of a network of major centres such as Wymondham, Diss and Harleston, and smaller centres such as Loddon and Long Stratton to meet their everyday needs.

13.11.3 Across Greater Norwich, there are significant differences in wealth, and wages remain low. Broadland and South Norfolk for example, are generally relatively affluent with small dispersed pockets of deprivation in only some rural areas. Norwich by contrast is more deprived, with extensive areas experiencing high levels of deprivation. Traditional industries of manufacturing and farming are also now of declining importance. Whilst, agriculture remains the largest user of land and automotive engineering remains strong, the service sector has grown considerably in both strength and importance in recent decades. (GNDP (2010): 'An economic assessment of Greater Norwich').

13.11.4 Figures presented below are for the LAI (consisting of a 500m buffer surrounding the proposed NDR scheme boundary), while wider comparisons are made with the WAI (Greater Norwich - Norwich, Broadland and South Norfolk), Norfolk and the New Anglia LEP area. Figures for England are provided to provide the context for local figures – to show whether the profile of the assessment area is broadly in line with national averages or not.

Population

Population, growth and density

13.11.5 The population within the Greater Norwich area has been increasing steadily over recent years. In all three districts the population has continued to increase with nearly 30,000 more people living in the area now compared to 10 years ago.

13.11.6 The table below shows the total population for the LAI, WAI, constituent districts as well as Norfolk and the New Anglia LEP area:

Table 13.11: Population of LAI and WAI(Source: Census 2011)

Area	Total population
LAI (500m Buffer)	10,175
Norwich	132,512
Broadland	124,646
South Norfolk	124,012
WAI (Greater Norwich)	381,170
Norfolk	857,888
New Anglia LEP	1,586,051

13.11.7 The area within 500m of the NDR route (the LAI) had a population of just over 10,000 according to Census 2011 data. The total population in the Greater Norwich area (the WAI) was just over 380,000 in 2011. (Norfolk Insight (2012): 'Demography').

13.11.8 Figure F.2 in Appendix F illustrates the population density of the LAI and WAI.

13.11.9 Overall the WAI is characterised by low population density, however much of Norwich and a few areas in the south of Broadland are densely populated. Within the LAI itself population density is low.

Age profile

13.11.10 The age pyramids below illustrate the population by five year age bands.

Figure 13.1: Age Pyramid for LAI

Source: Census 2011

Figure 13.2: Age Pyramid for WAI

Source: Census 2011

13.11.11 Within the LAI and WAI it can be noted:

- The LAI has a slightly higher proportion of children aged under 16 (22%) than the WAI and Norfolk (both 17%) and New Anglia LEP (19%)
- The LAI and the WAI have slightly higher proportions of working age people (aged 16 – 64) (65% and 64% respectively) than Norfolk and New Anglia LEP (both 62%).
- A lower proportion of older people (aged 65 and over) live within the LAI (13%) compared to the other geographic comparators (WAI,19%, Norfolk 22%,New Anglia LEP, 21%)
- There is variance within the WAI itself; Norwich has a higher proportion of working age people and a lower proportion of older people compared to both Broadland and South Norfolk.

The economy

Please note that the separately produced 'Land-use and economic development report' for NDR contains similar but slightly different data sets to those contained in this report, including OS Labour Market Statistics, 2013. The September 2013 data is based on economically active residents aged 16-64 and is not directly comparable with unemployment from Census 2011 though it does provide a reflection on the current position. As such, direct comparisons between the findings of the two reports should be avoided.

Employment and jobs

13.11.12 The employment rate in the LAI is 74%. This is high compared to the WAI (68%), Norfolk (64%) and New Anglia LEP area (65%).

13.11.13 Key employment sectors in Greater Norwich (the WAI) include public administration, banking and hospitality. The table below highlights the sector profile for Greater Norwich and its constitutive districts compared with Norfolk and East Anglia LEP. It shows that:

- Just over a quarter of the jobs in Greater Norwich are in the public sector (incorporating health and education), this is broadly equivalent to the LEP area percentage but remains lower than Norfolk.
- Greater Norwich also has a higher than average proportion of people working in the financial sector (21%) compared with 15% for the LEP area.
- Other key sectors in Greater Norwich include distribution, hotels and restaurants, where the proportion is similar to that for the LEP area and Norfolk.
- The lowest proportion of the population work in the agricultural sector (3%) and in energy and water (3%) across Greater Norwich. In both instances this is in line with the county and LEP area (2%).

*Table 13.12: Employment sector profile (Source: Annual Population Survey 2012
(Note that no figures were available for the LAI due to a lack of small area data
within this data set)*

	<i>Agriculture & fishing</i>	<i>Energy & water</i>	<i>Manufacturing</i>	<i>Construction</i>	<i>Distribution, hotels &</i>	<i>Transport & Communication</i>	<i>Banking finance & insurance etc.</i>	<i>Public admin education & health</i>	<i>Other services</i>
<i>Norwich (%)</i>	0%	0%	10%	6%	19%	7%	23%	31%	3%
<i>Broadland (%)</i>	2%	2%	12%	8%	17%	5%	20%	29%	5%
<i>South Norfolk (%)</i>	6%	6%	10%	8%	20%	10%	19%	20%	7%
<i>WAI (Greater Norwich) (%)</i>	3%	3%	10%	7%	19%	7%	21%	27%	5%
<i>Norfolk</i>	2%	2%	12%	8%	20%	7%	17%	30%	6%
<i>New Anglia LEP</i>	2%	2%	12%	8%	20%	8%	15%	27%	6%

Unemployment and worklessness

13.11.14 Within the LAI, unemployment remains low, with only 2% of the total population claiming Job Seekers Allowance (JSA). Whilst this proportion is similar to that of the WAI, it is lower than the figure for Norfolk (4%).

Table 13.13: Number and proportion of working age population claiming JSA (Source: Department for Work and Pensions (DWP via Nomis). Data relates to November, 2012.)

Area	Population 16-64	JSA Claimants (no.)	JSA Claimants (%)
LAI (500m Buffer)	6,609	104	2%
Norwich	91,460	4,540	5%
Broadland	75,841	1,520	2%
South Norfolk	75,194	1,620	2%
WAI (Greater Norwich)	242,495	7,680	3%
Norfolk	527,672	18,700	4%
New Anglia LEP	977,894	32,050	3%

13.11.15 Worklessness, which includes people not looking for work, also remains relatively low. The number of workless people claiming a key out of work benefit in the LAI is 385, equating to 6% of the working age population. This remains in line with levels for both Broadland and South Norfolk but is markedly lower than the district of Norwich (14%), Greater Norwich (10%), Norfolk (11%) and the LEP area (10%).

Table 13.14: Number and proportion of working age people claiming an out of work benefit (Source: Department for Work and Pensions (DWP via Nomis). Data refers to February 2013)

Deprivation

13.11.16 Figure F.3. in Appendix xF shows aggregate deprivation within the LAI and WAI by IMD quintile within the study impact area. The blue and green areas are less deprived while the orange and red areas are more deprived. Every three years the Department for Communities and Local Government publishes the Index of Multiple Deprivation (IMD) an index of all Lower Super

Output Areas (the smallest unit of local geography), ranked according to an aggregated score relating to deprivation (which covers a number of areas including employment, income, crime, health and access to services). All 34,000 LSOAs in England are ranked and divided into quintiles. The highest scoring 20 per cent are the 'most deprived' while the lowest scoring 20 per cent are the 'least deprived'.

- 13.11.17 Within the LAI deprivation remains low. All areas immediately surrounding the route fall within the least deprived IMD quintiles (one to three). The most deprived areas within the WAI are in Norwich.

Land use

The NDR passes through land that is predominantly rural farmland and former parkland (Beeston and Rackheath Halls) for most of the route. The route does also include some urban fringes particularly around Norwich Airport and Broadland Business Park – where land use includes residential, employment and commercial.

Residential sites

- 13.11.18 Within the WAI, housing allocations have been made as part of the JCS to ensure the delivery of at least 36,000 new homes between 2008 and 2026, of which approximately 33,000 will be within the Norwich Policy Area (NPA).
- 13.11.19 The strategic housing development areas within the WAI (those of over 300 dwelling, which are included within the JCS and therefore included in this assessment) are included in the table below. Allocation figures include allocations for Broadland (NPA) and the Andrew Growth Triangle. Both are proposed submission content following a high court decision to take both back to Regulation 19: Publication of Local Plan Stage. This content has now been resubmitted to the high court, following representations under Regulation 20 of the Town and Country Regulations.

Table 13.15: Strategic housing sites within the WAI (site in excess of 300 new homes)(Source: GNDP (2013): 'Joint Core Strategy for Broadland, Norwich and South Norfolk')

Location	Local Authority	Number of housing units
Core Development Area 3	Broadland	3000 - 4000
Core Development Area 2	Broadland	3000 - 4000
Core Development Area 1	Broadland	3000 - 4000
Sites R0983a, R0983b, 0542 & 0719 Long Stratton	South Norfolk	1200 - 1800
Three Score Bowthorpe	Norwich	1200
Site R1016, Site R0169, Site R0249a	South Norfolk	1200
Land north of Hethersett (Site no 950a)	South Norfolk	1080
Royal Norwich Golf Club, either side of Drayton High Road, Hellesdon	Broadland	800 - 1000
South and East of Easton (Site no 1152)	South Norfolk	900
Deal ground and May Gurney Sites	Norwich	600
Sites 0319, 0951c, R0983d & 0729	South Norfolk	600
West of Lodge Farm (site 0270a), Costessey	South Norfolk	500
Land adjoining Norwich City football Club, Kerrison Road	Norwich	400
Kerrison Road, Hardy Road Gothic Works	Norwich	400
Carpenters Barn (1)	South	350

Location	Local Authority	Number of housing units
	Norfolk	
King Street, Norwich	Norwich	335
Norwich Common (2)	South Norfolk	323
Rose Land and Mountergate, Norwich	Norwich	300
Hospital Grounds, southwest of Drayton Road, Hellesdon	Broadland	300
land north of Burgh Road and west of A140, Aylsham	Broadland	300
Land north of Shotesham Road, Poringland/ Framingham Earl	South Norfolk	300

13.11.20 Of these, the following are in part located within the LAI:

- Broadland Core Development Area 1 (The Growth Triangle)
- Broadland Core Development Area 2 (The Growth Triangle)
- Broadland Core Development Area 3 (The Growth Triangle)
- Royal Norwich Golf Club, either side of Drayton High Road, Hellesdon
- Hospital Grounds, south west of Drayton Road, Hellesdon

13.11.21 The total housing allocation for the areas within or intersecting with the LAI is between 10,000 and 13,300

13.11.22 The largest area of planned growth will therefore occur at the 'Growth Triangle' that is focussed on Old Catton, Sprowston, Rackheath and Thorpe St Andrew in Broadland, which will see an allocation of between 9,000 and 12,000 new homes including the eco-town at Rackheath.

Employment sites

13.11.23 Site analysis is also undertaken within the 'Land-use and economic development report'. Site analysis within this Socio-economics TA analyses different sites (and a different number of sites) for a different purpose to the analysis within the economic development report.

13.11.24 The key employment sites in the WAI and LAI are shown on Figure F.4 in Appendix F. These sites are comprised of the following land use types:

- mixed employment / commercial / retail land; and
- office / research space with a number of business parks and mixed use estates.

13.11.25 Within the WAI, key existing employment sites include:

- University of East Anglia/ Norwich Research Park (NRP)
- Norwich City Centre
- Bowthorpe Employment Area
- Hall Road
- Norwich International Airport
- Norwich Airport Industrial Estate
- Vulcan Road Industrial Estate
- Mason Road/Mile Cross Area
- Whiffler Road
- City Trading Estate
- St Andrews Business Park
- Broadland Business Park
- Meridian Business Park
- Rackheath Industrial Estate
- Aylsham estate

- Longwater
- Vinces Road Industrial Estate, Diss
- Border Valley Industrial Estate, Harleston
- Hethel (Lotus)
- Loddon Industrial Estate
- Broadhill Industrial Estate and Tharston Industrial Estate, Chequers Road, Long Stratton
- Ayton Road, Wymondham
- Gateway 11 Business Park, Wymondham

13.11.26 The WAI also includes a number of proposed new employment sites. These are:

- Norwich Aeropark
- Broadland Gate Business Park
- Rackheath Eco-town
- Beyond Green Land
- Hethel Technology Park
- Wymondham Employment Estate

13.11.27 The LAI includes a number of existing employment sites, including business parks and industrial estates.

- The south east of the NDR route includes two Business Parks in Thorpe St Andrew – Broadlands Business Park and Meridian Business Park.
- To the north east of the scheme, the Rackheath area includes Rackheath Industrial Estate and the proposed Rackheath eco-town development.
- Whilst immediately north of the route, a number of key developments are included surrounding Norwich International Airport – this includes the airport itself, Norwich Aeropark, Norwich International Airport Estate and Vulcan Road Industrial Estate.

13.11.28 A closer view of the LAI is shown in Figure F.5 in Appendix F, identifying clustered individual businesses along the NDR route.

13.11.29 A list of these businesses is provided in Appendix D. Appendix C also includes a table that describes the key employment sites that are within the WAI.

13.12 Mitigation and prediction of effects

Introduction

13.12.1 The following chapter describes the anticipated activities to be undertaken during the construction and operational phases of the NDR scheme which may result in impacts that could affect socio-economic receptors and resources. Mitigation measures to address the anticipated impacts are described, and then any remaining effects predicted to occur as a result of the scheme and post-mitigation are then outlined.

Works affecting socio-economics

Construction phase effects

13.12.2 During construction of the NDR scheme, potential socio-economic effects include the following:

- Direct employment through construction;
- Short-term increase in economic activity due to construction process;
- Temporary disruption to local businesses and reduced or disrupted access to businesses; and
- Land-take from existing businesses, disrupting business operations.

Operational phase effects

13.12.3 During operation of the NDR scheme, potential socio-economic effects include the following:

- Improved access to employment and other strategically important economic sites;
- Improved access to strategically important new housing sites;

- Supporting wider job creation and GVA growth in the WAI;
- Supporting wider growth in the WAI and East Anglia; and
- Supporting tourism in the WAI and Norfolk.

Mitigation

This section outlines the mitigation measures that will be incorporated into the scheme.

Construction phase mitigation

Construction Environmental Management Plan

13.12.4 This section outlines the key mitigation measures that will be incorporated into the scheme for the construction period. During the construction period, a Construction Environmental Management Plan (CEMP) will be produced (of which only a draft is currently available), which sets out measures to manage the effects of construction activities. The key measures that are established in the CEMP include:

- Communication and public liaison: Including with Broadland District Council; Natural England; Environment Agency; English Heritage; landowners and their agents; the general public
- Air quality: including management and minimisation of the effects of dust during the process.
- Noise control and monitoring: including use of 'best practicable means' for noise control and appropriate construction noise management in accordance with the Code of Practice BS 5228
- Lighting: In order to prevent excessive disruption, measures will be taken including: using downward directed lighting; avoiding excessive additional lighting; and directing lighting to where it is needed to avoid light spillage.
- Traffic disruption: construction movements and deliveries are subject to controls regarding routing, time of day, and point of access.
- Other aspects of construction: Including: construction compound layout and reinstatement; ecological management; pollution control; air quality management plan; and construction waste management.

13.12.5 Mid Norfolk Shooting School, a business located on the route, will experience severance of its access. Alternative access is being provided as part of the scheme.

Operational phase mitigation

13.12.6 No operational phase mitigation measures have been identified for socio-economics, as predicted operational effects for this discipline are considered to be positive.

Other proposed mitigation

13.12.7 Other mitigation measures are not incorporated into the programme of works as it currently stands. However, mitigation measures for both the construction and operational stages were also proposed during the consultation process. Stakeholders and consultees called for:

- Provision of safe diversionary routes around construction works.
- A footpath for pedestrian use on at least one side along the NDR. .
- Active management of obstacles on any walking routes so that they do not cause problems for those with visual impairments.
- Communication of changes to be made through NCC and Norwich City Council and interest groups (for example, the NNAB).
- Provision of adequate notice to local residents and facility managers prior to commencing works.
- Maintenance of existing traffic, cycling, pedestrian and public transport links where possible throughout the construction phase.
- Maintenance of pedestrian access to all adjacent properties and businesses.

13.12.8 Additionally, the contractors are seeking replacement land adjacent to the site of the City of Norwich Aviation Museum, who will lose an area of aeroplane display space to the scheme. Details on whether this land has been secured are not currently available.

Predicted effects

13.12.9 The following sections provide details of the effects predicted to occur as a result of the NDR scheme following implementation of the mitigation measures identified above.

Construction phase effects

13.12.10 This section predicts the direct and indirect effects of the development of NDR during the construction phase.

Direct construction effects

Direct employment through construction

13.12.11 The development of NDR will create temporary employment over the construction period. It is forecast that, at peak construction periods in the summer months (April to September) of 2016 and 2017, there will be approximately 200 employees working on the project. The majority of Birse Civils (the appointed contractor) staff will be existing employees, however it is anticipated that some agency staff from within the WAI (the Greater Norwich area) will also be employed. (Norfolk County Council (2013): 'Norwich Northern Distributor Road: Construction Methodology').

13.12.12 It is anticipated that a large proportion of staff will be based in the WAI (Greater Norwich) and that general labour and potentially some sub-contractors would be sourced from companies based in East Anglia. NDR works will be sublet in packages and the following packages have already been agreed (with core location of contractor identified in brackets):

- Earthworks package to Lancasters (Newmarket based);
- Surfacing package to Tarmac (Norfolk and Suffolk based); and
- Traffic Management to Road services (Peterborough based).

13.12.13 In terms of other trades, such as landscaping, a shortlist of three further sub-contractors has been agreed however details on these cannot be specified until sub-contracts have been let. (Norfolk County Council (2013): 'Norwich Northern Distributor Road: Construction Methodology').

- 13.12.14 Magnitude of effect: Minor beneficial as there will be a relatively small effects on employment opportunities in the LAI and WAI and these effects will be temporary.
- 13.12.15 Sensitivity of receptors: Low as many of the jobs that will result from the scheme will go to existing employees or contractors outside the LAI and WAI (although still in East Anglia). In addition, unemployment in the LAI and much of the surrounding area is low
- 13.12.16 Significance: Not significant

Short-term increases in economic activity during construction

- 13.12.17 There is likely to be an increase in economic activity as a result of the NDR contractor construction workers utilising local goods and services whilst employed on the scheme.
- 13.12.18 This activity is likely to be relatively minor as the vast majority of businesses in close proximity to the route are not retail-focussed in a way that would see them benefit (e.g. from additional trade, or service use).

Magnitude of effect: Negligible as additional activity is likely to be minor, temporary in nature and concentrated in the LAI.

Sensitivity of receptors: Low as additional activity and trade within the LAI and WAI would be a small increase when compared with existing business

Significance: Not significant

Disrupted access to existing local businesses due to construction traffic

- 13.12.19 The main construction site compound will be located on the airport land north of the NDR. This compound will have full welfare facilities, parking, accommodation, offices, plant storage and maintenance compound. Access to the compound will be from Cromer Road. Satellite compounds will also be constructed for office, parking and plant storage facilities at Drayton Lane, Buxton Road, Plumstead Road and Postwick. Smaller compounds will also be established at the sites of proposed bridges along the route. These will also provide welfare facilities, parking and material storage associated with construction activity. These sites will be restored and reinstated to their former

use on completion of the bridge construction. (Norfolk County Council (2013): 'Norwich Northern Distributor Road: Construction Methodology'). The list of compounds and their access and plant crossing activity is included in the table below.

Table 13.16: Compound sites during construction

Road	Site access requirements	Plant crossing
Fakenham Road	Eastbound access from existing highway	No
Marriott's and Breck Farm Way	None	Temporary crossing point
Reepham Road	Eastbound and westbound access	Yes (off peak)
Bell Farm	None	Temporary crossing point
Drayton Lane	Eastbound and westbound access	Yes
Holt Road	Eastbound and westbound access	Yes
Cromer Road	Eastbound access to Main Compound	Yes (off peak after Holt Road is closed)
Old Norwich Road	None	Temporary crossing point
Northern Airport access	None	Temporary crossing point
Quaker Road	None	Temporary crossing point
Buxton Road	Eastbound and westbound access	Yes
North Walsham Road	Eastbound and westbound access	Yes (off peak)
Beeston Farm	None	Temporary crossing point

Road	Site access requirements	Plant crossing
Wroxham Road	Eastbound and westbound access	Yes (off peak)
Newman Road	To offices and bridge site only	Temporary crossing point
Salhouse Road	Eastbound and westbound access	Yes
Plumstead Road	Access to compounds and bridge sites	No
Middle Road	None	No
Low Road	Eastbound and westbound access	Yes
Smee Lane	None	Yes
Postwick	Westbound access from new northern roundabout	No

13.12.20 4.22 Businesses located on the route, near to construction compounds, or along routes heavily used by construction traffic may experience negative impacts during construction. These impacts would include increased congestion and slow moving traffic and would cause disruption of usual access to these sites.

13.12.21 4.23 During the construction phase, the amount of traffic and numbers of Heavy Goods Vehicles (HGVs) are expected to increase on the road networks around the construction compounds and worksites. It is anticipated that during peak periods there will be up to 75 deliveries per day predominantly in 20 tonne eight wheeled wagons, in addition to staff and workforce transport.

13.12.22 4.24 The table below outlines the construction areas for the NDR route, and for each area where business are affected, these are identified, along with the duration of the disruption, calculated from likely start and end dates:

Table 13.17: Construction disruption to business sites along the proposed NDR route

Business areas impacted	Works areas (as specified in Construction Methodology)	Months' disruption
Broadlands Business Park/ Meridan Business Park	Low Road Overbridge To NDR Roundabout	32
Drayton	Bell Farm Overbridge To Drayton Lane Roundabout	22.5
	Drayton Lane Roundabout	
Horsford	Bell Farm Overbridge To Drayton Lane Roundabout	20.5
	Drayton Lane Roundabout	
	Drayton Lane Roundabout To Cromer Road Roundabout	
Great Plumstead	Railway Crossing To Plumstead Road Roundabout	32.5
	Borrow Pit - Plumstead Road To Postwick Hub	
	Plumstead Road North Roundabout & Link Road	
	Plumstead Road Rbt To Low Road Overbridge	
	Low Road Overbridge	
	Low Road North Embankment	
	Low Road South Embankment	
Rackheath	Buxton Road To North Walsham Roundabout	34.5
	North Walsham Roundabout	
	North Walsham Rbt To Wroxham Roundabout	
	Wroxham Road Roundabout To Newman Rd Overbridge	
	Newman Road Overbridge	

Business areas impacted	Works areas (as specified in Construction Methodology)	Months' disruption
	Newman Rd O/B. North Embankment	
	Newman Rd O/B. South Embankment	
	Newman Rd O/B To Salhouse Road Roundabout	
	Surplus Excavated Material Wroxham Rd To Salhouse Rd	
	Salhouse Road Roundabout	
	Salhouse Road Roundabout To Railway Crossing	
	Rackheath Railway Bridge	
	Rackheath Road Bridge	
Rackheath Industrial Estate	Wroxham Road Roundabout	33
	North Walsham Roundabout To Wroxham Roundabout	
Taverham	A1067 To Fir Covert Road	24
	Fir Covert Road (Turning Heads)	
	Fir Covert Road To Marriots Way Overbridge	
	Marriots Way Overbridge	
	Marriots Way - North Embankment	

Magnitude of effect: Moderate adverse as effects caused by construction traffic will last for as much as three years in some areas and will largely affect eight employment sites within the LAI.

Sensitivity of receptors: Low as most affected businesses will still be able to function.

Significance of effect: Not significant

Land-take from existing businesses, disrupting business operations

13.12.23 Construction of the NDR scheme will require land from Mid Norfolk Shooting School, which is located on Fakenham Road. Presently this business is accessed from the A1067; some of the land used for this access will be required for construction of the NDR but will be re-provided. Works in this vicinity will last for approximately 20 months, and access to the site will, therefore, be temporarily disrupted during this time. However, it is anticipated that the business will be able to trade as normal.

Magnitude of effect: Minor adverse because access will not be lost and will not have a permanent impact on the ability of the businesses to trade effectively

Sensitivity of receptors: Low due to the ability of the business to absorb the effects and continue to do business

Significance of effect: Not significant

13.12.24 The City of Norwich Aviation Museum is located on the Old Norwich Road at the airport site. Construction of the NDR will require land which is used for aeroplane displays. The loss of this land will mean reduced exhibition space and reduced capacity to earn revenue from operations using the space.

13.12.25 At the time of writing the contractors are seeking replacement land adjacent to the museum site but this had not been confirmed. Assessment is therefore made on the basis of this land being lost.

Magnitude of effect: Moderate adverse because a proportion of the display space will be lost, potentially affecting business revenue

Sensitivity of receptors: Low due to the overall ability of the business to absorb the loss of space and continue to do business

Significance of effect: Not significant

Operational phase effects

Direct operational effects

Access to employment and economic centres

13.12.26 The NDR will improve road access to a number of existing strategically-important employment sites and to other key economic drivers such as nearby business parks and Norwich Airport.

13.12.27 The changes in journey times to existing key strategic employment locations, economic centres and business districts throughout Greater Norwich are outlined in the tables below. Table 4.3 includes existing sites, while table 4.4 includes proposed sites.

- For each identified site three locations have been selected to provide indicative journey origin points. For these origin points the ‘centre’ for the largest settlements in each of the three districts that make up the study area have been chosen – Norwich, Taverham (in Broadland) and Wymondham (in South Norfolk). Clearly, not all journeys originate from these locations; they are intended to be indicative of potential changes and journey time savings as a result of the implementation of the NDR.
- The times indicated are for private transport during the AM peak for the year 2017. These times are intended to be indicative only. The detailed transport model for the NDR scheme has produced similar tables for the inter-peak and PM peak periods, for the return journey during that PM peak period, and for the second reference year 2032. Travel time impacts for other modes (such as public transport) have also been produced.
- The table provides journey times for two scenarios: one for ‘do nothing’, representing the network in its current form; and one for the ‘NDR’ in its current JCS configuration (which includes the Postwick Hub). The change in journey time between the two is illustrated in the far right column where decreases in journey time are marked in green and increases marked in red. No change in journey time is coloured orange.
- Using the traffic model to calculate journey times for the purposes of analysis in the HIA means that certain journey times in the ‘Do Something Scenario’ include Park and Ride interchanges, where this occurs there is scope for an additional artificial increase to the journey time included.

Table 13.18: Impact on journey times to existing strategic employment locations within Greater Norwich

Business District	Origin Point	Journey times		
		Do nothing	NDR	Change
Aylsham estate	Norwich	06 min 43 sec	06 min 36 sec	-00 min 07 sec
	Taverham	20 min 49 sec	17 min 16 sec	-03 min 33 sec
	Wymondham	21 min 10 sec	20 min 40 sec	-00 min 31 sec
Ayton Road, Wymondham	Norwich	18 min 26 sec	18 min 21 sec	-00 min 05 sec
	Taverham	25 min 58 sec	24 min 08 sec	-01 min 50 sec
	Wymondham	00 min 00 sec	00 min 00 sec	00 min 00 sec
Border Valley Industrial Estate, Harleston	Norwich	32 min 34 sec	32 min 41 sec	00 min 07 sec
	Taverham	42 min 28 sec	40 min 36 sec	-01 min 53 sec
	Wymondham	23 min 26 sec	23 min 26 sec	00 min 00 sec
Bowthorpe Employment Area	Norwich	15 min 53 sec	15 min 43 sec	-00 min 10 sec

*The origin point for Norwich is City Hall, just outside the centre of town.

13.12.28 Of the 26 employment sites analysed (using the three origin points) resulting in 78 journey time changes:

- 58 (64 per cent) journey times will decrease
- 13 (17 per cent) journey times will increase
- seven (nine per cent) journey times will not change
- 58 (64 per cent) journey times will see change (either increase or decrease) of two minutes or less

13.12.29 The vast majority of journey times will be reduced as a result of the NDR. In particular journey times from Taverham to Meridian Business Park, Great Plumstead/Thorpe End, Rackheath Industrial Estate, Broadland Business Park, and St Andrews Business Park will all reduce by more than 10 minutes.

13.12.30 Journey times from Wymondham to Meridian Business Park, Broadland Business Park, and St Andrews Business Park will see the largest increases in journey time, of more than two minutes. Other journey time increases, where they exist, are of less than one minute.

13.12.31 NDR will also provide access to a number of future employment sites identified in the JCS. These are detailed in the table below, applying the same methodology.

Table 13.19: Impact on journey times to proposed future employment locations within Greater Norwich

	Taverham	1 min 58 sec	0 min 8 sec	-01 min 50 sec
	Wymondham	0 min 0 sec	0 min 0 sec	00 min 00 sec

13.12.32 Of the 6 employment sites analysed (using the three origin points) resulting in 18 journey time changes:

- 13 (72 per cent) journey times will decrease
- 3 (17 per cent) journey times will increase
- two (11 per cent) journey times will not change
- 11 (61 per cent) journey times will see change (either increase or decrease) of two minutes or less

13.12.33 The vast majority of journey times to proposed employment sites will be reduced. The biggest reductions are to Broadland Gate Business Park, Norwich Aeropark, Beyond Green Land and Rackheath Eco-town. All will see

reduction of more than five minutes for at least one (and generally more than one) of the origin points identified in the table.

13.12.34 There will be some increases in journey times from Norwich (namely to Hethel Technology Park, Norwich Aeropark and Rackheath Eco-town) but these are expected to be very minor (around 30 seconds or less).

13.12.35 The greatest journey time savings are for those accessing the sites from outside of Norwich centre.

Magnitude of effect: Major beneficial as the vast majority of employment current and future locations are likely to experience permanent reductions in journey times from Norwich (where much of the population of the WAI live) and Taverham, Broadland (where the scheme is located)

Sensitivity of receptors: Medium as accessibility will be improved for people living within the WAI and wishing to travel to those sites – for example, those newly employed at the locations.

Significance of effect: Significant

Improved access to new housing sites

13.12.36 The separately published 'Land-use and economic development report' of the NDR scheme (Norfolk County Council (2013): 'Norfolk NDR: Land-use and economic development report') acknowledges that the NDR will have substantial effects on traffic flows and congestion in the immediate vicinity and in the Greater Norwich area (WAI) reducing journey times and improving accessibility.

13.12.37 In particular, the NDR will improve road access to a number of new strategically-important housing sites as identified in the JCS and other strategic local planning documents.

13.12.38 The change in journey times to each of these housing locations – using the same parameters as set out above – is detailed in the table below:

Table 13.20: Impact on journey times to strategic housing locations identified in the JCS during the Inter Peak period

	Taverham	12 min 42 sec	12 min 03 sec	-00 min 38 sec
	Wymondham	10 min 22 sec	10 min 22 sec	00 min 00 sec

13.12.39 Of the 11 housing sites analysed (using the three origin points) resulting in 33 journey time changes:

- 16 (48 per cent) journey times will decrease
- 11 (33 per cent) journey times will increase
- six (18 per cent) journey times will not change

13.12.40 27 (82 per cent) journey times will see change (either increase or decrease) of two minutes or less

13.12.41 4.42 The majority of journey times will be reduced, with the largest reductions at Broadland Core Development Areas 1, 2 and 3 when travelling from Taverham and Wymondham (all of which will see reductions of more than five minutes with the NDR in place).

13.12.42 4.43 The largest journey time increases are from Norwich, to new sites in Long Stratton and South Norfolk, where journey times are likely to increase by more than 11 minutes. These longer journey times are the result of a shift of travellers onto the Norwich Park and Ride system within the traffic model and should be considered as such. The journey time data in these cases accounts for possible journey switching to Park & Ride which, for trips into Norwich, can produce large journey time increases (although overall journey costs are reduced, accounting for the difference between city centre parking charges and Park & Ride fares). This switching can occur between Do Minimum and NDR JCS (Do Something) journeys, especially when city centre measures within the Do Something option would make car journeys less attractive. This causes drivers to switch to the Park & Ride in some circumstances, resulting in seemingly anomalous increases of the journey times into Norwich.

13.12.43 4.44 However, in general journey times from Norwich see a disproportionate number of increases to new housing sites including: Deal ground and May Guerne sites, the housing land north of Hethersett and the land south and east of Easton.

13.12.44 4.45 Journey times from Wymondham are unlikely to change significantly to most strategic housing locations as a result of the NDR scheme.

Magnitude of effect: Moderate beneficial as most housing locations are likely to experience reductions in journey times, though very few effects will be felt

for travellers from South Norfolk, and travellers from Norwich (for example, those who work in Norwich and may live in one of the new housing locations in the future) may experience journey time increases.

Sensitivity of receptors: Medium as accessibility will be improved, particularly for people living in Broadland.

Significance of effect: Significant

Indirect effects

Supporting job creation and GVA growth

13.12.45 The NDR scheme is likely to support wider job creation and subsequent GVA uplift in the WAI. The MSBC for NDR, submitted in 2008, and revised in 2011 anticipates positive effects in terms of employment. (Norwich County Council (2011) 'Norwich Northern Distributor Road Major Scheme Business Case addendum to 2008 Financial Delivery, and Commercial Case') Similarly, the separately published Land-use and economic development report of the NDR scheme states that the NDR and Postwick Hub will have positive effects on the economy of the WAI and more widely in terms of job creation. (Norfolk County Council (2013): 'Norfolk NDR: Land-use and economic development report'. Note that this report does not analyse all of the sites mentioned in this report. It does, however, provide the most up to date analysis of the likely employment effects of the DNR scheme and as such provides the most effective assessment of the likely employment impacts in the WAI.) These include:

13.12.46 4,358 net additional direct jobs arising from the development sites listed in the land use and economic development report;

13.12.47 when multiplier effects are included this figure (of 4,358) rises to 5,230 net additional jobs that would not otherwise arise in Greater Norwich;

13.12.48 £1.099bn of additional GVA is forecast to be generated by those 5,230 jobs over some 30 years;

13.12.49 £966m of net additional physical investment in roads, infrastructure and housing; and

- 13.12.50 an average of 426 construction jobs (rising to 511 when multiplier effects are included) in each of the years until development is complete (estimated at 2034).
- 13.12.51 These jobs will primarily be located at strategic employment sites as part of the JCS. These include the following, also identified in the Land-use and economic development report:
- 13.12.52 A number of business parks, including Broadland Business Park and Meridan Business Park, where a wider labour catchment could be of value to new or existing businesses. However, many sites also have constraints which would not be overcome by the NDR, which could depress the positive effect of the scheme. After deadweight is taken into account, the NDR scheme may stimulate site development, accommodating a maximum of 1,300 jobs. (Norfolk County Council (2013): 'Norfolk NDR: Land-use and economic development report')
- 13.12.53 Norwich International Airport and Airport Industrial Estate. The NDR will help to remove planning restrictions imposed on the airport due to poor surface access. Based on the assumption that expected growth in passenger numbers materialises, this could generate a maximum of 350 jobs by 2015 (though it should be recognised that due to the above-noted delays in the timetable, this target date is unlikely to be met).

Magnitude of effect: Moderate beneficial as the scheme will most likely result in permanent uplift in jobs and GVA in the WAI and more widely in East Anglia

Sensitivity of receptors: Medium as employment opportunities will be indirectly enhanced for people living within both the WAI, which contains high number of unemployed people.

Significance of effect: Significant

Cumulative effects

Supporting future development

- 13.12.54 The Land-use and economic development report notes that the NDR will support wider cumulative impacts in the WAI and in East Anglia.

13.12.55 The scheme is anticipated to help to enhance Norwich's strategic road infrastructure to help distribute the growth and development sought within the JCS. North-east Norwich in particular is proposed as a sustainable urban extension and the NDR is considered an important piece of infrastructure, providing a spine along which the spatial development of the area is dependent. Other areas of growth and development that will benefit include:

- The Broadland Gate Business Park Development releases 25 hectares of employment land and is supported by, amongst other developments the NDR and Postwick Hub schemes.
- The Former RAF Coltishall site: The former RAF Coltishall site has a prison on site presently but demonstrates longer-term potential for employment uses, The NDR will improve access and connectivity to the site making it more attractive for employment uses.
- Growth in Aylsham: Aylsham is a market town to the north of Norwich which will benefit from links to the NDR via the A140 where it joins the NDR west of Norwich Airport. The settlement has capacity for housing growth and its attractiveness will be enhanced by improved connectivity to employment opportunities along the NDR corridor, including those at Broadland Business Park, Norwich Airport, Rackheath and NRP.
- Growth in North Walsham: North Walsham will also benefit from links to the NDR via the B1150 where it joins the NDR near Spixworth. Though positive effects will be less pronounced, North Walsham will still be connected to the NDR via a 'B' road or via the A1151 through Wroxham.

Supporting tourism

13.12.56 The MSBC estimates that the NDR scheme will stimulate growth in employment opportunities in tourism and local services. Many disadvantaged and benefit-dependent residents of Norwich and the immediate vicinity will be able to take these jobs. NCC estimates that around 15-20% of jobs will be taken by residents in these categories.

13.12.57 The Land-use and economic development report confirmed this, noting the tourism effects for Norwich and Norfolk in particular:

- In Norwich: Other historic city centres with heritage and cultural attractions at their core (such as York) benefitted from removing traffic from the centre. Reduced traffic volumes in the city centre will make it more attractive as a

place to live, invest in and visit, with potential additional positive effects on property and land values, and visitor numbers. Simultaneously, visitor economy effects could well stimulate additional consumption leading to job creation over time through multiplier effects as the central area attracts more people, whose dwell time is longer and who spend more money in the process.

- In Norfolk: While it is difficult to assess the exact impact of the NDR on the volume and value of tourism in the WAI and wider Norfolk area, the scheme will improve connectivity for tourists visiting the Norfolk Broads, north Norfolk coast, Great Yarmouth and Norwich. The NDR supports greater intra-County connectivity enabling visitors to move around and between destinations with greater ease avoiding the need to travel through central Norwich.

13.12.58 No assessment of significance is applied to cumulative effects.

13.12.59 Table 4.6 below summarises the effects of the construction and operational stages of the NDR.

Table 13.2.1: Summary of mitigation and effects – socio-economics

Project Phase	Receptor	Summary of effect	Level of Effect	Nature of effect		Mitigation	Residual Effect
				Adverse / Beneficial	Permanent / Temporary		
Construction	Local residents of working age	Direct employment through construction	Minor	Beneficial	Temporary	None required	Not significant
	Local businesses	Short-term increase in economic activity due to construction process	Negligible	Beneficial	Temporary	None required	Not significant
	Local businesses	Temporary disruption to local businesses and reduced or disrupted access to businesses	Moderate	Adverse	Temporary	Implementation of the Construction Environmental Management Plan to limit construction effects such as disruption,	Not significant

	Local businesses (Mid Norfolk Shooting School and City of Norwich Aviation Museum)	Land-take from existing businesses, disrupting business operations	Minor-Moderate	Adverse	Temporary	Replacement of existing access for Shooting School. Replacement of land sought for Museum	noise and dust levels	Not significant	
Operation	Local residents of working age	Improved access to employment and other strategically important economic sites	Major	Beneficial	Permanent	None required		Significant: permanent overall improvements to access	
	Local residents	Improved access to strategically important new housing sites	Moderate	Beneficial	Permanent	None required		Significant permanent overall improvements to access	

	Working age people	Supporting wider job creation and GVA growth in the WAI	Moderate	Beneficial	Permanent	None required	Significant: permanent increase in jobs and GVA
	Local residents and businesses	Supporting wider growth in the WAI and East Anglia	N/A	N/A	N/A	N/A	N/A
	Local businesses	Supporting tourism in the WAI and Norfolk	N/A	N/A	N/A	N/A	N/A

13.13 Conclusions

Summary of Assessment

13.13.1 Although there will be some negative effects of the NDR scheme, during both the construction and operational phases, the majority of the effects will be beneficial, especially during the operational phase.

Community and Private Assets

13.13.2 It is considered that the impacts on agriculture during the Construction and Operational phases are similar. The impacts during Construction are marginally worse than Operation as they take into account both the temporary and permanent loss of agricultural land.

13.13.3 The effects on soils as a national resource are considered significant however this must be considered within the context of agricultural activity in Norfolk and current agricultural practice generally. DMRB Volume 11. Section 3 Part 6 states "The increasing efficiency of agricultural producers and changes in agricultural policy mean that retaining as much land as possible in agricultural use is no longer a top priority".

13.13.4 In addition POSTnote 418 September 2012 states: Achieving efficient and productive agriculture to ensure food security while conserving biodiversity is a key challenge considering predicted scenarios of rapid human population growth. Agriculture is highly dependent on benefits derived from nature, known as 'ecosystem services' (POSTnote 377). These include pollination, pest control and nutrient cycling. Although agriculture is dependent on biodiversity, agricultural intensification is also a major driver of biodiversity decline. Within this context, there is debate about the best way of balancing food production and wildlife protection.

13.13.5 The Parliamentary Office of Science and Technology: Postnote 418. September 2012 explores two approaches to managing land for balancing nature conservation with sustainable food production. Land sharing integrates the objectives of agriculture and benefits to wildlife on the same land. Land sparing on the other hand separates intensive farming areas from protected natural habitats at larger scales. Within this context, there is a wider debate about the best way of balancing food production and wildlife protection.

13.13.6 An ecosystem services assessment of the NDR (Volume 2, Chapter 13) was undertaken with regard to land use changes to enable the Scheme, and assessed the land lost to agriculture when balanced against habitat

creation (Volume 1, Chapter 8 of the ES). This demonstrated that there is the potential for long term environmental benefits associated with the Scheme with regard to agriculture. The land taken from intensive agriculture that will be used for landscaping, lagoons and habitat compensation may have the effect assisting the resilience of farming practices by enhancing biodiversity.

13.13.7 As regards the viability of farming units there are not considered to be significant effects as a result of either temporary or permanent land-take arising from construction of the NDR. As access and replacement irrigation systems are provided to severed fields and compensation will be given for any loss of land. Volume 2, Chapter 13, Section A provides a detailed report with drawings of the extent and effects of the NDR on individual farm units.

Socio-economics

Construction phase

13.13.8 The construction phase is likely to deliver some beneficial effects, which will be temporary, particularly in terms of:

- The creation of a number of fixed term construction jobs and the creation of new jobs for some local agency workers in Norwich.
- Some minor increased economic activity associated with the influx of construction workers during the construction period.

13.13.9 Some minor residual adverse effects are also likely to be experienced including:

- Unavoidable disruption to businesses along the route throughout the construction process.

13.13.10 However, these residual effects are not considered to be significant.

Operational phase

13.13.11 The operational phase is also likely to deliver positive effects. These include:

- Improved access to business centres providing jobs and economic output across the sub-region.

- Improved access to strategically important new housing developments as set out in the JCS.
- Support growth, job creation and GVA uplift in the WAI and beyond
- Supporting the development of and unlocking potential in a range of wider sites considered strategically important for the continued prosperity of Norwich, Broadland and Norfolk as a whole.
- Support for sectors such as tourism

13.13.12 No significant residual adverse effects are predicted as a result of the scheme.

Compliance with Planning Policy

National, sub-regional and local policy

13.13.13 The NDR scheme is consistent with and highly supportive of national, sub-national and local economic development policy objectives. By enhancing accessibility to businesses, services and employment for populations in both the north of Norwich, and by supporting economic development activity across Norfolk and East Anglia (and supporting the priorities of the New Anglia LEP area), NDR is clearly compatible with the Government's economic goals. Benefits should therefore be felt by local residents and businesses in terms of accessibility and the wider economic output of the LAI and WAI.

14. Road Drainage and the Water Environment

14.1 Introduction

- 14.1.1 The water environment encompasses surface water in rivers, streams and ponds, and groundwater within underground strata. The government is committed to maintaining and improving the quality of surface water and groundwater environments, and the drinking water supplies they support.
- 14.1.2 Historically, roads have not been considered a major source of pollution and rainfall has been allowed to run off and discharge with little or no treatment. In recent years, diffuse pollution from road drainage has been identified, in some circumstances, as contributing to poor water quality. Pollution can arise from a variety of sources including accidents, general vehicle and road degradation, and vehicle related fuel leaks. Mitigation techniques are now used to control this pollution and the impact on the natural environment.
- 14.1.3 This chapter assesses the potential impact on water quality and water resources arising from the construction and long term operation (including maintenance) of the Scheme. The Scheme is located in an area of groundwater sensitivity and has the potential to impact the water quality within this area. The chapter also addresses the potential indirect impacts of the Scheme on the River Wensum SAC. The impact of the Scheme in the vicinity of public and private water supplies is also assessed, as well as the potential impact on flooding risks in the area.
- 14.1.4 A separate Flood Risk Assessment (FRA) (Volume 2, Chapter 21: FRA, Section A) is submitted with the application and is summarised in this chapter.
- 14.1.5 A Habitats Regulations Assessment (Volume 2, Chapter 17: Habitats Regulations Assessment, Section A), assessing the potential impacts of the Scheme on the River Wensum SAC, also supports this assessment.
- 14.1.6 Potential impacts on wildlife associated with water resources in or near the Scheme are addressed in Chapter 8: Nature Conservation.

14.2 Scoping and Consultation

- 14.2.1 The Scoping Opinion provided by the Secretary of State (see Volume 1, Appendix 5), and responses from other consultees, raised the following issues:

- the provision of an FRA was welcomed, but it was pointed out that the management of additional surface water runoff should be addressed and that there should be consultation with the Environment Agency (Environment Agency), the Broads Internal Drainage Board and Norfolk County Council (NCC);
- details of the methodologies used to establish the baseline conditions in terms of water quality should be provided, including any abiotic and biotic indicators of water quality measures or assessed;
- opportunities to install Sustainable Drainage Systems (SuDS) should be taken, with a clear methodology on how systems are selected and an assessment of their impact;
- on-going monitoring should be addressed and agreed with the relevant authorities to ensure any mitigation measures proposed are effective; and
- the hydrology of The Broads should not be adversely affected.

14.2.2 The draft drainage proposals and FRA were submitted to the Environment Agency for comment. The Environment Agency advised on methods for testing infiltration rates (using minimum rather than average rates), agreed on how to estimate and manage overland flow and advised on changes required to the road and drainage design to further protect surface water or groundwater bodies.

14.2.3 Six separate meetings have taken place between NCC, Mott MacDonald and the Environment Agency to address water resources issues arising from the proposed Scheme. During these meetings specific discussions took place about the groundwater and surface water monitoring, and the road drainage design. The regulatory controls that would have to be complied with were identified, and the Environment Agency's views on conservation and pollution control were obtained.

14.2.4 Details of the consultation undertaken during the preparation of the Environmental Statement (ES) are given in Document 5.1: Consultation Report. The responses from consultees have been taken into account in preparing this ES.

14.2.5 In addition, two combined meetings were held with the Environment Agency and Natural England (NE) to discuss the Scheme and the specific requirements for an appropriate assessment of the western section of the

Scheme (from chainage 0 to 1900), given its proximity to the Wensum Valley SAC.

14.2.6 NCC met with the Internal Drainage Board (IDB) to discuss Scheme drainage proposals at 'The Springs' (Rackheath) where runoff from the Scheme would drain into an area under their jurisdiction.

14.2.7 The table below summarises consultees and purpose of consultation:

Table 14.1 Consultees and purpose of consultation

Consultee	Purpose
Environment Agency	<p>Request data</p> <p>To allow the Environment Agency to comment and provide feedback on land and road drainage design and assessment methodologies.</p> <p>To agree on appropriate surface water and groundwater quality monitoring regime.</p> <p>To agree how the impact on the Water Framework Directive (WFD) should be incorporated within this chapter (no separate WFD assessment report required).</p>
Natural England	<p>To discuss water features and their protection with respect to NE's interests (mainly River Wensum SAC but also discussed 'The Springs' area at Rackheath).</p>
North Norfolk District Council	<p>Requested information on strategic flood risk assessment around Dobbs Beck.</p>
Internal Drainage Board	<p>Requested information on strategic flood risk assessment around Dobbs Beck.</p> <p>To comment on and agree in principle to road drainage design within the IDB boundary ('The Springs' at Rackheath)</p>
Local private abstractors	<p>To obtain information regarding the supplies</p> <p>To ensure protection of supplies</p> <p>To obtain views on the proposed development with a view to</p>

	including appropriate mitigation where considered necessary.
--	--

14.3 Overall Approach and Methods

Overall approach

14.3.1 Roads have the potential to impact on surface water and groundwater flow by:

- Intercepting and blocking existing overland flow routes and watercourses
- Increasing the runoff from the hard surface of the road, increasing overall runoff rates in the area of the road.
- Intercepting or blocking shallow groundwater flow where below ground works intercept groundwater.

14.3.2 In addition, any road with high levels of traffic has the potential to impact on the water quality of the water resources in the area of the road. This impact arises from the release of contaminating substances through wear and tear of vehicles, road surfaces and contained within exhaust emissions. These substances are picked up by rainfall or other liquids running off the road, either as solid particles or as soluble components of the runoff. Depending on the nature of the discharge of runoff impacts can arise in receiving water bodies (surface or groundwater).

14.3.3 Finally, accidents on roads can release significant quantities of liquids which can have significant impacts on water resources if the discharge of these is not managed appropriately.

14.3.4 To measure impacts on water quality from road runoff an assessment is required of the traffic levels on the road. High traffic is measured in terms of the Annual Average Daily Traffic (AADT), and where this is over 10,000 there is a recognised risk of a significant potential impact on water resources occurring. AADT data for the 'Do Something' scenarios for 2017 and 2032 predict AADT over 10,000, as shown on Volume 2, Chapter 14, Section R, Drawing No. MMD-233906-DT-0981-0987. Therefore a full detailed impact assessment of the proposed Scheme was carried out in accordance with the Highways Agency (HA) guidance provided in the Design Manual for Roads and Bridges (DMRB) Volume 11, section 3, Part 10 (HD 45/09): Road Drainage and the Water Environment (hereafter referred to as HD45/09).

14.3.5 To assess the potential impacts from accidental spillage a risk assessment is carried out based on the layout of the road, the percentage of heavy goods

vehicles and the AADT predicted to use the road. The risk assessment is documented in HD45/09 which sets what are acceptable levels of risk, and which levels of risk require additional mitigation in the road design.

14.3.6 Consultation has been undertaken with the statutory bodies and other organisations (see Volume 2, Chapter 14: FRA, Section K).

14.3.7 The impacts have been assessed against significance criteria that have been developed in accordance with the requirements of DMRB (HD45/09) and which are summarised in Table 1.2, Table 1.3 and Table 1.4.

14.3.8 Using the baseline information collected for the EIA, the areas considered most sensitive to changes in traffic or the Scheme itself have been identified. The impact assessment includes the assessment of risk and consequence of accidental spillage and water quality. Hydrological or physical changes have also been assessed.

14.3.9 The detailed impact assessment using the HD45/09 methodology of the drainage network associated with the Scheme has been produced in Volume 2, Chapter 14: Road Drainage and the Water Environment, Section H.

14.3.10 An FRA has been prepared as a separate document to meet the requirements of the National Planning Policy Framework (NPPF, paragraph 103), and is included in Volume 2, Chapter 21: FRA. Key aspects of the FRA are summarised in this Chapter (sections 21.5.6 and 21.6.2).

Assessment area

14.3.11 The study area for the water quality and drainage assessment extends approximately 500m either side of the centre line of the route corridor in a band with a total width of 1000m. During the collection of baseline data and the assessment of impacts, the study corridor was extended around larger junctions (e.g. Cromer Road junction) and sensitive areas (e.g. River Wensum SAC), to ensure any significant impacts are adequately assessed (see Volume 2, Chapter 14, Section R, Drawing No. MMD-233906-DT-0684).

Data collection and surveys

14.3.12 Information for this assessment has been collated from the following sources:

- Environment Agency website (www.environment-agency.gov.uk);

- Defra's 'Magic' interactive map (<http://magic.defra.gov.uk>);
- National River Flow Archive data on the Centre for Ecology and Hydrology website (www.ceh.ac.uk);
- Review of information made available by the Environment Agency on the hydrogeology, hydrology, water quality and aquatic ecology characteristics of the study area;
- Study of 1:50,000 and 1:25,000 OS maps, the 1:125,000 regional hydrogeological map (BGS, 1976), 1:50,000 regional geology mapping (BGS, 1992) and online aerial photography (maps.google.co.uk);
- Information and comments from consultation with the Environment Agency, NE and local private water abstractors;
- Field measurements of water quality, groundwater levels and stream flows (2006 – 2013);
- Groundwater quality and level data from Attlebridge Landfill Site operators (2006 – 2013);
- Ground investigations completed by May Gurney (2006/2007);
- Landmark Envirocheck Report (2012);
- Norwich Northern Distributor Road, Scoping Report (Mott MacDonald);
- Norwich Northern Distributor Road, Appropriate Assessment Scoping Report (Mott MacDonald);
- Norwich Northern Distributor Road, final Habitat Regulations Assessment (Mott MacDonald) submitted with this ES (Chapter 17: Habitats Regulations Assessment, Section A);
- Norwich Northern Distributor Road, Flood Risk Assessment (Mott MacDonald) submitted with this ES (Volume 2, Chapter 21: FRA); and
- Traffic data for the Scheme (DCO Documents 5.5: Transport Assessment and 5.6: Forecasting Report).

14.3.13 A more detailed methodology used to establish the baseline conditions in terms of water quality is provided in Volume 2, Chapter 14, Sections C and E.

Assessment Process

14.3.14 The assessment of the impacts to the water environment has been carried out by applying the criteria as defined in the Scoping Report. The assessment follows HD45/09, which has the following requirements:

- Identify the baseline conditions, to record the existing quality or value of the water environment, the uses and any areas vulnerable to change;
- Define mitigation measures based on best practice and informed by initial results from HD45/09 risk assessments for surface water, groundwater, accidental spillage and flood risk;
- Predict the impacts (adverse/beneficial) on the baseline conditions as a result of the Scheme, with the embedded mitigation of the Scheme applied (see section G); and
- Identify significance of effects on the water environment.

14.3.15 The conservation value of water resources are in part defined by legislation (see section 14.4) which protects all controlled waters in England and Wales and, in effect, protects all water bodies (surface water or groundwater). Thus there cannot be any water feature which has negligible value. The value of controlled waters can be defined further by taking into account the use and conservation importance of the water body. The criteria used in this assessment to determine the value of each water feature and its attributes are set out in Table 14.2. Definitions of acronyms used in this table can be found in the Glossary.

Table 14.2 Criteria for Determining Conservation Value and Sensitivity of Water Environment Attributes

Value	Criteria	Typical Examples
Very High	Attribute has high quality on regional, national or international scale	<p>Surface Water: EC Designated Salmonid/Cyprinid fishery; Site protected under EU or UK wildlife legislation (SAC, SPA, SSSI, Ramsar site); River Basin Management Plan WFD Ecological Quality is 'high' and not at risk of deterioration.</p> <p>Groundwater: Groundwater vulnerability is classified as high; Principal aquifer providing a regionally important resource or supporting site protected under wildlife legislation; or SPZ 1.</p>

Value	Criteria	Typical Examples
		<p>Flood Risk: Receptor is at high risk from flooding (Flood Zone 3b); or floodplain or defence protecting more than 100 residential properties from flooding.</p>
High	Attribute has high quality and rarity on local scale	<p>Surface Water: Major Cyprinid Fishery; Species protected under EU or UK wildlife legislation; River Basin Management Plan WFD Ecological Quality is 'Good'.</p> <p>Groundwater: Groundwater vulnerability is classified as high; Principle aquifer providing locally important resource or supporting river ecosystem; SPZ 2.</p> <p>Flood Risk: Receptor is at high risk from flooding (Flood Zone 2 or 3a); floodplain or defence protecting between 10 and 100 residential properties or industrial premises from flooding.</p>
Medium	Attribute has a medium quality and rarity on local scale	<p>Surface Water: Receptor is of medium environmental importance; RBMP WFD water quality status 'moderate'.</p> <p>Groundwater: Moderate classification of groundwater vulnerability; Secondary aquifer providing water for agricultural or industrial use with limited connection to surface water; SPZ 3.</p> <p>Flood Risk: Receptor is at moderate risk from flooding (Flood Zone 2); floodplain or defence protecting 10 or fewer industrial properties from flooding.</p>
Low	Attribute has a low quality and rarity on local scale	<p>Surface Water: Receptor of low environmental importance; RBMP WFD water quality status 'poor'.</p> <p>Groundwater: Secondary aquifer with poor water quality not providing baseflow to rivers; non-aquifer.</p> <p>Flood Risk: Receptor is at low risk from flooding (Flood Zone 1); floodplain with limited constraints and a low probability of flooding of residential and industrial properties.</p>

14.3.16 Potential impacts of the proposed Scheme on water resources are identified through an evaluation of the sensitivity of the water resources within the study area, and consideration of the sources of potential impacts after mitigation (with design and best practice mitigation applied) including:

- construction processes, particularly those that could give rise to pollution from spills or siltation from run-off;
- operational processes, such as pollutants from vehicles;
- loss or gain of surface water features;
- change in infiltration resulting from alteration of land-use; and
- flood risk.

14.3.17 Measures already embedded within the Scheme design or best practice to mitigate potential adverse impacts are described in section 14.6 below and Volume 2, Chapter 14: Road Drainage and the Water Environment, Section G. They include elements of the design, such as the use of soft landscaping and surface water features to attenuate surface water run-off, and pollution control measures to be implemented both during construction and operation.

14.3.18 The assessment of impacts to the water environment has been carried out in accordance with the HA's DMRB HD 45/09, which includes the detailed assessment of the following risks:

- surface water risk from routine runoff (Method A);
- groundwater risk from routine runoff (Method C);
- spillage risk to both surface water and groundwater (Method D); and
- flood risk to and from the Scheme (Method E).

14.3.19 The risk assessment methodologies have also been used to inform the mitigation measures to be embedded within the Scheme design. The results are described in more detail in Volume 2, Chapter 14: Road Drainage and the Water Environment, Section H.

14.3.20 There are three discharges to surface waters incorporated in the Scheme (see section 14.6.2 'Mitigation strategy to protect water quality' and drawings Volume 2, Chapter 14: Road Drainage and the Water Environment,

Section R, MMD-233906-DT-0690 and MMD-233906-DT-0691). The potential impact of pollutants from routine road runoff on receiving surface waters has been assessed using the HA Water Risk Assessment Tool (HD45/09, HAWRAT, Method A). In Step 1, HAWRAT predicts the statistical distribution of key pollutant concentrations in untreated and undiluted highway runoff (worst case scenario) and is reported as a 'pass' (no predicted short-term impact associated with road runoff) or 'fail' (unacceptable impact and further assessment required).

14.3.21 If the design includes measures that would prevent undiluted or untreated water to discharge to the environment then the HAWRAT Step 2 takes account of the embedded mitigation in the drainage design discharging to the outfall, the flow rate of the receiving watercourse and the physical dimensions of the watercourse to calculate the available dilution of soluble pollutants and potential dispersion of sediments. A further comparison with pollutant thresholds is then made. The results from this assessment identify the magnitude of the potential impact which is then used with the value of the receiving water body to determine the magnitude of the effect, and thus the significance of the impact.

14.3.22 Only if these standard design measures fail to prevent a significant effect is additional mitigation required.

14.3.23 Impacts on groundwater are assessed in terms of the risk of pollution occurring from drainage from a road i.e. through infiltration from a swale or an infiltration pond (using HD45/09 Method B). The drainage network proposed has several final disposal points which would enable water running off the Scheme to eventually reach groundwater (see Volume 2, Chapter 14: Road Drainage and the Water Environment, Section R, Drawing No. MMD-233906-DT-0981-0987 and Volume 2, Chapter 14: FRA, Section O, Appendix E).

- The spillage risk assessment (HD45/09 Method D) identifies the risk of spillages from a highway and potential pollution to the receiving water environment. The following criteria were considered as per the guidance:
- the calculated spillage risk return period must not be greater than 1 in 100 years;
- the calculated spillage risk return period must not be greater than 1 in 200 years where spillage could affect: protected areas for conservation, important drinking water supplies or important commercial activities; and
- spillage risk from existing outfalls must not be increased.

14.3.24 The results of these risk assessments are presented in section 14.6.2, with more detailed results in Volume 2, Chapter 14: FRA, Section H. The Scheme design and embedded mitigation was informed by the results of these assessments.

14.3.25 The risk of flooding (HD45/09 Method E) to and from the Scheme has been considered in the FRA (Volume 2, Chapter 21:FRA, Section A) and the results summarised in section 14.6.2 'Mitigation strategy to manage flood risk'.

14.3.26 The assessment of the magnitude of the impact of the Scheme takes into account any embedded mitigation measures or strategies, including the likely effectiveness of the mitigation, the timescale over which the impact occurs and the substitutability of the attribute. The criteria used for determining the magnitude of impact is based on Table A4.4 in DMRB HD45/09 (see Volume 2, Chapter 14: FRA, Section H) and summarised in Table 14.3.

Table 14.3 Assessing Magnitude of Potential Impacts

Magnitude	Criteria
Major adverse / major beneficial	Adverse impact would be a loss of attribute and/or quality and integrity of the attribute or function, e.g. loss or extensive change to a fishery. Beneficial impact results in major improvement of attribute quality or function, e.g. removal of existing polluting discharge, or removing the likelihood of polluting discharges occurring to a watercourse.
Moderate adverse / moderate beneficial impact	Adverse impact results in moderate decline in the attribute quality or function, e.g. calculated risk of pollution from spillages >1% annually and <2% annually. Beneficial impact results in moderate improvement of attribute quality or function, e.g. reduction in peak flood level (1% annual probability) >50 mm.
Minor adverse / minor beneficial	Adverse impact results in measurable change in attribute quality or function, e.g. failure of either soluble or sediment-bound pollutants in HAWRAT. Beneficial impact results in some beneficial effect on attribute or function, or reduced risk of an existing negative effect occurring, e.g.

Magnitude	Criteria
	calculated reduction in existing spillage risk by 50% or more (when existing spillage risk is <1% annually).
Negligible	No measurable impact on an aquifer, or one that is so slight as to have no effect on the quality or function of the attribute.

14.3.27 The impact assessment has to take into account the minimum protection measures likely to be required by regulators in the design of the scheme. These are embedded mitigation measures, and are taken account of in the assessment process. Only if the impact assessment indicates that even with these measures is there a significant impact is it necessary to identify additional mitigation measures to be included in the scheme.

14.3.28 The potential significance of effects for the construction and operation (including maintenance) of the proposed Scheme was predicted with reference to Table A4.5 in DMRB HD45/09 as provided below in Table 14.4 (see section 14.7.1 and 14.7.2). The significance of potential effects is considered separately for construction and operation of the proposed Scheme and is based on criteria set out in Table A4.6 in DMRB HD45/09 (Qualifying Conditions for Overall Assessment Scores). Effects that are moderate, large or very large are considered significant effects. Effects that are slight or neutral are not significant.

Table 14.4: Assessing Significance of Potential Effects

Magnitude of Potential Impact	Value / sensitivity of attribute			
	Very high	High	Medium	Low
Major	Very large	Large / Very large	Large	Slight / Moderate
Moderate	Large / Very Large	Large / Moderate	Moderate	Slight
Minor	Moderate / Large	Slight / Moderate	Slight	Neutral

Negligible	Neutral	Neutral	Neutral	Neutral
------------	---------	---------	---------	---------

Note: Effects are negative or positive or neutral.

14.3.29 The implications and compliance of the proposed Scheme in relation to the Water Framework Directive (WFD) have also been considered. The aims of the Directive (amongst other things) are to improve the water quality and ecological status of watercourses and the quality of groundwater, addressing diffuse pollution from urban and rural sources, including roads. Following consultation with the Environment Agency, and consideration of the implications of the Scheme on WFD objectives, it was determined that no separate WFD compliance assessment would be required (email from the Environment Agency dated 26th May 2013 (Volume 2, Chapter 14: Road Drainage and the Water Environment, Section K). The Environment Agency’s view is that it is unlikely that the Scheme would compromise the achievement of WFD objectives in any of the adjacent or underlying waterbodies. Measures were considered which could be incorporated in the Scheme to enhance and improve nearby waterbodies, particularly Dobbs Beck. As a result, the waterbodies might achieve good ecological potential (see conclusions in section 0).

14.4 Relevant Regulatory and Planning Background

14.4.1 The legislation and policies set out below are the key documents relevant to the water environment and related to water attributes within the study area.

EU Legislation

14.4.2 The key EU legislation covering the water environment which has a bearing on this Scheme includes:

- The Groundwater Directive (80/68/EEC as amended by 91/692/EEC)
- The Groundwater Daughter Directive (2006/118/EC)
- The Water Framework Directive (2000/60/EC)
- The Habitats Directive (92/43/EEC)

14.4.3 The Groundwater Directive (91/692/EC) sets out the basis for groundwater protection from pollution. Hazardous and non-hazardous substances are defined. There are strict limits and controls in relation to groundwater.

Hazardous substances should not enter groundwater, and non-hazardous substances should be prevented from entering groundwater.

14.4.4 The Groundwater Daughter Directive (2006/118/EC) aims to prevent the deterioration in status of all bodies of groundwater. It sets out requirements for countries to establish boundaries around groundwater bodies, to identify trends of chemical substances in the groundwater bodies, and to establish criteria from which to assess good groundwater chemical status. The Directive also requires countries to prevent or limit inputs of pollutants to groundwater.

14.4.5 The Water Framework Directive (2000/60/EC) (WFD) established a framework for management of water resources throughout the European Union. The Directive was translated into English and Welsh law through The Water Environment (Water Framework Directive) (England and Wales) Regulations 2003, which came into force in January 2004. The WFD will be fully effective by 2015. In the short term, the Directive requires the development of new monitoring and classification of surface waters, groundwaters, wetlands and protected sites. The key objectives, relating to the WFD, are defined for this study area within the Anglian River Basin Management Plan (RBMP). The key objectives of the WFD, provided for in the RBMP, are to:

- prevent deterioration, enhance and restore bodies of surface water, achieve good chemical and ecological status of such water and reduce pollution from discharges and emissions of hazardous substances;
- protect, enhance and restore all bodies of groundwater, achieve good chemical and quantitative status of groundwater, prevent the pollution and deterioration of groundwater, and ensure a balance between groundwater abstraction and replenishment; and
- preserve protected areas.

14.4.6 The WFD places most importance on the health of animal and plant groups. It requires that the water environment be looked at as a whole, integrating water quality, quantity and physical habitat with ecological indicators. The Environment Agency provides WFD ecological status classes (High, Good, Moderate, Poor, Bad) and chemical status classes (Pass/Fail) for most surface water bodies. In addition, groundwater status (quantitative and chemical status) has been assigned to groundwater bodies, defined as 'Good' or 'Poor'.

14.4.7 One of the main goals of the Directive is to aim for at least 'good' ecological and 'good' chemical status for surface waters, and 'good' chemical and 'good' quantitative status for groundwaters by 2015. For water bodies designated as 'artificial or heavily modified', such as canals or reservoirs, the Directive aims to achieve 'good ecological potential' rather than 'good ecological status'. The Drinking Water Protected Area (DrWPA) objectives of the WFD aim to protect waterbodies where 'raw' water is abstracted for human consumption at a rate of at least 10m³/day, or over 50 people are served by the abstraction. Classification can result in the establishment of non-statutory Safeguard Zones, where actions to address pollution are required (Environment Agency, 2013).

14.4.8 The EC Habitats Directive (1992) on the Conservation of Natural Habitats and of Wild Fauna and Flora, as amended (92/43/EEC), is also relevant due to the close proximity of the Scheme to the River Wensum SAC (see Chapter 8: Nature Conservation for more details).

UK Acts and Regulations

14.4.9 The EU legislation is implemented in the UK through various acts and regulations. The key UK legislation, directly regulating the water environment in relation to new roads, is as follows:

- Water Act 2003 (WA 2003);
- Water Resources Act 1991 (WRA 1991);
- Environmental Permitting (England & Wales) Regulations (2010) (EPR 2010); and
- Highways Act 1980 (HA 1980).

14.4.10 The EPR 2010 aim to protect groundwater and surface waters from pollution by controlling the inputs of potentially harmful and polluting substances. The Regulations implement the WFD, the Groundwater Daughter Directive 2006 and the Groundwater Directive 1980 (until it is repealed in December 2013). The EPR 2010 replaces those parts of the WRA 1991 that relate to the regulation of discharges to controlled waters (including groundwater).

14.4.11 Substances controlled under EPR 2010 fall into two lists:

- Hazardous substances – most toxic and prevented from entering groundwater; and
- Non-hazardous – less toxic but could be harmful to groundwater, and the entry of these substances into groundwater must be limited.

14.4.12 Under the EPR 2010 no environmental permit is required for uncontaminated surface water runoff from roads, pathways or clean hardstanding areas, provided the Environment Agency's Pollution Prevention Guidance is followed e.g. surface water runoff is passed through a well-designed and maintained oil interceptor (see section 1.6.1).

Legislation regarding pollution prevention and discharges of road runoff

14.4.13 Section 85 of the WRA 1991 makes it an offence to knowingly pollute controlled waters, which includes all groundwater and surface waters (ponds, streams and rivers) located along the Scheme.

14.4.14 The Groundwater Regulations (1998) protect all groundwater in England absolutely. Aquifers are protected as being valuable in their own right. NCC is not required to hold a discharge consent under the Groundwater Regulations, but must comply with the technical requirements of the Regulations. Currently, the Regulations primarily restrict the discharge of List I and List II substances.

14.4.15 Under the Highways Act (section 100), NCC has a right to discharge runoff from highways into inland and tidal waters, or groundwaters (i.e. controlled waters as defined under the Water Resources Act 1991), but is subject to the requirement not to pollute controlled waters (WRA 1991, section 85).

14.4.16 The NCC is exempted by section 89(5) of WRA 1991 from applying for discharge consents for road runoff under WRA 1991 or under the Groundwater Regulations 1998. However, the Environment Agency has powers under section 86 of WRA 1991 to serve a prohibition to stop pollution occurring from discharges. For discharges to ground, the Environment Agency has a duty to use section 86 powers to prevent pollution.

14.4.17 Before construction of drainage outfalls, agreement for the outfall design is required from the Environment Agency and the IDB.

Protecting groundwater quality and public water supply

14.4.18 Section 93 of the WRA 1991 provides for the establishment of water protection zones. The requirements of section 93 are implemented under the Environment Agency's document 'Groundwater Protection: Principles and Practice (GP3)' issued in August 2013. Source Protection Zones (SPZs) are defined for groundwater sources used for public water supply. The Environment Agency's position statement relating to the use of sustainable drainage systems within these zones is also set out in GP3.

14.4.19 The SPZs are defined as follows:

- Inner Protection Zone (SPZ 1) - defined by a travel time of 50 days or less from any point within the zone at, or below, the water table, to the abstraction source. Additionally, the zone has, as a minimum, a 50 m radius. The SPZ 1 is based principally on biological decay criteria and is designed to protect against the transmission of toxic chemicals and water-borne disease. The Environment Agency expects strict controls on development implemented within the SPZ 1.
- Outer Protection Zone (SPZ 2) - defined by the 400 day travel time from a point below the water table to the abstraction source. This zone has a minimum radius of 250 or 500 metres around the abstraction source, depending on the size of the abstraction. The travel time is derived from consideration of the minimum time required to provide delay, dilution and attenuation of slowly degrading pollutants. The Environment Agency expects some control on development implemented within the SPZ 2.
- Total Catchment Zone (SPZ 3) - defined as the area around an abstraction source within which all groundwater recharge is presumed to be discharged at the abstraction source. The shape and size of the zones is controlled by many factors. Some of these reflect natural hydrogeological conditions, other environmental factors and the operation of the groundwater abstraction. The Environment Agency expects normal best practice to be implemented to ensure the protection of groundwater in SPZ 3.

14.4.20 The presence of SPZs has implications for any potentially polluting activities proposed within the zones. The most severe restrictions on construction activities, drainage and development are generally applied within the inner zone.

14.4.21 No Environmental Quality Standards (EQS) have been published for protecting groundwater. In the absence of such standards, the drinking water

standards are frequently used for comparing with groundwater quality. This practice has been adopted in the ES.

Legislation and policies protecting surface water quality

14.4.22 The Environment Agency classifies rivers under WFD using defined criteria, and also sets objectives that the Environment Agency considers should be achieved in terms of improving water quality for sections of river. The criteria and objectives for the region are set out in the Environment Agency's Anglian River Basin Management Plan (RBMP). The objectives are set for 'main rivers' which are the surface water bodies maintained by the Environment Agency. There is one main river, the River Wensum, located within the study area extending 500m to either side of the centreline of the route corridor. The River Wensum, and other main rivers beyond the study area, have been monitored by the collection and assessment of physical, chemical and biological data.

14.4.23 Policies and plans affecting water resources are summarised below. The National Planning Policy Framework (NPPF) was issued in March 2012 and resulted in the withdrawal of a number of planning policy guidance notes, including Planning Policy Statement 25: Development and Flood Risk. This assessment for road drainage and the water environment takes into account the NPPF (Chapter 10 "Meeting the challenge of climate change, flooding and coastal change"), and the supporting technical guidance in relation to flood risk.

14.4.24 Chapter 10 of the NPPF states in paragraph 99 that ".....New development should be planned to avoid increased vulnerability to the range of impacts arising from climate change. When new development is brought forward in areas which are vulnerable, care should be taken to ensure that risks can be managed through suitable adaptation measures, including through the planning of green infrastructure." The technical guidance to the NPPF is more generic than the superseded PPS25, but the principles and intent are the same. The requirements are described further in the FRA (Volume 2, Chapter 21: FRA, Section A).

14.4.25 Furthermore the NPPF indicates that the Floods and Water Management Act (FWMA) 2010 establishes a Sustainable Drainage Systems Approving Body in unitary or county councils. This body must approve drainage systems in new developments and re-developments before construction begins. In the case of Norfolk County Council, the approving

body (currently the Flood Risk and Water Management team) is in the process of being set up (due to be established April 2014) and have been consulted during the design process. The approving body will review any new planning application or reserved matters relating to drainage arising since April 2012 should construction not have commenced before April 2014. This will include approval of any drainage works prior to construction.

14.4.26 Schedule 3 of the FWMA defines the key aims of sustainable drainage systems, as follows:

- reduce damage from flooding;
- improve water quality;
- protect and improve the environment;
- protect health and safety; and,
- ensure the stability and durability of drainage systems.

14.4.27 Joint Core Strategy (as amended February 2013) has one relevant area-wide policy, Policy 1. This addresses climate change and the protection of environmental assets; this includes both surface and ground water. The development should *“be located to minimise flood risk, mitigating any such risk through design and implementing sustainable drainage; minimise water use and protect groundwater sources; and improve the resilience of ecosystems to environmental change”*.

14.4.28 The Norfolk Structure Plan includes:

- Policy RC.1: “Development which will lead to a material deterioration in the quality of underground, surface or coastal water will not be acceptable.”
- Policy RC.3: “New development or the intensification of existing development will only be acceptable in areas at risk from fluvial flooding or in areas where it is likely to increase the risk of flooding elsewhere to an unacceptable level, including defined washlands, natural flood plains, and other areas adjacent to rivers to which access is required for maintenance purposes, where suitable mitigation measures have been agreed.”

14.4.29 The Broadland Local Plan includes:

- Policy CS2: “Surface water drainage from new developments should be by way of a sustainable drainage system where appropriate. Where such

systems are not feasible a positive piped system incorporating adequate anti-pollution measures should be used.”

- Policy CS9 “for all development proposals consideration will need to be given to flood risk issues, including the possibility of the development increasing flood risk elsewhere and where necessary, appropriate flood defence or prevention measures will be required.”
- Policy CS10 “within areas at high risk of flooding new development or the intensification of existing development will not be permitted except:
 - Within a defined settlement limit, or
 - There is a particular need for the development to be in that location, or
 - The proposed use is a low key use of land e.g. playing fields, nature reserve etc.
- And the appropriate minimum standard of flood defence (including suitable warning and evacuation procedures) will be provided and maintained for the lifetime of the development.”

14.5 Baseline

Hydrology

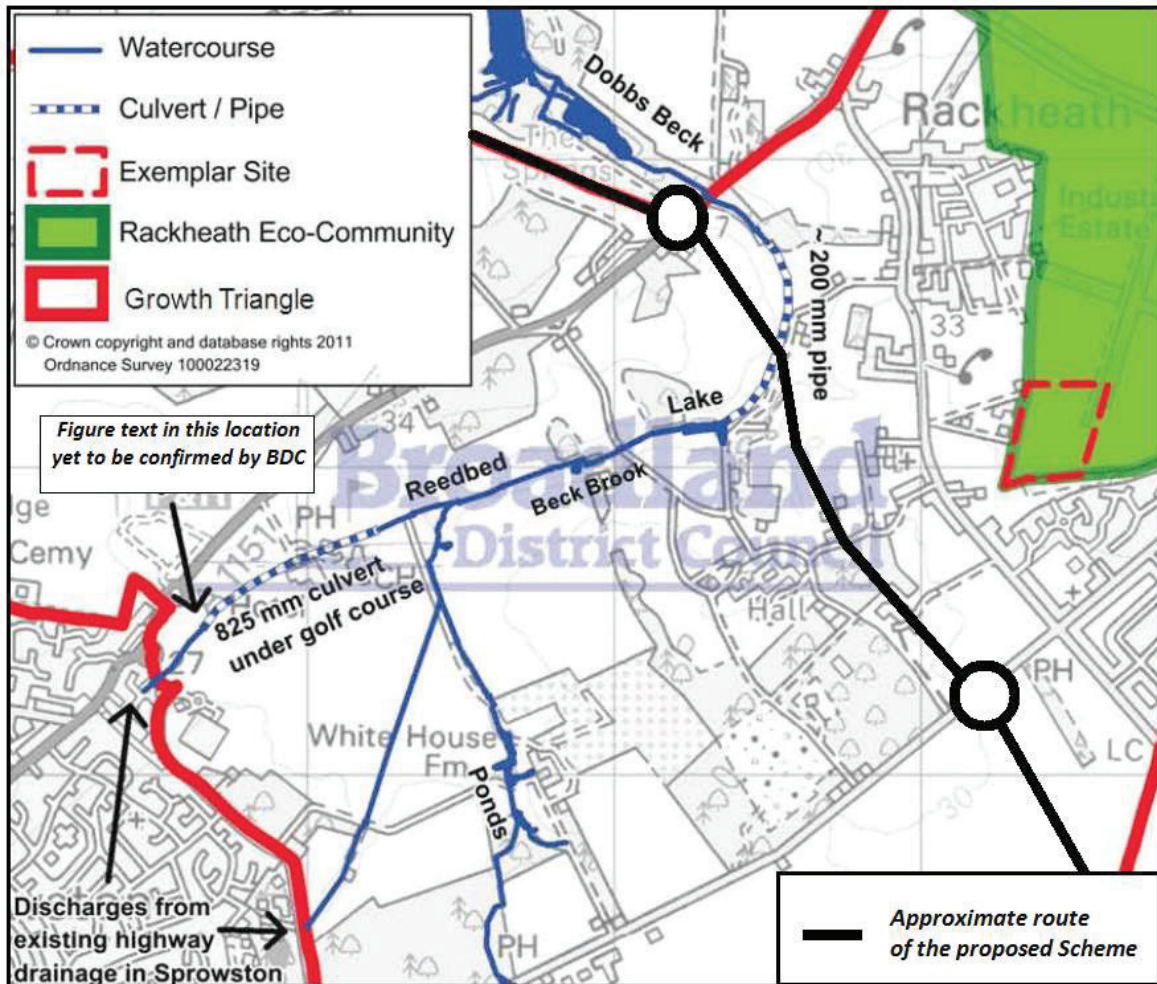

14.5.1 The study area falls within the surface water catchments of three Main Rivers: the River Wensum, the River Bure and the River Yare. The locations of the rivers and catchment watersheds, in relation to the Scheme, are shown in Volume 2, Chapter 14: Road Drainage and the Water Environment, Section R, Drawing No. MMD-233906-DT-0684. At no point would the Scheme route cross an open watercourse.

14.5.2 The River Wensum is located within 300m of the Scheme near Attlebridge. The river then flows south east out of the study area to the confluence with the River Yare (at Whitlingham). The Scheme does not cross the floodplain of the River Wensum.

14.5.3 On the eastern side of Norwich, the River Yare and floodplain are approximately 600 m from the A47 and the eastern end of the Scheme. The River Bure is located to the North of the Scheme. However, several tributaries in the vicinity of the Scheme drain to the River Bure, including Horsford Brook, Dobbs Beck, Spixworth Beck and Spixworth Brook.

- 14.5.4 The route passes within 300m of the River Wensum SAC, and within 100m of 'The Springs' at Rackheath which form part of the Ladies Wood, Church Carr and Springs County Wildlife Site (CWS). Dobbs Beck and Spixworth Beck are also within the CWS.
- 14.5.5 The junction improvement at Crostwick Lane is approximately 850m south of Spixworth Brook and 1.35km west of Spixworth Beck. The improvements at the Green Lane West junction are located approximately 490m north-east of Dobbs Beck. Plumstead Road East junction improvements are about 1.8km from Witton Run, which is a tributary of the River Yare.
- 14.5.6 The Scheme crosses the catchment of Beck Brook which continues as Dobbs Beck immediately south of Wroxham Road. Dobbs Beck is a tributary of Spixworth Beck. Figure 1.1 shows the location of Beck Brook and associated drainage features. The Scheme crosses at the point where Beck Brook flows underground through a 200mm (approx.) diameter pipe connecting the 'Lake' (also known as the 'Dry Lake' on other OS maps) to a ditch comprising the Dobbs Beck just south of Wroxham Road. Water primarily leaves the lake as infiltration to ground. Any overflow is via the underground pipe.
- 14.5.7 A drainage survey of this area, undertaken by Birse in November 2012 (see Volume 2, Chapter 21: FRA, Section A), identified sections of this 200mm pipe that had collapsed. The pipe structure itself may no longer function to convey surface water between the Lake and Dobbs Beck, however the construction and back fill of the pipe trench with granular material is likely to maintain part, if not all, of this flow path to Dobbs Beck.
- 14.5.8 Flows in the ditch south of Wroxham Road also pass through a 200 mm (approximate) diameter pipe under Wroxham Road. North of Wroxham Road, Dobbs Beck is fed by a number of springs and surrounding field drains.

Figure 1.1: Dobbs Beck and associated drainage features (Source: Figure 4-6 extracted from the draft North East Norwich WCS provided by Broadland District Council (BDC) (June 2013))

14.5.9 Three watercourses or water bodies will receive discharges of road runoff from the proposed Scheme as follows:

- the second lake between Dobbs Beck and Spixworth Beck;
- Dobbs Beck; and
- River Yare, via the existing A47 drainage

14.5.10 Data from a gauging station on the River Yare at Colney is held on the National River Flow Archive. The data shows a 95 percentile river flow (Q95) of 0.32m³/sec and a base flow index (BFI) of 0.65.

14.5.11 Q95 is the flow exceeded 95% of the time i.e. it is a measure of the flow of water in the river when flow is very low. The BFI is a measure of the proportion of the river flow that derives from storage in bedrock, superficial deposits and soils (i.e. from groundwater). The base flow index is greater in catchments where there is a higher level of storage and contribution from groundwater. The baseflow sustains river flow during periods of dry weather. The Q95 and BFI are indications of the capacity to dilute and disperse contaminants discharged into the watercourse, without significant harm to the watercourse or the dependent ecosystem.

14.5.12 There is no gauging station on Dobbs Beck or for the lake at 'The Springs'. A BFI of 0.5 is used in the assessment, as per the DMRB guidance HA DMRB HD 45/09 para A.5, Annex 1), and a Q95 of 0.01m³/sec based on flow monitoring between 2007 and 2008.

14.5.13 Numerous small ponds have been highlighted during surveys. However, none of these are considered to be linked to any significant watercourses and are, thus, not considered to comprise a major component of local water resources. Some are considered important habitats and are discussed further in Chapter 8: Nature Conservation.

14.5.14 Minor field drains and ditches are crossed by the Scheme. Where this occurs, drains will be culverted to ensure that flow paths are not obstructed. Where the routes of overland flow are intercepted by the Scheme alignment, flow will be drained to soakaway systems e.g. spreader ditches, and/or a flow path will be maintained.

Groundwater

14.5.15 The regional geology within the study area of the route is described in Chapter 9: Geology and Soils.

14.5.16 The bedrock underlying the study area consists of White Chalk and Crag Group (formally referred to as Upper Chalk and Norwich Crag), both of which are classified by the Environment Agency as principal aquifers. Principal aquifers may support water supply and/or river base flow on a strategic scale. Glacial deposits present on the higher ground consist of Boulder Clay (Lowestoft Formation) and Glacial Sand and Gravel (undifferentiated Corton Formation and Lowestoft Formation), which are 'Secondary A' aquifers capable of supporting water supplies at a local rather than strategic scale. Norwich Brickearth (a part of the undifferentiated Corton Formation), a superficial deposit of homogenous unstructured loam or silt, is

found widely across the study area. The permeability of the brickearth is significantly lower than that of glacial sands and gravels and the Crag.

- 14.5.17 There are no published SPZs 1 or 2 within the study area. However, the Environment Agency has advised a temporary 750m radius Source Protection Zone 1 (SPZ 1) surrounding one licensed (but currently unused) public water supply borehole near Postwick. This temporary SPZ1 is intended to protect the area that is most vulnerable to pollution until the Environment Agency define a more accurate SPZ outline. This supply is discussed further in section 14.5.5.
- 14.5.18 A default area with a 50 m radius has been designated as a SPZ1 around private water supplies located within the study area (as required under Environment Agency GP3 2013). Volume 2, Chapter 14: Road Drainage and the Water Environment, Section R, Drawing No. MMD-233906-DT-0978-0980 shows the location of these sites.
- 14.5.19 The Scheme crosses SPZ 3 of two public water supplies within the study area, at the locations described in Table 14.5 and as shown on Volume 2, Chapter 14: Road Drainage and the Water Environment, Section R, Drawing No. MMD-233906-DT-0978-0980.
- 14.5.20 SPZs relate purely to groundwater flow below the water table and do not take into account the depth to groundwater and the nature of the overlying soils and rock. It is important to use the groundwater vulnerability mapping (Environment Agency online maps, 2013) to assess the risks and potential impacts of spillages to the unsaturated zone overlying the water table. The maps take into account the properties of the overlying rocks and soils in defining groundwater vulnerability. Groundwater vulnerability maps show that the majority of the Scheme is located on soils with a high leaching potential . Thus the groundwater vulnerability is also high.
- 14.5.21 The groundwater vulnerability and SPZs relevant to the Scheme are shown in Volume 2, Chapter 14: Road Drainage and the Water Environment, Section R, Drawing No. MMD-233906-DT-0975-0977 and MMD-233906-DT-0978-0980. A summary of source protection zones and vulnerability classifications along the route is given below.

Table 14.5: Groundwater protection along the route

Chainage Section (m)	Source Protection Classification and/or Groundwater Vulnerability
0 – 2200	High vulnerability
2200 – 3200	SPZ 3 and high vulnerability
3200 – 13300	Low and high vulnerability
13150 – 13300	Intermediate vulnerability
13300 – 16300	SPZ 3 and high vulnerability
16300 – 16550	High vulnerability
16550 – end	SPZ 1, SPZ 3 and high vulnerability

Groundwater Levels and Flows

14.5.22 Generally the main regional groundwater table is located in, or close to the surface of, the White Chalk (see Chapter 9: Geology and Soils for depths). However, the Crag Group also contains significant groundwater in some areas. The two formations are in variable states of hydraulic continuity in places where the Crag overlies the Chalk.

14.5.23 Superficial deposits that contain lenses of silty sands, sands or gravels could also hold significant groundwater.

14.5.24 The regional hydrogeological map, produced by the British Geological Survey (BGS, 1976), provides groundwater level contours which give an indication of the direction of groundwater flow in the region. From chainage 0 to about chainage 2900, the hydrogeological map indicates that flow is towards the Wensum. From chainage 2900 to 6500 the Scheme is along a groundwater divide. Groundwater could flow either south towards the Wensum or north towards Horsford Brook. From chainage 6500 to about 16000 the groundwater divide is south of the road and groundwater flow tends to be northwards away from the Wensum. Beyond chainage 16000, groundwater again flows southwards towards the River Wensum.

14.5.25 Groundwater level information was also sourced from monitoring carried out at the Attlebridge Landfill site and, most recently, from the ground

investigations carried out specifically for the Scheme. Groundwater levels have been monitored on either a monthly or quarterly basis intermittently between September 2006 and August 2013 at these boreholes. The monitoring locations are shown on Volume 2, Chapter 14: Road Drainage and the Water Environment, Section R, Drawing No. MMD-233906-DT-0971-0974 together with maximum, minimum and average groundwater elevations.

14.5.26 A cross section showing the depths at which groundwater was encountered during the ground investigations is shown on Volume 2, Chapter 14: Road Drainage and the Water Environment, Section R, Drawing No. MMD-233906-DT-0815-0827. The section is based on borehole data within 50 m of the Scheme. Road levels indicate that the Scheme elevation is above maximum observed groundwater levels except possibly in the vicinity of chainage 15750. Groundwater levels along the route vary between about 0.95 m AOD (P196) and 31.08 m AOD (BH6B). The ground level varies between 15.10 and 39.70 m AOD and the road level generally between 17.90 and 38.94 m AOD. The unsaturated thickness below the road ranges between 2.44 and 28.62 m along the route, apart from at chainage 15750, as discussed further below. The Scheme does not intersect the Chalk water table.

14.5.27 In general, Chalk groundwater levels within 50 m of the Scheme range between 2.44 m (at P153, chainage 15750) and 20.29 mBGL (at P196, chainage 22100) (0.76 to 31.34 mAOD). Volume 2, Chapter 14: Road Drainage and the Water Environment, Section R, Drawing No. MMD-233906-DT-0975-0977 shows the depth to water table for the area, as well as the elevation of the top of the Chalk (as m AOD), based on contouring for the drought period in 1976, taken from the Hydrogeological Map.

14.5.28 There is one main area of groundwater discharge along the route, at 'The Springs', located between 120 m and 50 m north of the Scheme between chainage 13250 and 14500. The relationship between the lakes at 'The Springs' and groundwater has been assessed through the installation of a number of borehole piezometers to measure groundwater levels. The piezometers include:

- GW2A (Chalk), GW2B and GW2C (both Crag, piezometers at different depths)
- GW3A (Chalk), GW3B (Corton Till)
- GW4A and GW4B (both Crag, piezometers at different depths)

- GW7A (Crag) and GW7B (glacial sand and gravel)
- GW9A (Chalk) and GW9B (Alluvium)
- GW10A (Chalk), GW10B (Crag) and GW10C (Corton Till)
- GW11A (Chalk) and GW11B (Crag)

14.5.29 The piezometer sites are shown on Volume 2, Chapter 14: Road Drainage and the Water Environment, Section R, Drawing No. MMD-233906-DT-0971-0974. Sites GW3, GW5, GW6, GW9 and GW11 are located within 250 m of the centreline of the proposed route. GW1, GW2, GW7, GW8 GW10 and GW12 are more distant, ranging from 300 to 600 m away.

14.5.30 A cross section through the two lakes and the monitoring boreholes shows that the Chalk groundwater level in the area is above the water levels in the lake and Dobbs Beck (see Volume 2, Chapter 14: Road Drainage and the Water Environment, Section D, Figure D.1). As a result, the lakes and the Dobbs Beck should be receiving groundwater inflow from the Chalk in this area. This is undoubtedly the reason why this area is called “The Springs”.

14.5.31 The groundwater levels at the sites were monitored to show whether there was any difference between groundwater levels in the overlying formations and the Chalk. This was achieved by installing piezometers at the same location but in different formations. Changes in groundwater levels in the various formations were found to be reasonably consistent, i.e. levels tend to rise in all formations in the same periods. However, the relationship at individual locations between the overlying and deeper formations is not as consistent. Hydrographs showing the variation in groundwater levels over and time and between sites is provided in Volume 2, Chapter 14: Road Drainage and the Water Environment, Section L. These show the groundwater table does not vary much over any 12 month period (typically about 0.2m) and over the almost 6 years of records the maximum variation is around 1 to 1.5m. These annual variations are relatively small for the Chalk.

14.5.32 Although no significant and widespread perched water tables have been observed, localised perched water tables appear to be present as follows:

- Shallow groundwater is observed at BHP153 (chainage 15750) within the glacial sand and gravel deposits, potentially overlying the Corton Till. The water table varied by 1.0 m, between 28.87 and 27.87 m AOD. The range in groundwater levels is estimated to be between 0.6 m below and 0.4 m above

the construction base of the proposed bridge at Newman Road (~28.47mAOD).

- Shallow groundwater is found in the crag in GW3B and these groundwater levels vary in a different manner to the chalk groundwater levels in GW3A. At times the chalk has higher groundwater levels, whilst at other times the relationship is reversed. When groundwater levels in the chalk are higher than in the crag groundwater would flow from the chalk into the overlying crag. As GW3B is close to “The Springs” this is what would be expected in this area. It is worth noting that GW4A / 4B located close to GW3A/ 3B shows no difference between the crag and chalk groundwater levels.
- Shallow groundwater is found in the alluvium in GW9B which shows almost exactly mirrors the groundwater variations seen in the chalk borehole GW9A. The groundwater in the alluvium maintains a head difference over the chalk groundwater levels of about 20 to 30cms and indicates groundwater would flow from the alluvium into the chalk.
- Shallow groundwater is found in piezometers GW10C (Corton Till) and GW2C (Crag) which are located on opposite sides of Dobbs Beck, close to chainage 13750 and 15300. The groundwater levels are both significantly higher than the land elevation in the valley of Dobbs Beck or the Scheme. This is not unusual as for springs to occur you need to have groundwater levels higher than the land surface, and so in area of “The Springs” this phenomena should be observed.

14.5.33 From the groundwater level monitoring it was concluded that overlying formations are often in hydraulic continuity with the underlying Chalk, and there are no significant widespread perched water tables in superficial deposits in the study area. Minor perched water bodies occur where glacial sands and gravels overlie Corton or Lowestoft Till. The presence of the Till reduces rainfall infiltration to the Crag and Chalk aquifers below.

Springs and Seepages

14.5.34 During site walkovers, wet and boggy ground was observed in areas, surrounding the lakes at ‘The Springs’, as shown on Volume 2, Chapter 14: Road Drainage and the Water Environment, Section R, Drawing No. MMD-233906-DT-0690.

14.5.35 The most noticeable area of seepages was downstream of the Anglian Water Services (AWS) wastewater treatment plant in the woodland marked as

Lady's Carr on Ordnance Survey maps. The extent of this wet/boggy ground changed seasonally. The closest point on the Scheme is at chainage 13300. The wetland area is also close to a proposed drainage lagoon (Lagoon 17).

- 14.5.36 Monitoring of surface water flows upstream and downstream of the two fishing lakes in the CWS was carried out between March 2007 and May 2008. The results confirmed the indications that the lakes receive substantial inflow from groundwater as the inflow was much lower than the outflow e.g. 0.004 m³/s compared to 0.02 m³/s in March 2007. Detailed results from the monitoring are presented in Volume 2, Chapter 14: Road Drainage and the Water Environment, Section D.
- 14.5.37 Surface water inflow into the upstream lake is very small except when there has been significant rain. However, flow downstream of the lakes is quite substantial, even in summer. Even allowing for contributions to the system from the AWS wastewater treatment plant, there is still a much greater outflow than inflow.
- 14.5.38 Monitoring of the quality and source of groundwater and surface water in and near the CWS has been carried out intermittently between 2006 and 2013 as described in Volume 2, Chapter 14: Road Drainage and the Water Environment, Section C and E. The water quality results are discussed further in the Water Quality section below.
- 14.5.39 The CWS is designated for its woodland, marshy grassland and standing water habitat. As the area is spring fed, any alterations to the groundwater flow or quality could have a significant effect on the species within these habitats.
- 14.5.40 No other springs or seepages of any significance have been identified within 500 m of the Scheme.

Water Quality

Surface Water Quality

- 14.5.41 The Anglian River Basin Management Plan (RBMP) identifies the current status of main rivers in the region. Those relevant to the Scheme are as follows:
- The section of the River Wensum nearest the Scheme at Attlebridge is a heavily modified waterbody that is currently at 'poor' ecological potential and failing for biological and chemical elements (Waterbody ID

GB105034055881). The RBMP target for the River Wensum is good ecological potential by 2027 and good chemical status by 2015 to meet WFD objectives;

- Spixworth Beck (Waterbody ID GB105034050960) and the River Bure (Waterbody ID GB105034050930) are considered heavily modified waterbodies. Both are considered to have a ‘moderate’ ecological potential currently, and are predicted to sustain this status in 2015. No chemical status has been given. The RBMP target for Spixworth Beck is good ecological potential by 2027; and
- The tidal section of the River Yare (Waterbody ID GB105034051370), located to the south of the A47, is considered to have a ‘moderate’ status. The RBMP target for the River Yare is to achieve good ecological status by 2027 to meet WFD objectives.

14.5.42 A programme of water quality monitoring of surface watercourses was implemented and samples taken at quarterly intervals between September 2006 and June 2013 at the locations shown in Table 14.6 and as shown on Volume 2, Chapter 14: Road Drainage and the Water Environment, Section R, Drawing No. MMD-233906-DT-0971-0974. Monthly samples were collected at ‘The Springs’ at Rackheath. The purpose of the surveys was to establish the baseline water quality conditions, and to provide data for the assessment of the potential impact of road runoff to watercourses. The water samples were analysed for a suite of parameters that included standard quality indicators used by the Environment Agency, and also indicators for typical road runoff pollutants (see Volume 2, Chapter 14: Road Drainage and the Water Environment, Section E.

Table 14.6: Surface Water Monitoring Details

Location	Number/ID	Grid Ref		Frequency
		Easting	Northing	
River Wensum	Wensum-001	612800	316700	Quarterly
River Wensum	Wensum-002	615900	313700	Quarterly
River	Yare-004	626800	307800	Quarterly

Location	Number/ID	Grid Ref		Frequency
		Easting	Northing	
Yare				
River Yare	Yare-005	629600	306100	Quarterly
Dobbs Beck	Rackheath-001	627200	313900	Monthly
Dobbs Beck	Rackheath-002	626600	314500	Monthly
Dobbs Beck	Rackheath-003	627327	313860	Monthly (2013 only)
Horsford Stream	Horsford 001	617900	316400	Quarterly
Horsford Stream	Horsford 002	619400	315700	Quarterly
Horsford Stream	Horsford 003	622600	316000	Quarterly

14.5.43 Samples from 'The Springs' show measurable levels of some Polycyclic Aromatic Hydrocarbon (PAH) compounds, which are typically found in road runoff. The Total PAH concentration (the sum of a standard set of four PAH compounds) exceeded the drinking water standard of 100 ng/l (100 nanograms per litre), with concentrations ranging between 228 and 1310 ng/l. Concentrations of total Benzo(a)pyrene also exceed the drinking water standard (>10 ng/l), ranging between 17 and 330 ng/l. The source of these PAH compounds has not been specifically identified but is most likely to be runoff from the A1151 Wroxham Road as runoff from the A1151 discharges into this location without any treatment, as there are no other probably sources in this area.

14.5.44 Elevated concentrations of dissolved copper and total zinc at 'The Springs' also support this theory of road runoff contributing to the poor water quality in this area. Dissolved copper concentrations exceeded the EQS, ranging between 13 and 72 µg/l at Rackheath-001 and between 25 and 29

µg/l at Rackheath-002. Total zinc concentrations at Rackheath-001 and Rackheath-002 also exceeded the EQS, with concentration ranges of 93-270 µg/l and 77-190 µg/l respectively.

- 14.5.45 The chloride EQS of 250 mg/l (250 milligrams per litre) was also exceeded at 'The Springs' for five samples, ranging between 371 and 900 mg/l. The chloride was probably derived from runoff from gritted roads as the concentrations exceed the EQS during winter months (between October and January).
- 14.5.46 The River Wensum and the River Yare samples showed no detectable levels for the sum of the four PAH compounds.
- 14.5.47 Total PAH and benzo(a)pyrene concentrations at Horsford-003 exceeded the drinking water standard in January 2008 (176 ng/l and 56 ng/l respectively). However, the concentration may have been the result of an unusual or exceptional event as all other samples from this site showed undetectable levels of these parameters. The source of the high PAH and benzo(a)pyrene concentrations in one sample is not known and could have been an incidence of contamination during sampling.
- 14.5.48 Total zinc concentrations at sampling sites Wensum-001 and Yare-005 exceeded the EQS concentration in September 2006 and March 2007 respectively. The total zinc concentration at Wensum-001 was 125 µg/l and at Yare-005, 780 µg/l. In September 2006 a total zinc concentration of 150 µg/l was recorded at Horsford-003. The source of these higher concentrations are not known.
- 14.5.49 Water quality monitoring carried out intermittently at 'The Springs' since September 2006 showed moderate to good biological water quality.

Groundwater Quality

- 14.5.50 The Anglian RBMP identifies the current status of groundwater in the region, for the Broadland Rivers Chalk & Crag waterbody (Waterbody ID 'GB40501G400300'). Groundwater in the region has a current and predicted 2015 chemical quality status of 'poor (deteriorating)' due to a failure in the general chemical assessment (high levels of nitrate, phosphate and pesticides). Groundwater also has a 'poor' quantitative status due to concerns for groundwater dependent terrestrial ecosystems. The RBMP predicts good quantitative and chemical status by 2027.

- 14.5.51 A programme of groundwater monitoring was implemented and water samples collected from site investigation and groundwater level monitoring boreholes installed for this EIA. The location of monitoring points is shown on Volume 2, Chapter 14:FRA, Section R, Drawing No. MMD-233906-DT-0971-0974. Water samples were taken at quarterly intervals between September 2006 and 2008, with further samples in May and June 2013. Groundwater quality data was also obtained from the operator of the Attlebridge Landfill Site.
- 14.5.52 Samples were analysed for a suite of parameters that included standard quality indicators used by the Environment Agency and typical road runoff pollutants. The purpose of the monitoring was to establish an understanding of the seasonal variations in the baseline groundwater chemistry.
- 14.5.53 Detailed groundwater quality results are presented in Volume 2, Chapter 14: Road Drainage and the Water Environment, Section C, Table C.2.
- 14.5.54 Generally the groundwater is good quality. Few contaminants associated with road runoff were detected in the samples taken.
- 14.5.55 Chromium was measured in concentrations above the drinking water standard of 50 µg/l in a number of boreholes. The elevated levels of Chromium and other metals in groundwater (as listed above) occur in four areas as follows:
- Down gradient from the Attlebridge Landfill, where a leachate plume is known to exist (at the proposed location for Drainage Lagoon 1A).
 - Down gradient from the industrial area at the northern end of Norwich Airport (near to the proposed location for Drainage Lagoon 12).
 - Down gradient of the Rackheath Landfill (at the proposed location for Drainage Lagoon 17).
 - In two boreholes located up gradient of the A47 Postwick area (near to proposed infiltration ponds at the Postwick Junction). No obvious source of contaminants exists in the area.
 - The four areas are shown on Volume 2, Chapter 14: Road Drainage and the Water Environment, Section R, Drawing No. MMD-233906-DT-0971-0974.

- 14.5.56 The source of chromium is unknown. The presence of other metals in elevated concentrations was also noted (total zinc, total copper, lead, nickel) as well as higher than normal levels of chemical oxygen demand (COD) for groundwater. The metals were monitored as they are often found in road runoff, but it is unlikely that these minor roads are the source of the elevated levels as the AADT on these roads is less 10,000 - which DMRB states would not be high enough to generate metals at these levels in groundwater.
- 14.5.57 BHGW11 at 'The Springs' showed elevated sodium concentrations about the EQS (280 mg/l) in October 2007. The highest sodium concentrations in the remaining samples was 43.5 mg/l. The source of the high sodium concentration is not known and could have been an incidence of contamination during sampling.
- 14.5.58 Total PAH concentrations were higher than the drinking water standard in three boreholes (BHGW3A, BHGW8 and BHP87). Only one sample at BHGW3A and BHGW8 exceeded the drinking water standard during the monitoring period and the source of the high levels of PAH is not known. BHP87 is located down gradient from the industrial area at the northern area of Norwich Airport. Concentrations at BHP87 ranged from 131 and 269 µg/l. Higher concentrations were recorded at this site in July (348,000 µg/l) and September 2009 (16,000 µg/l). Given the location of this borehole down gradient from the Airport, it is possible some contamination by hydrocarbon leak or spillage occurred in the past and caused these excessively high levels of PAH has occurred in the past, but it is not known where or what this might have been.
- 14.5.59 Total Petroleum Hydrocarbons (TPH) was detected at boreholes at 'The Springs' ranging between 32 and 1500 ng/l, most of which were sampled in January 2008. Concentrations were also detected at BHP87 (460 ng/l), BHPW2 (35 ng/l), BHP190 (530 ng/l) and BHP196 (63 ng/l), all of which were also sampled in January 2008. The source of TPH at these groundwater locations is unknown.

Consented Discharges

- 14.5.60 The only consented discharge located within 500 m of the Scheme, is for the treated effluent from the Anglian Water Services Wastewater Treatment Works (WwTW) located between the two lakes at 'The Springs', as shown on Volume 2, Chapter 14: Road Drainage and the Water Environment, Section R, Drawing No. MMD-233906-DT-0978-0980. The cumulative impact

of the proposed discharges into Dobbs Beck and the second lake at 'The Springs' and the WwTW discharge could affect the ability of the receiving water body to dilute and remove chemical parameters.

Abstractions

Public Water Supplies

14.5.61 There is one licensed public water supply for groundwater abstraction (by AWS) within the study area, located approximately 500m south-east of the Scheme, near Postwick. The exact location of this supply cannot be shown on a plan to ensure protection of the supply. The Environment Agency has advised a temporary 750m radius SPZ1 surrounding the supply, representing the area that is most vulnerable to pollution as shown on Volume 2, Chapter 14: Road Drainage and the Water Environment, Section R, Drawing No. MMD-233906-DT-0978-0980. The borehole at the source is approximately 100m deep but it is not yet operational. Abstractions will be made from the Chalk, which is in direct hydraulic continuity with the overlying Crag (17m thick at this location). It is understood that non-pumping groundwater levels are approximately 20m below ground level. The abstraction is licensed for 4,000m³ per day.

14.5.62 As indicated in section 14.4, the Environment Agency expects strict controls on development implemented within the SPZ 1 but has not raised objections to the proposed road drainage network in this area in the meetings held with the Environment Agency about the Scheme.

14.5.63 Volume 2, Chapter 14: Road Drainage and the Water Environment, Section R, Drawing No. MMD-233906-DT-0978-0980 also shows that the Scheme crosses an SPZ 3 in some areas as described in section 14.5.2. This is the total catchment zone supporting abstraction for public water supplies in the area. As indicated in section 14.4, the Environment Agency expects normal best practice to be implemented to ensure the protection of groundwater in SPZ 3.

Private Water Supplies

14.5.64 Details of licensed abstractions (more than 20 m³/day) from surface water and groundwater in the area were obtained from the Environment Agency. A postal survey of landowners within 250m of the proposed route provided information on both licensed and unlicensed private supplies (less

than 20 m³/day) potentially affected by the Scheme. The 250m study area was chosen to ensure the survey took into account:

- the default 50m radius around each private water supply, taking into account Environment Agency guidance on groundwater protection (as discussed in the following paragraph); and
- a 200m buffer to allow for variations to the route alignment, and the extent of features such as junctions associated with the route.

14.5.65 All private supplies are from groundwater and used either to supply domestic properties with drinking water or for agricultural purposes. In accordance with Environment Agency guidance on groundwater protection (GP3), a default SPZ 1 with a 50m radius was applied around abstraction points used for human consumption or food production purposes (but not irrigation of crops). No further default SPZs (SPZ2 or SPZ3) are required, and no associated restrictions on the use of infiltration features for road runoff beyond the 50m SPZ1.

14.5.66 None of the proposed drainage network infiltration ponds are located within 50m of any potable groundwater source.

14.5.67 The closest private source of drinking water to the Scheme is located at chainage 17000. The source is separated from the proposed Scheme by a railway line and houses on either side of the railway. The actual abstraction is located more than 75 m from the outer boundary of the Scheme.

14.5.68 Another private water supply used for agricultural purposes (irrigation) is located in close proximity to the slip road at chainage 5350. The location of the supply is immediately east of the slip road running north to the proposed roundabout at Drayton Lane. The slip road alignment has been adjusted to ensure sufficient separation (>50m) to prevent any significant impact on the supply due to the Scheme.

14.5.69 No other private or licensed abstractions are sufficiently close to the Scheme to warrant special protection measures.

14.5.70 Consultation with private abstractors suggested that the groundwater supplies are reliable, with the exception of the abstraction at Spring Farm (chainage 1400) which was noted to dry up in times of drought. Comments on the quality of the water stated that the groundwater was generally always clear, with a pleasant taste. Only three abstractors stated that the water contained some sediment and appeared discoloured as a result. This poor

water quality is almost certainly related to borehole construction rather than the quality of groundwater.

- 14.5.71 The Environment Agency commented that mains water has been supplied to properties down gradient of the Attlebridge Landfill site due to the contamination of groundwater from landfill leachate. However, the properties still have the right to use any private sources of water in this area. These private supplies are the only private supplies down gradient of proposed infiltration ponds.

Licensed Surface Water Abstraction

- 14.5.72 One licensed surface water abstraction is located within the study area at 'The Springs'. The abstraction is from the second lake, and has a licence for a total yield of 1637 m³/d (annual licence 50,000 m³/year). The supply is used for general agricultural purposes (spray irrigation).

Flood Risk

- 14.5.73 The FRA (see Volume 2, Chapter 21:FRA, Section A) was carried out in accordance with the requirements of the NPPF and NPPF Technical Guidance. Consideration was given to both the flood risk to the proposed Scheme and the impact of the Scheme on the flood risk to the surrounding area. Allowances were made for increased flows due to climate change. The proposed Scheme, including the three offline junction improvements, was assessed as essential infrastructure under the NPPF Technical Guidance.
- 14.5.74 According to Environment Agency flood maps the entire Scheme is located in Flood Zone 1 (low risk) and as such has less than a 0.1 per cent probability of annual fluvial flooding. The Scheme is not located in an area likely to be affected by coastal flooding or by extreme tidal and surge events. Historic flooding reports from the Environment Agency also suggest there is little fluvial (or tidal) flood risk to the Scheme. The nearest area of historic flooding is at Attlebridge which was flooded in 1993 along the River Wensum. However the flood extent boundaries were more than 200m from the western end of the Scheme, along Fakenham Road.
- 14.5.75 The proposed Scheme will cross 43 natural surface water catchment drainage areas (see Figure 3.2 in the FRA, which illustrates the location of each of these catchments, and Table 3.2 in the FRA, which summarises their characteristics). Whilst none of the catchments include an open watercourse

at the Scheme crossing location, the catchments could pose a potential flood risk to the route as a result of overland flow during a storm event. The Scheme may also have the potential to increase flood risk elsewhere within a catchment if, for example, overland flow gathered upstream of an embankment.

14.5.76 'Surface water' is defined the Flood and Water Management Act 2010 as the 'surface runoff' generated by rainwater (including snow and other precipitation) which is (a) on the surface of the ground (whether or not it is moving), and (b) has not yet entered a watercourse, drainage system or public sewer (excludes overflowing watercourses, drainage systems or public sewers caused by catchment-wide rainfall events or river flow).

14.5.77 The Environment Agency Flood Maps for Surface Water (FMfSW) indicate that the Scheme will cross an area of "deeper surface water flooding" (more than 0.3m deep) during a 1 in 30 and 1 in 200 rainfall event within the catchment of Dobbs Beck. This is supported by the Environment Agency maps of Areas Susceptible to Surface Water Flooding that shows the Scheme crosses just one area 'more' susceptible to surface water flooding. Both these maps are presented in FRA (Volume 2, Chapter 21: FRA, Section A). This vulnerability occurs where the route crosses the catchment of Beck Brook and Dobbs Beck. The overland flow catchment area for Dobbs Beck (OL20) at the intersection with the proposed route of the Scheme is 6.77km², as shown on Volume 2, Chapter 14: Road Drainage and the Water Environment, Section R, Drawing No. MMD-233906-DT-0981-0987.

14.5.78 The 0.3m threshold is chosen as it represents a typical value for the onset of significant property damages when property flooding may start (above doorstep level) and because it is at around this depth that moving through floodwater (driving or walking) may become more difficult; both of which may lead users to consider the need to close roads or evacuate areas.

14.5.79 There are no known records of groundwater or surface water flooding from Norfolk County Council, and no Highways Agency records of any known surface water issues along the proposed route, or within the immediate vicinity of the route. However, the lack of historic evidence may be because such flooding goes unreported.

Aquatic Ecology

- 14.5.80 Chapter 8: Nature Conservation describes sites which are protected for ecological reasons. The two sites linked to water are the River Wensum SAC and the 'The Springs' CWS.
- 14.5.81 The watercourses and lakes at 'The Springs' CWS is the closest water body with a potential hydraulic link to the proposed Scheme. The CWS is designated for its woodland, marshy grassland and standing water habitat. A number of small ponds are located within 100m of the proposed Scheme, but these are isolated and are not fed by watercourses.
- 14.5.82 Macro-invertebrate sampling was undertaken at four points around 'The Springs' and in two ditches in the area. Section J in Chapter 8 describes in detail the sampling at the CWS and the analysis of this information.
- 14.5.83 The results show that 'The Springs' currently has moderate to good biological water quality, with relatively diverse macro-invertebrate communities present, particularly in the emergent vegetation habitats at the edges of the first fishing lake and connecting ditches. Further details are provided in section J in Chapter 8. Of particular note was the presence of the Desmoulin's Whorl Snail. This was identified in the seepage areas at the first lake, and in the area of Dobbs Beck. Desmoulin's Whorl Snails were not present in the vegetation surrounding the second lake, which will receive the treated road runoff, and are therefore unlikely to be affected by any potential changes in water quality.
- 14.5.84 The CWS is predominantly groundwater fed. Any alteration in the groundwater flow or quality could have a significant effect on the habitats mentioned above. The HRA considers the River Wensum SAC aquatic ecology and the potential impacts of the proposed Scheme on the SAC designated features (Volume 2, Chapter 17: Habitat Regulations Assessment). The conclusions of the HRA are summarised in more detail in Chapter 8: Nature Conservation, Section 6, with an overall conclusion that the Scheme would not have an adverse impact on the SAC.

Existing Road Drainage

- 14.5.85 No existing road drainage is being replaced along the route, as the Scheme is a new road. However, there are intersections with existing roads, with new junctions in most places, as shown on the Scheme engineering layout (Document 2.6). There are also three offline junction improvements.

- 14.5.86 Information on existing drainage is generally very poorly recorded for minor roads, including the minor roads crossed by the Scheme. Almost all minor roads in the area have no formal drainage. Road runoff from the edge of the carriageway generally drains into ditches or infiltrates into the soil. In some areas, kerbs exist with some drainage, for example on the Wroxham Road (A1151) which discharges into the watercourse at Rackheath.
- 14.5.87 Road runoff is not treated on these roads, and in most cases treatment would not be justified as the Annual Average Daily Traffic (AADT) levels are lower than 10,000 (vehicles per day).
- 14.5.88 As there is no formal treatment of runoff along Wroxham Road (A1151) there are also no pollution control measures in the event of a significant accident.

14.6 Mitigation

Mitigation during Construction

14.6.1 During construction, best practice for pollution prevention and water management, set out in the following documents, will have to be implemented as part of the overall Construction Environmental Management Plan (CEMP) as appropriate to the specific circumstances of the Scheme and where this is practicable to do so:

- Environmental good practice on site (CIRIA, 3rd Edition, 2010)
- Control of water pollution from construction sites – guide to good practice (CIRIA, 2002);
- Control of water pollution from linear construction projects (CIRIA, 2006); and
- Environment Agency Pollution Prevention Guidelines (PPG), in particular:
 - PPG1 Understanding your environmental responsibilities - good environmental practices;
 - PPG2 Above ground oil storage tanks;
 - PPG3 Use and design of oil separators in surface water drainage systems
 - PPG5 Works and maintenance in or near water;
 - PPG6 Working at construction and demolition sites;
 - PPG21 Incident Response Planning; and

- PPG22 Dealing with spills.

14.6.2 Some examples of specific mitigation measures which will be required in the CEMP (Volume 2, Chapter 24: CEMP) are as follows:

- Works will be undertaken in accordance with any conditions imposed in consents for temporary discharges and abstractions (e.g. dewatering excavations) obtained from the Environment Agency;
- Measures to control discharge of surface water run-off from construction compounds will be implemented;
- All fuel and oils will be stored in accordance with the Control of Pollution (Oil Storage) Regulations 2001. Storage areas will be located away from surface water drainage, and will be within bunds with sealed bases. Refuelling would always be undertaken remote from drainage and surface water features and using automatic shut-off fuel delivery systems. Similar measures will be implemented for the storage of chemicals;
- Pumps, generators and other small items of plant will be provided with drip trays to collect any oil/fuel spills;
- Where wheel washes are installed adjacent to site accesses/egresses, these will be self-contained, will recycle wash water where possible and will not discharge directly to the environment;
- Where practicable, topsoil (with vegetation) will be replaced on earthworks areas to limit scouring and the generation of silt-laden runoff;
- Drainage from existing roads will not be impeded during construction of road crossings ; and
- Monitoring of surface water and groundwater quality, groundwater levels and flows in the streams at 'The Springs' will commence six months prior to any pre-construction works. The monitoring will continue during construction at frequencies to be agreed with the Environment Agency.
- Emergency response procedures will be developed and implemented to cover any incidents that might lead to release of pollutants to the aquatic environment (including spillages to ground).

Mitigation during operation

Mitigation strategy to protect water quality

14.6.3 There are three watercourses receiving runoff from the Scheme: (i) the second lake between Dobbs Beck and Spixworth Beck; (ii) Dobbs Beck; and (iii) River Yare via the existing A47 drainage (Eastbound A47 Off-slip). Due to a lack of other suitable watercourses in the locality, most of the road runoff will be discharged into systems that eventually result in the runoff infiltrating into the ground.

14.6.4 To minimise risk to the water environment in accordance with the SUDS Manual (CIRIA, 2006), discharges of routine runoff to surface water and groundwater will flow through a three tiered treatment system. Where carriageway alignment and safety considerations permit, runoff will flow through a grassed swale, then discharge to a lined settlement pond, followed by an infiltration pond (if discharging to groundwater) or a surface flow wetland (if discharging to surface water), as agreed with the Environment Agency. Where swales are not feasible, a two tiered treatment train is provided (lined pond and infiltration pond). Each treatment stage reduces the concentration of contaminants present in the road runoff to different degrees, as defined in DMRB Surface and Sub-surface Drainage Systems for Highways, Volume 3, Section 2, Part 3 (HD 33/06). Further details on treatment systems proposed in each drainage catchment are provided in Volume 2, Chapter 14: Road Drainage and the Water Environment, Section G.

14.6.5 A substantial proportion of the contaminants from highway runoff are held in suspended particles in the runoff. Partial removal of dissolved pollutants including some metals and salts, prior to discharge to surface water, would occur through:

- Settlement of suspended sediment in swales and settlement ponds.
- Adsorption of colloidal particles and soluble chemical compounds onto organic materials and clays in fine sediments held in vegetated treatment areas in retention ponds.
- Uptake (and breakdown) of chemical elements and compounds as part of the metabolic activity of bacteria/algae in areas of vegetative treatment (particularly in the root zone).

14.6.6 The majority of the road runoff will be discharged to infiltration ponds as there are very few watercourses along the route suitable for accepting the runoff (see Volume 2, Chapter 14: Road Drainage and the Water Environment,

Section R, Drawing No. MMD-233906-DT-0981-0987. As agreed with the Environment Agency, the main mitigation measure taken to protect groundwater has been to establish that 1.2 m or more of unsaturated ground would exist between the base of an infiltration pond and the underlying water table in high groundwater level conditions. The maximum groundwater levels observed during monitoring from 2007 to 2013 were used as a guide to high groundwater level conditions. Although the maximum groundwater levels in the period are unlikely to be as high as the long term maximum levels, the levels used should be reasonably representative of high water table conditions for many wet winter periods.

14.6.7 The distance between the base of the proposed infiltration ponds and the maximum observed groundwater level (the unsaturated zone) is provided in Table 14.7.

Table 14.7: Assessment of Unsaturated Zone Thickness beneath Proposed Infiltration Ponds

Lagoon Number	Chainage (m)	Lagoon Base Elevation (Invert Level) (mAOD)	Maximum Observed Groundwater Level (mAOD)	Minimum Thickness of Unsaturated Zone (m)
1	650	13.4	9.9	3.5
1A (Overland flow only)	600	15.0	9.9	5.1
2	1625	32.8	9.9	22.9
3	2820	32.4	30.9	1.5
4	3125	31.3	30.9	0.4
5	4200	26.8	DRY	-
6	5350 (1075	26.0	DRY	-

Lagoon Number	Chainage (m)	Lagoon Base Elevation (Invert Level) (mAOD)	Maximum Observed Groundwater Level (mAOD)	Minimum Thickness of Unsaturated Zone (m)
	Offline)			
6A	5350 (500 Offline)	30.9	DRY	-
8	6700 (385 Offline)	22.1	20.99	1.11
8A (Overland flow only)	6700 (340 Offline)	24.6	21.0	3.6
9	6750 (400 Offline)	21.2	20.38	1.12
12	8900	19.4	15.31	4.09
13	9800	20.5	DRY	-
13A (Overland flow only)	9900	21.2	DRY	-
14	11000 (180 Offline)	16.6	13.18	3.42
14A	11000 (430 Offline)	19.8	13.3	6.5
16	12800	14.1	DRY	-
17 (Lined)	13400	12.0	12.63	-0.63
18	14600	13.2	12.4	0.8

Lagoon Number	Chainage (m)	Lagoon Base Elevation (Invert Level) (mAOD)	Maximum Observed Groundwater Level (mAOD)	Minimum Thickness of Unsaturated Zone (m)
(Lined)				
18A	14450	14.0	12.4	1.6
19	16200	25.1	18.2	6.9
20	16400	25.9	18.2	7.7
21	17000 (140 Offline)	22.2	18.0	4.2
22	17200 (160 Offline)	21.6	18.0	3.6
23	18160	23.4	18.0	5.4
24	18760	21.8	9.1	12.7
25	19350	22.8	9.1	13.7
26	19500 (120 Offline)	17.5	8.7	8.8
27 (swale - lined)	19750	24.15	8.7	15.45
28 (lined)	20000 (100 Offline)	18.35	1.4	16.94
29	20350	9.4	1.4	7.99
30	20000 (300 Offline)	15.4	1.4	13.99

14.6.8 In five locations the requirement for the depth of unsaturated zone (1.2m) is unlikely to be achieved (at Lagoons 4, 8, 9, 17 and 18). Lagoons 17 and 18 at

‘The Springs’ will be lined and discharged to surface water. The drainage design will incorporate permanently wet surface flow wetlands within the second lagoon, with a hydro-brake controlling the outflow rate.

14.6.9 It is not possible to line the infiltration pond at Lagoons 4, 8 and 9 as there is no watercourse to receive a positive outfall. However, the risk assessment results confirm that, without lining this lagoon, the level of risk to groundwater from road runoff and from an accidental spillage is considered acceptable, and this risk is further reduced by the treatment systems and pollution prevention measures proposed (see Volume 2, Chapter 14: Road Drainage and the Water Environment, Section G). The detailed design will be agreed with the Environment Agency, including the potential need to raise invert levels or incorporate other pollution control mechanisms (e.g. penstock valves to isolate the primary lagoon in the event of a spill), where possible, at these locations.

14.6.10 All drainage networks will be constructed with measures to contain any accidental spillage of harmful substances. The measures will prevent the spillage reaching the final discharge point by containment within the initial lined settlement pond.

Mitigation strategy to manage flood risk

14.6.11 Flood risk will be mitigated in the following ways:

- Drainage networks will be installed, capable of storing volumes of road runoff and overland flow for a 1:100 year event;
- Soakaway systems and culverts under the road will be installed to control and direct overland flow (i.e. flow originating from outside the Scheme boundary), in circumstances where the flow cannot be directed to a drainage lagoon;
- Lagoons 1A, 8A and 13A will provide storage for overland flow during a 1:100 year event for their associated catchments;
- The drainage lagoons will regulate discharge rates to surface waters at the existing greenfield runoff rates (Lagoons 17 and 18);
- Infiltration lagoons with half drain-down times exceeding 7 days will be designed to contain additional runoff from a follow-on 1 in 10 year storm within the freeboard, as requested by the Environment Agency; and

- The area of new slip roads to be drained to the A47 surface water drainage system would be no greater than the area of the existing merge slip road onto the A47 eastbound that is to be decommissioned. As such, there will be no significant change to existing drainage. There will be no change to flood risk in this area as concluded in the FRA.

14.6.12 As described in section 14.5.6 in this chapter, and in section 3.1.4 of the FRA (Volume 2, Chapter 21: FRA), the Scheme has the potential to increase flood risk from overland flow. To compensate for this potential increase, culverts are proposed at the low points of larger overland flow catchments, where flow is not directed and stored within the proposed infiltration lagoons. The culverts will convey the overland flow to the down gradient side of the road to prevent flooding upstream of the road and embankments. In most catchments, spreader ditches are also proposed along the road edge or embankment toe. The ditches will direct flow to the culverts and promote infiltration.

14.6.13 Lagoons 17 and 18 will be constructed with a hydro-brake controlling the outflow rate at a greenfield runoff rate. Using the overland flow catchment areas draining to Lagoon 17 and Lagoon 18 (see Volume 2, Chapter 14: Road Drainage and the Water Environment, Section R, Drawing No. MMD-233906-DT-0981-0987), and the FEH catchment descriptors e.g. permeability of the soils of these catchments, the greenfield runoff rate was estimated. Methods used to estimate the greenfield runoff rate were selected based on the catchment size (as defined in the SuDS Manual (CIRIA 2007)). The Institute of Hydrology Report 124 (IOH124) method was used for both Lagoon 17 and Lagoon 18 (catchments less than 200 ha). Detailed calculations are presented in Volume 2, Chapter 14: Road Drainage and the Water Environment, Section N, Appendix D.

14.6.14 The greenfield runoff rates were calculated for a 1:100 year event plus 30% for climate change. These calculations do not include any increased runoff from urban areas within the catchments, providing a conservative estimate. The resulting greenfield runoff rates are compared to the proposed discharge rates from the lagoons in Table 14.8 below, and show the proposed discharge rates are below the greenfield runoff rates for these catchments.

Table 14.8: Greenfield Runoff Rates

Lagoon Number	Overland flow catchments draining to discharge point	Greenfield Runoff Rates (1:100 yr+ 30% cc)		Maximum proposed discharge rate from Lagoon
		litres per second	litres per second per hectare	Litres per second
17	OL16, OL16A and OL16B	7.53	0.66	7.5
18	OL19 and OL20	22.66	0.66	20

14.6.15 There is the potential for the Scheme to deviate from the current proposed elevation by +/- 0.5m during the detailed design stage. Road elevations may be varied within these limits provided they remain:

- above the estimated maximum flood levels for overland flow for a culvert blockage scenario, as described in the FRA; and
- above the long term maximum groundwater levels.

14.6.16 This assessment assumes there will be no change to the high and low points of the road as a result of any variations in road elevations. As a consequence, therefore, the associated road drainage arrangements would remain unchanged. It also assumes no significant changes to the level and slope of culverts proposed to convey overland flow under the Scheme.

14.6.17 At chainage 100 there is a bridleway that is at risk of flooding from overland flow during a 1:100 year storm event. To avoid this occurring a retention bund will be constructed (see Volume 2, Chapter 14: Road Drainage and the Water Environment, Section R, Drawing No. MMD-233906-DT-0815) with a crest level to be specified with reference to the maximum flood levels calculated in the FRA, plus a 300mm freeboard. The flood bund will ensure access to the bridleway is maintained during and following storm events.

Mitigation strategy for private and public water supplies

- 14.6.18 As described in section 14.5.2 and 14.5.5, and as agreed with the Environment Agency, a default 50m radius SPZ1 has been assigned to all private water supplies used for drinking water and all infiltration systems have been excluded from within this zone to protect its integrity.
- 14.6.19 Swale no. 27 and Lagoons 28, 29 and 30 are located within the temporary SPZ1 surrounding the AWS public water supply. Swale no. 27 and Lagoon 28 are both lined and discharge to Lagoon 30. The only structures discharging to groundwater within the SPZ1 are Lagoons 29 and 30. A three stage treatment step and pollution control systems is proposed in both these locations as described under 'Mitigation strategy to protect water quality' in this section. An unsaturated zone of more than 5m has been provided beneath the base of Lagoons 29 and 30 as agreed with the Environment Agency.
- 14.6.20 The Environment Agency's position on sustainable drainage systems in SPZ1 is set out in their policy on Groundwater Protection: Principles and Practice (GP3, August 2013). The Environment Agency requires a risk assessment to determine whether pollution to groundwater would occur from the proposed infiltration systems within the temporary SPZ1 of the new proposed public water supply based on the source-pathway-receptor approach. This approach considers the pollutants potentially contained within the road runoff, the processes that may modify, contain or convey the pollutants through the soil and subsoil, and whether the pollutants are likely to reach the groundwater. As indicated in section 14.3, the framework behind the DMRB groundwater risk assessment is based on the source-pathway-receptor approach that has been developed and supported by the Environment Agency. Therefore the mitigation proposed to effectively treat runoff and contain accidental spillages (see 'Mitigation strategy to protect water quality' in this section) is considered adequate to mitigate risks to protect the integrity of the supply. This mitigation has been discussed with and approved by the Environment Agency.

SuDS maintenance and monitoring

- 14.6.21 The process undertaken to select appropriate and effective road drainage systems for the Scheme in each drainage catchment is provided in Volume 2, Chapter 14: Road Drainage and the Water Environment.

- 14.6.22 The culverts, spreader ditches, swales and attenuation lagoons proposed by the drainage design will be maintained in accordance with policies, standards and practices of NCC's Transport Asset Management Plan and The SuDS Manual (CIRIA, 2007).
- 14.6.23 NCC have agreed to install erosion protection measures at the discharge points from Lagoons 17 and 18, and at the downstream outfall point of all culverts conveying overland flow beneath the Scheme. Regular monitoring by NCC will be undertaken to ensure these measures are effective.
- 14.6.24 In order to maintain the efficiency of the SuDS elements of the proposed drainage design, regular maintenance will be required. It is anticipated that swales, filter trenches and detention ponds will require regular inspection, litter and debris removal, and grass cutting, as well as occasional maintenance such as sediment management and vegetation replacement to retain design capacities and functionality. As outlined in the NCC's Transport Asset Management Plan (2013/14-17/18), the routine maintenance of the Scheme and its associated drainage will be the responsibility of Norfolk County Council including the actions outlined in section 5.4.5 and 5.4.6 of the Plan.

14.7 Assessment of Effects

14.7.1 This outlines the potential impacts arising from the construction and operation of the proposed Scheme on the water environment. The assessment takes into account the mitigation already set out in section 14.6 Mitigation.

Construction

- 14.7.2 Construction of the proposed Scheme has the potential to give rise to negative impacts from:
- spills of fuel and chemicals, which could enter groundwater or nearby ponds or drains;
 - surface water run-off with high sediment loading being generated from working areas, which could contaminate surface water features, leading to lowered water quality and potentially the blockage of small drains and ponds; and
 - a reduction in permeability along the route, from construction of access roads, materials stores and compounds, with the consequence of increasing maximum surface water run-off and increasing flood risk elsewhere.

14.7.3 Measures to manage surface water during construction is provided in the CEMP (Volume 2, Chapter 24: CEMP) and is based on the mitigation measures identified in the FRA (Volume 2, Chapter 21: FRA, Section A) and section 14.6.1 above.

14.7.4 During a major storm event there is the potential for sediment laden runoff to overwhelm site protective measures at locations protecting nearby watercourses and alter overland flows, however this impact would be temporary and localised. Due to the large overland flow catchment draining to Dobbs Beck, the risk is greatest in this location.

14.7.5 Table 14.9 provides the assessment of potential positive and negative impacts during construction and the significant effects of these impacts with the mitigation applied (section 14.6.1). The mitigation proposed in the table highlights measures to reduce any significant adverse effects.

Table 14.9: Assessment of Potential Impacts and Significant Effects – Construction

Potential Impact	Feature	Attribute (as defined in Table A4.1 in HD45/09)	Value of the Attribute (see Error! Reference source not found.)	Importance of Receptor	Mitigation Proposed (Construction)	Magnitude of Impact	Significance of Effect (as defined in Table A4.6 in DMRB HD45/09)
Surface Water							
Change in surface water quality	River Wensum (chainage 0 -1600)	Biodiversity	Special Area of Conservation	Very High	Road drainage network and infiltration ponds to be installed at an early stage. No direct discharges into ditches or watercourses feeding the Wensum.	Negligible	Neutral

Change in surface water quality (and flow)	Dobbs Beck (chainage 14500)	Biodiversity	County Wildlife Site	Medium	runoff can be managed more effectively. Managing discharge from construction requires careful planning. Road drainage network and infiltration ponds to be installed at an early stage. No direct discharge to be permitted. Only discharge via temporary storage and silt trap systems.	Minor Adverse – potential temporary changes to flow	Slight adverse
Change in surface water quality	River Yare (Offline at chainage 20000)	Dilution and Removal of Waste Products (Runoff from	WFD classification 'moderate'	Medium	As for Dobbs Beck & Spixworth Beck.	Minor Adverse – short term flushing from drainage	Slight adverse

Change in surface water quality	Other minor field ditches potentially connected to larger surface water bodies	A47 slip road)	Dilution and Removal of Waste Products	Unknown quality status.	Low	CEMP method statements to be developed based on appropriate Environment Agency PPG. All construction compounds to have properly bunded and contained storage facilities for hazardous soluble substances. All batching plant areas (e.g. concrete or bitumen) to be on concrete pads with properly constructed drainage to contain spillages.	outfalls. Negligible (no direct discharge permitted into any ditch)	Neutral
---------------------------------	--	----------------	--	-------------------------	-----	---	--	---------

Change in surface water quality	First lake d/s of Dobbs Beck (chainage 13900)	Recreation	Carp fishery	Medium	No discharges permitted directly into the lake.	Negligible impact	Neutral
Change in surface water quality	Second lake d/s of Dobbs Beck, (chainage 13500) and d/s Spixworth Beck (500m offline at chainage 13300)	Private Water Supply (surface water)	Local abstraction for spray irrigation. Spixworth Beck: WFD classification 'moderate'	Low	None required	Negligible, No change	Neutral
Change in surface water	Four ponds (Chainag	Biodiversity (Stillwater ponds --	Great Crested Newts (protected)	Very High	No direct discharge permitted. Temporary silt traps	Negligible	Neutral

quality	e 4000, 9000, 10000 and 15250)	holding Great Crested Newts)	species)		(straw bales or other suitable method) to prevent construction site runoff entering the ponds.		
Groundwater							
Change in groundwater quality	Principal aquifer (Crag and Chalk)	Groundwater supply (public water supply)	Regionally important resource & SPZ1	Very High	Compliance with Environment Agency PPG. Following pollution prevention measures required in SPZ1 within GP3.	Negligible	Neutral
Change in groundwater quality	Principal aquifer (Crag and Chalk)	Groundwater supply (private domestic supplies)	Local resource	Medium	No abstraction/dewatering permitted within 50m radius (nominal SPZ1).	Negligible	Neutral

Change in groundwater quality	Principal aquifer (Crag and Chalk)	Vulnerability	Area of high leaching potential soils and unconfined principal aquifers.	High	No routine discharges will be permitted to ground of any contaminated water. Compliance with Environment Agency PPG.	At a local scale, road cuttings will remove some of the protective unsaturated zone and thus increase vulnerability. However, scale of impacted area is small in relation to whole aquifer.	Negligible	Neutral
Flood Risk								

Flooding from groundwater	Principal aquifer (Crag and Chalk)	Conveyance of Flow	Perched water table serving small catchment	High	Consent required from Environment Agency/IIDB for any temporary dewatering during earthworks and road construction.	Negligible	Neutral
Flooding from increased surface water runoff	Dobbs Beck (chainage 14500)	Conveyance of Flow	Dobbs Beck serving small catchment.	Low	Discharge from Lagoon 18 at or near the greenfield runoff rate. Improved conveyance of overland flow through the new culvert and ditch under track that leads to AWS pumping station; a larger culvert installed under Wroxham Road and 2500mm culvert at chainage	Negligible (see also the FRA (Volume 2, Chapter 21, Section A))	Neutral

							14750.		
--	--	--	--	--	--	--	--------	--	--

14.7.6 Based on the implementation of mitigation measures described in section 14.6.1 and the conclusions of the FRA, no significant adverse impacts as a result of construction works are predicted on the water features described under section 14.5.

Operation

14.7.7 During operation the Scheme has the potential to impact water resources from:

- Discharging poor quality water from the road drainage network to surface water and groundwater bodies and the associated water users;
- Improving existing road runoff treatment and spillage containment discharging to surface water or groundwater;
- Increasing the runoff from land occupied by the road and associated low permeability structures;
- Intercepting and blocking overland flow during high intensity rainfall events; and
- Disturbance and transportation of potentially contaminated sediments during SuDS maintenance into surface and groundwater bodies.

14.7.8 These potential impacts are discussed further in the following sub-sections.

Potential impacts on surface water quality

14.7.9 The potential for pollutants from routine road runoff to have an adverse impact on the three surface water bodies receiving drainage discharges is considered low. Application of the DMRB HAWRAT indicates that the quantities of sediment and soluble copper and zinc entering surface waters are acceptable. Detailed calculation worksheets to support this conclusion are provided in Volume 2, Chapter 14: Road Drainage and the Water Environment, Section P.

14.7.10 The low return periods for spillage risk suggest no additional pollution prevention measures would be required. Detailed calculation worksheets to support this conclusion are provided in Volume 2, Chapter 14: Road Drainage and the Water Environment, Section P. However, due to the sensitivity of the receiving watercourses and aquifer, the requirements set out by the Environment Agency and suggested best practice in the SuDS Manual (CIRIA 2006), the three tiered treatment system has been applied.

Potential impacts on groundwater quality

- 14.7.11 HD 45/06 requires the groundwater assessment to use a source-pathway-receptor approach and predicts whether risks of contamination to groundwater are high, moderate or low. The action required to mitigate any identified risk depends on the value and sensitivity of the groundwater, for example, the groundwater may contribute baseflow to ecologically important habitats, or could be used for public water supply.
- 14.7.12 A risk assessment has been undertaken for the Scheme for all the road drainage networks that would discharge to ground, which includes the risk of routine runoff on groundwater (Method C) and the risk of accidental spillage (Method D), as described in section 14.3. The results are provided in detail in Volume 2, Chapter 14: Road Drainage and the Water Environment, Section O, Appendix E and Section Q.
- 14.7.13 As described in section 14.6.2, as there was insufficient unsaturated zone available to help protect groundwater (less than 1.2m) Lagoons 17 and 18 at 'The Springs' will be lined and discharged to surface water due to high groundwater levels in the area. The drainage design will incorporate permanently wet surface flow wetlands within the second lagoon, with a hydro-brake controlling the outflow rate.
- 14.7.14 The groundwater risk assessment (HD45/09 Method C) considered the depth to groundwater beneath each infiltration pond. Table 14.10 summarises the results of the groundwater risk assessment using the method in HD45/09, which assumes runoff discharges directly from the road to the ground, with no mitigation measures incorporated. The individual assessments for each lagoon are included in Volume 2, Chapter 14: Road Drainage and the Water Environment, Section O, Appendix E. Although Lagoons 18 is lined, it has been included in this assessment as the receiving water body (Dobbs Beck) varies seasonally between dry and wet conditions. Therefore in dry conditions the discharge will be to ground and not to surface water.

Table 14.10: Summary of Groundwater Risk Assessment for Drainage Network

Lagoon Number	Chainage (m)	Overall Groundwater Risk Score	Risk of Impact on Groundwater
1	650	150	Medium
1A (Overland flow only)	600	N/A	N/A

29	20350	150	Medium
30	500 offline (east)	150	Medium

14.7.15 In many cases, the ground investigation for the Scheme provided information on lithology and clay content. In some locations, no relevant information was available, and so information from the nearest boreholes was used to assign values for the assessment. The boreholes used in the assessment of each lagoon are listed in Volume 2, Chapter 14: Road

Drainage and the Water Environment, Section B, Table B.1. Conservative values were generally selected for the relevant parameter.

14.7.16 The risk of pollutants entering groundwater from routine runoff is shown to vary between low to moderate adverse along the route. A medium risk is assigned to any site which scores between 150 and 250. Most lagoons are in the lower half of the Medium Risk range. Five lagoons have low risk (<150). When using the risk matrix, all drainage catchments have the same drainage catchment characteristics i.e. flow type, rainfall volume and intensity, and all drainage catchments have AADT less than 50,000. The factors which changed in the risk assessment tables were:

- the soakaway geometry;
- the size of sand particles and proportion of clay in the underlying lithology; and
- the depth to the water table from the base of the proposed pond.

14.7.17 Lagoon 9 has the highest risk due to the shallow depth to groundwater and low proportion of clay in the lithology.

14.7.18 The ground water risk assessment provides only an approximation of the risk as substantial generalities are included. The method does not allow for mitigation measures to be adequately represented. SuDS treatment systems described in section 14.6.2 can provide a reduction in contaminants before runoff reaches the infiltration pond, reducing the risk to groundwater and resulting in a lower risk than presented above. For example, the reduction factors associated with the combination of a grass swale and settlement ponds are not taken into account in the assessment. Vegetated systems can produce a reduction of pollutants which exceed 60% in some circumstances, as discussed in DMRB Volume 4, Section 2, Part 1 (HA 103/06).

14.7.19 The risk of a pollution incident arising from spillage at all drainage discharge points has been assessed and Volume 2, Chapter 14: Road Drainage and the Water Environment, Section Q shows these are all well below maximum acceptable probability set out in HD45/06 (i.e. the probability of a spillage for any drainage network has been calculated to have an annual probability of less than 1%). As described in section 14.6.2, this risk will be reduced further with the proposed measures to contain any accidental spillage of harmful substances (containment within the initial lined settlement pond).

14.7.20 The only users of groundwater that could be affected by runoff infiltration are the private water supplies and the AWS public water supply. No

significant adverse effects are predicted on private water supplies used for drinking water as all lagoons are located outside the default 50m buffer. The risk of pollutants entering the groundwater via the proposed infiltration ponds and other soakaway structures within the temporary 750m radius SPZ1 is considered low using the DMRB groundwater and spillage risk assessment tools. The risk to the public water supply abstraction is therefore also considered low.

Potential impacts on flood risk

- 14.7.21 As shown on Volume 2, Chapter 14: Road Drainage and the Water Environment, Section R, Drawing No. MMD-233906-DT-0689, the Scheme is in close proximity to the environmentally sensitive area of 'The Springs'. This gives rise to a potential flood risk due to increased surface water runoff, as indicated in the FRA (Volume 2, Chapter 21: FRA). Greenfield runoff rates have therefore been used in the highway drainage design to size settlement and balancing ponds, with a controlled discharge point to 'The Springs' (see section 1.6.2 'Mitigation strategy to prevent flood risk'). The design incorporates SuDS and addresses the potential risk due to increased runoff.
- 14.7.22 The outfall from Lagoon 17 at 'The Springs' will discharge to the second lake that outfalls to Spixworth Beck. However, no additional flood risk is predicted for the Spixworth Beck due to the restricted greenfield runoff rate for the 1:100 year flood. A similar approach to the design of Lagoon 18 at 'The Springs' (chainage 14600) will ensure that flood risk is not enhanced by the Scheme.
- 14.7.23 It is therefore concluded that, in terms of flood risk, the Scheme meets the requirements of NPPF providing the proposed mitigation measures and SuDS design are employed.
- 14.7.24 Table 14.11 provides the assessment of potential positive and negative impacts during operation, and the significant effects of these impacts taking into account the mitigation measures proposed in section 1.6.2. The mitigation proposed in the table highlights measures to reduce any significant adverse effects.

Table 14.1.1: Assessment of Potential Impacts and Significant Effects – Operation

Potential Impact	Feature	Attribute (as defined in Table A4.1 in HD45/09)	Value of the Attribute (see Error! Reference source not found.)	Importance	Mitigation Proposed (Operation)	Magnitude	Significance of Effect (as defined in Table A4.6 in DMRB HD45/09)
Surface Water							
Change in surface water quality	River Wensum (chainage 0 – 1600)	Biodiversity	Special Area of Conservation	Very High	No direct discharges into ditches or watercourses feeding the Wensum. Discharge to ground in this area.	Negligible – no change	Neutral

			<p>reducing the unsaturated zone which provides protection to the aquifer.</p>		<p>spillage risks. Risk assessment shows that no sections of the Scheme have significant risks from accidents.</p> <p>Drainage networks and treatment designed to intercept and remove significant contaminants loading in the runoff prior to discharge to infiltration ponds.</p> <p>No infiltration pond is located where highest measured main water table, as monitored, is less than 1.2 m below base of infiltration pond except Lagoons 4 and 9 (see section</p>		
--	--	--	--	--	--	--	--

Flood Risk					1.6.2).		
Flooding from increased surface water runoff	Large catchment (OL20) of Beck Brook and Dobbs Beck (chainage 14500)	Conveyance of flow	Minor watercourse draining surrounding land	Medium	All runoff is discharged at greenfield runoff rates from the lined Lagoons 17 and 18 at 'The Springs' to the receiving watercourse. Spreader ditches, large box culvert (2500mm) and new ditch providing flow path to Dobbs Beck, to maintain runoff from associated overland flow catchment. Permanent drainage installed as soon as practical. Regular maintenance	Minor beneficial – improving conveyance of overland flow under track near AWS pumping station and under Wroxham Road	Slight beneficial

Flooding from increased surface water runoff	Large overland flow catchment (chainage 1000)	Conveyance of flow	Catchment draining towards Fakenham Road and potentially the River Wensum	Low	to prevent blockage. Flood bank to protect the bridleway proposed at chainage 1000. Permanent changes to overland flowpath.	Negligible	Neutral
Flooding from increased surface water runoff	Other surface water catchments	Conveyance of flow	Small catchments draining to field ditches or infiltrating to ground	Low	Spreader ditches and/or culverts to maintain runoff from overland flow catchments downstream of the road crossing. Regular maintenance to prevent blockage.	Negligible	Neutral

Climate change considerations

- 14.7.25 A climate change risk assessment considers the impact of climate change on the Scheme and the wider environment. This is provided in Volume 2, Chapter 16: Climate Change Risk Assessment, Section A) and points of relevance to the water environment summarised below.
- 14.7.26 The only aspect of climate change likely to affect the proposed route of the Scheme is the variation in rainfall patterns. This has been considered using the DEFRA/NPPF guidance which suggests an increase of 30% should be expected in peak rainfall intensity by the year 2115. A precautionary increase of 30% has been applied to calculations of surface water runoff from the road and adjacent natural catchments. As a result, the attenuation lagoons have been designed to contain a 100-year event plus 30% allowance for climate change, as described in (Volume 2, Chapter 21: FRA, Section B). Where the half drain-down time exceeds 7 days, lagoons have been designed to have the capacity for a follow on 1 in 10 year event within the freeboard. In addition, capacity and flow routing for extreme events (up to the 1 in 1000-year event) have been incorporated within the system.
- 14.7.27 Maintenance of drainage structures (see section 14.6.2) will provide a degree of resilience to climate risks. These activities also provide the opportunity to assess vulnerability and impacts and make improvements as part of maintenance, modification or replacement regimes. Retrofitting of assets to reduce vulnerability can be undertaken during asset management and maintenance activities e.g. unblocking drains.

14.8 Conclusions

- 14.8.1 During construction the overall effect of the Scheme during construction on surface water quality is predicted to be slight adverse at worst (not significant). During a major storm event there is the potential for sediment laden runoff to overwhelm site protective measures at locations protecting nearby watercourses and alter overland flows, however this impact would be temporary and localised.
- 14.8.2 During operation the overall effect on surface water quality is considered to be neutral to slight beneficial. A slight beneficial effect will result from the improvement of treatment to existing runoff from the A1151. Runoff from the A1151 currently discharges into the CWS without any form of treatment.
- 14.8.3 The Scheme crosses areas of high leaching potential soils and unconfined principal aquifers, and is in reasonably close proximity to some private

abstraction sites and an AWS public water supply source. There may be a slight adverse effect on groundwater quality for some private water supplies which are located down-gradient of infiltration ponds. However, all infiltration ponds are outside the default 50m radius SPZ1 under Environment Agency guidance, applied to all potable groundwater abstraction sites (unlicensed). Otherwise, during construction and operation, the overall effect of the scheme on groundwater quality and flow is predicted to be neutral.

14.8.4 The overall effect of the Scheme on flood risk is predicted to be neutral to slight beneficial. The Scheme provides a new flow path between the Scheme and Dobbs Beck, along the dry valley, to convey flood flows. With the mitigation measures in place, no increase in flood risk is predicted.

14.8.5 The overall effect of the Scheme on aquatic biodiversity is considered in Chapter 8: Nature Conservation.

14.8.6 Mitigation recommended for construction and operation (including maintenance works), to reduce the overall effect of the Scheme, is set out in Volume 2, Chapter 21: FRA, Section B and section 21.6 of this chapter. The recommendations will be incorporated into the CEMP and Norfolk's Transport Asset Management Plan, with the Scheme being maintained by NCC.

14.8.7 With the appropriate mitigation measures for construction and operation (including maintenance) discussed in this chapter, there are a limited number of slight adverse effects and slight beneficial effects (i.e. not significant effects). As all the other effects are considered neutral, the overall effect of the Scheme on water resources and flood risk is concluded to be not significant.

15. Cumulative Impacts

15.1 Summary

- 15.1.1 The assessment of combined and cumulative effects of the Scheme bring together the principal findings of each of the previous topics of the Environmental Statement in order to identify and assess the combined effects of the Scheme and the cumulative effects of the Scheme in association with other existing or future significant development projects within the study area.
- 15.1.2 Combined effects can be defined as effects which can result from multiple actions on receptors and resources over time and are generally additive or interactive in nature.
- 15.1.3 The assessment methodology for combined effects involves the identification of impact interactions associated with the Scheme upon separate environmental resources or receptors. The significance of construction and operational phase environmental impacts are taken from the preceding chapters of the Environmental Statement into matrices providing a clear summary of potential impacts. The significance of combined effects upon each environmental resource is then made based upon the balance of significance scores.
- 15.1.4 Cumulative impacts can also be considered as impacts resulting from incremental changes caused by other past developments that are reasonably foreseeable as occurring at a similar time to the construction of the Scheme.
- 15.1.5 The assessment of cumulative effects is not intended to provide a detailed assessment of the effects of future developments. In many instances the layout and design of future projects have not been developed to the same level of detail as that for the Scheme, they may be phased in over years and their construction timetable as yet unconfirmed. As such, assessments have been undertaken at a relatively high level in the context of broad development parameters sufficient to provide an understanding of the likely environmental effects of future developments and to enable adequate consideration of cumulative effects.
- 15.1.6 The Scheme will have an overall moderate adverse and significant environmental effect during the construction phase. The adverse effects come from construction noise and visual intrusion from the lighting of construction compounds and after dark construction activities in the winter. These

combined noise and visual effects will adversely impact on bats and birds but these effects will be temporary.

15.1.7 There are significant benefits to non-motorised and motorised users from the NDR during operation with reduced severance and increased connectivity. There are environmental benefits to residents from the removal of vehicles from unsuitable suburban roads. However there will be adverse impacts to wildlife due to land-take, traffic noise and tree removal.

15.1.8 There are anticipated to be significant adverse cumulative impacts during the construction phase. These effects will mostly impact on road users and biodiversity, however it is unlikely that construction will occur simultaneously so this represents a worst case scenario.

15.1.9 During the first year of operation impacts on protected species are moderate adverse due to land-take and severance, however maintaining commuting and foraging routes for bats during construction reduces some of the effects that may occur during the first years of operation.

15.1.10 By design year all the adverse impacts will have reduced in significance and the benefits to motorised and motorised users will still be significantly beneficial as the other development phases in. The adverse impacts on biodiversity will reduce as the landscaping and habitat creation matures.

15.2 Introduction

15.2.1 This chapter brings together the principal findings of each of the topic chapters of the Environmental Statement (ES) in order to identify and assess the Combined effects of the Scheme and the cumulative effects of the Scheme in association with other existing or future significant development projects within the study area.

15.2.2 Cumulative effects can be defined as effects which can result from multiple actions on receptors and resources over time and are generally additive or interactive in nature.

15.2.3 Cumulative impacts can also be considered as impacts resulting from incremental changes caused by other past, present or reasonably foreseeable actions together with the NDR.

15.2.4 DMRB Volume 11, Section 2, Part 6 suggests that the reporting of cumulative assessments should be included towards the end of the ES as it is easier to

sum up the cumulative effects after the consideration of the effects on the respective subject areas.

15.3 Methodology

15.3.1 The DMRB (HD 205/08) recommends that the significance criteria for cumulative effects is standardised into five categories. The following tables taken from DMRB (HD 205/08) sets out a framework for determining significance of cumulative effects, which has been used in this assessment.

15.3.2 The assessment of the significance of both the combined effects of the Scheme and the cumulative effects of the Scheme with other major developments has been based upon the definitions within Tables 15.1 to 15.3.

Table 15.1: Sensitivity of Receptor Group

Value (Sensitivity)	Typical Descriptors
Very High	Very high importance and rarity, international scale and very limited potential for substitution.
High	High importance and rarity, national scale, and limited potential for substitution.
Medium	High or medium importance and rarity, regional scale, limited potential for substitution.
Low (or Lower)	Low or medium importance and rarity, local scale.
Negligible	Very low importance and rarity, local scale.

Source: DMRB (HD 205/08)

Table 15.2: Magnitude of Impact

Impact	Definition
Major (Adverse or Beneficial)	Where the balance of the impacts of the Scheme or combined effects of the Scheme in association with other existing or more than likely/near certain future major developments upon an individual

	or collection of environmental receptors would be highly significant (positive or negative).
Moderate (Adverse or Beneficial)	Where the balance of the impacts of the Scheme or combined effects of the Scheme in association with other existing or more than likely/near certain future major developments upon an individual or collection of environmental receptors would be significant (positive or negative)
Minor (Adverse or Beneficial)	Where the balance of the impacts of the Scheme or combined effects of the Scheme in association with other existing or more than likely/near certain future major developments upon an individual or collection of environmental receptors would be noteworthy but not significant (positive or negative).
Negligible	Where the balance of the impacts of the Scheme or combined effects of the Scheme in association with other existing or more than likely/near certain future major developments upon an individual or collection of environmental receptors would be negligible (positive or negative).
Neutral	Where the positive and negative impacts of the Scheme or the combined effects of the Scheme in association with other existing or more than likely/near certain future major developments would balance

Source: DMRB (HD 205/08)

Table 15.3: Significance of Effect

		Magnitude of Impact or Degree of Change (Beneficial or Adverse)				
		no change	negligible	minor	moderate	major
(sensitivity)	Very High	Neutral	Slight	Moderate or Large	Large or Very Large	Very Large
	High	Neutral	Slight	Slight or Moderate	Moderate or Large	Large or Very Large
	Medium	Neutral	Neutral or Slight	Slight	Moderate	Moderate or Large
	Low	Neutral	Neutral or Slight	Neutral or Slight	Slight	Slight or Moderate
	Negligible	Neutral	Neutral	Neutral or Slight	Neutral or Slight	Slight

Combined Effects

15.3.3 The assessment methodology for combined effects involves the identification of impact interactions associated with the Scheme upon separate environmental resources. The significance of construction and operational phase environmental impacts are brought forward from the preceding chapters of the ES into matrices providing a clear summary of potential impacts. The significance of combined effects upon each environmental resource is then made based upon the balance of significance scores.

15.3.4 For the purposes of this assessment combined effects of moderate adverse or beneficial and above are considered significant, although minor effects are still worthy of note. Weighting of impacts has not been applied to the matrices as such an approach is considered subjective and would make interpretation of the results difficult.

Cumulative Effects

15.3.5 This cumulative effects assessment involves the identification of incremental changes likely to be caused by other future developments together with the proposed Scheme. The identification of which potential significant transport related schemes and other major developments will be included within the cumulative effects assessment was based upon the scoping criteria given in Table 15.4.

Limitations to the assessment

15.3.6 The assessment of cumulative effects is not intended to provide a detailed assessment of the effects of future developments. In many instances the layout and design of future projects have not been developed to the same level of detail as that for the proposed Scheme, they may be phased in over years and their construction timetable as yet unconfirmed. As such, assessments have been undertaken at a relatively high level in the context of broad development parameters sufficient to provide an understanding of the likely environmental effects of future developments and to enable adequate consideration of cumulative effects.

15.4 Context

Technical

- 15.4.1 The study area for the assessment of the combined effects of the Scheme reflects the study areas identified within the relevant topic chapters of the ES.
- 15.4.2 The cumulative effects of the Scheme are assessed in the context of other potential significant transport related schemes and major developments up to the Design Year (2032) which fall within the 'more than likely' and 'near certain' categories as defined in the Highways Agency Interim Advice Note 81/06, Assessment and Management of Environmental Effects see Table 15.4.

Planning and Legislative

- 15.4.3 The European Community Directive 85/337/EEC as amended by the Directive 97/11/EC on "The assessment of certain public and private projects on the environment" requires consideration of the direct, indirect, secondary and cumulative impacts of a project. The EIA Directive also requires consideration of the interactions between potential environmental impacts.
- 15.4.4 Schedule 4 of the Infrastructure Planning (Environmental Impact Assessment) (England and Wales) Regulations 2009 also requires a description of the likely significant effects of a development, which specifically includes the assessment of cumulative effects.
- 15.4.5 The assessment of the combined and cumulative effects of the Scheme draws upon the following sources of guidance:
- 15.4.6 Highways Agency Interim Advice Note 81/06, DMRB Volume 11 Section 2 Part 5: Assessment and Management of Environmental Effects. DMRB Volume 11, Section 2, Part 6 and DMRB (HD 205/08)
- 15.4.7 Guidelines for the Assessment of Indirect and Cumulative Impacts as well as Impact Interactions, Hyder May 1999, commissioned by the European Commission: Directorate-General XI (Environmental, Nuclear Safety and Civil Protection).
- 15.4.8 Institute of Environmental Management & Assessment: Guidelines for Environmental Impact Assessment, IEMA 2004.

15.5 Baseline

15.5.1 The baseline conditions and key receptors for each environmental topic are presented in the topic Chapters 4 -14 of Volume 1 of the ES..

15.5.2 The identified receptor groups for combined and cumulative effects taken from the topic chapters of the ES are:

- Residential properties, schools and health care facilities
- Protected Species and Designated Sites
- Amenity and Non-Motorised Users including Cultural Heritage
- Ground and surface water
- Land Use
- Motorised Users
- Climate Change with regard to Carbon
- Cultural Heritage

15.5.3 The identification of which potential significant transport related schemes and other major developments will be included within the cumulative effects assessment was based upon the scoping criteria given in Table 15.4 . Generally developments were included if they were generally likely to come forward.

Table 15.4 Criteria for Inclusion or exclusion into the assessment

Certainty of Outcome	Development Status
Near Certain: The outcome will happen or there is a high probability of it occurring	Intent announced by proponent to regulatory agencies. Approved development proposals.

Certainty of Outcome	Development Status
	Projects under construction.
<p>More than likely: The outcome is likely to happen but some uncertainty</p>	<p>Development application within the consent process and in accordance with development plan.</p> <p>Development conditional upon the transport strategy/project proceeding.</p>
<p>Reasonably foreseeable: The outcome may happen but significant uncertainty</p>	<p>Identified within a development plan and, although not directly associated with the transport project, may occur if the project is implemented.</p>
<p>Hypothetical: There is considerable uncertainty whether the outcome would ever happen</p>	<p>Conjecture based upon currently available information.</p> <p>Discussed on a conceptual basis.</p> <p>One of a number of possible inputs in an initial consultation process.</p>

Source: Highways Agency Interim Advice Note 81/06, Assessment and Management of Environmental Effects

15.5.4 The following developments have been identified for inclusion within the cumulative effects assessment, they are developments that either have planning permission or partial planning permission or are locations for housing and commercial properties allocated for some years.

Table 15.4: Developments assessed with the NDR for the Cumulative Effects Chapter

Development/Strategy	Certain	More than likely	Reasonably foreseeable /hypothetical
Beyond Green Incorporates 3,520 houses, 1,000 jobs and local shops and services at North Sprowston and Old Catton (NS&OC)	X		
Rackheath Eco Community Mixed-use community offering employment, day-to-day services, and public transport in addition to the 4,150 houses.		X	
Broadland Gate Mixed- use houses and commercial development.	X		
Norwich Airport Engine testing centre	X		
Norwich Airport Aviation Business Park 850,000 sq ft	Partial	X	
Laurel Farm and Brook Farm 600 homes and commercial development	X		
Blue Boar Lane Lane (White House Farm) 1233 houses	X		
Norwich Area Transport Strategy (NATS)	X		
Proposed JCS housing allocation for 4000			X

Development/Strategy	Certain	More than likely	Reasonably foreseeable /hypothetical
homes to the north west of Norwich (at present exact location unknown).			

15.5.5 As the locations of the proposed JCS housing allocations to the north west of Norwich are currently unknown and as the delivery date is also unknown it has been excluded from this assessment.

Beyond Green

15.5.6 The Beyond Green Development at North Sprowston and Old Catton incorporates up to 3,520 homes of mixed size, tenure and type including up to 33% affordable homes, up to 16,800m² of business and employment space creating 1,000 local jobs by the time the development is completed (with another 200 created during construction);

15.5.7 It is proposed to produce up to 8,800m² of retail and service development providing for shops, banks, cafés, restaurants, pubs and other local services to meet local people’s daily needs in a traditional high street setting.

15.5.8 There will be provision for two new primary schools and up to 2,000m² of community space including two community halls, a health centre and library.

15.5.9 In addition there will be up to 1,000m² of hotel or guesthouse accommodation and access to public transport and streets designed to make walking and cycling the most convenient modes of transport.

15.5.10 The development provides over 80 hectares of green space including a major new public park at Beeston Park, three recreation grounds, allotments and community gardens, with 40% of the site, not including private gardens, becoming accessible green space.

15.5.11 A low-carbon decentralised energy network, plus infrastructure to manage water resources sustainably is proposed.

Rackheath Eco Community

- 15.5.12 Rackheath has been short listed for development of an Eco Community comprising of approximately 3,400 houses. It is the only site of 12, short listed by the government, to score an 'A' rating for suitability.
- 15.5.13 The Eco-Community Rackheath will incorporate a facility for renewable on-site energy production; public transport systems, encouraging people to use cycles and walkways recycling and waste management; amenities, including shops, schools and sports facilities and a network of green open spaces, parks and gardens.

BroadLand Gate

- 15.5.14 BroadLand Gate Business Park will be located in an already established business area, it is intended to provide a range of potential employment opportunities. It will contain restaurants, cafés, a hotel, conference centre and spa, local retail and leisure facilities.
- 15.5.15 The community zone consists of the business accommodation to the north and east of the site. It will provide business space designed to meet the needs of potential employers. Uses could range from small serviced offices through to large scale enterprises, along with the scope for the provision of small warehouse units. It is anticipated that buildings will be no higher than three-storeys clearly identified and set within their own landscaped areas. With a Gross External Area (GEA) of 42,000m²
- 15.5.16 The community zoned comprises serviced apartments specifically for the existing and proposed business community, a medical centre, and facilities such as a crèche the GEA will be up to 7,500m²
- 15.5.17 The business village will be situated in the northwest corner of the site, this zone will be designed to create a service hub for both the BroadLand Gate Business Park and is positioned to enable the established BroadLand Business Area to access its amenities, which will include shops, financial and professional services, restaurants, cafes and pubs/restaurants with a GEA of up to 4,650m².
- 15.5.18 The hotel & leisure zone, sitting alongside the community zone in the southwest corner of the development, will comprise a hotel, spa, conference and associated leisure facilities with a GEA of up to 9,100m² there is also a car showroom – consisting of a car dealership, with highway frontage to the south-west corner of the development GEA of 1,200m².

Norwich Airport Engine Testing Centre

15.5.19 The proposed Development comprises the construction of 2,557m² of new concrete to supplement the existing concrete of the Bravo-November Interchange (taxiway), the assembly of a 10m high pre-fabricated Ground Run Enclosure (GRE) and movable jet blast deflector with the open side facing towards the south west and the installation of foundations to support the GRE. The aircraft must face into the wind during testing to avoid the engines potentially becoming severely damaged by tailwinds. The GRE has been oriented to take account of the prevailing wind direction (which is from the west / southwest). Aircraft can be accommodated within the GRE nose in i.e. facing towards the north east or nose out i.e. facing towards the south west and at varying angles due to the moveable blast deflection system (aircraft can be rotated approximately 30° either side of the centreline, depending on the aircraft type and wind velocity). It is unlikely to be operational for more than 100 days throughout the year.

Norwich Airport – Norwich Aviation Business Park

15.5.20 Norwich International Airport and Wrenbridge, a Cambridge based property company, developed outline plans for the development of an 850,000 sq ft (c 80,000 sq m) aviation related business park at Norwich International Airport. A 160,000 sq ft area has been pre-let to Air Livery, the aircraft painting company, for an aircraft painting facility which will accommodate planned expansion at the airport and provide 120 jobs.

15.5.21 The park will be developed on 100 acres of land to the north east of the main runway and sits inside the operational boundary of the airport offering direct access to the airport's infrastructure. The land is currently jointly owned by Norwich City and Norfolk County Councils. As part of their long term commitment to the airport and to encourage the creation of new jobs, both Councils have agreed to release land to enable this development proposal to come to fruition. The site is capable of accommodating up to 850,000 sq ft of hangar and ancillary office space and will focus primarily on businesses associated with the maintenance, repair and overhaul of aircraft.

Laurel Farm and Brook Farm

15.5.22 This development will provide 600 dwellings with a local centre incorporating 1,035m² of A1 retail and a community hall on the Brook Farm side of the development. Approximately 57,480sqm of B1, B2 or B8 (office, industrial, storage) employment land is proposed on the Laurel Farm part of the site. In addition this development is proposing a link road through the whole development connecting Peachman Way at the northernmost part of the existing Broadland Business Park with Plumstead Road East. It is proposed that this would join onto Middle Road and cross the railway line at this existing point. This proposal would also lead to Green Lane being cut off to vehicles and becoming a pedestrian/cycle route. The proposal also identifies land to the immediate north of the existing Green Lane vehicular crossing of the railway line for a rail halt.

Blue Boar Lane – White House Farm

15.5.23 This application seeks outline planning permission for the erection of up to 1,233 dwellings at White House Farm in Sprowston in two main phases. The first phase comprising the western part of the site would consist of up to 450 dwellings. The second phase for the remainder of the site would be reserved for development beyond 2011. Although the application is in outline, full details are for a proposed road linking from the Park and Ride roundabout on Wroxham Road to a new roundabout junction on Salhouse Road.

15.5.24 Of the proposed dwellings 40% 1,233 dwellings, would be affordable, a primary school site of 1.5 hectares, vehicular access from the new Link Road, extension of the existing bus service to be routed through the site from Linacre Avenue, pedestrian and cycle network within the site linking to existing routes and developments, public open space and public recreation access to Boar Plantation, Harrison's Plantation and The Breck.

Norwich Area Transport Strategy (NATS)

15.5.25 The Strategy aims to provide high-quality alternatives to the car including public transport, cycling and walking and to reduce carbon emissions and the impact of transport on the environment and our communities. However, the plan also allows that for many people the car will remain essential, particularly for those who live in more rural areas and that through-traffic to and from the north of Norwich adds to congestion in and around the city.

15.5.26 The Northern Distributor Road (NDR) is designed to provide an alternative route for traffic to and from the north of Norwich, widening the scope for major improvements and enabling promotion of more sustainable modes of transport in and around the city. It will also ensure that new housing areas to the north-east of Norwich are properly served by transport links and do not simply add to congestion. It should be noted that the NDR is integrated within NATS.

Mitigation

15.5.27 Mitigation for combined effects are incorporated into the individual assessments contained in Volume 1 of the ES (chapters 4 -14) and in the Volume 1 of the ES: Appendix 3 Mitigation Schedule.

15.5.28 Mitigation for effects is incorporated into both the individual designs for the developments and in the NDR. Moreover, mitigation is now inherent within the planning process, for example the upcoming Local Authority SuDs Approvals Process potentially due for implementation in 2014, will ensure that flood risk is minimal and water is conserved prior to construction of any new large scale developments. In addition the construction of sustainable homes and communities seeks to incorporate low carbon technologies and the use of sustainable building materials, while providing for ecology and landscaping. There is a requirement for new developments to provide sustainable transport infrastructure.

15.6 Assessment of Effects

15.6.1 The data for the assessments below has been taken from the individual specialist chapters (4-14) of the ES. The first assessment within this section will examine the combined effects arising from the interactions of impacts from the Scheme as a result of construction activities on the previously identified receptor group in (Table 15.6).

Construction

15.6.2 The following table (15.6) addresses the combined effects that may arise as a result of construction activities. Table 15.6 Combined effects resulting from construction activities.

Table 15.6 Combined effects resulting from construction activities.

Receptor Group	Sensitivity	Identified Impacts	Mitigation	Impacts	Effect Significance
Residences Schools and Health Care facilities	High	Changes in noise levels	Bunding put in place before construction starts. Haul routes avoiding unsuitable roads.	There will be intermittent noise effects from construction activities and temporary visual effects from lighting of road works and construction compounds including the housing and hygiene facilities for workers. Severance as a result of construction activities will be minimised by the provision of safe crossing points . Air quality	Effects during construction are likely to be significant although temporary.
		Changes to Air Quality	Dust management and suppression during construction.		
		Socio-economic impacts	Provision of housing and hygiene facilities for construction workers. Traffic plan for workers and construction vehicles.		
	Visual Impacts	Landscaping, bunding and habitat			

Receptor Group	Sensitivity	Identified Impacts	Mitigation	Impacts	Effect Significance
			<p>creation implemented prior to pavement construction</p> <p>Lighting scheme at compounds designed to be as non- intrusive as possible at site compounds.</p> <p>Maintenance of safe crossing points for pedestrians and vehicle users.</p>	<p>management will ensure that dust generation will not contribute to the effects above.</p> <p>Overall impacts are likely to be moderate adverse</p>	
Protected Species and Designated Sites	High	Changes in noise levels	<p>Landscaping, bunding and habitat creation implemented prior to pavement construction.</p>	<p>There will be moderate adverse impacts on protected species from noise and the visual</p>	Effects will be significant but temporary

Receptor Group	Sensitivity	Identified Impacts	Mitigation	Impacts	Effect Significance
		<p>Visual Impacts</p> <p>Changes to air quality</p> <p>Landtake.</p>	<p>Landscaping, bunding and habitat creation implemented prior to pavement construction.</p> <p>Lighting scheme at compounds designed to be as non-intrusive as possible at site compounds.</p> <p>Dust management and suppression during construction.</p> <p>Substantial habitat creation put in place before construction.</p>	<p>impacts from lighting. The initial land-take will also have an effect. Air quality and water quality will be unaffected.</p> <p>Overall impacts during construction will be moderate adverse.</p>	

Receptor Group	Sensitivity	Identified Impacts	Mitigation	Impacts	Effect Significance
Amenity and Non-Motorised Users	Medium	Severance of foraging habitat	Substantial habitat creation and crossing points in place before construction.	There will be adverse noise impacts from construction and visual impacts from lighting due to night time construction activities. Impacts are considered to be minor adverse.	Effects are temporary and not significant.
		Water quality	Water treatment before discharge into either surface or groundwater		
		Changes in noise levels	Traffic plan to ensure minimal disturbance on residential roads.		
		Visual impacts	Landscaping and habitat creation implemented before carriageway construction.		
		Severance	Provision of safe crossing points for non-motorised users		

Receptor Group	Sensitivity	Identified Impacts	Mitigation	Impacts	Effect Significance
Surface and Groundwater	High	Visual impacts	<p>will be provided throughout the construction period.</p> <p>Landscaping and habitat creation implemented before carriageway construction.</p>		
		<p>Deterioration in water Quality</p> <p>Flooding</p>	<p>Water treatment before discharge into either surface or groundwater. The Scheme will prevent the potential for silt to enter the Wensum.</p> <p>Surface water management plan within the CEMP.</p>	<p>There are no anticipated major or moderate adverse impacts on flooding or groundwater and therefore the Designated Sites and Species will be unaffected.</p> <p>Overall impacts are negligible.</p>	<p>Effects will be temporary and not significant.</p>

Receptor Group	Sensitivity	Identified Impacts	Mitigation	Impacts	Effect Significance
Land Use		Impacts on protected species and Designated sites			
	Medium	Land-take	Financial compensation for loss of revenue.	All access and irrigation systems will be maintained where possible. Compensation will be paid to farms for loss of revenue. The land-take will result in initial habitat loss and may have a moderate adverse impact on biodiversity.	Effects are significant but temporary
		Severance	Maintenance of field access and irrigation systems where possible and financial compensation for loss of revenue where appropriate.		
		Impacts on biodiversity	Intensively farmed land has low biodiversity value, however tree removal will adversely impact on		

Receptor Group	Sensitivity	Identified Impacts	Mitigation	Impacts	Effect Significance
Motorised Users			Bats. Mitigation will be in place at the start of construction.		
	High Medium	Impacts on journey times Road safety	Construction traffic scheduling and the provision of dedicated haul routes. Traffic management to ensure that roads are not used for construction traffic during school pick up and drop down times. Wheel cleaning facilities will	There will be some minor adverse impacts on motorised users however these will relate mostly to traffic Management resulting in potential delays.	Effects are significant but temporary

Receptor Group	Sensitivity	Identified Impacts	Mitigation	Impacts	Effect Significance
Climate change with regard to Carbon			prevent mud and soil on the road.		
		Visual impacts	Impacts from lighting of road works and site compounds.		
		Construction traffic and plant operation Lighting and heating of construction compounds Sourcing of materials	Traffic planning to ensure minimal haul routes and use efficient plant. Use lighting only when and where necessary Use local resources and recycled local materials.	The Scheme construction carbon assessment has assessed for all carbon generated during construction and that embedded within the Scheme itself.	With regard to national or regional emissions this is not considered significant.
Cultural Heritage	Medium	Visual impacts accessibility of heritage assets.	Sensitive appropriate landscaping prior to construction.	The overall impacts on cultural heritage are moderate to slight	The effects are significant but temporary.

Receptor Group	Sensitivity	Identified Impacts	Mitigation	Impacts	Effect Significance
		Severance and loss of amenity.	Improvement of City centre through enabled measures and traffic management.	adverse.	
		Damage to heritage assets through demolition.	Preservation by record of derelict buildings		

Summary of Combined Effects from Construction

15.6.3 Overall there is likely to be significant effects as a result of construction of the NDR but they will be temporary.

Table 15.6 Combined effects resulting from operation of the NDR at Opening Year (2017) and Design Year (2032).

Receptor Group	Sensitivity	Identified Impacts	Mitigation	Impacts	Effect Significance	
					In 2017	In 2032
Residences Schools and Health Care facilities	High	Changes in noise levels	Bunding and noise fencing, traffic measures to avoid the use of unsuitable roads.	Noise and air quality will improve on suburban roads in the north of Norwich, there will also be improvements arising in the city centre as a result of the implementation of NATS. Bunding will reduce noise levels adjacent to the Scheme. There will be a reduction in air	Overall the effects are significant and beneficial	Overall the effects are significant and beneficial
		Changes to Air Quality	Traffic measures to decrease the traffic levels on city and suburban residential roads			
		Socio-economic impacts	Benefits to journey times and access to public transport

		protected species and Designated sites	before discharge.			
Land Use	Medium	Landtake	Mitigation for farm viability is given in the form of compensatory land or financial compensation for loss of revenue. There is no mitigation for loss of agricultural land as a resource.	With mitigation in place there will be no significant impacts on farm viability. Intensively farmed land will be lost to the Scheme. However farmland will be improved by increasing biodiversity through habitat creation and the maintenance and provision of wildlife	There are significant effects associated with loss agricultural land in 2017.	By 2032 effects will not be significant as agricultural activity settles in after the opening year.

15.7 Summary

15.7.1 The combined effects are generally most significant during construction, however these effects are temporary. During the first year of operation the effects are still significant, as the landscaping and habitat creation matures these become less significant, there are large beneficial impacts to both non-motorised and motorised users from opening year (2017).

Cumulative Effects

15.7.2 The following tables provide a matrix to examine how the NDR will interact with other potential large scale developments in the area and determine if there is the potential for cumulative environmental effects. The following matrices demonstrate the potential interactions during construction and opening year (2017) and design year (2032).

15.7.3 The impacts during construction represent a worst case scenario as it assumes that all construction will be occurring simultaneously unless otherwise indicated.

Table 15.8: Cumulative Effects During Construction (Worst Case Scenario assuming all construction occurring within a similar timeframe).

Receiving Baseline	Beyond Green	Rackheath Eco Community	Broadland Gate Business Park	Norwich Airport Engine Testing Centre	Norwich Airport Aviation Park	Heading Laurel and Brook Farm	Blue Boar Lane	NATS	NDR	Significance

Cultural Heritage	Slight Adverse	Slight Adverse	Slight Adverse	Slight Adverse	Slight Adverse	Slight Adverse	Slight Adverse	Slight Adverse	Slight Adverse	Not Significant

15.7.4 Overall there will be significant adverse effects arising from land-take, impacts on road users, nature conservation and local residents and facilities during construction. However this represents a worst case scenario and assumes construction will occur simultaneously. It is most likely that this construction programme of development will be gradually phased in over some years.

Table 15.9 Cumulative Effects During Operation at Opening Year (2017)

Receiving Baseline	Beyond Green	Rackheath Eco Community	Broadland Gate Business Parks	Norwich Airport Engine Testing Centre	Norwich Airport Aviation Park	Heading Laurel and Brook Farm	Blue Boar Lane	NATS	NDR	Significance

Cultural Heritage	Moderate/Slight Adverse	Slight Adverse	Slight Adverse	Slight Adverse	Slight Adverse	Slight Adverse	Slight Adverse	Slight Adverse	Slight Adverse	Moderate/Slight Adverse	Not Significant

15.7.5 During the first year of operation (2017) impacts on protected species are moderate adverse due to land-take and severance, however maintaining commuting and foraging routes for bats during construction reduces some of the effects that may occur during the first years of operation. There will be significant benefits to motorised and non-motorised users.

Heritage	Adverse	Adverse				Adverse	e		se	Significant

15.7.6 By 2032 all the adverse impacts will have reduced in significance and the benefits to motorised and motorised users will still be significantly beneficial as the other development phases in. The adverse impacts on biodiversity will reduce as the landscaping and habitat creation matures. The benefits to non-motorised and motorised users are significant. Also the job creation and increased housing will have significant benefits.

16. Conclusion

16.1.1 This chapter draws out and combines the overarching conclusions from each of the technical chapters of the ES, for both the construction and operational phases of the proposed Scheme.

16.2 Air Quality

16.2.1 A qualitative assessment of potential construction phase effects has been undertaken. Mitigation measures have been identified for incorporation within the CEMP commensurate with the risk of dust effects identified and in line with best practice. Potential impacts are concluded to be Negligible to Slight Adverse, at worst and therefore not Significant.

16.2.2 Operation phase effects have been assessed using an advanced dispersion model. Concentrations of key traffic-related pollutants have been predicted at sensitive human health and ecological receptors and the change as a result of the Scheme has been quantified. Existing concentrations of nitrogen dioxide (NO₂) are of concern in Norwich, particularly in the city where an 'Air Quality Management Area' (AQMA) has been declared. The Scheme is predicted to cause a Slight Beneficial effect on NO₂ concentrations, including within the AQMA, and negligible effects on fine particulate concentrations. Overall, operational phase air quality effects are concluded to be not significant.

16.3 Carbon

16.3.1 This assessment has considered the impact of the Scheme on carbon emissions, and involved the consideration of emissions in the construction phase and operational phase, including the effects on the wider transport network of which the Scheme is part.

16.3.2 The construction phase will lead to a one-off emission of 57.8ktCO₂ from the use of construction materials, plant and transport. Mitigation measures have been included in the Scheme design, which reduce emissions by 13.8ktCO₂ and are detailed in the Construction Environmental Management Plan (CEMP) (See Volume 2, Chapter 24).

16.3.3 During the operational phase there will be an increase in carbon emissions by 13.4ktCO₂ in the opening year (2017) due to an increase in vehicular travel. Changes in absolute emissions represent around 1% of the total emissions from all sources within the relevant Local Authorities in the assessment years. There are no targets in place to reduce emissions at the local or regional

level, however, the Scheme is part of NATS, which will enable other sustainable and lower carbon travel modes to be introduced in the area.

16.4 Cultural Heritage

Archaeology

16.4.1 The Scheme will have a Moderate Adverse and significant effect during construction on the archaeological resource along the line of the route. Aerial survey, combined with fieldwalking, metal-detector survey and geophysics has provided a good appreciation of the local archaeology, but further surveys are required to ascertain the location and nature of archaeological remains across the proposed Scheme.

16.4.2 There are no scheduled monuments, or undesignated remains of equal value, that are likely to be affected by the Scheme, and as such preservation in situ is not required. A detailed archaeological mitigation strategy agreed with the County Archaeologist will be produced setting out the requirements for further site evaluation and the recording of below-ground archaeological deposits which will be impacted by the Scheme.

Historic Buildings

16.4.3 A total of 61 historic buildings were identified for assessment. The only direct impacts upon historic buildings will be the demolition of some undesignated WWII structures at Rackheath, which are currently in a poor condition. The scheme will have a Major Adverse impact on the structures. These above-ground structures will be recorded prior to their demolition.

16.4.4 The main statutory listed historic buildings which will have their setting significantly affected by the Scheme are Rackheath Hall (including its bridge and gateway) and Horsford Hall. It is anticipated that the Scheme will result in Moderate Adverse visual and audible impacts upon these historic assets during both construction and operation.

Historic Landscapes

16.4.5 To the north-east of Norwich, the proposed route will pass through an area characterised by a cluster of historic parks and series of blocks of ancient woodland. The parkland is generally of medium value reflecting averagely well-preserved historic landscapes with reasonable coherence.

16.4.6 The Scheme will result in a Major Adverse and significant effect degree on Beeston historic park associated with severance impacts. The scheme will have Moderate Adverse impacts on a second park at Rackheath. In view of the difficulty of avoiding severance impacts, it will not be possible to reduce the magnitude of impact through mitigation.

16.4.7 Catton Hall Grade II* Registered Park and Garden is located approximately 2 km to the south of proposed Scheme, within the urban area of Norwich. No adverse effects are anticipated due to the distance of the designated site from the Scheme.

16.5 Landscape

16.5.1 The predominant landscape character along the NDR is generally one of fairly open arable farmland with many small hamlets and isolated properties spread throughout the area. There are clear urban fringe influences, from features such as housing development, Norwich Airport and the Broadland Business Park. However, a higher quality area is centred around the former parklands of Beeston and Rackheath Halls, where the landscape is characterised by a larger woodland component on more undulating topography.

16.5.2 Extensive mitigation planting and screen mounding is proposed along the route which would help to integrate the Scheme into the landscape and to provide screening for affected properties.

16.5.3 Landscape effects will generally be Moderately Adverse and significant during the Construction period and in the first year of opening (2017), reducing to Slight Adverse by the design year (2032) once mitigation planting has matured. Night time impacts will be Slight Adverse and not significant, largely associated with car headlights and road lighting towards Postwick Junction.

16.5.4 Visual Intrusion has been assessed for a variety of receptors; including residential properties, commercial properties, users of public rights of way and transport routes (road and rail). Overall the Scheme will result in a Moderate to Large Adverse and therefore significant effect upon visual receptors during construction and in the first year of opening (2017), reducing to Moderate to Slight adverse by the design year (2032) once mitigation planting establishes to form a more effective visual screen.

16.6 Nature Conservation

16.6.1 Several species of bat use areas likely to be affected by the Scheme. Great crested newts are known to exist at three locations, although just one

breeding pond will be directly affected. A number of badger populations are also known to exist within the vicinity of the Scheme. Breeding bird populations are ubiquitous throughout the landscape, including barn owls, a particularly sensitive bird species. Aquatic invertebrates have been identified at Ladies Wood, Church Carr & Springs County Wildlife Site, as well as those sensitive habitats suitable for terrestrial invertebrates.

16.6.2 Construction phase impacts on designated sites, protected species and habitats will include the permanent and temporary loss and severance of habitats, and disturbance due to the presence of plant machinery, people, and general construction activity. Operational phase impacts will include the presence of traffic using the proposed Scheme, with the associated disturbance in terms of noise. Mitigation measures have been included in both the CEMP and the Scheme design to reduce and where possible avoid these impacts during the construction and operational phases of the Scheme respectively.

16.6.3 During construction, the proposed Scheme will result in significant adverse effects on:

- Fakenham Road RNR;
- Important Hedgerows (under the Hedgerow Regulations 1997);
- Bats, or more specifically directly affected roosts in buildings and trees and important flight paths and areas of activity; and,
- Breeding bird species of both High and Medium conservation value.

16.6.4 During the operational phase of the Scheme, significant adverse effects are predicted to remain only for the bats using the flight paths along Marriott's Way during the opening year (year 1). By the design year (year 15), the effects on this flight path would no longer be significant. No other significant adverse nature conservation effects are predicted during the operational phase, however. Significant beneficial effects are predicted on terrestrial invertebrate habitats at The Springs.

16.7 Geology and Soils

16.7.1 Impacts upon geology and soils will predominately occur during the construction phase of the Scheme. However, there will be no significant residual effects with the implementation of the mitigation measures identified in the CEMP.

16.7.2 Impacts during the operational phase of the Scheme will be limited to the potential continued consolidation of soils over time which may adversely affect fauna and flora. However, these effects will not be significant due to the implementation of mitigation through the Soil Handling and Management Plan element of the CEMP during construction.

16.8 Materials

16.8.1 The Scheme has the potential to use large amounts of raw materials and generate quantities of waste. The bulk of the material requirements will be for the earthworks, comprising an estimated 1,814,555m³ of soil, sub-soil, sub base and granular capping material. The Scheme will generate an estimated 1,873,668m³ of excavated material, which will be close to a cut and fill balance after wastage has been taken into consideration. However, 10,599m³ of excavated material will need to be disposed of in landfill, the majority of which will be excess soil material. An estimated 1,421,926m² of vegetation will be removed from site during construction, all of which will be disposed off to the landfill or as green waste.

16.8.2 A considerable quantity of raw or virgin materials will be required, predominantly for surfacing, concrete and precast concrete, sub-base and bitumen macadam. However, some materials, including concrete and bitumen macadam, will be sourced from a decommissioned site, thereby reducing the reliance on raw materials. Other materials will be used for new signage, fences and barriers. These will have a smaller recycled component and will have to be sourced off site from a supplier.

16.8.3 It is anticipated that there would not be a significant effect resulting from the materials likely to be used and the waste produced from the Scheme due to the cut and fill balance achieved through design and the implementation of a Site Waste Management Plan by the Contractor as part of the CEMP.

16.9 Noise and Vibration

16.9.1 A noise and vibration assessment has been undertaken to establish significant effects associated with construction and operation of the Scheme. Mitigation measures incorporated into the Scheme include a thin surface course, three lengths of acoustic barrier and extensive bunding and false cuttings. Temporary barriers will also be required during construction at some sensitive locations.

16.9.2 Construction noise has been predicted to generate temporary significant effects at a limited number of locations prior to mitigation. Further construction

noise calculations will be undertaken as more detailed construction-related information becomes available, and the Contractor will be required to apply for Section 61 consent under the Control of Pollution Act 1974 which will minimise construction related noise.

16.9.3 Traffic using the completed Scheme will generate noise related effects. At Year 1 the proposed Scheme is predicted to significantly adversely affect 2658 residential and 24 non-residential receptors, and to significantly beneficially affect 718 residential and 15 non-residential receptors.

16.9.4 By the design year (year 15) the Scheme is predicted to significantly adversely affect 1984 residential and 25 non-residential receptors, and to significantly beneficially affect 494 residential and 14 non-residential receptors.

16.10 Effects on All Travellers

16.10.1 The proposed Scheme will result in an overall long term benefit for Non-Motorised Users, through the provision of a network of approximately 25km of new or improved routes, and for vehicular travellers by relieving some communities of high volumes of traffic which would transfer to the proposed Scheme. However, some adverse impacts have been identified at certain locations and for some user groups.

16.10.2 Overall a Slight Adverse but not significant effect is anticipated for All Travellers during construction for a temporary period, as a result of construction delays, route diversions and the presence of construction plant. However, once the Scheme is operational, it is considered that there would be a Moderate Beneficial and therefore significant impact for All Travellers. This is as a result of reduced traffic and congestion on the majority of radial routes, improved amenity for NMUs and relief from existing severance within and between communities caused by existing high traffic levels.

16.11 Community and Private Assets

16.11.1 Impacts on agriculture during the construction and operational phases of the Scheme will be similar. However, impacts during construction will be marginally worse than those during Operation as they take into account both the temporary and permanent loss of agricultural land. There will be no significant effects on farm viability as a result of either temporary or permanent land-take arising from construction of the NDR.

16.11.2 An Ecosystem Services Assessment was undertaken with regard to land use changes to enable the Scheme, and assessed the land lost to agriculture when balanced against habitat creation within the landscaping scheme. This assessment concluded that there is the potential for long term environmental benefits associated with the Scheme with regard to agriculture. The land taken from intensive agriculture that will be used for landscaping, lagoons and habitat compensation may have the effect of assisting the resilience of farming practices by enhancing biodiversity.

16.11.3 The construction phase of the Scheme is likely to deliver some temporary beneficial effects, including the creation of a number of fixed term construction jobs, the creation of new jobs for some local agency workers in Norwich, and some minor increased economic activity associated with the influx of construction workers. Some minor adverse effects are also likely to occur, including unavoidable disruption to businesses close to the route throughout the construction process. However, these effects are not considered to be significant.

16.11.4 The operational phase of the Scheme is likely to deliver beneficial and significant effects including:

- Improved access to business centres providing jobs and economic output across the sub-region;
- Improved access to strategically important new housing developments as set out in the JCS;
- Support growth, job creation and GVA uplift in the WAI and beyond;
- Supporting the development of and unlocking potential in a range of wider sites considered strategically important for the continued prosperity of Norwich, Broadland and Norfolk as a whole; and
- Support for sectors such as tourism

16.11.5 Although there will be some adverse effects of the Scheme, the majority of the effects upon community and private assets will be beneficial, particularly during the operational phase.

16.12 Road Drainage and the Water Environment

16.12.1 The overall effect of the Scheme during construction on surface water quality is predicted to be Slight Adverse at worst. During a major storm event there is the potential for sediment laden runoff to overwhelm site protective

measures at locations protecting nearby watercourses and to alter overland flows however, this impact would be temporary and localised.

- 16.12.2 During the operational phase of the Scheme the overall effect on surface water quality is considered to be Neutral to Slight Beneficial. A beneficial effect will result from the improvement of treatment to existing runoff from the A1151 into The Springs and subsequently Dobbs Beck, a tributary of the River Bure. Runoff from the A1151 currently discharges into The Springs without any form of treatment.
- 16.12.3 There may be a Slight Adverse effect on groundwater quality for some private water supplies which are located down-gradient of infiltration ponds. During construction and operation, the overall effect of the Scheme on groundwater quality and flow after mitigation is predicted to be Neutral.
- 16.12.4 The overall effect of the Scheme on flood risk is predicted to be Neutral to Slight Beneficial. The Scheme will provide a new flow path between the NDR and Dobbs Beck, along the dry valley, to convey flood flows. With the mitigation measures in place, no increase in flood risk is predicted.
- 16.12.5 With the implementation of mitigation measures for both construction and operation phases of the Scheme, effects upon water resources will not be significant.

16.13 Cumulative Effects

- 16.13.1 The Scheme would have an overall Moderate Adverse and significant combined environmental effect during the construction phase. The adverse effects will arise from construction noise and visual intrusion from the lighting of construction compounds and after dark construction activities in the winter. These combined noise and visual effects will adversely impact on bats and birds but will be temporary.
- 16.13.2 There will be significant benefits to non-motorised and motorised users during the operational phase of the Scheme, with reduced severance and increased connectivity. Environmental benefits to residents will arise from the removal of vehicles from unsuitable suburban roads. However, a number of Slight adverse effects will remain.
- 16.13.3 Significant adverse cumulative effects will occur during construction of the Scheme. These will mostly impact upon road users and biodiversity, however it is unlikely that construction of all the major developments identified

in the assessment will occur simultaneously so this represents a worst case scenario.

16.13.4 During the first year of operation, effects on protected species will be Moderate Adverse due to land-take and severance. However, maintaining commuting and foraging routes for bats during construction will reduce the effects that may occur during the first years of operation.

16.13.5 By the design year (year 715) all the adverse impacts will have reduced in significance and the benefits to motorised and motorised users will still significantly beneficial as the other development phases in. The adverse impacts on biodiversity will reduce as the landscaping and habitat creation matures.

17. Glossary

Word/Acronym	Definition
A	
AADT	Annual Average Daily Traffic
AADTF	Annual Average Day Time Flow (24 hourly traffic)
ADWT	Annual Average Week-day traffic
Air Quality Action Plans	Local Authorities are required to develop Air Quality Action Plans to improve pollutant concentrations in Air Quality Management Areas.
Air Quality Management Areas.	An Air Quality Management Area is declared by a Local Authority where the air quality objective for one or more of nine specified pollutants is unlikely to be met.
Ambient Noise	Totally encompassing sound in a given situation at a given time usually composite of sounds from many sources near and far.
Ancient Woodland	An area of woodland which has had a continuous history of tree cover since at least 1600.
AOD	Above Ordnance Datum, the standard denomination of ground level.
AONB	Area of Outstanding Natural Beauty
Appropriate Assessment.	Directive 92/43/EEC (The Habitats Directive) on the Conservation of Natural Habitats and Wild Fauna and Flora requires an Appropriate Assessment to be undertaken to assess the impacts of a land-use plan against the conservation objectives of a European Site, and to ascertain whether it would adversely affect the integrity of that site.
Aquifer	A water-bearing geological stratum or layer.
A-weighting	The human ear also has a non-linear frequency response,

Word/Acronym	Definition
	being most sensitive in the frequency range 1 kHz to 4 kHz and is less sensitive at higher and lower frequencies. The A-weighting is a frequency response function commonly applied to the linear output of a microphone to simulate the subjective response of the ear. All noise levels described in this report are A-weighted. Such levels are usually indicated by a subscript A or postscript (A).
B	
Background noise level LA90 T	The A-weighted sound pressure level of non-specific noise in decibels exceeding for 90% of the given time, T. [BS4142].
Baseline Studies	The systematic collation of data on the existing environmental conditions (i.e. baseline information) to enable possible environmental changes to be predicted and assessed as part of an environmental impact assessment.
Basic Noise Level	The level calculated from traffic data and road characteristics at a distance of 10m from the nearside carriageway edge using CRTN without before corrections for attenuation due to distance, absorption etc. (Department of Transport Welsh Office, 1988).
Bat Bridge	Wire construction enabling bat species to safely cross roads
Benefit Cost Ratio (BCR)	Outcome measure of a Cost-Benefit Analysis.
Best Practicable Means	The principle for selecting the best pollution control technique, recognising effectiveness, technical constraints, costs and other factors.
Biodiversity	The number and variety of organisms found in a specified area – an important measure of health and vitality of an area's ecology.
Biodiversity Action Plan	A framework for conserving, enhancing and restoring biological diversity.

Word/Acronym	Definition
Bridleway	A highway over which the public have a right of way on foot and a right of way on horseback or leading a horse, but with or without the right to drive animals of any description along a highway. Bicycles may also be ridden on bridleways.
Bund	Impermeable surround for storage areas, preventing leakage of fuels, oils or chemicals into local water resources.
C	
Carbon Footprint	A carbon footprint is a calculation of the amount of carbon dioxide (CO ₂) emitted by someone or something during their construction and normal operation.
Carbon Dioxide (CO ₂)	A naturally occurring greenhouse gas that is the product of combustion activities, such as in vehicle engines
Carbon Monoxide (CO)	Colourless, tasteless, poisonous gas produced when fuels containing carbon are burned where there is too little oxygen, and is present in vehicle emissions.
Catchment area	Area from which ground and surface water's drain into a particular watercourse.
Chainage	Distance along the proposed road route from west to east, and is measured in meters.
CIA: Cumulative Impact Assessment	Cumulative Impact Assessment
CLEA	Contaminated Land Exposure Assessment Model.
Climate Change	A change to the climate caused by the greenhouse gas pollutants effect whereby pollutants, predominantly carbon dioxide, but also methane and others, re-radiate heat in the atmosphere. Human activity is now thought to be accelerating the climate change in addition to the natural climate change variations.
Compensation	A form of mitigation in situations where the significant adverse effect cannot be avoided through the implementation of mitigation measures, therefore

Word/Acronym	Definition
	compensation is provided. Any example would be the provision of habitat creation areas at an alternative site.
Community Strategy or Sustainable Community Strategy	Wide ranging strategy for a geographical area (e.g. Norfolk) introduced by the Local Government Act 2000. Aim is to improve social, economic and environmental wellbeing. Focuses on the needs and aspirations of the area's community and is developed, adopted, and delivered by a range of agencies and organisations (in the public, private and voluntary sectors) in a partnership approach, with a view to achieving synergistic working towards common goals. The partnership is formally known as the Local Strategic Partnership. Modified in the 2006 Government White Paper to focus on "sustainability". Development Plans should aim to give a special expression to the strategy. Local Area Agreements compromise the action plan for the strategy. Overseen by the Local Strategy Partnership, or, in the case of Norfolk Ambition, the County Strategic Partnership.
Conservation Area	An area designated by a local authority under the Town and Country Planning (Listed Buildings and Conservation Areas) Act 1990 as possessing special architectural or historical interest.
Construction Environmental Management Plan (CEMP)	A systematic management plan to reduce the impact of the construction phase of the development on the surrounding environment.
Contaminated Land	Land that may retain residual polluting substances by virtue of its previous usage, and presents a potential risk to the water environment, especially if redevelopment takes place.
Cumulative effects	The summation of effects that result from changes caused by a development in conjunction with other past, present or reasonably foreseeable actions.
CWS	County Wildlife Site. Designated by local authorities, due to their local wildlife importance.

Word/Acronym	Definition
D	
Decibel	Sound and noise are commonly described using the decibel (dB) scale, which is logarithmic in nature to relate to the response of the human ear. The range of human hearing commonly varies from the threshold of audibility (0 dB) to the threshold of pain (120 dB). Such limits are seldom experienced in practice and typical levels might vary between 30 dB in a quiet bedroom at night to 90 dB at the kerbside of a busy road.
DEFRA	Department for the Environment, Food, and Rural Affairs
Development	Development is defined under the Town and Country Planning Act 1990 as “the carrying out of building, engineering, mining, or other operations, in, on, over or under land, or the making of any material change in the use of any building or other land.
Development Consent Order (DCO)	The Planning Act 2008 (Act) system for approving nationally significant infrastructure projects (NSIPs) in England and Wales. The Development Consent Order (DCO) made by the Planning Inspectorate authorising NSIPs, replaces the consents required for major infrastructure projects.
Development Control	The process through which a local authority determines whether a proposal for development should be granted planning permission, taking into account the development plan and any other material considerations.
Diversity	Where a variety of qualities or characteristics occurs.
DMRB	Design Manual for Roads and Bridges
E	
EA	The Environment Agency
East of England Plan	The East of England Plan describes the Regional Spatial Strategy, prepared and delivered by the East of England

Word/Acronym	Definition
	Regional Assembly. Provides regional spatial planning framework and policies, and constitutes a part of the development plan. The Local Development Plan documents need to be in conformity with it. For this “Minerals and Waste Development Plan: Core Strategy and Development Control Issues and Options”, the version of the East of England Plan used was “The Secretary of State’s Proposed Changes to the Draft Revision to the Regional Spatial Strategy for the East of England” published in December 2006 for consultation. Revoked in January 2013.
Ecological Network	Areas of semi-natural habitat that are linked by corridors or stepping stones, and thus enable wildlife to move through the wider landscape.
Ecological Resource	A species, species assemblage, habitat or designated site which would receive an impact from the scheme.
Ecology	The relationship between humans, animal life and plant life and the environment in which they live.
Ecosystems	A functional ecological unit in which biological, physical and chemical components of the environment interact.
Ecosystems Services	The benefits people obtain from ecosystems.
Effects	Change in the elements, characteristics, character and qualities of the landscape or townscape as a result of development. These effects can be both positive and negative.
Element	A component of the townscape or landscape (i.e. woods, roads, fences etc).
Enhancement	Improvements through restoration, reconstruction, or creation.
Environment	Our physical surroundings including air, water and land.
Environmental Appraisal	Generic term for the evaluation of the environmental

Word/Acronym	Definition
	implications of proposals.
Environmental Impact Assessment (EIA)	The process by which information about the likely significant environmental effects of a major project is gathered, evaluated, and taken into account by the local authority when considering whether or not planning permission should be granted.
Environmental Statement (ES)	Report summarising the findings of an Environmental Impact Assessment.
Environmental Stewardship Scheme.	A scheme promoted by DEFRA, by which farmers receive incentives to manage areas of their farmland in a more environmentally sustainable manner, reducing the intensity of their practices.. E.g. this could be by preserving set aside land and reducing maintenance cutting on hedgerows to encourage wildlife, or preserving ancient woodlands and other landscape features.
Equivalent continuous sound level, LAeq	Time-varying noise such as that from industrial or construction operations may not best be described using the statistical approach described above. The equivalent continuous noise level, LAeq , may be used, which is the notional level of a steady sound which, at a given position and over the same period of time, would deliver the same sound energy as the fluctuating one.
(EU) Directive	An international, legally binding instruction, outlining the legislative changes that must be made on a particular subject and the timescales for their implementation. The precise methods of implementation are normally left to individual national Governments.
F	
Façade noise level	A façade noise level the noise level 1m in front of the most exposed window or door in a building façade. The effect of reflection, is to produce a slightly higher (+2.5dB) sound level than it would be if the building was not there. [Noise Insulation Regulations]

Word/Acronym	Definition
Factor	A circumstance or influence contributing to the impression of a landscape or townscape (e.g. scale, enclosure, elevation etc.)
Feature	A prominent eye-catching element (e.g. a church spire or wooded hilltop).
Field pattern	The pattern of hedges and fences and walls that define fields in farmed landscapes.
Footpath	See Public Footpath
Free-field level	The level of a sound measured in the open and unaffected by reflection from nearby surfaces.
G	
Geodiversity	The variety of rocks, minerals, fossils, soils and landforms, together with the natural processes which shape the landform.
Geographical Information Systems (GIS)	Computerised database of geographical information that can easily be undated or manipulated.
Greenhouse Gas	Naturally occurring atmospheric gasses, such as carbon dioxide (CO ₂) and methane (CH ₄), which absorb outgoing infrared radiation and re-radiate it in all directions, including back to the Earth's surface
H	
Habitat	The locality, site, and particular type of environment inhabited by animals and plants.
Hectare	10,000 square meters or 2,771 acres.
Heritage	Historical or cultural associations.
HDV	Heavy Duty Vehicle
HGV	Heavy Goods Vehicle (weighing > 3.5tonnes)

Word/Acronym	Definition
Hertz (Hz)	This is the unit of frequency representing the number of times a periodic wave repeats itself per second.
Heterogeneous	A condition in which a material (e.g. an aquifer) has different characteristics at different locations (spatially or with depth).
Highways Agency (HA)	The Highways agency is an Executive Agency for the Department for Transport. The Agency manages, maintains, and improves the network of trunk roads and motorways in England on behalf of the Secretary of State. The Agency works closely with other transport operators and with local authorities to integrate the trunk road network with the rest of the England's Roads and other forms of transport. Their aim is to secure the delivery of an efficient, reliable, safe, and environmentally acceptable motorway and trunk road network.
Homogenous	A condition in which a material (e.g. an aquifer) has the same characteristics at different locations.
Hydrology	The study of surface waters (rivers, lakes and streams)
Hydrogeology	The study of groundwater (water that is held in geological formations or issues as springs).
I	
Improved Grassland	Grassland which shows clear signs of agricultural improvement (e.g. by drainage, applications of fertilisers, herbicides etc). Generally lacking in biodiversity.
Indirect Impacts	Impacts on the environment, which are not a direct result of the development, but are often produced away from it, or as a result of a complex pathway.
Infiltration Pond	A depression constructed to enable runoff to be stored until it infiltrates into the ground. Not intended to provide permanent standing water, but to be dry most of the time.
Informative	When granting planning permissions a local authority may impose conditions on the approval notice which must be complied with. A local authority may also attach

Word/Acronym	Definition
	<p>informatives, which seek to guide the applicant or other consents that may be necessary or confirm drawing numbers that the decision notice is based on. Unlike conditions, they are not statutory parts of the decision notice, but the applicant is recommended to study them closely as they may assist in ensuring the development is properly carried out.</p>
<p>The Infrastructure Planning (Applications: Prescribed Forms And Procedures) Regulations 2009 as amended by the Consequential Amendments Regulations 2012(Came into force 1st October 2009)</p>	<p>Sets out the detailed procedures which must be followed for submitting and publicising applications for Nationally Significant Infrastructure Projects.</p>
<p>The Infrastructure Planning (Environmental Impact Assessment) Regulations 2009 as amended by the Infrastructure Planning (Environmental Impact Assessment) (Amendment) Regulations 2012 and the Consequential Amendments Regulations 2012</p>	<p>Sets out the procedures that must be followed so that the consideration of applications for Nationally Significant Infrastructure Projects fully reflect the requirements of European Council Directive 85/337/EEC – as amended – on the assessment of the effects of certain private and public projects on the environment (The ‘EIA Directive’).</p>
J	
No entries	
K	

Word/Acronym	Definition
Key Centres for Development and Change	Those parts of the East of England that will need to accommodate and plan for significant jobs and housing growth between 2001 and 2021, the period of the East of England Plan.
L	
LA10 (18-hour) level	LA10 (18-hour) level: The LA10 (18-hour) level has been adopted as the standard descriptor for traffic noise in the UK. It is the arithmetic average of the one-hour values of LA10 for each of the 18 one-hour periods between 06.00 and midnight (Department of Transport Welsh Office, 1988).
LA90	The LA90 is the level exceeded for 90% of the measurement period. It is a measure of the lower levels in the absence of higher level transient events and is commonly used to describe the ambient or background noise.
Landform	Combinations of land use and vegetation that cover the surface.
Landmarks	A building which has become a point of reference because its height, siting, distinctive design or use sets it apart from surrounding buildings. Examples may include churches and other important civic buildings.
Landscape	Human perception of the land conditioned by knowledge and identity with a place.
Landscape Character	A distinct and consistent pattern of elements in the landscape which makes one landscape look different from another, creating 'Character Areas'. These effect how this is perceived by people and creates a sense of place in different areas of the landscape or built environment.
Landscape/Townscape Character Areas	Single, unique landscape or townscape areas with their own distinctive individual character and identity.
Land Uses.	The primary use of the land, including both rural and urban activities.

Word/Acronym	Definition
Layout (Townscape)	The way in which buildings, routes, and open spaces are placed in relation to each other.
L.B.A.P	Local Biodiversity Action Plan
Light Industry	An industrial use falling within Class B1 (c) of the Town and Country Planning (Use Classes) Order 1987, and which can be carried out in any residential area without detriment to the amenity of that area by reason of noise, vibration, smell, fumes, soot, ash, dust or grit.
Listed Buildings	The Secretary of State compiles a list of buildings of special architectural or historic interest for the guidance of local planning authorities in the exercise of their planning functions under the Planning (Listed Buildings and Conservation Areas) Act 1990 and the Town and Country Planning Act 1990. Buildings are graded as follows:
Local Access Road	Road with the purpose to provide for local traffic and to provide access to land and buildings in the immediate vicinity of the roads.
Local Development Framework	A portfolio of documents. Collective term for the Development Plan Documents, the Local Development Scheme, the Statement of Community Involvement, Annual Monitoring Report, and any supplementary planning documents.
Local Planning Authority	An organisation with statutory planning powers, in most areas the relevant County, District or Unitary Council.
Local Transport Plan	A document produced by Local Highway Authorities that describes its transport policies and its broad implementation programme.
Localism Act 2011	The Act abolishes the Infrastructure Planning Commission and transfers the decision making powers of the Commission to the Secretary of State. The Act also makes a number of amendments to the Planning Act 2008 which have the effect of altering some aspects of the procedure for seeking development consent for nationally significant

Word/Acronym	Definition
	infrastructure projects.
M	
Magnitude	A combination of scale, extent, and duration of effect.
Manufacturing Industry/sector.	Industries whose activities are primarily concerned with the making and processing of goods.
µg/m ³	Microgrammes per cubic meter
Mitigation	Measures to avoid, reduce, and possibly remedy significant adverse effects.
Mixed Use Areas	Provision of a mix of complementary uses, such as residential, community and leisure uses, on a site or within a particular area.
N	
NATS	The current Norwich Area Transport Strategy
NPPF	National Planning Policy Framework
National Planning Policy Framework	The National Planning Policy Framework sets out the Government's planning policies for England and how these are expected to be applied.
Natural England (NE)	Statutory Body incorporating the former English Nature.
Nitrogen Dioxide (NO ₂)	Formed when nitric oxide, which is emitted from vehicles, is oxidised in air (including during the combustion process).
Nitrogen oxide (N ₂ O)	A greenhouse gas that may be formed in the combustion process.
Nitrogen oxides (NO _x)	Generic term for a group of highly reactive gases, all of which contain at least one nitrogen and oxygen atom.
Noise Index	A measure of noise over a period of time which takes account of the disturbing qualities of noise, and correlates well with average subjective response.

Word/Acronym	Definition
Non-motorised Users	Pedestrians, equestrians, cyclists etc
Non-technical Summary (NTS)	The purpose of an NTS is to provide an accurate and balanced statement of key information contained within an environmental statement (ES) including the findings of the studies and the mitigation measures.
Norfolk Ambition	The Community Strategy for Norfolk (see community strategy).
Norfolk Biodiversity Action Plan	The Norfolk BAP is the county's response to the UK Biodiversity Action Plan. It currently contains over 60 habitats and species action plans, and seeks to conserve and enhance biodiversity or national importance found in Norfolk.
O No entries	
P	
Particles (PM10)	Mixture of organic and inorganic substances, as both solids and liquids. Particles from vehicles are often described as PM10 which are particles with an aerodynamic diameter of 10 microns or less.
Parks and Gardens of Special Historic Interest (GSHI)s.	Parks and gardens containing historic features dating from 1930s or earlier. These may be of local or national interest. Sites of national interest are registered by English Heritage. These parks and gardens are graded I, II* or II in the same way as listed buildings.
Percentile Level (statistical sound level indices LAN LA90)	LAN is the dBA level exceeded N% of the time measured on a sound level meter with a Fast (F) time weighting, e.g. LA90 the dBA level exceeded for 90% of the time, is commonly used to estimate background noise level. LA10, the level exceeded for 10% if the time, is commonly used in the assessment of road traffic noise.
Perched water table	A discontinuous saturated layer with unsaturated conditions existing both above and below.

Word/Acronym	Definition
Perception	The psychology of seeing and possibly attaching value and/or meaning to the landscape or townscape.
Permeability	A measure of how well a geological formation can transmit water (the higher the permeability, the more water can be transmitted through the formation.)
Permissive Paths (sometimes called Concessionary Paths)	A path which the landowner permits the public to use, with the intention that it should not become a public right of way. Often notices will be erected that that effect.
Permitted Development	Minor types of development and certain changes between use classes which are automatically granted planning permission under the General Permitted Development Order, and for which no planning application needs to be submitted.
Piezometer	A tubular device used for measuring the elevation of the water table in aquifers.
Planning Act	The Planning Act 2008 process was introduced to streamline the decision-making process for nationally significant infrastructure projects.
Planning Advantage	The provision of some elements of public benefit, in association with a new development, such as open space, housing or leisure facilities, at little or no cost to the community.
Planning Brief	A statement regarding a local authority views on the opportunities and constraints for the development of a particular site, intended to guide potential developers.
Planning Obligations.	An agreement under section 106 of the Town and Country Planning Act 1990 regarding the use or development of land. An obligation can either be made by agreement between the local planning authority and a developer or by a unilateral undertaking by the developer. Obligations may also be used to enhance development proposals. (See definition of section 106 agreement).

Word/Acronym	Definition
Planning Permission	Formal approval by a local authority, often with conditions, allowing a proposed development to proceed. Full permissions are usually valid for five years; outline permissions, where details are reserved for subsequent approval, are valid for three years.
Planning Policy Guidance (PPG)/Planning Policy Statements (PPS)	These are a series of guidance notes and statements covering various aspects of the planning system prepared by Central Government and due weight must be given to them when considering individual planning applications as they are material factors in their determination. They are listed on the Communities and Local Government website. Planning Policy Statements will replace the guidance notes with time.
Population:	
	1: A group of organisms of one species occupying a defined area.
	2: The total number of individuals of a species in a defined area.
Population Density	The numbers in a population per unit area.
Population Dynamics	The variations in time and space in the size and densities of a population.
Porosity	The pore space in a rock or soil formation. The total porosity is greater or equal to the effective porosity. The effective porosity is determined by the connectivity of pores in the rock/medium.
Prevailing Noise Level.	The prevailing noise level is a term defined by the Noise Insulation Regulations as the façade noise level caused, as expected to be caused, by road traffic immediately prior to the commencement of the relevant work improvement. It is quoted in dB, using the LA10(18hour) index.
Private Open Space	Open space which is usually privately owned and is not usually accessible by members of the public. Some private

Word/Acronym	Definition
	spaces are subject to access agreements allowing some form of access.
Public Open Space	Open space, designated by the local authority, defined where public access is generally not formally established, but which fulfils or is capable of fulfilling a recreational and/or non-recreational role (for example, amenity, ecological, educational, social or cultural). Includes most nature reserves, city farms, cemeteries, reservoirs (including covered reservoirs), and some private institutional and housing estate grounds which are not considered suitable for built development. Public Open Space does not include school playing fields, nor the amenity areas associated with the development of homes or flats, or pedestrian precincts (Local Government Act 1966, Section 8).
Public Right of Way (PROWs)	A right of passage by the public over the surface of the land without impediment. Includes public footpaths, bridleways and byways open to all traffic.
Public Transport Accessibility	An assessment of proximity to, and frequency of public transport services, giving relative accessibility on a scale of one to six, where one is the lowest provision and six is the highest.
Q No entries	
R	
Ramsar site	An area designated under the Ramsar convention (1971) and protected as a Wetland of International Importance.
Receptor	An element in the environment which will experience an effect of the development. This may be a physical landscape or townscape, flora, fauna, and human populations.
Regionally Important Geological Sites (RIGS)	These are geological or geomorphological sites (excluding SSSIs) that are considered worthy of protection for the educational, research, historical or aesthetic importance.
Regional Policy	The primary purpose of regional Planning Guidance is to

Word/Acronym	Definition
Guidance (RPG)	provide a regional framework for the preparation of local authority development plans. In addition, RPG provides the spatial framework for other strategies and programmes, including the preparation of local transport plan by local authorities and the regional strategies of the various development agencies such as the East of England Development Agency (EEDA).
Relevant noise level	The maximum façade noise level expected to be caused by road traffic within the 15 year period after scheme opening. It is quoted in dB using the LA10 (18hour) index.
Resource	The combination of the elements that contribute to the landscape or townscape context, character or value.
Review and Assessment (R&A)	Four-stage process involving assessment of local levels of air pollutants and estimation and assessment of likely future levels undertaken by Local Authorities in the UK.
S	
SAC	SAC: Special Area of Conservation, designated under the EC Directive on the conservation of Natural Habitats and Wild Flora and Fauna (92/43/EEC) (The Habitats Directive). SACs and SPAs contribute to the Natura 2000 network of sites contributing to the preservation of the natural heritage.
Scale	The size of buildings, structures or other features within a landscape or townscape, in terms of their height and mass.
Scheduled Ancient Monument	A set of archaeological remains included in the Schedule of Monuments, compiled under Section 1 of the Ancient Monuments and Archaeological Area Act 1979. Schedule monuments have statutory protection under this Act (Section 2) and an application for schedule monument consent must be made to the Secretary of State for the Environment if work to a schedule monument is proposed. The Secretary of State for the Environment is responsible for the scheduling under the provisions of the Ancient Monuments and Archaeological Area Act 1979. Scheduled ancient

Word/Acronym	Definition
	monuments are excluded from listed building control procedures, Prior notice of works to schedule ancient monuments must be given to the Secretary of State.
Scoping	The process seeks to identify those impacts that are critical, significant issues that should be addressed by the EIA process
Screening	Consideration of whether an Environmental Impact Assessment (EIA) is required for a project due to its potential to give rise to significant environmental effects
Section 106 Agreement	A binding agreement between a local authority and a developer, or his successors in title, on the occasion of a granting of planning permission regarding matters linked to the proposed development (see definition of planning obligations).
Semi-improved grassland	Grassland which is intermediate in quality, between improved and unimproved grassland.
Sense of place: The essential character and spirit of an area (genius loci).	The essential character and spirit of an area (genius loci).
Sensitivity	The extent to which the landscape or townscape can accept change of a particular type and scale without unacceptable adverse effects on its character.
Site noise	The component of the ambient noise in the neighbourhood of a site that originates from the site [BS5228].
Site of Special Scientific Interest (SSSI)	Nationally designated sites that are of particular interest because of the wildlife they support, or because of the geological features that are found there.
SPA: Special Protection Area	Special Protection Area. Designated under the EU Directive on the Conservation of Wild Birds (1979).
Sound level	Sound level, in decibels, is the weighted sound pressure level obtained by use of a sound level meter. The reference

Word/Acronym	Definition
	pressure is 20 μ Pa, unless stated otherwise.
Source Protection Zone (SPZ)	Areas around groundwater sources used for public water supplies. Three levels of SPZ exist (I, II and III) with increasing control being implemented from SPZ III to I. The size of SPZs is determined by the size of abstraction and aquifer conditions in the area.
Soakaway	A covered hole in the ground or trench designed specifically to store water until it infiltrates into the ground.
Spring: The point at which groundwater is discharged at the ground surface.	The point at which groundwater is discharged at the ground surface.
Statistical sound level, LAN	Noise which fluctuates with time may be described using a statistical approach. The statistical level LN is the level in dB exceeded for N% of the overall measurement period. The A-weighted L10, designated LA10, has been adopted as the standard descriptor for road traffic noise in the UK. Being the level exceeded for 10% of the measurement period, it is a measure of the higher levels experienced.
Statutory Undertaker	Persons authorised to carry out any railway, light railway, tram way, road transport, water transport etc. undertaking. Any public gas supplier, water or sewerage undertaker, the Environment Agency, the Post office, and the Civil Aviation Authority are deemed to be Statutory Undertakers (Town and Country Planning Act 1990).
Storage, specific storage, storativity	Measures of the amount of water that might be stored in a geological formation – the terms in used depends on the confined nature of the formation. Specific storage is a measure of the volume of water that a unit volume of unconfined aquifer releases from the storage under a unit decline in hydraulic head. Storativity is a measure of the volume of water that a unit surface area if a confined aquifer releases from storage per unit of storage area of an aquifer per unit decline in hydraulic head.

Word/Acronym	Definition
Strategic Environmental Assessment (SEA)	The formalised, systematic and comprehensive process of evaluating the environmental impacts of a policy, plan or programme, and its alternatives, the preparation of a written report on the findings, and the use of the findings in the decision making process.
Statement of Community Involvement.	A document that sets of an LPAs intended consultation strategy for different elements of the planning process. This is a requirement brought in by the Planning and Compulsory Purchase Act 2004.
SUDS.	A technique of treating runoff which mimics natural drainage and filtration methods, such as grass swales and small settlement and infiltration lagoons.
Sulphur Dioxide (SO ₂)	Colourless, non-flammable gas which is a by-product in the combustion process. At elevated concentrations can lead to acute respiratory effects.
Sustainable Development/Sustainability	Defined by the Bruntland Commission (1987) as: “development which meets present needs, without compromising the ability of future generations to achieve their own needs and aspirations”. The World Conservation Union (1991) definition is also useful – “improving the quality of life while living within the carrying capacity of supporting ecosystems”.
Swale	A gentle depression in the ground, constructed with the purpose of transferring rainfall runoff to a specific point. The swale is often grassed to encourage the removal of contaminants in normal runoff by the vegetation. In higher risk areas, swales are generally lined to stop accidental spillages infiltrating into the ground, and thus preventing pollution of groundwater
T	
Threshold	A specific level of grading effects, for example, of magnitude, sensitivity or significance.

Word/Acronym	Definition
Townscape	Physical and social characteristics of the built and unbuilt urban environment and the way in which those characteristics are perceived. The physical characteristics are expressed by the development form of buildings, structures and space, whilst the social characteristics are determined by how the physical characteristics are used and managed.
Traffic calming	Traffic management measures specifically designed to reduce vehicular speed along route or through areas. Usually associated with improving the local environment and reducing road accidents.
Traffic management	The process of adjusting of adapting the use of a highway to meeting specific objectives without resorting to substantial road construction.
Traffic restraint	Controlling traffic volumes by bans, parking restrictions, implementing tolls, electronic road pricing or other means, usually applied in a town or city.
Translocation	The removal of their organisms from their existing habitat to a new site. Often part of a mitigation programme.
Transport Policies and Programmes (TPP)	A five year rolling programme submitted annually to the department for Environment, Transport and the regions by each Local Highway Authority. The TPP contains transport proposals (which should be in lie with the policies of the Unitary Development Plan) for which Central Government funding is sought. The TPP process has however, be rescinded in favour of Local Transport Plans
Tree Preservation Order (TPO)	Made under the Town and Country Planning Act 1990 by the local planning authority, to protect trees of importance for amenity, landscape and nature conservation.
U	
UKBAP	UK Biodiversity Action Plan, the response tit e United Nations Convention on Biological Diversity. The BAP includes a description of the UK's biological resources and a

Word/Acronym	Definition
	suite of habitat and species action plans.
Unimproved grassland	Grassland showing no obvious signs of management activities intended to improve the agricultural utility of the land.
Urban Grain (Townscape)	The pattern of the arrangement and area of buildings and their plots in a settlement and the degree to which an area's pattern of streets are small and frequent (fine grained) or large and infrequent (coarse grain).
V	
Value	The relative value or importance attached to a landscape or townscape (often as a base for designation or recognition), which expresses national or local consensus, because of its quality, special attributes, including perceptual aspects, such as scenic beauty, tranquillity or wilderness, cultural and historical associations and other conservation issues.
Valued Ecological Resource	An ecological resource considered to have a value of parish level or higher.
Vah/hr	Vehicles per hour
VER	Valued Ecological Resource
Visual Amenity	The value of a particular area or view in terms of what is seen.
Visual Envelope	Extent of potential visibility to or from a specific area or feature.
W	
Water table	The continuous surface in saturated formations where fluid pressure in pores is exactly equal to atmospheric pressure.
WebTag	A methodology website (http://www.webtag.org.uk) which originally bought together the Department of Transport's existing guidance, and is particularly useful for the guidance it gives on determining environmental capital and

Word/Acronym	Definition
	environmental significance criteria.
Wildlife Tunnel	A tunnel under the road of sufficient diameter to allow wildlife, including deer and bats to cross the proposed road scheme. These are used in conjunction with fencing to guide wildlife to the tunnel, aiming to minimise road mortalities.
X and Y No entries	
Z	
Zone of Influence (Zoi)	Area that is affected by the proposed development, for example impacts on local ecology.
Zone of Visual Influence (ZVI)	Area within which a proposed development may have an influence or effect on visual amenity.

This document is issued for the party which commissioned it and for specific purposes connected with the above-captioned project only. It should not be relied upon by any other party or used for any other purpose.

We accept no responsibility for the consequences of this document being relied upon by any other party, or being used for any other purpose, or containing any error or omission which is due to an error or omission in data supplied to us by other parties.

This document is submitted in relation to the application for a proposed development by Norfolk County Council to the Planning Inspectorate, under the Planning Act 2008.

The application is for the Norfolk County Council (Norwich Northern Distributor Road (A1067 to A47(T))) Order, to grant development consent for the construction of a new highway running west-east between the A1067 Fakenham Road and the A47 Trunk Road at Postwick, including improvements to the existing highway network to the north and north east of Norwich.

This document comprises part of the application documents and relates to Regulation 5(2)(a) of the Infrastructure Planning (Applications: Prescribed Forms and Procedure) Regulations 2009.

NDR Environmental Statement Non-Technical Summary

www.norfolk.gov.uk/transportfor Norwich

January | 2014

Norwich Northern Distributor Road

Introduction

1

Environmental Assessment...

An Environmental Statement has been prepared by Mott MacDonald on behalf of Norfolk County Council (NCC), in support of an application, by NCC, for a Development Consent Order to construct a dual carriageway all-purpose strategic distributor road. This road will link the A1067 Fakenham Road, near Attlebridge to the A47 Trunk Road (T) at Postwick and is known as the Norwich Northern Distributor Road or NDR.

This document provides a Non-Technical Summary of the Environmental Statement and contains information necessary to understand and report the effects of the NDR on the environment and provides a background to the evolution of the Scheme.

Specialisms have been divided into topic specific chapters, and assessments have been made for each topic during the construction phase, at opening year (year 1, 2017), and at the design year (year 15, 2032).

14. Road Drainage and the Water Environment
15. Combined and Cumulative Effects
16. Summary of Effects

Scheme Description and Mitigation...

From west to east, the Scheme will start with the realignment of the A1067 Fakenham Road and provision of a new roundabout. The NDR will continue eastwards to its new roundabout with the C262 Fir Covert Road. From this roundabout, the NDR will then cross Marriott's Way which will be taken across the Scheme via a new bridge, then on to a new roundabout with the C261 Reepham Road.

The NDR will then continue south eastwards, crossing Bell Farm Track which will be taken over the NDR via a new bridge before connecting with a roundabout west of the C282 Drayton Lane. From here, the NDR will continue south eastwards to a new junction with the A140 Cromer Road, located north west of Norwich International Airport.

East of the A140, the NDR will continue north eastwards around the northern boundary of the airport to a further new roundabout at the northern tip of the airport. From this roundabout, the NDR will continue south eastwards, before turning eastwards and passing under the new highway for the C246 Buxton Road. The route of the NDR will then continue eastwards through the north of Beeston Park. It will then connect with the B1150 North Walsham

Road and the A1151 Wroxham Road via new roundabouts, before turning south eastwards and entering the north eastern section of Rackheath Park.

The NDR will then continue south eastwards, passing under a new bridleway and access bridge across the NDR south west of the junction of Newman Road (U57490). The NDR will then connect with the C283 Salhouse Road via a new roundabout, then crosses both the Norwich to Cromer & Sheringham rail line and the C874 Plumstead Road on individual bridges, prior to a new roundabout on the NDR, which will connect it via a new link road to a further roundabout on the C874 Plumstead Road.

The NDR route will then continue southwards, crossing under the C442 Middle Road which will be raised to pass over the NDR via a new bridge before connecting with a new roundabout known as the Business Park Roundabout. A single carriageway will then link to the existing C829/C830 Broadland Way/C831 Peachman Way roundabout and includes a roundabout on the link road to the proposed Broadland Gate Business Park.

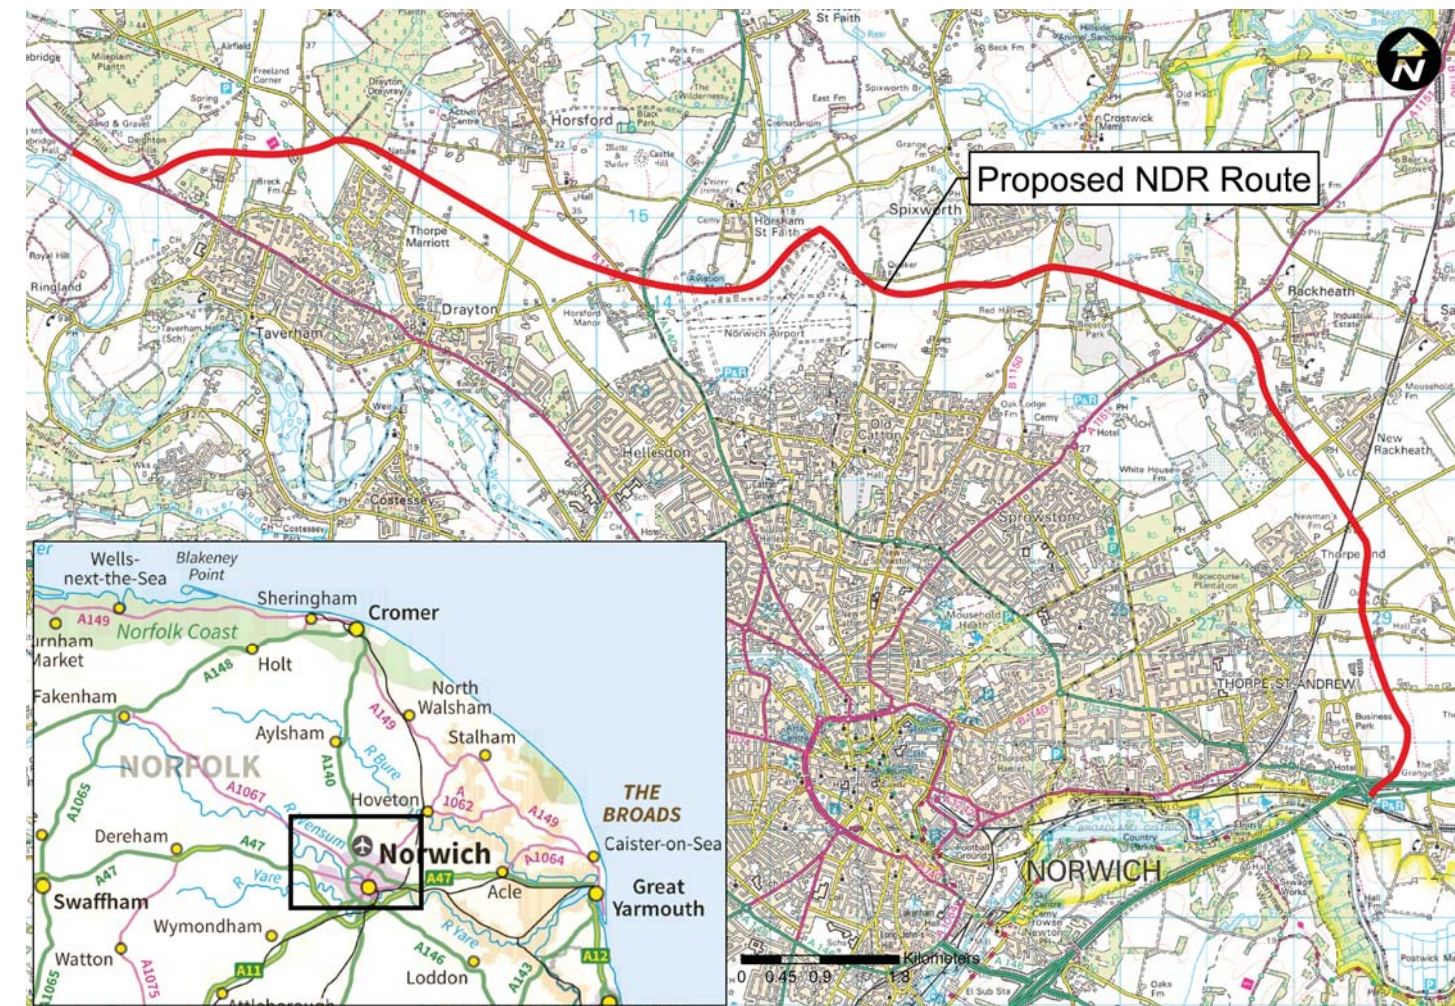

From the Business Park roundabout the NDR will proceed southwards to a new Postwick north east roundabout immediately north of the A47(T)

Norwich Southern Bypass. This roundabout will have links from a new A47(T) eastbound slip road and a new A47(T) eastbound merge slip road. The NDR will continue over the A47(T) on a new bridge and will terminate at its southernmost point at a signalised junction, which will replace the existing Park and Ride roundabout with the A1042 Yarmouth Road.

Mitigation

The Scheme has been designed with a host of mitigation measures incorporated, to reduce or minimise impacts on people and the environment. Designing the road in cutting, with adjacent bunding, will reduce the visual impact and traffic noise. The extensive landscaping scheme will, once established, allow the proposed Scheme to become incorporated within the existing landscape, with habitats that marry up with those surrounding areas. The landscaping scheme has been formulated in conjunction with Ecologists, to ensure that the proposals benefit protected and other species that exist locally.

Where major corridors of movement of protected species will be affected, measures will be installed to reduce the impacts. For

example Marriott's Way bridge will be a 'green bridge', with hedgerows up to and over the bridge itself, to allow bats and other animals to continue to use this route. Other measures to achieve similar results include wire gantries, adapted highway bridges and an underpass, each to allow bats to continue to navigate along their existing routes. Other new habitats and ponds will be created to rehome newts.

The drainage of the proposed Scheme will use Sustainable Drainage Systems for the majority of locations, where

conditions allow. This will mitigate for any potential impact on water quality and flooding issues, to ensure that flood risk is minimised and that the quality of discharged water to watercourses and groundwater will match or improve on the existing quality.

Construction Environmental Management Plan (CEMP)

The CEMP is the document that brings together all the construction phase mitigation measures proposed for the Scheme. It covers the management of a Contractor's

activities and those of any Sub-Contractor, and defines the minimum requirements that have to be met. It identifies the procedures required to minimise the impact of noise, vibration, dust and waste disposal resulting from the construction phase of the Scheme. It includes details of measures to be employed to ensure that no pollution incidents occur, that impacts on protected species are minimised as far as possible, that archaeological features are identified and recorded, and that impacts on nearby residents are kept to an absolute minimum.

The Best Solution...

Queuing on Riverside Road

The NDR is needed to improve connectivity and accessibility across both the northern part of the Norwich urban area and areas of the county in an arc from the north west to the east of this main urban area. Such improvement will ease the relative disadvantage of the peripheral location of these areas and provide the basis of the transport infrastructure required to address existing and future problems and achieve the growth objectives which have been identified for Norwich and its surrounding area.

The requirement to improve connectivity and accessibility arises out of the analysis that

led to the production of the Norwich Area Transportation Strategy (NATS) and the conclusions reached. This strategy sets out NCC's and Norwich City Council's agreed approach to the delivery of sustainable transport in and around Norwich.

The overall strategy set out in NATS is that a package of transport improvements, interventions and measures, which includes the NDR Scheme, needs to be implemented. Together these improvements, interventions and measures will (amongst other things) deliver a reliable, efficient and long-term sustainable transport network which will improve accessibility and connectivity and which will support the continued economic and physical growth of the Norwich area. In setting out the Authority's approach to current and future needs, NATS seeks to improve the overall economic competitiveness of Norwich as a focus for inward investment, create conditions in which sustainable forms of transport can be promoted and improve the quality of life.

The possibility that the need could be met in some other way, for example by a different standard NDR, by an NDR following a different route, or without road construction has been addressed in principle and detail over a lengthy period. The

necessary environmental, traffic and economic studies and analyses have been progressed as a central component of the development of NATS in the context of the evolution of planning and economic policies for Norwich and the surrounding area.

The studies confirm that the NDR is an essential component of the NATS package of measures to address existing and likely future issues of congestion, connectivity and economic and urban growth. Analysis of other approaches have confirmed that it is not possible to meet the need without the NDR and that the role of the NDR cannot be replicated by improving the existing road network or public transport. Examination of alternative standards and alignments has confirmed that the application proposals are the most appropriate response to the need, taking account of the results of the Environmental Impact Assessment (EIA).

Assessment of alternative routes

The Scheme has the potential to cause air quality effects during the construction and operational phases. During the construction phase, the Scheme will introduce new emission sources in the form of traffic and plant at some locations, and involve potentially dust generating activities. A qualitative assessment of potential construction phase effects has been undertaken. Mitigation measures have been identified for incorporation within the CEMP, commensurate with the risk of dust effects identified and in line with best practice. Potential impacts are concluded to be negligible to slight adverse, at worst, and therefore not significant.

Operation of the proposed Scheme in the opening year will change traffic flows within Norwich and could affect

ambient air quality. The opening operational phase effects have been assessed using an advanced dispersion model. Concentrations of key traffic related pollutants have been predicted at sensitive human health and ecological receptors and the change as a result of the Scheme has been quantified. Existing concentra-

tions of nitrogen dioxide (NO₂) are of concern in Norwich, particularly in the city where an Air Quality Management Area (AQMA) has been declared. The Scheme is predicted to cause a Slight Beneficial effect on NO₂ concentrations, including within the AQMA, and Negligible effects on fine particulate concentrations overall. Operational phase air quality effects are concluded to be not significant.

In conclusion, effects on air quality during construction are considered to be **negligible to slight adverse** and not significant. Effects at the opening year are also considered not to be significant. The opening year of the proposed Scheme is expected to present the worst case within the first 15 years of opening and therefore, no other future year has been assessed.

The changes in carbon emissions during the construction and operation of the proposed Scheme have been calculated. These changes are expressed as emissions of carbon dioxide over a given time period.

During the construction phase, the proposed Scheme will lead to emissions of carbon from construction traffic and plant, as well as from carbon embodied in the materials that will be used to construct the Scheme. These emissions have been calculated to be 52ktCO₂. This includes mitigation measures included in the design which reduce the impact by 14ktCO₂. There are also measures in the CEMP which aim to make the construction process as efficient as possible.

Traffic flows will change during the operational phase affecting distances travelled,

and congestion across the network. These changes will affect emissions of carbon. The overall effect of the Scheme will be to increase emissions by around 13ktCO₂ in 2017, due largely to an increase in vehicle kilometers travelled.

This increase is around 0.6% compared to all emissions in the local authority areas around the Scheme. In 2032, the increase will be 18ktCO₂ representing 1.1% of all emissions in the local authority areas. The assessment has not considered the wider influence of the package of measures within the NATS of which the Scheme forms part.

There are currently no local or regional emission reduction targets in place for carbon reductions. At the national level, the increase in emissions associated with the Scheme is unlikely to materially affect the ability of local authorities to contribute to national level emission reduction targets.

The cultural heritage assessment draws upon information gained from desk-based sources, a search of archaeological records from the Norfolk Historic Environment Record (NHER) database, site inspections and archaeological field surveys, including fieldwalking, metal detecting, geophysical surveys and trial trenching. A diverse range of heritage features have been identified, including prehistoric archaeological remains, deserted medieval villages, historic buildings and parklands. The Scheme will also pass between two areas of ancient woodland.

The majority of significant cultural heritage effects will occur during construction. These will comprise the removal of archaeological remains, including a possible Neolithic mortuary enclosure, Bronze Age and Iron Age settlements at the western end of the route; elements of two deserted medieval villages at Rackheath; and further prehistoric enclosures around the Postwick Hub at the eastern end of the Scheme. Additionally a number of un-designated WWII structures at Rackheath will be demolished during construction, and there will be changes to the setting of several historic buildings including Horsford Hall, Rackheath Hall and the bridge at Rackheath, all of

which are Grade II listed. Two locally important parklands will be crossed by the Scheme, namely Beeston Park, where the northern third of the park will be severed, and Rackheath Park where the eastern boundary will be removed. No impact is predicted for the Grade II* listed Catton Hall Park, located 2km to the south of the Scheme.

Measures incorporated into the Scheme to mitigate impacts include the use of appropriate construction methods to avoid or limit damage to heritage assets; and landscape bunding and planting to integrate the proposed Scheme into the historic landscape and screen historic buildings. An archaeological mitigation strategy will be produced and will set out the detailed requirements for recording below-ground archaeological deposits which will be impacted by the Scheme. This will record the locally important archaeological sites, which have been

identified during fieldwalking, geophysical survey and trial trenching. A photographic survey of historic buildings and important elements of the historic landscape is also proposed.

Significant cultural heritage effects during operation will be through visual and noise impacts on Listed Buildings, including Horsford Hall, Rackheath Hall and the bridge at Rackheath. Beeston Park and Rackheath Park will also experience significant effects during operation. However, these effects will lessen as planting matures over time.

In conclusion, the overall effects upon cultural heritage are considered to be **moderate adverse** during construction. Effects during operation will be **slight adverse** during both the opening year (2017) and the design year (2032), although effects will reduce to some degree as mitigation planting matures.

Extant remains of Horsham St Faith Priory

The route of the NDR will pass through a predominantly arable landscape of largely rural character, but with some urban fringe influences such as housing development, Norwich Airport and the Broadland Business Park. The landscape generally comprises fairly commonplace rural farmland along much of the route, but with a higher quality area centred around the former parklands of Beeston and Rackheath Halls where the landscape is characterised by a larger woodland component on more undulating topography.

The route of the NDR has been optimised to avoid impacts on property and the wider landscape as far as possible. With this in mind, the design of the Scheme includes the following measures:

- The creation of 'naturalistic' landforms associated with embankments, cutting slopes and other areas of topography;
- Extensive new planting to

screen views of the road from houses and to develop habitat links between the NDR planting and the surrounding woodland and hedges; and,

- Ensuring that the landscape planting is in keeping with that which is found in the local area.

The following is a summary of the overall landscape and visual effects along the route that will occur for the construction period, for opening year and for design year. Night time effects will only be slight adverse throughout the Scheme (arising from vehicle headlights) since, with the exception of the Postwick Hub which is already well lit, the Scheme will not be lit.

Between the A1067 and Reepham Road landscape effects are regarded as being moderate adverse for construction and the opening year (2017) over this stretch of the route on account of the relatively high quality of the

landscape, particularly at the western end of the Scheme, combined with the addition of new infrastructure elements (such as the Marriott's Way bridge) into the landscape. However, by the design year (2032) these effects will have reduced to slight adverse due to the screening effect of the mitigation planting. There are relatively few properties in the vicinity of the route, although a number will experience moderate adverse visual impacts in design year, even after mitigation planting has matured.

Between Reepham Road and A140 the route will clip the south west corner of the existing Drayton Drewray woodland, resulting in the loss of a small part of a coniferous plantation. Higher quality woodland further north will, however, be avoided. The route will then traverse a wide open landscape close to, and roughly parallel with, the existing Reepham Road. Over this section of the Scheme, landscape effects

will be slight adverse during construction and in the opening and design years. Only relatively few properties lie in the vicinity of this section of the Scheme, a number of which will experience moderate adverse visual effects at the design year due to their close proximity to the new road.

Between the A140 and the B1150, the route will cross an area of low landscape quality adjacent to the airport, before passing through an area of higher quality to the south of Spixworth. Opportunities for linking mounding and mitigation planting into an existing shelter-belt near Spixworth have been taken. The landscape effects in this section of the Scheme are likely to be moderate adverse for construction and the opening year, reducing to slight adverse by the design year. A fairly large number of properties will be affected by visual impacts, particularly on the edges of Horsham St. Faith and Spixworth. Visual effects on

properties in Spixworth will reduce from moderate adverse during construction and the opening year to slight adverse by the design year as mitigation planting matures. However, visual effects on some properties in Horsham St. Faith will remain moderate adverse in the design year as the close proximity to the airport precludes extensive mitigation planting.

Between the B1150 and Salhouse Road this section of the route will pass through an area of high landscape value centred on the remains of historic parklands. Mitigation, using a combination of mounding and planting to tie into existing woodland blocks and blend the new road into the landscape, will help to reduce overall landscape effects to slight adverse along this section by the design year. A relatively large number of properties will be affected by visual impacts as the route will pass close to the southern boundary of Rackheath. However, the

majority of these will only experience slight adverse effects by the design year once the NDR planting has matured, helped by the screening effects of existing intervening vegetation.

Between Salhouse Road and the A47, the route will rise to cross the Norwich to Sheringham railway line, resulting in moderate adverse landscape and visual effects. These effects will remain in the design year at this location due to the prominence of this structure in this flat landscape, before passing through a more wooded arable landscape through to the southern end of the Scheme. Beyond the railway crossing the mitigation planting will be effective, reducing landscape effects to slight adverse by the design year as the mitigation planting matures.

In conclusion, the overall balance of landscape effects will be **moderate adverse** as a result of the Scheme during the construction period and in the opening year, reducing to **slight adverse** by the design year as mitigation planting matures. For visual effects, the balance will lie between **large and moderate adverse** during construction and in the opening year, reducing to **moderate to slight adverse** by the design year as the planting scheme matures.

Photomontage looking North East from Low Road towards the proposed Middle Road Overbridge at opening year (2017)

The proposed Scheme has the potential to cause nature conservation effects during the construction and operational phases.

Desk-based studies into Statutory Designated Sites and protected areas have been carried out alongside extensive field surveys of species and habitats, most of which are protected by UK and EU laws. These surveys have taken place over several seasons in many cases, and have enabled a detailed understanding of the populations within the Zone of Influence (the area in which the proposed Scheme could potentially impact on ecological features).

The assessment of ecological effects in the Environmental

Statement considers those ecological receptors that are of sufficient conservation value and potentially vulnerable to significant effects arising from the proposed Scheme. These are termed Valued Ecological Receptors.

Valued Ecological Receptors that have been assessed include Statutory Designated Sites such as Special Areas for Conservation (SAC) and Sites of Special Scientific Interest (SSSI), and other Designated Sites such as County Wildlife Sites (CWS) and Roadside Nature Reserves (RNR). Some of these sites will be directly affected, some indirectly affected, and some unaffected by the Scheme.

Several species of bat are known to use areas likely to be affected by the proposed Scheme, such as roosts in buildings and trees. Bats and

their roosts are protected by UK and EU law. Great crested newts are known to exist at three locations, although just one breeding pond will be directly affected by the Scheme. Great crested newts are also protected under UK and EU law.

A number of badger populations are known to exist around the proposed Scheme. Breeding bird populations are ubiquitous throughout the local landscape, their population densities and mixes varying with habitat type and quality. Barn owls, a particularly sensitive bird species are also found within the study area. Aquatic invertebrates exist at Ladies Wood, Church Carr & Springs CWS.

Mitigation measures have been incorporated into the proposed Scheme design to eliminate or reduce impacts on Valued Ecological Resources as far as

possible. A landscaping scheme has been designed to provide as much benefit to Valued Ecological Receptors as possible, in terms of species mix, form and layout, and timing of planting. A number of crossings for bats are proposed comprising wire gantries across the carriageway, two bridges that will incorporate hedgerows, an underpass, and modified standard bridge designs to include dark corridors to encourage use by bats.

New bat roosts will be provided where existing roosts will be lost. Great crested newts that use the one pond to be lost to the proposed Scheme will be relocated to new ponds nearby, and temporary fencing will be erected to ensure that they do not re-enter the construction area.

Badger fencing will be installed where necessary, to ensure that badgers do not enter onto the carriageway. All habitat clearance will be carried out at such a time, and in such a manner as to ensure that impacts upon breeding birds and other species are minimised.

Assessments of the overall effects on Valued Ecological Receptors have been carried out for the construction phase, and for the operational phase, which includes the opening year and the design year of the

Scheme. Construction phase impacts will include permanent and temporary habitat loss and severance, and disturbance due to the presence of plant machinery, people, and construction activity. Operational phase impacts will include the presence of traffic using the Scheme, with the associated disturbance in terms of noise.

During the Construction phase, the Scheme is predicted to have **significant adverse** effects on:

- Fakenham Road RNR;
- Important Hedgerows (under the Hedgerow Regulations 1997);
- Bats, and more specifically directly affected roosts in buildings and trees, and

important flight paths and areas of activity; and,

- Breeding bird species of both high and medium conservation value.

During the operational phase of the Scheme, the adverse nature conservation effects will lessen. At the opening year **significant adverse** effects are predicted to remain in place only for the bats using the important flight paths along Marriott's Way. By the design year the effects on this flight path will no longer be significant. No other significant adverse effects are predicted by the design year. However, **significant beneficial** effects are predicted for terrestrial invertebrate habitats at the Springs.

Proposed Bat House at Gazebo Farm

The Scheme has the potential to affect the geology and the soils along the route and as a result constraints could be imposed on the construction of the Scheme due to the existing ground conditions.

The construction phase will involve shallow excavation works, earthworks, potential piling, rock-cutting and retaining walls, and general construction works involving the movement of soil materials and storage of hazardous chemicals. All have the potential to impact on the geology and soils underlying the Scheme.

Appropriate mitigation measures that have been identified include the implementation of a Materials Management Plan and Construction Environmental Management Plan and use of appropriate guidelines, including the DEFRA 2009

Code of Practice for Sustainable Use of Soils and best practice guidance on the prevention and control of pollution on site.

With the implementation of these mitigation measures, it is considered that there will be no significant effects relating to geology and soils during

the construction phase of the Scheme.

Impacts during the operational phase of the Scheme will be limited to those associated with surface water runoff from hard surfaces and the potential continued consolidation of soils over time. However, the highways drainage scheme, and associated pollution control measures, coupled with the implementation of the Materials Management Plan and geotechnical design for the Scheme during the construction phase will mitigate against these longer term effects.

In conclusion, there will be **no significant** effects relating to geology and soils as a result of the Scheme during the construction phase and at the opening and design years.

The materials assessment quantifies the resources required for the construction of the Scheme. Through this process the waste and surplus materials likely to be produced by the Scheme have been identified, leading to the assessment of material re-use on site, recycling and disposal of waste off site. This assessment was achieved using National and Local planning and legislative framework as guidance and studying the baseline conditions for Norfolk, with regards to mineral availability and waste disposal availability and capacity.

The potential main environmental impacts associated with construction of the Scheme are the extraction and transportation of minerals and aggregates, and the manufacturing and transport of new materials for construction. The potential main environmental impacts associated with waste arising from the Scheme are likely to be a surplus of materials from excavation, and materials brought onto site that were not available for use due to damage, off-cuts and surplus. Further impact from waste will be associated with its movement, transport, processing and eventual disposal.

The assessment of materials to be used in the Scheme was carried out with reference to

the Bill of Quantities drawn up for the Scheme. Materials from this schedule were assessed on their initial recycled/re-used content, their source of origin and their potential for recycling upon decommission. The anticipated waste arisings of the Scheme were assessed based on the excavations programmed to take place.

Quantities of material excavated, less materials calculated to be re-used in earthworks of the Scheme, will result in close to a cut and fill balance. However, an estimated 10,599m³ of excavated material will remain for disposal off-site upon completion of the Scheme. The earthworks strategy will mean that the Scheme will be self-sufficient with regards to soils and aggregate, reducing the impact of extracting and then transporting minerals from

another external site.

Other mitigation measures include; maximisation of the usage of materials sourced within the Scheme footprint; maximisation of the recycled content of materials sourced from outside the Scheme boundary; segregation of waste within the Scheme to maximise recycling; sourcing of materials locally and disposal in available disposal sites in close proximity to the Scheme. These measures will be achieved by constantly evolving the Schemes Materials Management Plan and Site Waste Management Plan.

In conclusion the Scheme will not have a **significant adverse** effect in relation to the use of materials and production of waste during construction and operation.

A noise and vibration assessment has been undertaken to establish significant effects associated with construction and operation of the proposed Scheme.

Two phases of the development have been considered: temporary impacts resulting from the construction activities and permanent impacts due to noise and vibration from road traffic using the Scheme and the local highway network.

The methodology adopted for traffic noise and vibration was the Highways Agency's Design Manual for Roads and Bridges. For construction, the noise and vibration methodology was BS 5228 'Code of practice for noise and vibration control on construction and open sites'. In both cases, the approach was:

- Identification of potential sources and prediction of noise and vibration impacts likely to be received at

Typical noise contours at Norwich International Airport

nearby sensitive receptors including dwellings;

- Comparison of the predicted impacts with the baseline conditions;
- Evaluation of the receptor sensitivity and the significance of effects; and,
- The consideration of noise mitigation measures incorporated within the design and an assessment of any remaining effects.

Prior to the assessment, baseline noise monitoring was undertaken across the area.

Noise levels from construction activities have been predicted at the façades of representative sensitive receptors along the NDR route. Various operations have been considered, such as; whole route linear works, including earthworks, drainage and paving; bridge construction sites; construction traffic; and construction compounds. Significant effects are predicted at the nearest receptors to the Scheme which will be mitigated through the formal consent process, whereby working methods, durations and operating times are agreed with the Local Authority prior to works commencing. Construction mitigation measures will include enclosure of plant; temporary noise barriers; restrictions on delivery times; and appropriate location of

ingress and egress points. Temporary barriers will be required during construction at some locations.

Construction noise has been predicted to generate temporary significant effects at some locations. Further construction noise calculations will be undertaken as sufficient construction-related information becomes available, and the Contractor will apply for Section 61 consent under the Control of Pollution Act 1974. Following mitigation, it is anticipated that construction noise effects will not be significant.

Mitigation measures incorporated into the design of the Scheme include a thin surface course for the carriageway, three lengths of acoustic barrier and extensive bunding and false cuttings. Noise levels during operation will have a significant adverse effect at 2393 residential and 17 non-residential receptors on opening. By the design year, significant adverse effects are predicted to occur at 1936 residential and 14 non-residential receptors.

In conclusion, noise effects are considered to be **slight adverse** during construction. During operation, **moderate or large adverse** effects are predicted on opening, although the number of receptors affected will reduce by the design year.

The assessment of the effects of the Scheme for All Travellers addresses the impact on vehicle travellers in terms of the change in the view from the road, and the impact of the Scheme on Driver Stress. The assessment also addresses the impacts for non-motorised users (NMUs), which includes pedestrians, equestrians and cyclists, as a result of changes to the network of Public Rights of Way (PRoW) and minor roads. It also considers changes in journey length and times, the provision of amenities such as PRoW, and connectivity between communities and community facilities.

Overall, it is expected that there will be a temporary adverse impact during construction on the view from the road for motorised users passing along routes that intersect with the NDR, as a result of changes from a rural, high quality outlook to that of a temporary construction site. This will result in a temporary slight adverse impact for views from the road for vehicle travellers. The need to travel through road-works for some motorised users, particularly at these intersections, is also likely to result in temporary short-term delays which could lead to some level of driver frustration. However, measures to minimise impacts, such as the phasing of works, will be included in the construction programme, and

the majority of the route will be constructed off-line. Impacts are therefore not considered to be significant.

Once the Scheme is operational, it is anticipated that where the existing routes will intersect with the NDR, the view from the road for motorised users is likely to be restricted, changing from a rural setting to one of a dual carriageway corridor with associated landscape planting. Once screening vegetation that is included as part of the landscape design and mitigation for the Scheme has matured, it is considered that views from the road will be neutral for those travelling on affected routes within the zone of visual influence, and for those travelling on the proposed NDR itself. Driver stress is generally considered to reduce as a result of the NDR, due to reduced congestion and improved journey time reliability for radial and secondary routes where traffic will transfer to the Scheme. As a result, a long term significant beneficial effect on driver stress for users of those radial and secondary routes is anticipated.

For NMUs, the construction stage is predicted to result in short term slight adverse impacts as a result of the temporary closure or diversion of Public Rights of Way, resulting in an increase in journey times for some NMUs in a small number of locations. In addition, some NMUs may be deterred from making certain journeys during construction due to the presence of construction plant and increased traffic on alternative routes due to diversions. However, once the Scheme is open, the NDR will provide additional amenities for NMUs such as approximately 25km of bridleways, cycle tracks and footpaths, and all PRoW will be maintained or reinstated. Changes to traffic levels on routes currently used by NMUs will also result in a positive benefit on the whole for communities. This is because it is expected that there will be a decrease in traffic on a number of radial roads within the parishes that will be affected by the NDR, resulting in some relief from existing community severance for NMUs accessing key services. A long term significant beneficial effect for NMUs is therefore predicted.

In conclusion, the effects on all travellers are considered to be **slight adverse** during the construction phase and **moderate beneficial** at the opening and design year.

The community and private assets assessment identifies impacts associated with the demolition of property, the loss of land used by the community, and impacts on development and agricultural land. The assessment also examines the impacts the Scheme will have on the social and economic environment of Norwich.

One residential property will be demolished to accommodate the Scheme. This property is currently derelict, and other outbuildings attached to another property which are also dilapidated will be demolished. Fifteen properties will lose some land to the Scheme, however development land will not be adversely affected. In order to maintain the amenity and ecological value of Marriott's Way, a green bridge will be constructed. The small amount of land that will be taken at Great Plumstead Fuel allotments will be replaced with a larger adjacent allotment area.

The Scheme will result in the permanent loss of 307.57ha of agricultural land, however 45.64ha will be returned to agricultural use after construction. During construction, access to farmland and water supplies to fields will be maintained where possible. Where this is not possible, compensation for loss of revenue will be provided to the farm owner.

Irrigation systems will be maintained during operation and farms will be compensated for permanent land loss.

The socio-economic impacts on the local community from construction will be short-term job creation and an increase in local economic activity. There will also be temporary disruption to economic activity and land-take during the construction phase.

The effects on soils as a national resource are considered significant adverse. However, this must be considered within the context of agricultural activity in Norfolk and current agricultural practice generally. It is considered that the increasing efficiency of agricultural producers and changes in agricultural policy mean that retaining as much

land as possible in agricultural use is no longer a top priority. In addition farmers will be compensated for loss of revenue.

Upon completion of the Scheme, socio-economic effects will be major beneficial resulting from improved access to employment and tourist areas, job creation, housing and development growth.

In conclusion, the effects on community and private assets are considered to be **slight adverse** during construction. Following completion of the Scheme, effects during the opening year will be **slight beneficial** rising to **moderate to large beneficial** and significant by the design year.

The water environment encompasses surface water in rivers, streams and ponds, and groundwater within underground strata. The government is committed to maintaining and improving the quality of surface water and groundwater environments, and the drinking water supplies they support.

Historically, roads have not been considered a major source of pollution and rainfall has been allowed to run off and discharge with little or no treatment. In recent years, diffuse pollution from road drainage has been identified, in some circumstances, as contributing to poor water quality. Pollution can arise from a variety of sources including accidents, general vehicle and road degradation, and vehicle related fuel leaks. Mitigation techniques are now used to control this pollution and the impact on the natural environment.

Groundwater levels within 50m of the proposed Scheme have been monitored intermittently since 2006 and range between approximately 2m and 20m below ground level. The proposed Scheme is not foreseen to intersect the chalk water table at any point. There is one principal area of groundwater discharge along the proposed route located at 'The Springs' County Wildlife Site (CWS). Dobb's Beck and Spixworth Beck pass within 'The Springs'

CWS and form a tributary of the River Bure. The proposed Scheme crosses the catchment of Dobb's Beck. Water quality monitoring has been carried out intermittently at 'The Springs' since September 2006 and has shown moderate to good biological water quality.

Drainage discharge into 'The Springs' is proposed from Lagoons 17 and 18 as part of the proposed Scheme. The drainage design incorporates Sustainable Drainage Systems (SuDS) surface water treatment mechanisms and is planned to include reed bed treatment. The reed bed treatment will ensure that a higher level of water quality is discharged into 'The Springs' than is currently found in the area.

For the first few hundred metres at the western end the route will pass within 300m of the River Wensum Special Area of Con-

servation (SAC), at Attlebridge. At the eastern end of the proposed Scheme the route will pass within 600m of the River Yare.

The underlying chalk is a major aquifer used to supply much of the drinking water to the Norwich area. There is one licensed public water supply within the study area, located approximately 500m south-east of the Scheme, near Postwick. The Environment Agency (EA) has advised that a temporary 750m radius source protection zone, SPZ1 should be allowed for surrounding the supply. The SPZ1 represents the area that is most sensitive and requires the highest level of protection around a public or private potable abstraction. The route will pass through the more extensive total contributing catchment SPZ3, associated with groundwater supplies, in some areas. However, the Scheme will not represent a significant concern regarding impacts to the groundwater in the SPZ3.

A Flood Risk Assessment (FRA) has been carried out for the Scheme. The FRA shows the Scheme is located in Flood Zone 1 where there is little or no likelihood of fluvial or tidal flooding. However, the road alignment will cross the catchment of Dobb's Beck near Rackheath where available surface water mapping indicates some flood risk from rainfall runoff (over-

land flow). The depth, extent and duration of any flooding in this area is currently minimal, and the road will be built above the maximum flood levels and therefore removed from flood risk. In compliance with best practice, the highway drainage for the Scheme has been designed in line with SuDS principles to restrict runoff to greenfield discharge rates. Therefore flood risk due to surface water runoff will be mitigated to acceptable levels.

The overall effect of the Scheme on flood risk is predicted to be neutral to slight beneficial. The Scheme will provide a new flow path between the new road and Dobb's Beck, along the dry valley, to convey flood flows. With the mitigation measures in place, no increase in flood risk is predicted.

The drainage design has been subject to risk assessments required under best practice guidance, to inform the Scheme design and identify any embedded mitigation measures required. These embedded mitigation measures increase beneficial effects, or prevent or reduce negative effects.

During construction, the overall effect of the Scheme on surface water quality is predicted to have no significant adverse effects.

During operation the overall

effect on surface water quality is considered to be neutral to slight beneficial. A slight beneficial effect will result from the improvement of treatment to existing runoff from the A1151, which currently discharges into the CWS without any form of treatment.

The Scheme will cross areas of high leaching potential soils and unconfined principal aquifers, and is in reasonably close proximity to some private abstraction sites and a public water supply source. There may be a slight adverse effect on groundwater quality for some private water supplies which are located down-gradient of infiltration ponds. However, all infiltration ponds are outside the default 50m radius SPZ1 under EA guidance, applied to all potable groundwater abstraction sites (unlicensed). Otherwise, during construction and operation, the overall effect of the Scheme on groundwater quality and flow is predicted to be neutral.

Mitigation for construction and operation (including maintenance works) has been embedded in the Scheme design to reduce the overall effect of the Scheme. This mitigation will be incorporated into the CEMP and Norfolk's Transport Asset Management Plan, with the Scheme being maintained by NCC.

With the appropriate mitigation measures for construction and operation, the Scheme will result in a limited number of slight adverse and slight beneficial effects. All other effects are considered neutral.

In conclusion, the road drainage and water effects of the Scheme will **not be significant** during construction. Similarly, effects at the opening and design years are also considered to be **not significant**.

The assessment of combined and cumulative effects of the Scheme bring together the principal findings of each of the previous topics of the Environmental Statement in order to identify and assess the combined effects of the Scheme and the cumulative effects of the Scheme in association with other existing or future significant development projects within the study area.

Combined effects can be defined as effects which can result from multiple actions on receptors and resources over time and are generally additive or interactive in nature.

The assessment methodology for combined effects involves the identification of impact interactions associated with the Scheme upon separate environmental resources or receptors. The significance of construction and operational phase environmental impacts are taken from the preceding chapters of the Environmental Statement into matrices providing a clear summary of potential impacts. The significance of combined effects upon each environmental resource is then made based upon the balance of significance scores.

Cumulative impacts can also be considered as impacts resulting from incremental

changes caused by other past developments that are reasonably foreseeable as occurring at a similar time to the construction of the Scheme.

The assessment of cumulative effects is not intended to provide a detailed assessment of the effects of future developments. In many instances the layout and design of future projects have not been developed to the same level of detail as that for the Scheme, they may be phased in over years and their construction timetable as yet unconfirmed. As such, assessments have been undertaken at a relatively high level in the context of broad development parameters sufficient to provide an understanding of the likely environmental effects of future developments and to enable adequate consideration of cumulative effects.

The Scheme will have an overall moderate adverse and significant environmental effect during the construction phase. The adverse effects come from construction noise and visual intrusion from the lighting of construction compounds and after dark construction activities in the winter. These combined noise and visual effects will adversely impact on bats and birds but these effects will be temporary.

There are significant benefits to

non-motorised and motorised users from the NDR during operation with reduced severance and increased connectivity. There are environmental benefits to residents from the removal of vehicles from unsuitable suburban roads. However there will be adverse impacts to wildlife due to land-take, traffic noise and tree removal.

There are anticipated to be **significant adverse** cumulative impacts during the construction phase. These effects will mostly impact on road users and biodiversity, however it is unlikely that construction will occur simultaneously so this represents a worst case scenario.

During the first year of operation impacts on protected species are **moderate adverse** due to land-take and severance, however maintaining commuting and foraging routes for bats during construction reduces some of the effects that may occur during the first years of operation.

By design year all the adverse impacts will have reduced in significance and the benefits to motorised and motorised users will still be **significantly beneficial** as the other development phases in. The adverse impacts on biodiversity will reduce as the landscaping and habitat creation matures.

Summary of Effects

16

Specialism	Effects during Construction	Effects at Opening Year	Effects at Design Year	Mitigation
Air Quality	Slight Adverse to Neutral	Neutral	Neutral	<ul style="list-style-type: none"> Best practice mitigation measures contained in the Construction Environmental Management Plan
Cultural Heritage	Moderate Adverse	Slight Adverse	Slight Adverse	<ul style="list-style-type: none"> Archeological Mitigation Strategy during construction Landscaping bunding and planting to integrate into historic landscape

The Norfolk County Council (Norwich Northern Distributor Road (A1067 to A47(T))) Order

10.1 Road Safety Audits and Briefs

Planning Act 2008

Infrastructure Planning

The Infrastructure Planning (Applications: Prescribed Forms and Procedure) Regulations 2009

PINS Reference Number: TR010015

Document Reference: 10.1

Regulation Number: 5(2)(q)

Author: Norfolk County Council

Revision	Date	Description
0	8 th January 2014	Revision For Submission

INTRODUCTION

This document is submitted in relation to the application for a Development Consent Order by Norfolk County Council (NCC) to the Secretary of State, under the Planning Act 2008.

The application is for the Norfolk County Council (Norwich Northern Distributor Road (A1067 to A47(T))) Order, to grant development consent for the construction of a new highway running west to east, to south, between the A1067 Fakenham Road and the A47 Trunk Road at Postwick, including improvements to the existing highway network to the north and north east of Norwich.

This document comprises part of the application documents and relates to Regulation 5(2)(q) of the Infrastructure Planning (Applications: Prescribed Forms and Procedure) Regulations 2009.

The scheme has been the subject of a number of road safety audits carried out by NCC's independent audit teams in accordance with DMRB HD 19/03: Road Safety Audit throughout the development of the scheme.

The NDR Stage 1 Safety Audit was carried out in November 2013. The brief submitted to the road safety audit team, the Safety Audit Report and the response of NCC's highway design team (the Designer's response) are included in Appendix A of this document.

Separate Stage 1 Safety Audits for the three 'off-line schemes', namely Crostwick Junction, Rackheath Junction and Thorpe End Improvements were carried out in September 2013. The brief submitted to the road safety audit team, the Safety Audit Report and the Designer's response are included in Appendix B of this document, which is in three parts: Part 1 – Crostwick Junction; Part 2 – Rackheath Junction; and Part 3 – Thorpe End Improvements.

The Postwick Junction Stage 2 Safety Audit was undertaken in April 2013. The brief submitted to the road safety audit team, the Safety Audit Report and the Designer's response are included in Appendix C of this document.

The road safety audit team at Norfolk County Council has confirmed that the Designer's response for the NDR Stage 1 Safety Audit, Postwick Junction Stage 2 Safety Audit, Crostwick Junction Stage 1 Safety Audit, Rackheath Junction Stage 1 Safety Audit and Thorpe End Improvements Stage 1 Safety Audit are satisfactory and there are no outstanding issues.

SCHEDULE OF APPENDICES AND REPORTS INCLUDED IN THIS DOCUMENT

Document Title	Date
Appendix A comprising:	
Norwich Northern Distributor Road – Stage 1 Safety Audit submission	November 2013
NDR Stage 1 Safety Audit Report	November 2013
Norwich Northern Distributor Road – Stage 1 Safety Audit Designer's Response	November 2013
Appendix B comprising:	
Part 1	
Crostwick Junction Improvements Preliminary Design Stage 1 Safety Audit Submission	September 2013
B1150 Crostwick: Junction Improvement Stage 1 Safety Audit	25 September 2013
Stage 1 Safety Audit, NDR Off Line Improvements – Crostwick Junction Response Sheet	29 September 2013

Part 2	
Rackheath Junction Preliminary Design Stage 1 Safety Audit Submission	September 2013
A1151 Rackheath: Green Lane Junction Improvement Stage 1 Safety Audit	26 September 2013
Stage 1 Safety Audit, NDR Off Line Improvements – Rackheath Junction, Response Sheet	29 November 2013
Part 3	
Thorpe End Highway Improvements Preliminary Design Stage 1 Safety Audit Submission	September 2013
C874 Plumstead Road Thorpe End: Highway Improvement Stage 1 Safety Audit	25 September 2013
Stage 1 Safety Audit, NDR Off Line Improvements – Thorpe End, Response Sheet	29 November 2013
Appendix C comprising:	
A47/A1042 Postwick Hub Junction Stage 2 Safety Audit Submission	April 2013
Postwick Hub Junction Stage 2 Safety Audit	10 April 2013
Postwick Hub Junction Stage 2 Safety Audit, Response Sheet	24 May 2013

vph	vehicles per hour

Glossary

accommodation works	works to private properties affected by the scheme
connector road	a collective term for interchange links, link roads, slip roads and loops
crest curve	a vertical curve that rises to a high point
cycle track	a track separated from the main carriageway for use by cyclists
footway	the pedestrian-only area normally adjacent to a road and often separated from it by means of a kerb
ghost island	an area of carriageway suitably marked to separate lanes of traffic travelling in the same direction on both merge and diverge layouts
grade separated junction	a road junction where roads cross at different levels
hardstrip	a surfaced strip that abuts the carriageway edge
infiltration	the act of storm water slowly filtering into the ground
lane drop	a layout where a lane or lanes of the upstream carriageway becomes the diverging connector
mainline	the carriageway carrying the main flow of traffic (generally passing straight through a junction or interchange)
merge/diverge	a layout where merging or diverging traffic joins or leaves the mainline carriageway
non-motorised user	pedestrian, cyclists and equestrians (sometimes abbreviated to NMU)
overbridge	a bridge that carries a side road over the main road
pavement	the part of the road on which vehicles travel; the construction make-up of the road carriageway

1. BACKGROUND

- 1.1. The aim of this Safety Audit is to bring together all the elements of the Norwich Northern Distributor Road (NDR) and its associated works into one audit prior to submitting an application for development consent under the Planning Act 2008.
- 1.2. The audit will present some modifications to the scheme that have not previously been formally part of the earlier reports. These modifications are in part, the result of a recent round of formal Public Consultation and previous comments received from the audit team in 2012. The significant modifications have been highlighted in section 1.3 and 1.4 below.
- 1.3. The modifications referred to above comprise:
 - Provision of dual carriageway between A1067 and A140
 - Provision of a new Roundabout at western end of NDR – close to A1067
 - Removal of closure on Fir Covert Road with junction of Reepham Road
 - Provision of new bridge carrying Bell Farm Track over the NDR.
 - Closure of Drayton Lane to the south of the Reepham Road.
 - Removal of at grade roundabout at junction with A140 and provision of grade separated junction.
 - Closure of Broad Lane north of Plumstead Road.
 - Removal of pedestrian/cycle/agricultural vehicle bridge at Low Road, Gt Plumstead and provide all vehicle bridge at Middle Road instead.

- 1.4. In addition to the above; a number of off-line improvements are also being undertaken at the same time as the main scheme these are as follows:
- Improvements to A1151/Green Lane West Junction.
 - Highway improvements on Plumstead Road, Thorpe End.
 - Improvements to Crostwick Lane/North Walsham Road junction including closure of Rackheath Lane.

2. PREVIOUS SAFETY AUDITS

2.1. The following historical Safety Audits have been undertaken:

- Stage 0 was carried out in March 2007
- Stage 1 was carried out in December 2008
- Stage 1 was carried out in February 2012
- Stage 2 was carried out in April 2013 (Postwick Hub Junction only)
- Stage 1 was carried out in September 2013 (off-line improvements only)

2.2. As set out in 2.1 above the last full audit was undertaken in February 2012.

2.3. The Safety Audit submissions listed in 2.1 above have not been included in the appendices of this report, but can be made available if required.

3. OUTCOME OF CONSULTATIONS

3.1. A series of exhibitions were undertaken on the NDR (including the Postwick Hub Junction) in July/August/September 2013 as part of the statutory process prior to submitting an application for development consent. The results of these consultations have been considered and where appropriate are reflected in the drawings contained within this safety audit.

4. TRAFFIC MODELLING

- 4.1. The standard of the NDR has been determined so that the Scheme will meet its key objectives whilst balancing the provision against the Scheme cost and its environmental impact.
- 4.2. Throughout development of the scheme modelling work has demonstrated that improving the level of provision at junctions leads to greater attractiveness to drivers of the new route as an alternative to existing roads and diverts residual traffic away from inappropriate parts of the network. There is potential demand in the network that may only be alleviated by larger or split level junctions. However, Norfolk County Council is looking to provide an optimum and a decision has to be made between the ever increasing costs of larger junctions and their environmental impacts, compared to benefits accruing on the rest of the network. It becomes uneconomic and is likely to impose unacceptable impacts to design for free flow conditions on the NDR at all times, and the additional costs for greater capacity provision for NDR would be at the expense of other improvements in the city and county given the limitations on the Council's transport budget. Hence, accepting some level of congestion on the scheme at peak times, as we already do at other locations on the existing highway network, in order to maintain the cost of the scheme within an affordable budget, makes the best use of Council resources.
- 4.3. The current strategic transport model used to assess the impact of the NDR for the NSIP Development Consent Order (DCO) application is based largely on new origin destination surveys and extensive traffic counts carried out in autumn 2012.

5. ROAD DESIGN STANDARDS AND DESIGN SPEEDS

- 5.1. All main line links will be designed to the Design Manual for Roads and Bridges (DMRB):

- TD 9/93: (Highway Link Design)
- TD 27/05: (Cross-Sections and Headrooms)
- TD 22/06: (Layout of Grade Separated Junctions)
- TD 51/03: (Segregated Left Turn Lanes and Subsidiary Deflection Islands at Roundabouts)

Roundabouts are designed in accordance with the DMRB

- TD 16/07: (Geometric design of roundabouts).

5.2. Refer to drawing in Appendix A which sets out the design speeds used. Junction Details are contained within in Appendix B and Junction Geometry Details in Appendix C.

6. DEPARTURES AND RELAXATIONS FROM STANDARDS

6.1. The NDR is designed in accordance with the Design Manual for Roads and Bridges (DMRB). Where it has not been possible to comply with the DMRB a Departure from Standards will be sort. These are categorized as follows, those on the Trunk Road network and those on a County Road network.

6.2. The NDR alignment has been designed using the design speeds shown in Appendix C. Based on these design speeds section 5.2 and 5.3 sets out the Departures from Standards that are required

6.3. Trunk Road Network – Highways Agency

6.3.1. Eastbound Diverge Slip Road - layout was submitted to the HA as a Departure from Standard and approved in 2012.

6.3.2. Eastbound Merge Slip Road - layout was submitted to the HA and approved as a Departure from Standard in 2008.

6.3.3. Westbound Merge Slip Road - Departure from Standard to retain the existing two-lane taper merge was submitted to the HA and approved in 2013.

6.3.4. New Postwick Bridge - Departure from Standard for the omission of Abutment Galleries was submitted to the HA and approved in 2010.

6.3.5. The Departure from Standards submissions and approvals listed in 5.2.1 to 5.2.4 above have not been included in the appendices of this report, but can be made available if required.

6.4. **County Road Network – Norfolk County Council**

6.4.1. Cross Sections: The proposed cross section along the length of the mainline design is in accordance with TD27/05 for carriageway, hardstrip and central reserve widths, in some cases verge width provision is 1.5m rather than the required 2.5m. In these situations the verge is reduced due to the need for a shallow drainage swale. The swales are generally 3.0m wide with 1 in 5 side slopes and 200mm depth

6.4.2. NDR/A140 Grade Separated Junction: Based on the vph traffic flows for the eastbound and westbound merge slip roads the ideal layout is a Type E lane gain layout in accordance with TD22/06 Figure 2/3. A Type E layout would provide a single lane merge slip road joining a one lane NDR mainline carriageway to form a two lane downstream mainline carriageway. However, for reasons of route continuity, the NDR mainline has been designed with two lanes throughout. Therefore the nearest compliant layout is a Type A single lane taper merge. A Type A layout has therefore been adopted.

6.4.3. NDR/A140 Grade Separated Junction: The westbound merge slip road has a two way section near the A140 Cromer Road Roundabout South. This is to allow access to a property and for maintenance vehicles to access the lagoon. Therefore the eastbound flow on the slip road will be extremely low. Paragraph 5.27 in TD22/06 states that two way slip roads must be dual carriageway with opposing traffic separated by a physical central reserve with vehicle restraint system. Due to the low opposing flow it is considered that a physical separation would result in an overdesigned layout. Therefore the two-way section of the slip road is a departure from standards and has been designed as a 7.3m wide two way carriageway. Signing will be provided to

inform drivers of the layout ahead.

- 6.4.4. The NDR passes under Middle Road bridge between Plumstead Road Roundabout (South) and the Business Park Roundabout. At this location the Stopping Sight Distance (SSD) is restricted to 2 steps below standard due to the presence of the required Vehicle Restraint System (VRS) and the bridge pier within the central reservation. Two steps below desirable minimum would normally be considered a relaxation. The horizontal radius under the bridge is also 1 step below standard and therefore this combination of relaxations is a departure from standards.

The departure is considered acceptable by the design team as reduction in SSD will be momentary visibility impairment only. Increased visibility will be achievable over the VRS and behind the bridge pier.

- 6.4.5. At-Grade NMU Crossings: Uncontrolled crossings via refuge islands are provided for cyclists/pedestrians at or close to roundabouts on the NDR. This is considered an acceptable approach given the low crossing flows of pedestrians in particular). DMRB TD16/07 Table 6/1 shows normal provision for pedestrians and cyclists at or near roundabouts where there is significant demand to justify them. However the crossing flows do not support the provision of signalised facilities and their introduction, as suggested in LTN 1/95 paragraph 4.2.4, may actually be detrimental to safety with drivers becoming habituated in to not seeing a red signal. Grade separation of these low flow routes would not be cost effective.

- 6.4.6. At-Grade NMU Equestrian Crossings: Three equestrian crossings are proposed near to roundabouts on the NDR. Holding areas will be provided for equestrians either side of the minor road where equestrians will cross. Due to equestrians taking longer to make a decision to enter the carriageway and the need to manoeuvre from holding areas, these crossing points need to be set further back from the roundabout junctions, using the visibility requirements in TA90/05 Table 3.4. Traffic speeds will be considerably less than the speed limit when leaving the roundabout, therefore it is considered that a 'y' distance of 135m is appropriate for the visibility splay towards the roundabout. For

traffic approaching the roundabouts the 'y' distance should be appropriate to the actual approach speed and visibility splays will be provided in accordance with TA90/05 Table 3.4. Refuse islands will not be provided at equestrian crossing points.

- 6.4.7. With regards to the equestrian crossing point on Wroxham Road, a slightly less 'y' distance of 120m northwards towards the roundabout will be provided.

7. SCHEME DESCRIPTION

- 7.1. The Scheme (the Norwich Northern Distributor Road, known as the NDR) is a dual carriageway all-purpose strategic distributor road, which would link the A1067 Fakenham Road, near Attlebridge to the A47 Trunk Road (T) at Postwick. This will be over a length of approximately 20.4km
- 7.2. From west to east, the NDR is proposed to start at a new at-grade roundabout junction with the A1067 Fakenham Road, located to the west of Taverham. This would then continue eastwards as a dual carriageway to a new at-grade roundabout junction with the C262 Fir Covert Road. From this roundabout, the NDR would then cross the Marriott's Way (a permissive path providing a pedestrian, cycling and horse riding facility along the route of a disused railway; which will cross over the NDR via a new bridge), to a new at-grade roundabout junction with the C261 Reepham Road. This would then continue south eastwards, crossing Bell Farm Track/Horsford Restricted Byway No. 5 (which will be taken up over the NDR via a new Restricted Byway and private access accommodation bridge) before connecting with the C282 Drayton Lane via a new at-grade roundabout junction. Sections of the C282 Drayton Lane either side of its junction with the NDR will be re-aligned.
- 7.3. The NDR would then continue south eastwards from its junction with C282 Drayton Lane to a new grade separated junction (provision of a bridge over the NDR with slip roads to/from the NDR) with the A140 Cromer Road, located close to and just North-West of Norwich International Airport. The provision of this grade separated junction will require the stopping up of

lengths of the B1149 Holt Road and U57142 Holly Lane and the re-alignment westwards of parts of the A140 Cromer Road to take it over the NDR. East of the A140, the NDR would continue as a dual carriageway, turning north eastwards around the northern boundary of the airport to a further new at-grade roundabout junction at the northern tip of the airport. The primary purpose of this roundabout is to allow the NDR to undertake a roughly 90 degree change of direction. From this roundabout, the NDR would continue to follow around the north east part of the airport boundary before turning eastwards and passing under the C246 Buxton Road; which would be re-aligned eastwards and cross over the NDR on a new bridge. The route of the dual carriageway NDR would then continue eastwards through the north of Beeston Park. This would then connect with both the B1150 North Walsham Road and the A1151 Wroxham Road via a new at-grade roundabout at each location, before entering the north eastern section of Rackheath Park approximately 250m from the western end of Sir Edward Stracey Road. The NDR would then turn toward the south-east, passing under re-aligned Newman Road, which will run over the NDR via a new Bridleway/Private Access accommodation bridge.

- 7.4. The NDR would then connect with the C283 Salhouse Road via a new at-grade roundabout, before rising up on an embankment (maximum height approximately 8.5m) to cross both the Norwich to Sheringham rail line and the C874 Plumstead Road on individual bridges in close proximity, prior to a new roundabout on the NDR, which would connect it via new local connections and a further small at-grade roundabout to the C874 Plumstead Road.
- 7.5. The NDR route would then continue southwards, crossing the C442 Middle Road (which would pass over the NDR via a new bridge) before connecting with a new at grade roundabout known as the Business Park Roundabout.
- 7.6. At this point a single carriageway link is provided west to the existing Broadland Way/Peachman Way roundabout and includes an at-grade roundabout on the link road to the proposed Broadland Gate Business Park.

7.7. From the Business Park roundabout the NDR proceeds southwards as a dual carriageway to a new Postwick North East at-grade roundabout immediately north of the A47(T). This roundabout has links from a modified A47(T) eastbound diverge slip road and a new A47(T) eastbound merge slip road. The NDR continues over the A47(T) as a four lane carriageway one lane north and three South; on a new bridge and terminates at its southernmost point at a signalised junction, which replaces the existing Park and Ride roundabout with the A1042 Yarmouth Road.

7.8. This signalised junction provides further links:

- Directly to and from the park and ride site for buses;
- West to the existing Postwick North West roundabout, via the existing Postwick bridge over the A47(T);
- East to the proposed park and ride site entrance at the proposed Oak's Lane roundabout and further East to the Brundall Low Road junction with the A1042 Yarmouth Road to Postwick village; and
- West to the A47(T) via an existing westbound merge slip road.

7.9. The works at the A47 (T) Postwick Junction, will include modifications to the existing Postwick North West roundabout (as a result of closing the existing eastbound diverge slip road) and to the existing A1042 Yarmouth Road overbridge of the A47(T) to provide revised traffic lanes and the provision of a shared use cycle/footway.

8. **JUNCTIONS**

8.1. Grade separated junctions will be required in the following locations:

- A140 Cromer Road (to include eastbound and westbound merge and diverge slip roads) (Chainage 6800)
- A47 Postwick (to include new roundabout east of the existing roundabout with provision of new eastbound diverge and eastbound merge slip roads)

to/from the A47(T)) (Chainage 19450 – 20400)

8.2. At-grade junctions will be required in the following locations:

- A1047 Fakenham Road (Chainage 510)
- C262 Fir Covert Road (Chainage 1750)
- C621 Reepham Road (Chainage 2910)
- C282 Drayton Lane (Chainage 5330)
- B1150 North Walsham Road (Chainage 12100)
- A1151 Wroxham Road (Chainage 14240)
- C283 Salhouse Road (Chainage 16100)
- 874 Plumstead Road (South) (Chainage 17300)

8.3. On-line access roundabouts will be required in the following locations:

- Northernmost point of Norwich Airport to include a new access to the Petans offshore training facilities and secure access to Norwich International Airport. (Chainage 9120)
- At the proposed Broadland Gate Business Park location to link the NDR new road to the proposed Broadland Gate link road. (Chainage 19450 – 20400)

8.4. Off-line roundabouts will be required in the following locations:

- C282 Drayton Lane/B1149 Holt Road junction
- C874 Plumstead Road (North)
- Proposed site of the Broadland Gate Business Park

8.5. Major/minor priority junction will be required in the following location:

- C282 Drayton Lane/C621 Reepham Road

9. STRUCTURES

9.1. Structures will be required in the following locations:

9.1.1. New Overbridges

- Marriott's Way – permissive path providing a pedestrian, cycling and horse riding facility along the route of disused railway. (Chainage 2390)
- Bell Farm Track – Horsford Restricted Byway No. 5 and private means of access. (Chainage 3980)
- A140 Cromer Road (Chainage 6800)
- C246 Buxton Road (Chainage 10940)
- Private means of access leading from Newman Road (Chainage 15500)
- C442 Middle Road (Chainage 18060)

9.1.2. New Underbridges

- Norwich to Sheringham railway line (Chainage 16920)
- C874 Plumstead Road (Chainage 17010)
- New flood culvert/bat underpass which will be located to the West of Rackheath (Chainage 14810)
- A47 Trunk Road at Postwick (Chainage 2022)

10. WILDLIFE STRUCTURES

10.1. In addition to the above, structures would be provided to facilitate the movement of wildlife across the road and also confinement of some species.

These comprise:

- Badger fencing to confine badger movement and prevent access to carriageway at Deighton Hills, Drayton Drewray, Marriott's Way and Sprowston Wood.
- Seven high level bat bridges at Chainage's 760, 5780, 10020, 12650, 13140, 17730 and 19000 linking to tree canopies, to facilitate the movement of bats across the NDR. These would comprise poles with a horizontal steel structure covered with netting approximately three metres wide between the tree canopies and supported on poles placed so the ends are close to tree branches.
- Deer reflectors to discourage deer from the carriageway.

11. DRAINAGE

11.1. Highway drainage has been designed, in consultation with the Environment Agency, using the principles of sustainable drainage in accordance with government guidance set out in Planning Policy Statement (PPS) 25 and the DMRB and the Construction Industry Research and Information Association (CIRIA) Report C697. Various legislative controls and guidance on ground

and surface water quality will also be followed, and assessments made using guidance within the DMRB.

- 11.2. The majority of the scheme will be drained using a system of grass swales, which will convey water from the carriageway into 30 infiltration basins eventually resulting in the runoff discharging into the ground.

12. PUBLIC UTILITIES

- 12.1. Various utility services are present along the NDR route, mainly on arterial roads crossing the NDR where plant will be protected or diverted. The affected utilities are:

- Anglian Sewage
- Anglian Water
- UK Power Networks
- National grid Gas mains
- Vodafone
- Virgin Media
- High Pressure Gas (GPSS)
- BT

13. LANDSCAPING

- 13.1. Landscaping is shown on the Engineering Layout Drawings Appendix D and is proposed beyond areas where sight-lines are required, the principal measures being:

- Planting of side slopes
- Provision of boundary hedges
- Combined ecological and landscape mitigation areas to link existing woodland areas, comprising a mixture of woodland, scrub and grassland.
- Additional planting by agreement with adjacent landowners to augment the

roadside planting.

- Larger blocks of planting proposed at adjacent fields in conjunction with earth mounding at specific locations where screening is required for affected properties.

14. NON MOTORISED USERS (NMU)

- 14.1. Public rights of way and private access track proposals are on the Engineering Layout Drawings Appendix D. The NDR should bring benefits for NMUs in conjunction with the aim of the NDR scheme to reduce traffic levels on local roads. This should provide a more conducive environment for pedestrians and cyclists and encourage a greater number of journeys by these modes. Wider NMU links are shown on the drawing in Appendix F.
- 14.2. PROW proposals have been consulted on with relevant user groups (Ramblers, Cyclists, Sustrans, British Horse Society) and the Local Access Forum (set up under the Countryside and Rights of Way Act to represent users of soft roads and public rights of way).
- 14.3. An NMU Audit is currently being undertaken and will be submitted as part of the Stage 2 Safety Audit.

15. SIGNAGE

- 15.1. The NDR will be signed in accordance with The Traffic Signs Regulations and General Directions 2002 including the Traffic Signs Manual, and other relevant standards. This will include all relevant warning and regulatory signs, direction signs to provide route information and other information signs that are considered necessary. Signing will be required on the NDR and the side roads which join it. Other signs on the existing road network may need to be

modified to take account of the introduction of the NDR, to be compatible with both the Highway Agency and the County Councils routing strategies. Signs will be unlit where Regulations permit; those that will require illumination will be within 50 yards of a street lighting system.

16. LIGHTING

16.1. The majority of the proposed scheme will not be lit. The exception to this is the Postwick area of the scheme which will provide lighting as follows:

- From the Business Park roundabout West to the Peachman Way roundabout on 10m high columns. (Chainage 19450 – 20400)
- South to and including the Postwick North East roundabout on 12m high columns. (Chainage 19450 – 20400)
- South from the Postwick North East roundabout across the new overbridge to the signalised junction on 12m high columns. (Chainage 19450 – 20400)
- The signalised junction on 12m high columns. (Chainage 19450 – 20400)
- On the modified A47(T) bridge on 10m columns. (Chainage 19450 – 20400)
- From the modified A47(T) bridge to and including Postwick North West roundabout on 12m high columns. (Chainage 19450 – 20400)

17. VEHICLE RESTRAINT SYSTEMS

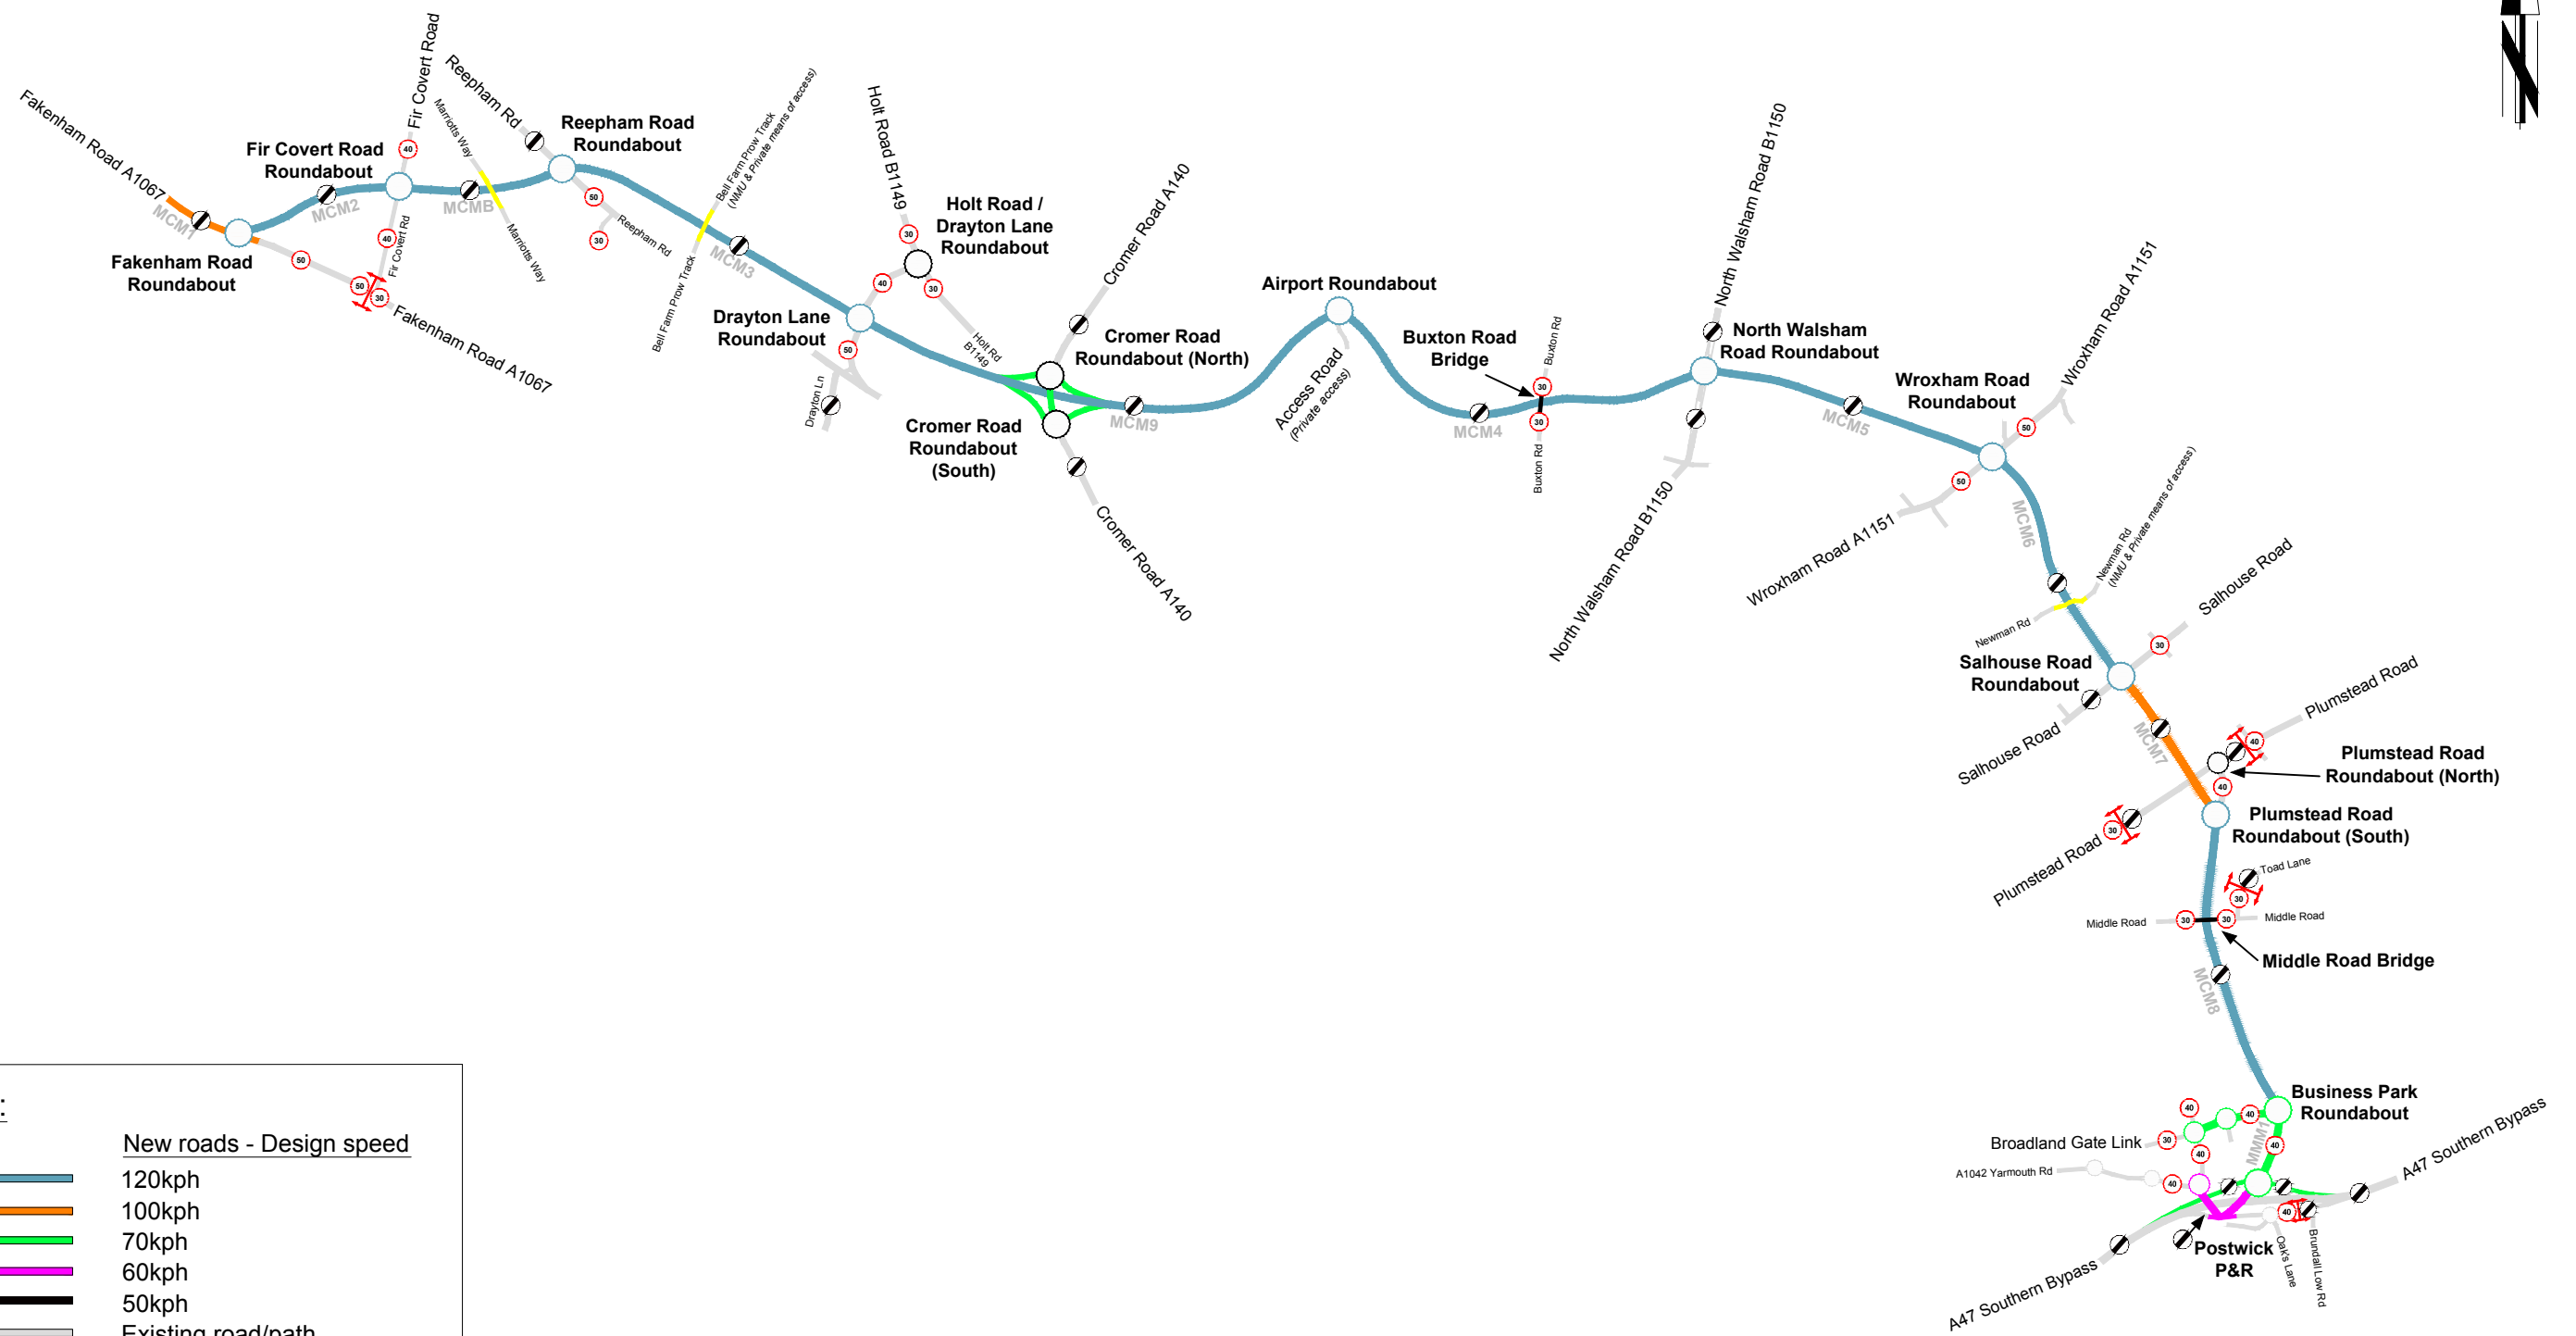

- 17.1. The development of the proposals for vehicle restraint systems (VRS) have been assessed and designed dependent on whether the section of the scheme forms part of the Trunk Road Network or the Local County Highway Network.
- 17.2. On the Trunk Road sections of the scheme, the provision of VRS has been assessed and designed in accordance with the DMRB TD19/06 and the Road Restraint Risk Assessment Process (RRRAP)
- 17.3. A Speed limit of 40mph is proposed for the Postwick Junction links, which form part of the local County Highway network. Consequently, the provision of VRS has been assessed using the emerging "The Use of Vehicle Restraint Systems in Norfolk" guidance on County Roads developed by Norfolk County Council.
- 17.4. The NDR from Business Park roundabout north-westwards is subject to national speed limit, therefore it is considered more appropriate for VRS to be assessed in accordance with the DMRB TD19/06 and the Road Restraint Risk Assessment Process (RRRAP), and will be submitted as part of the Stage 2 Safety Audit.

18. DRAWINGS

- 18.1. Relevant drawings are provided in the Appendices as follows:
 - The NDR Layout – Design Speeds drawing number R1C093-R1-4342, Appendix A (Naming conventions, design speeds and speed limits are shown on this drawing)
 - The Engineering Layout Sheets 1 - 12, drawings numbers R1C093-R1-4003E to 4014E in Appendix D (Public rights of way and private access tracks are shown on these drawings)
 - Typical cross-sections drawings numbers R1C093-R1-5115 to 5130 in Appendix E

- Individual Junctions drawings numbers R1C093-R1-4068C to 4080C, 4297C, 4302A & 4303A in Appendix B
- Non-Motorised User Links drawing number R1C093-R1-4053A in Appendix F

Appendix A
NDR Layout – Design Speeds
(Drawing No R1C093-R1-4342)

Key:

- New roads - Design speed 120kph
- 100kph
- 70kph
- 60kph
- 50kph
- Existing road/path
- Non motorised user (NMU) crossing
- 50 Speed limit MPH/National
- MCM9 Link road reference number

R1C093-GP04- Holt Road / Drayton Lane Roundabout		
Drawing No: R1C093-R-4071C		
Description	Measurement	Notes
D = inscribed circle diameter	40.0	
central island diameter	28.0	
Arm A:- Holt Road Northbound		
v = approach half width	3.3	
e = entry width	6.0	
l' = effective flare length	30.4	
r = kerb entry radius	20.0	
∅ = entry angle	44°	
Segregated left turn lane	No	
Arm B:- Holt Road - NDR Link Road Eastbound		
v = approach half width	3.3	
e = entry width	6.0	
l' = effective flare length	12.2	
r = kerb entry radius	20.0	
∅ = entry angle	43°	
Segregated left turn lane	No	
Arm C:- Holt Road Southbound		
v = approach half width	3.3	
e = entry width	6.0	
l' = effective flare length	14.4	
r = kerb entry radius	20.0	
∅ = entry angle	37°	
Segregated left turn lane	No

NDR Stage 1 Safety Audit Report

November 2013

INTRODUCTION

This report contains the results of a Stage 1 Safety Audit carried out on the above scheme. The Audit was carried out at the request of Norfolk County Council Highways Group.

The Audit Team membership was as follows:-

Nevil Calder BSc(Hons) CEng MICE MCIHT MSoRSA (Audit Team Leader)	Principal Consultant Mott MacDonald
--	--

Kevin Allen BEng(Hons) IEng MCIHT MSoRSA (Audit Team Member)	Project Engineer Network Analysis + Safety Norfolk County Council
---	---

Specialist Advisors:-

Andrew Sykes	Casualty Reduction Officer Norfolk County Council
--------------	--

The Audit took place at Carrow House on 08 and 14 November 2013. The audit comprised an examination of the Safety Audit submission document, previous safety audits of the scheme and a site inspection on 14 November 2013 by the Audit Team Leader. The weather was bright and road surfaces dry.

The terms of reference are as described in Environment, Transport and Development Highways Service Manual Procedure SP03-07. The Auditors have examined and reported only on the road safety implications of the scheme as presented and have not verified the compliance of the design to any other criteria.

ITEMS RAISED AT PREVIOUS AUDIT

Some safety issues raised at previous safety audits (stage 0 March 2007, stage 1 Dec 2008 and Feb 2012) have not been fully addressed and are referred to again in this report under items 1.1, 2.3, 5.1 and 5.3.

ITEMS RAISED AT THIS STAGE 1 AUDIT

1.0 General

1.1 Problem

Location: roadside throughout the scheme

Summary: risk of high severity impact with mature trees

Details of proposed planting were not included in this submission. On high speed roads mature trees present a significant hazard to errant vehicles, resulting in high severity injuries.

Recommendation

In accordance with TD19/06 no shrub planting should occur within 4.5m of the carriageway and no climax species within 9.0m unless protected by VRS.

Consideration should also be given to sideslope gradients within these distances.

Slopes steeper than 1in3 are considered non-traversable ie. on downslopes errant vehicles are likely to rollover or speed up towards any hazard at the bottom.

Where planting is proposed adjacent to visibility splays it should be set back at least 1m in order to allow for future growth. Permanent markers delineating such splays can assist future maintenance.

1.2 Problem

Location: roadside throughout the scheme

Summary: risk of high severity impact with roadside fencing

Details of proposed fencing were not submitted at this stage. On high speed roads fencing with rigid horizontal rails presents a significant hazard to errant vehicles. Impact can result in penetration of the vehicle cabin causing high severity injuries.

Recommendation

On NDR mainline no fencing should have rigid horizontal rails

2.0 Alignment

2.1 Problem

Location: CH8200 and CH10200

Summary: visibility partially obstructed by median VRS

There are locations where visibility appears to be restricted to 2 steps below standard by median VRS in combination with horizontal curvature of 1 step below. This obstruction to visibility is partial (only affects lower height objects) and occurs on non-event sections, away from junctions where braking/queuing might be anticipated; however it should be noted as a departure from standard.

Recommendation

In order to minimise the obstruction to visibility, a median VRS of the wire rope barrier type is recommended due to its narrow profile and lower height.

2.2 Problem

Location: CH8600 approach to airport roundabout

Summary: visibility obstructed by median VRS

Visibility appears to be restricted by the median VRS to 1 step below standard on approach to a roundabout junction. As above, the obstruction is partial, however a departure from standard is not considered appropriate here due to the likelihood of braking/queuing.

Recommendation

Check visibility and amend the alignment and/or widen the median in order meet standard SSD.

2.3 Problem

Location: CH18700

Summary: lay-by provision introduces conflicts

In view of the distributor nature of the road and frequent junction provision, a strategy of non provision of lay-bys has been adopted. The proposed lay-bys at this point are the only ones on the 21km length and the exceptional nature of this location is not understood. They appear to introduce unnecessary potential conflicts.

Recommendation

Delete the proposed lay-bys.

3.0 Junctions

3.1 Problem

Location: NDR roundabouts - radial route approaches

Summary: splitter island lengths

The splitter islands on many of the radial route arms are shorter than desirable on a high speed approach. A longer island would aid conspicuity (particularly as roundabouts will be unlit), improve tangential guidance and minimise risk of crossover accidents on busy exits.

Recommendation

Extend splitter island lengths to 30-50m where practicable.

3.2 Problem

Location: Fakenham Road roundabout

Summary: narrow 3 lane entry/circulatory increases risk of side swipe collisions

The 3-lane north-western entry feeding into a 9m circulatory carriageway is considered to raise the risk of side swipe collisions. Projected traffic flows here do not appear to require 3 lanes.

Recommendation

Reduce the Fakenham Road north-west entry to 2 lanes. This may also offer the opportunity to improve the tangential path guidance provided by the splitter island.

3.3 Problem

Location: Fakenham Road roundabout

Summary: relaxed entry path curvatures raises risk of failure to give way

The entry path radius on the Fakenham Road SE arm appears to be in excess of 100m raising the risk of failure to give way.

Recommendation

Check entry path radius and modify geometry as necessary.

3.4 Problem

Location: Fir covert Road roundabout

Summary: excessive circulatory width for projected flows

The 12m circulatory width (in common with other NDR roundabouts) appears excessive for the projected flows here. This can lead to poor lane discipline, higher speeds and increased risk of accidents on the circulatory area.

Recommendation

Review the need for such a wide circulatory carriageway. If the capacity is judged necessary in the long term then temporary measures to reduce the width may be appropriate.

3.5 Problem

Location: Reepham Road roundabout

Summary: SE arm geometry safety implications

Inadequate tangential guidance is provided by the splitter island on the SE arm which raises the risk of striking the central island or losing control. The flare length also appears to be very short raising concern over potential queuing on this arm.

Recommendation

Review the geometry of this arm to address these issues.

3.6 Problem

Location: Cromer Road westbound merge slip road

Summary: 2-way layout poses risk of head-on collisions

The length of the proposed 2-way section coupled with low eastbound usage raises concern over westbound drivers using it either deliberately or mistakenly for overtaking.

Recommendation

Reposition the access to lagoon 8A to its SE corner thereby significantly shortening the 2-way length to mitigate this risk.

3.7 Problem

Location: Various roundabouts

Summary: Private/service accesses

A number of the roundabouts have an arm serving private access to farms or drainage lagoons. This adds to the complexity of the roundabout layout which can have

adverse safety implications. In addition to clear signing, a different surface treatment would help differentiate these exits for circulating traffic.

Recommendation

Provide flush kerbs and a band of contrasting coloured surfacing to these arms.

3.8 Problem

Location: Airport roundabout

Summary: southern arm layout is potentially misleading for drivers

A 2-lane exit from the roundabout is shown for the private access road to the Airport and Petans training centre. This will make it look unnecessarily like the other dual carriageway exits, increasing the potential for driver confusion. The airport access in particular will need to be gated to avoid inadvertent entry to the airfield.

Recommendation

Redesign this arm to reduce the potential for confusion, providing conspicuous gates together with turning facilities for any errant vehicle to rejoin NDR without reversing onto the roundabout.

3.9 Problem

Location: Broad Lane closure at Plumstead Road

Summary: farm road offers potential rat-run

A farm access road is indicated which bypasses the closure point at the Broad Lane junction. This could be attractive to general through traffic, eroding the benefit of the closure and increasing use of the lower standard farm access junction.

Recommendation

Ensure that the access road is gated

3.10 Problem

Location: Business Park Roundabout

Summary: high speed approach to segregated straight ahead lane

As noted in TD51 (parag 2.71), segregated straight ahead lanes have a number of inherent safety issues. These are exacerbated on a high speed dual carriageway where traffic approaching at 70mph is required to safely negotiate reverse curves of radius more than 6 design steps below standard. The reverse curves make application of superelevation extremely problematical. There is therefore a high attendant risk off loss of control, run-off accidents and HGV rollover.

Recommendation

Reconsider whether this feature is essential (it appears that conflicting traffic on the circulatory is limited to a single lane entry from the Business Park Link which will be interrupted by frequent northbound NDR traffic). If so, then provide measures to reduce speeds on entry to the segregated ahead lane to less than 40mph; the proposed mandatory speed limit is unlikely to suffice. In addition provide measures to mitigate against loss of control (eg high friction surfacing) and potential run-off (eg VRS).

4.0 Non-motorised Users

4.1 Problem

Location: Fir Covert Road Roundabout

Summary: bridleway ends at busy roundabout

A bridleway is indicated on the south side of NDR between Marriotts Way and Fir Covert Road. However this would bring horses out onto Fir Covert Rd roundabout with no obvious continuation of the facility.

Recommendation

Redesignate this stretch as footway/cycleway only.

4.2 Problem

Location: Reepham Road Roundabout

Summary: bridleway adjacent to busy roundabout

A bridleway is indicated on the north-western side of the roundabout in close proximity to the circulatory area where horses may be startled by the close proximity to heavy traffic. Furthermore the bridleway appears to be shown crossing Reepham Road using the roundabout splitter island which is not considered a safe refuge for horses.

Recommendation

Realign the bridleway route further from the roundabout to link with the specific horse crossing of Reepham Road.

4.3 Problem

Location: bridleway - CH10900 beneath Buxton Rd overbridge

Summary: proximity of bridleway to NDR mainline

A bridleway is indicated passing beneath the Buxton Rd overbridge adjacent to the westbound carriageway of NDR. The proximity to oncoming fast moving heavy traffic within the confines of the bridge structure is considered likely to be intimidating for horses with potential for rearing/bolting. This not only poses a danger to riders but also to NDR traffic should fencing not contain the animal.

Recommendation

Delete this section of bridleway; an alternative route appears to be available.

4.4 Problem

Location: Wroxham Road Roundabout

Summary: bridleway adjacent to busy roundabout

A bridleway is indicated on the south-eastern side of the roundabout in close proximity to the circulatory area where horses may be startled by the close proximity to heavy traffic. This appears to be a shared pedestrian cycle route posing a danger to other users. Furthermore there is concern about the risk of pedestrian/cycle crossing points being mistakenly used by horse riders.

The identified horse crossing point on the southern arm of Wroxham Road is around 120m from the roundabout suggesting that visibility in that direction will be less than recommended in TA90 even assuming 50kph roundabout exit speeds.

Recommendation

Realign the horse route further from the roundabout, segregated from ped/cycle use if possible. Move the horse crossing point further from the roundabout.

4.5 Problem

Location: CH17000 Road Roundabout

Summary: bridleway adjacent to railway line

A bridleway is proposed between Plumstead Road and Broad Lane directly adjacent to the railway line. Although rail traffic is quite light, horses may be startled by their close proximity, with potential for rearing/bolting.

Recommendation

Provide secure fencing/screening between bridleway and railway.

4.6 Problem

Location: bridleway - Plumstead Rd South Roundabout to CH17700

Summary: proximity of bridleway to NDR mainline

A bridleway is indicated adjacent to roundabout circulatory and southbound carriageway of NDR. Horses may be startled by the close proximity to fast moving heavy traffic, with potential for rearing/bolting. This poses a danger to riders and also to NDR traffic.

Recommendation

Move the proposed bridleway further from the carriageway and provide screening/fencing.

5.0 Signs, Lighting and Markings

5.1 Problem

Location: throughout the scheme

Summary: lack of street lighting increases night time accident risk

It is noted that the cost/benefit of lighting the scheme has been subject to a separate safety assessment in accordance with TD47/07 and that lighting is not proposed except for the complex Postwick interchange. Nevertheless there is some concern about night time risk, particularly at the large multi-lane roundabouts where some mitigation measures would be beneficial.

Recommendation

Full provision of white, red, amber and green road studs is recommended throughout in accordance with the TSM. Reduced stud spacing may be advantageous on approach to the unlit roundabouts. It is also recommended that key signs associated with the roundabout junctions should be lit, particularly direction signs at each exit (on the circulatory area the sweep of headlights tends to lag behind the driver's viewpoint).

Lighting is particularly beneficial to the safety of vulnerable road users. It may be considered that VRU crossing points at the roundabouts are initially likely to be very lightly used at night. However this should be reviewed in future in conjunction with planned development within and close to the NDR.

5.2 Comment

Location: NDR mainline

Summary: safety benefit of raised profile edge lines

Specific details of road markings were not submitted at this stage. However raised profile edge markings are recommended, not only for the benefit of audio vibratory warning but also improved night time and wet weather visibility.

5.3 Comment

Location: roadside throughout the scheme

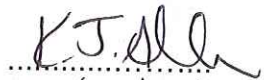

Summary: risk of high severity impact with large diameter sign posts and lighting columns

Post details were not submitted at this stage. However the benefits of passive posts should be assessed in accordance with NCC policy *The Use of Passively Safe Street Furniture in Norfolk*

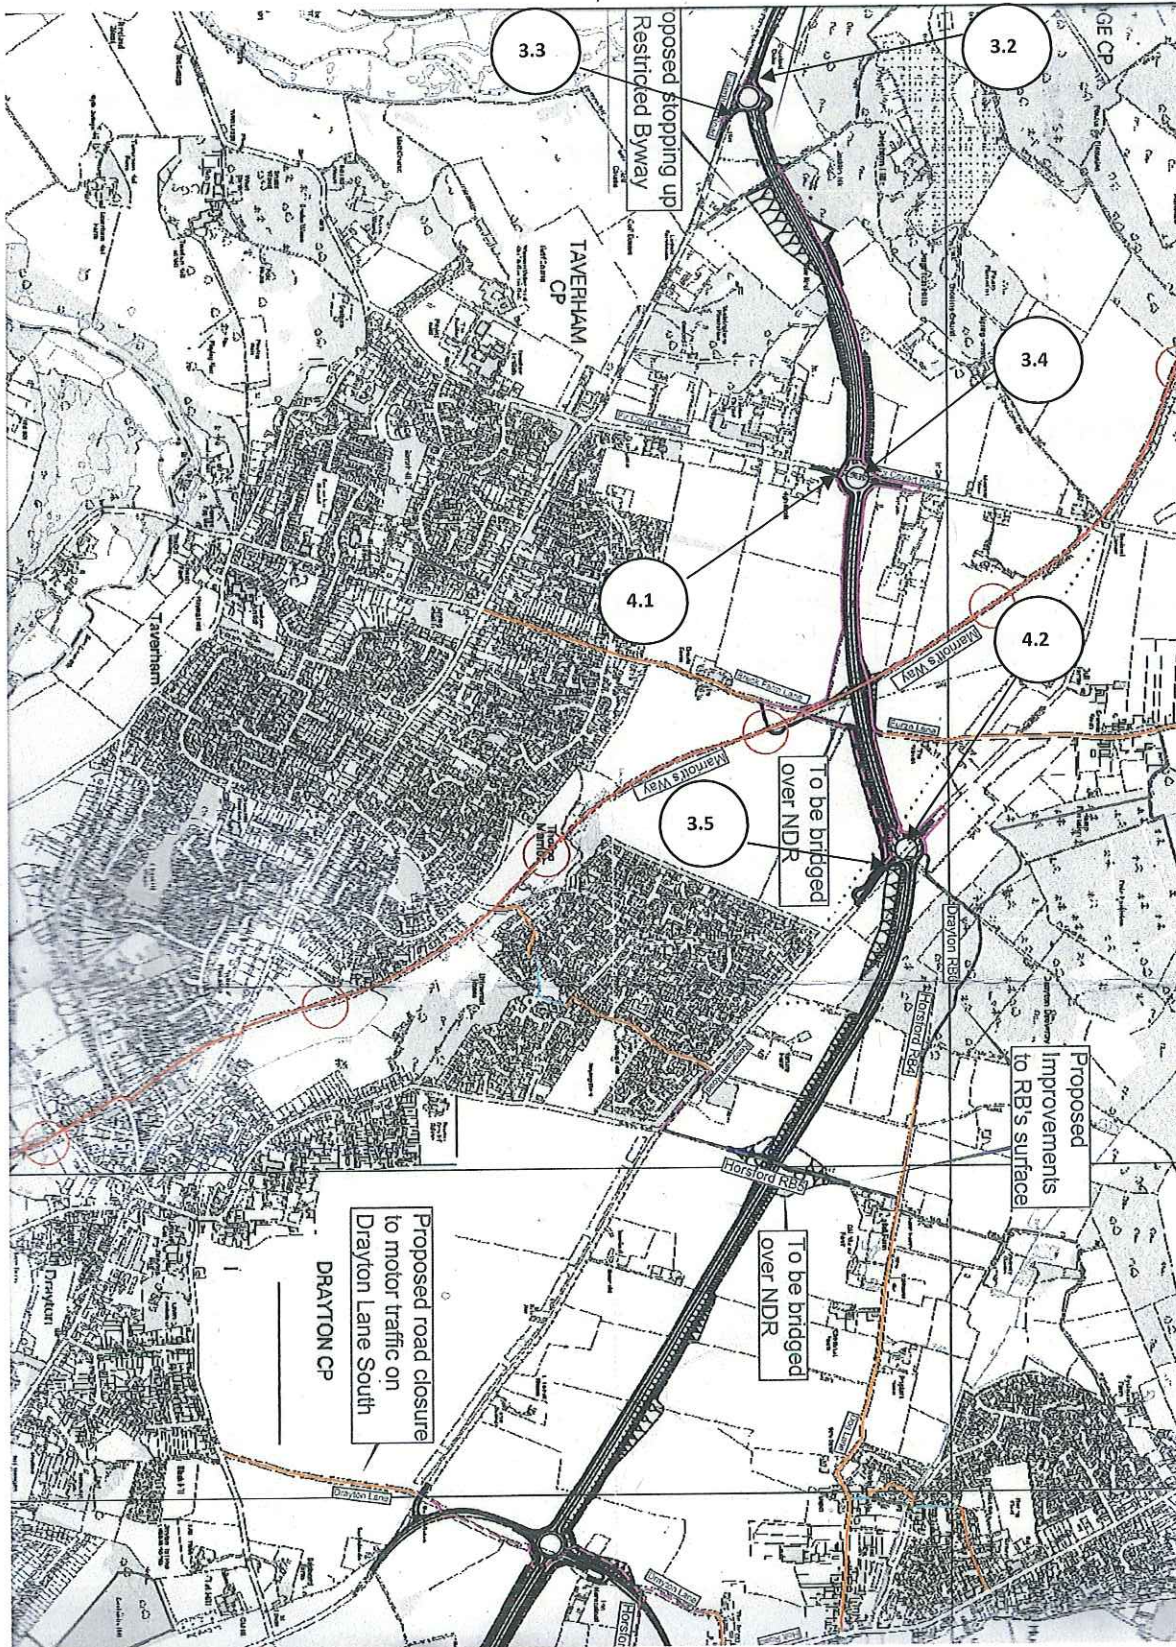

AUDIT TEAM STATEMENT

We certify that this audit has been carried out in accordance with Norfolk County Council Environment, Transport and Development Procedures.

Introduction

This report is the Designer's response to the Stage 1 Road Safety Audit carried out on the Norwich Northern Distributor Road (NDR). Text extracted from the Stage 1 Road Safety Audit is indicated in italics. The Designer's response to each comment follows the Auditor's original Summary and Recommendation.

The Stage 1 Road Safety Audit report is titled **Norwich NDR Stage 1 Safety Audit** and is dated **14 November 2013**.

Items Raised At This Stage 1 Audit (using the Auditors' numbering references)

1 General

- 1.1 Location: roadside throughout the scheme**
Summary: risk of high severity impact with mature trees
Designer's Response: Agree

Detailed design of the landscape and planting proposal will be carried out in accordance with the recommendation.

- 1.2 Location: roadside throughout the scheme**
Summary: risk of high severity impact with roadside fencing
Designer's Response: Agree

Generally, fencing along the highway boundary will be post and wire with hedge planting where required. We will take into consideration the recommendation during ongoing discussions with landowners and during detailed design.

2 Alignment

- 2.1 Location: CH8200 and CH10200**
Summary: visibility partially obstructed by median VRS
Designer's Response: Disagree

We have investigated this issue and we can confirm that visibility will be restricted to 1 step below standard. Therefore in combination with horizontal curvature of 1 step below standard this is the relaxation and not a departure from standard.

- 2.2 Location: CH8600 approach to airport roundabout**
Summary: visibility obstructed by median VRS
Designer's Response: Disagree

We have investigated this issue and we can confirm that visibility of 295m will be achieved on approach to the Airport roundabout.

2.3 Location: CH18700
Summary: lay-by provision introduces conflicts
Designer's Response: Disagree

The provision of Lay-bys has been considered in accordance with TD 69/07. The spacing of Junctions on the scheme (on average 1 per 2km) is more frequent than the recommended frequency of lay-bys (1 per 2.5km) and therefore generally obviates the need for lay-bys. However two lay-bys on either side of the NDR at chainage 18700 are proposed due to their proximity to the strategic road network where journeys could involve longer distance routes and so their provision is considered appropriate at this location.

3 Junctions

3.1 Location: NDR roundabouts - radial route approaches
Summary: splitter island lengths
Designer's Response: Disagree

The proposed junction layout including splitter islands complies with the current design standard.

3.2 Location: Fakenham Road roundabout
Summary: narrow 3 lane entry/circulatory increases risk of side swipe collisions
Designer's Response: Agree

We will consider modifying the layout from three lanes to two lanes at detailed design stage.

3.3 Location: Fakenham Road roundabout
Summary: relaxed entry path curvatures raises risk of failure to give way
Designer's Response: Disagree

We have investigated this issue and we can confirm that the entry path radius is below 100m in accordance with the current design standard.

3.4 Location: Fir covert Road roundabout
Summary: excessive circulatory width for projected flows
Designer's Response: Agree

We will review the circulatory width at the detailed design stage.

3.5 Location: Reepham Road roundabout
Summary: SE arm geometry safety implications
Designer's Response: Agree

We will review the tangential alignment of the splitter island at the detailed design stage.

- 3.6 Location: Cromer Road westbound merge slip road**
Summary: 2-way layout poses risk of head-on collisions
Designer's Response: Disagree

The drainage lagoon 8A will be accessed from Holly Lane. The 2-way carriageway is only proposed up to the Lagoon 8 access point.

- 3.7 Location: Various roundabouts**
Summary: Private/service accesses
Designer's Response: Agree

We will review the use of the different surface treatment at detailed design stage.

- 3.8 Location: Airport roundabout**
Summary: southern arm layout is potentially misleading for drivers
Designer's Response: Agree

We will review the possibility of reducing the exit width at detailed design stage and also ensure that appropriate signing and gating is provided to avoid inadvertent entry to the airfield. The signing will be developed during detailed design and submitted as part of the Stage 2 Safety Audit.

- 3.9 Location: Broad Lane closure at Plumstead Road**
Summary: farm road offers potential rat-run
Designer's Response: Agree

Access road will be gated.

- 3.10 Location: Business Park Roundabout**
Summary: high speed approach to segregated straight ahead lane
Designer's Response: Agree

The segregated straight ahead filter lane is necessary at this location. Speed reduction measures will be investigated at detailed design stage.

4 Non-motorised users

- 4.1 Location: Fir Covert Road Roundabout**
Summary: bridleway ends at busy roundabout
Designer's Response: Disagree

A physical barrier will be provided at Fir Covert Road to avoid inadvertent equestrian access onto Fir Covert Road.

- 4.2 Location: Reepham Road Roundabout**
Summary: bridleway adjacent to busy roundabout
Designer's Response: Agree

As part of the detailed design, we will review the proposals and realign the bridleway as far as possible from the roundabout. Fence segregation between footway/cycleway and the bridleway will be provided. A cycle barrier will be installed to prevent equestrians using the roundabout splitter island.

4.3 Location: bridleway - CH10900 beneath Buxton Rd overbridge
Summary: proximity of bridleway to NDR mainline
Designer's Response: Disagree

Clear signing and cyclist barrier will be provided to encourage equestrians to use the alternative route and a barrier to prevent equestrian's access to the underpass. The facility is suitable for cyclists and pedestrians and eliminates the need to cross Buxton Road.

4.4 Location: Wroxham Road Roundabout
Summary: bridleway adjacent to busy roundabout
Designer's Response: Agree and Disagree

As part of the detailed design, we will review the proposals and realign the bridleway as far as possible from the roundabout.

The equestrian crossing point is only 15m less than the 135m which is described in the design standard as a preferred minimum (and not an absolute minimum). The design will maximise visibility at the crossing point. Also, visibility is in excess of stopping site distance for main line vehicular traffic.

All bridleways are intended for shared use by equestrians, cyclists and pedestrians. A cycle barrier will be installed to prevent equestrians using the roundabout splitter island.

Positive signing will be developed at detailed design stage to encourage equestrians to use the designated crossing point.

4.5 Location: CH17000 Road Roundabout
Summary: bridleway adjacent to railway line
Designer's Response: Agree

We will investigate the possibility of fencing and hedge planting at detailed design stage.

4.6 Location: bridleway - Plumstead Rd South Roundabout to CH17700
Summary: proximity of bridleway to NDR mainline
Designer's Response: Agree

As part of the detailed design, we will review the proposals and realign the bridleway as far as possible from the roundabout and investigate the possibility of fencing and hedge planting.

5 Signs, Lighting and Markings

5.1 Location: throughout the scheme
Summary: lack of street lighting increases night time accident risk
Designer's Response: Agree

We will investigate the provision of white, amber and green road studs and the lighting of the key roundabout signs at detailed design stage.

- 5.2 Location: NDR mainline**
Summary: safety benefit of raised profile edge lines
Designer's Response: Agree

We will consider the use of raised profile edge markings at detailed design stage.

- 5.3 Location: roadside throughout the scheme**
Summary: risk of high severity impact with large diameter sign posts and lighting columns
Designer's Response: Agree

Passive posts will be considered at detailed design stage in accordance with The Use of Passively Safe Street Furniture in Norfolk.

5. Traffic Data	3
6. Other Data	

APPENDICES

- A Scheme Drawings
- B Photographs
- C
- D

1. Background

- (a) Traffic modelling work for the proposed NDR shows that there will be an increase in traffic along North Walsham Road (B1150). Turning right out of Crostwick Lane on to the B1150 is currently not easy manoeuvre, particularly during peak time, due to the traffic flow on to the B1150 as well as traffic joining from Rackheath Lane heading in to Norwich. The situation is made worse by the fact that the bell mouth of Crostwick Lane is only a single car width, meaning all cars whether they are performing a left or right turn or going straight ahead must all wait in the same queue.
- (b) The scheme is proposed to widen the existing bell mouth on Crostwick Lane to allow additional capacity for vehicles turning left on to the B1150 and close Rackheath Lane to remove the conflict with vehicles joining the B1150 from Crostwick Lane.

2. Design Standards

- (a) Design speed adopted – Original speed limits to be maintained (North Walsham Road 50mph, Rackheath Lane 60mph, Crostwick Lane 30mph)
- (b) Any departures from standards, giving reasons – There are no departures from standards

3. Plans

(a) General Scheme Layout

A general scheme layout is included in Appendix A - Drawing No. 233906-ES-01-C-DR-00-XX-002

i. Junctions, including visibility splays

The left side of the bell mouth on Crostwick lane will be widened to provide extra space for private cars or public service vehicle/refuse vehicle turning left while a private car is waiting at the giveway line.

ii. Parking

N/A.

iii. Accesses:-

Rackheath Lane will be closed and a turning head will be provided to accommodate HGVs before Rackheath, B1150 junction.

iv. Levels/gradients:-

There will be no significant changes to levels.

v. Details of abutments, parapets, fences, existing signs, central barriers, crests, vehicle parking, and any other restriction to visibility:-

There will be no restrictions to visibility.

vi. Accommodation works:-

There are no known accommodation works at this stage.

vii. Street lighting:-

Junction is not lit and no new lighting proposed.

viii. Signing and lining details, including diagram numbers, sizes and mounting heights:-

Road marking on B1150 needs to be updated. Removing arrows indicating right turn to Rackheath Lane. Signage design will be done as part of NDR.

ix. Drainage information:-

Gullies at the bell mouth of Crostwick lane and Rackheath lane need to be backfilled and new gullies will be provided along the new kerb. Existing kerb outlet needs to be removed and new one will be placed along the new kerb line, connected to existing outlet. See Appendix A – Drawing No. 233906-ES-01-C-DR-00-XX-003.

x. Kerbing details and surfacing information:-

Providing new kerbs at the edge of the widened carriageway and also providing new kerbs along the right side of B1150 to close Rackheath Lane.

xi. Existing and proposed TROs:-

Stopping up of existing Rackheath junction will be done as part of NDR.

xii. Safety fences/barriers:-

N/A.

xiii. Pedestrian provision, including refuges, guard railing, signing, dropped kerbs:-

Existing informal crossing will be kept. No new footway proposed.

xiv. Provision for cyclists:-

N/A.

xv. Equestrian provision:-

N/A.

xvi. Provision for disabled persons:-

N/A. Existing pedestrian facilities will not be affected.

xvii. Bus stops and lay-bys:-

N/A.

xviii. Landscaping:-

None

xix. Service apparatus:-

Existing BT cables and water pipe might be affected by the widening. See Appendix A – Drawing No. 233906-ES-01-C-DR-00-XX-100.

(b) Local Highway Network

A location plan showing the surrounding highway network is included in Appendix A – Drawing No. 233906-ES-01-C-DR-00-XX-001.

4. Site Photographs or Video Recording

Photographs are included in Appendix B.

5. Traffic Data

- (a) Route hierarchy status of all effected roads – Crostwick Lane, North Walsham Road (B1150), Rackheath Lane
- (b) Latest traffic counts, including turning movements where appropriate. Indication of presence of regular queuing or junctions operating near capacity –N/A.
- (c) Traffic forecast data – N/A.
- (d) Measured speed data – N/A.
- (e) Non vehicular movements – N/A.

6. Accident Data

07/11/2012 (Daylight) – Collision with vehicle from right – Slight
04/04/2013 (Daylight) – Right turn joining, head on – Slight
30/07/2013 (Daylight) – Tail end collision – Slight

7. Construction Programme & Operation

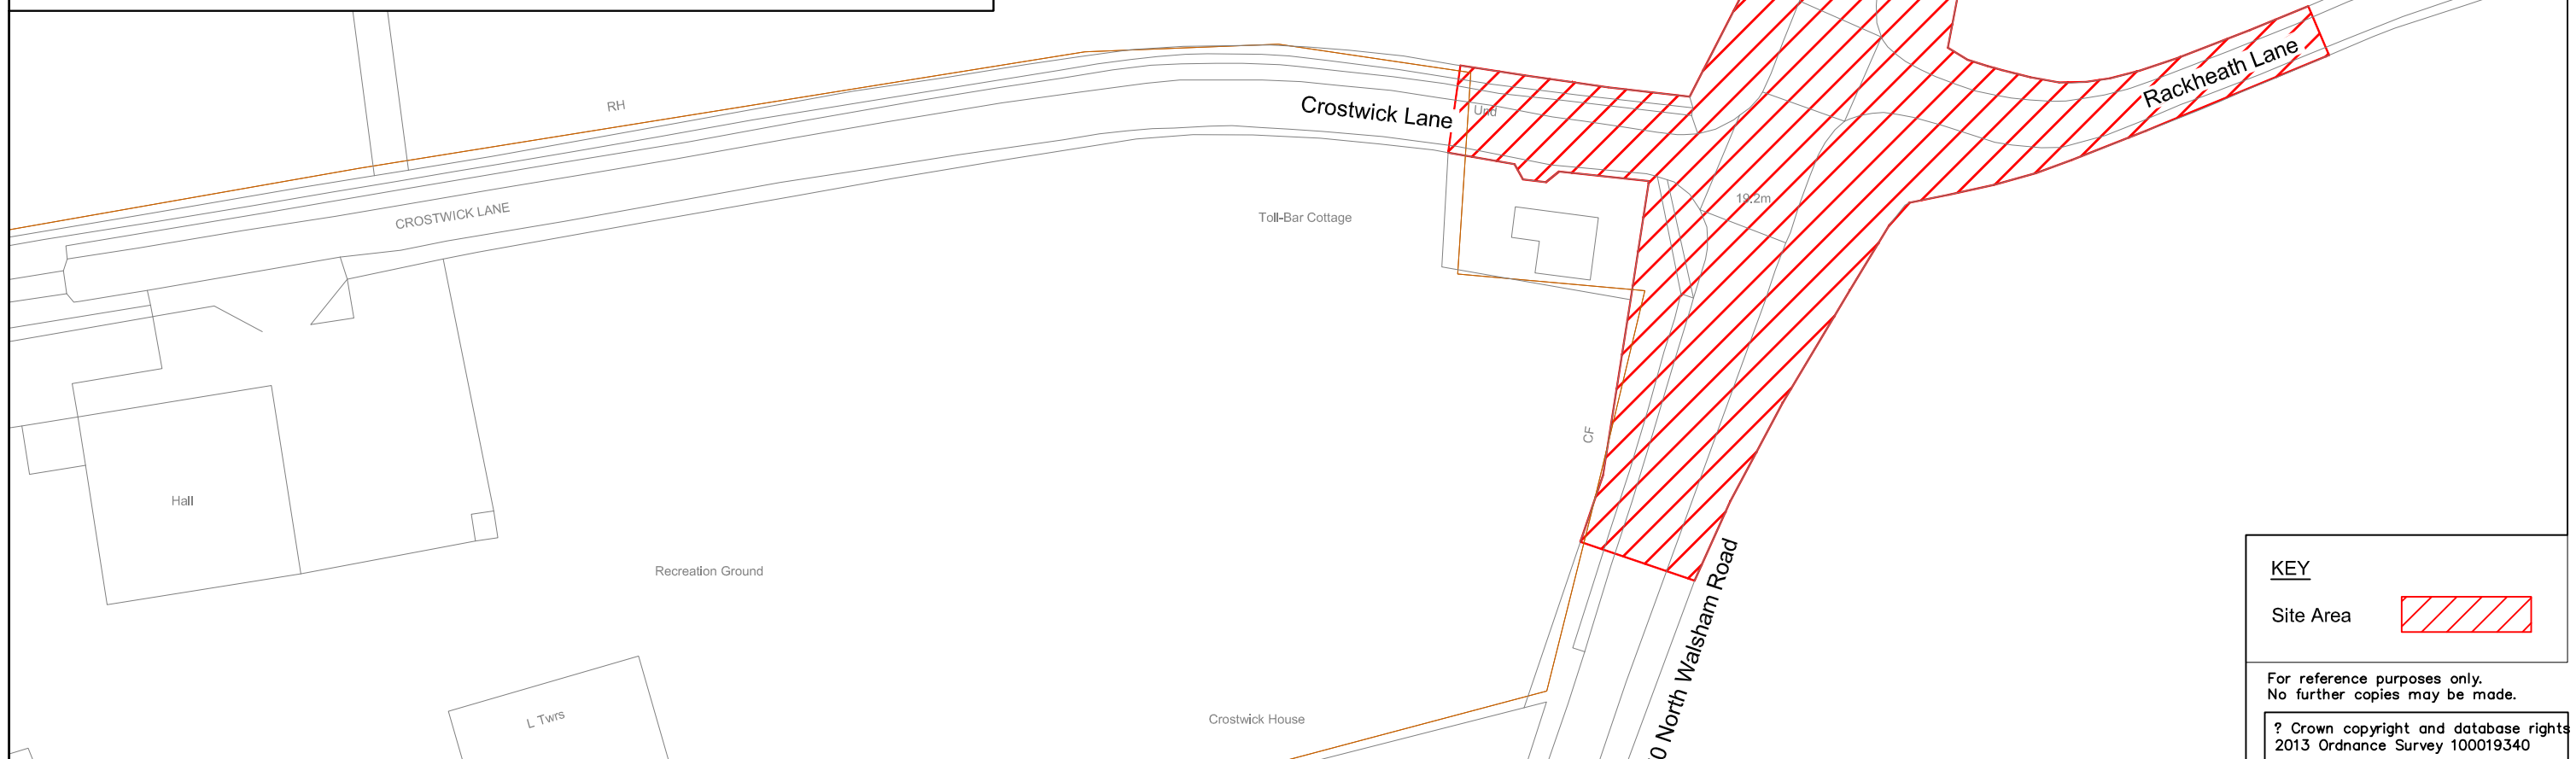

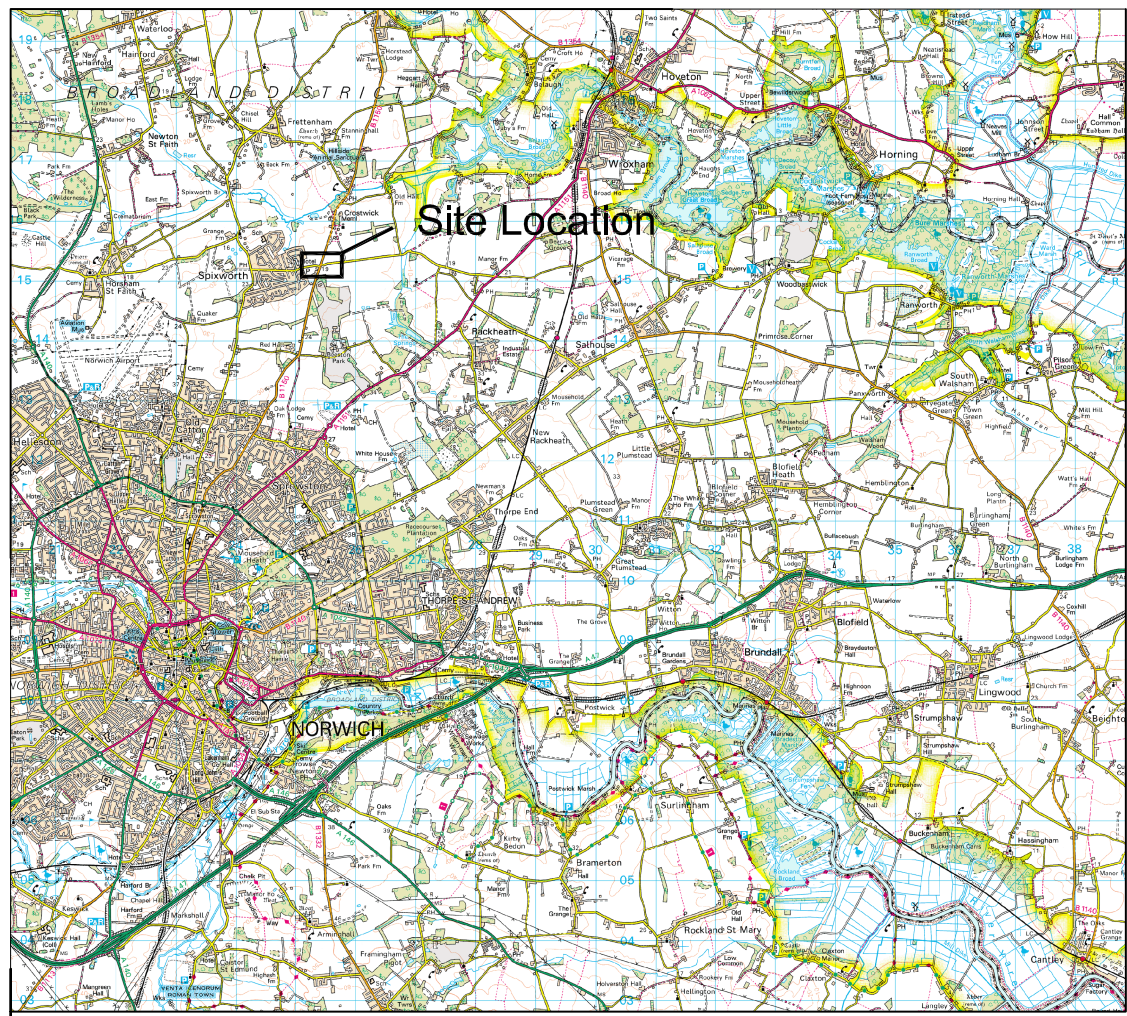

- (a) The scheme will form part of the NDR DCO application and will be delievered together with the mainline works.
- (b) Preliminary design is to be completed by the end of September 2013.
- (c) Detailed design - TBC

8. Other Relevant Information

N/A

- New carriageway
- Existing carriageway to become verge
- Grasscrete turning head
- Existing carriageway to be broken out
- Highway boundary
- Proposed carriageway

Notes

1. Preliminary layout based on the ordinance survey.
2. Provision for HGV's for the turning head.
3. Exact location of the junction will be determined based on the safety audit comments, junction capacity checks and the environmental impact assessment.
4. Signing design to be carried out as part of the NDR.

Utilities Affected:

1. Widening on Crostwick Lane - Utilities Present and Impact
 - BT - Likely to be affected
 - Water Pipe (90mm MDPE/PE80) - Likely to be affected
2. Breaking out existing carriageway on Rackheath Lane - Utilities Present and Impact
 - BT - Unlikely to be affected
 - Water Pipe - Unlikely to be affected

For reference purposes only.
No further copies may be made.

Part 1

B1150 Crostwick: Junction Improvement
Stage 1 Safety Audit
25 September 2013

INTRODUCTION

This report contains the results of a Stage 1 Safety Audit carried out on the above scheme. The Audit was carried out at the request of Norfolk County Council Highways Group.

The Audit Team membership was as follows:-

Nevil Calder BSc(Hons) CEng MICE MCIHT MSoRSA Principal Consultant
(Audit Team Leader) Mott MacDonald

Kevin Allen BEng(Hons) IEng MCIHT MSoRSA Project Engineer
(Audit Team Member) Network Analysis + Safety
Norfolk County Council

Specialist Advisors:-

Andy Micklethwaite Casualty Reduction Officer
Norfolk County Council

The Audit took place at Carrow House on 25 September 2013. The audit comprised an examination of the Safety Audit submission document and a site inspection on 26 September 2013 by the Audit Team Leader. The weather was bright and the road surface dry.

The terms of reference are as described in Environment, Transport and Development Highways Service Manual Procedure SP03-07. The Auditors have examined and reported only on the road safety implications of the scheme as presented and have not verified the compliance of the design to any other criteria.

ITEMS RAISED AT PREVIOUS AUDIT

No previous safety audit.

ITEMS RAISED AT THIS STAGE 1 AUDIT

1.0 General

1.1 No comment

2.0 Alignment

2.1 No comment

3.0 Junctions

3.1 Problem

Location: B1150 right turn into Crostwick Lane

Summary: substandard length RTL increases risk of tail-end collision

The proposed central right turn lane is not dimensioned but scales at 50m. While this is a considerable improvement on the existing situation, it is substandard for a 50mph road, increasing the risk of tail-end collision.

Recommendation

Increase the length of RTL to 65m in accordance with TD42. The adjacent eastern verge appears to offer scope to achieve the necessary carriageway widening.

3.2 Problem

Location: B1150 eastern verge/Rackheath Lane turning head

Summary: potential conflict between mainline traffic and turning traffic

The proposed turning head on Rackheath Lane lies within the eastern verge of B1150 presenting a number of safety issues:-

- Turning vehicles may appear to be on or entering the mainline, causing confusion/distraction to drivers on B1150. This will be exacerbated at night with the added risk of headlight dazzle.
- Any vehicle stationary in the turning head would be an obstruction of the verge, presenting a collision risk in event of a vehicle leaving the carriageway.
- The narrow width between the turning head and B1150 would be easy to cross encouraging abuse of the closure.

Recommendation

Provide a minimum 3.5m wide verge to B1150 free of obstruction. Behind this a physical closure should be provided (see also 4.1 below); ideally this should be a continuous hedgeline to give visual closure without posing a collision hazard to errant vehicles. Rather than provide a turning head at this location it may be better to gate Rackheath Lane at a point further east.

3.3 Comment

Location: Crostwick Lane approach to B1150

Summary: angle of intersection of the junction

Crostwick Lane currently meets B1150 at an angle of around 80degrees. In widening the bellmouth, the opportunity should be taken to true up the final approach to 90degrees in order to optimise driver positioning at the give way lane.

3.4 Comment

Location: Crostwick Lane approach to B1150

Summary: visibility to the left obstructed

It was noted at the time of site visit that the B1150 verge to the north of Crostwick Lane has been allowed to become overgrown by bushes which obstruct visibility to the left for drivers emerging from Crostwick Lane. This should be remedied as soon as possible to achieve 4.5m x 160m splay.

Bushes (behind sign array) obstructing visibility splay

4.0 Non-motorised Users

4.1 Problem

Location: B1150 at junction

Summary: risk of serious injury to NMUs in conflict with heavy traffic

The closure of Rackheath Lane will make this route more attractive and suitable for NMUs, however the busy B1150 poses a crossing risk.

Recommendation

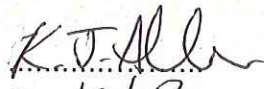

An appropriate gap should be provided in the physical closure point. A refuge island sited in the central hatching immediately south of the RTL would assist pedestrians and cyclists in crossing.

5.0 Signs, Lighting and Markings

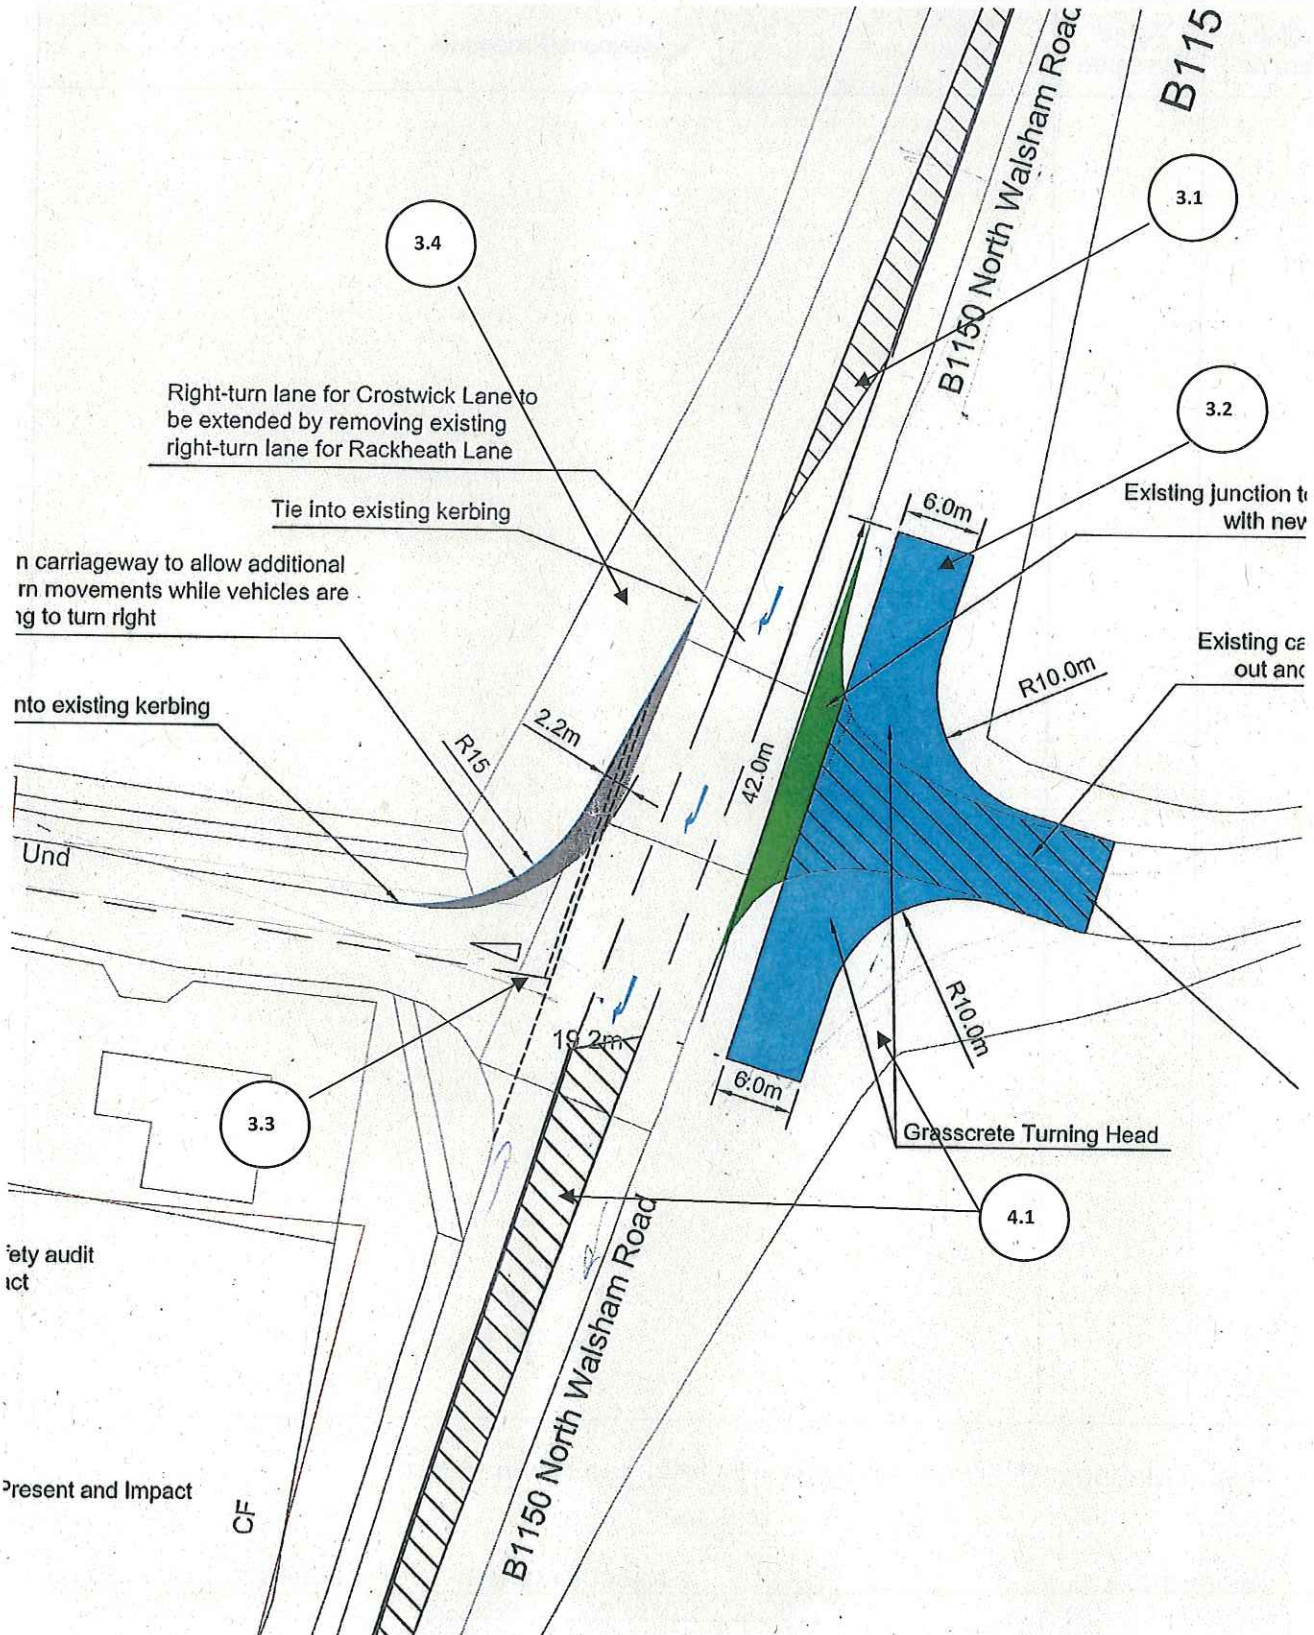

5.1 No comment at this stage

AUDIT TEAM STATEMENT

We certify that this audit has been carried out in accordance with Norfolk County Council Environment, Transport and Development Procedures.

APPENDIX B

Part 1

Stage 1 Safety Audit, NDR Off Line
Improvements – Crostwick Junction
Response Sheet

29 November 2013

NDR Off line Improvements – Crostwick Junction

RESPONSE SHEET

Problem (para no.)	Agree/ Disagree	Reasons/Proposals
3.1	Agree	The length of turning lane is increased to 65m.
3.2	Agree	Alternative solutions indicated on the drawings. This will be addressed at later stage.
3.3		The alignment and the roadmarkings are revised to improve the intersection angle, however this is based on OS map because a topo-survey is not available at present.
3.4		Maintenance issue beyond the scope of this scheme, NCC informed.
3.5	Disagree	During site visits no evidence of pedestrian use on the East of B1150 is identified. Also there are not any facilities for pedestrians along the Rackheath lane and it is not anticipated that NDR on its own will cause an increase in the number of pedestrians on the East of B1155. Potential increase in the number of pedestrians due to other developments is beyond the scope of our works.

6. Other Data	

APPENDICES

- A Scheme Drawings
- B Photographs
- C
- D

1. Background

- (a) Traffic modelling work for the proposed NDR shows that there will be an increase in traffic along Wroxham Road (A1151). The visibility at the existing Green Lane West/A1151 junction is poor and there is a need to improve the junction to encourage vehicles (particularly HGVs) accessing the Rackheath Industrial estate to use this junction rather than any alternative routes which may take additional traffic through Rackheath village.
- (b) The scheme is proposed to close the existing junction and re-align Green Lane West so it forms a give-way junction with Wroxham Road to the south of the existing location, where both horizontal and vertical visibility can be improved. It is also proposed to widen the existing carriageway to be able to introduce a right hand turn lane on the A1150 for vehicles turning into the re-aligned Green Lane West.

2. Design Standards

- (a) Design speed adopted – Proposed new carriageway 40mph, Green Lane West 40mph, Wroxham Road (A1151) 50mph.
- (b) Any departures from standards, giving reasons – Vertical visibility to the right at the new junction to be checked once the topographical survey is made available.

3. Plans

(a) General Scheme Layout

A general scheme layout is included in Appendix A - Drawing. No. 233906-ES-02 -C-DR-00-XX-006

i. Junctions, including visibility splays

The ghost island junction will improve the visibility to meet the standard and provide an extra lane for right turning vehicles from A1151.

ii. Parking

N/A.

iii. Accesses:-

The existing Green Lane West will be closed at the original A1151 junction and a turning head will be provided there to accommodate Large Refuse vehicle.

iv. Levels/gradients:-

The farm is 1.2 metres lower than the edge of A1151 carriageway. High point of A1151 is 10-20 m to the north of existing junction. Low point of A1151 is approximately 600 m to the south of existing junction.

Green Lane West has a low point close to the mid point of the road between the existing junction and its proposed junction with the re-aligned road.

- v. Details of abutments, parapets, fences, existing signs, central barriers, crests, vehicle parking, and any other restriction to visibility:-**
Trees and fences along A1151 which restrict visibility need to be removed.
- vi. Accommodation works:-**
There are no known accommodation works at this stage.
- vii. Street lighting:-**
Junction is not lit and no new lighting proposed.
- viii. Signing and lining details, including diagram numbers, sizes and mounting heights:-**
Road markings on A1151 junction and new Green Lane West junction will be updated. Sign design will be done as part of NDR.
- ix. Drainage information:-**
The existing drainage of A1151 and Green Lane West junction is improved by using grasscrete. For the proposed carriageway and Northeast part of the new A1151 junction, combined kerb drainage along southern channel is introduced to minimize land taken. For the Southeast part of the new A1151 junction, kerb outlets is to be introduced to increase capacity of existing drainage, discharging to existing swale. Refer to Appendix A - Drawing. No. 233906-ES-02 -C-DR-00-XX-007.
- x. Kerbing details and surfacing information:-**
New kerbs are along proposed carriageway and new A1151 junction. Combined kerb drainage and kerb outlets are included in Appendix A - Drawing. No. 233906-ES-02 -C-DR-00-XX-007.
- xi. Existing and proposed TROs:-**
All TROs including stopping up orders will be managed as part of NDR DCO.
- xii. Safety fences/barriers:-**
None.
- xiii. Pedestrian provision, including refuges, guard railing, signing, dropped kerbs:-**
Existing footpath along Green Lane west will be realigned to match the new layout. Indicative footpath shown on the general arrangement.
- xiv. Provision for cyclists:-**
N/A.

xv. Equestrian provision:-

N/A.

xvi. Provision for disabled persons:-

N/A.

xvii. Bus stops and lay-bys:-

The existing lay-by on Green Lane West will be stopped. No changes to existing bus stops to the north of existing junction on A1151. Proposed realignment is not anticipated to have negative impact on these.

xviii. Landscaping:-

New trees will be planted to replace the trees that will be felled as a result of the widening on A1151. Potential location is the land between the new road and the existing property to the north of it.

xix. Service apparatus:-

Existing BT cables might be affected. Refer to Appendix A – Drawing No. 233906-ES-02-C-DR-00-XX-100.

(b) Local Highway Network

A location plan showing the surrounding highway network is included in Appendix A – Drawing No. 233906-ES-02-C-DR-00-XX-001.

4. Site Photographs or Video Recording

Photographs are included in Appendix B.

5. Traffic Data

- (a) Route hierarchy status of all effected roads – Green Lane West, Wroxham Road (A1151)
- (b) Latest traffic counts, including turning movements where appropriate. Indication of presence of regular queuing or junctions operating near capacity –N/A.
- (c) Traffic forecast data – N/A.
- (d) Measured speed data – N/A.
- (e) Non vehicular movements – N/A.

6. Accident Data

06/09/2008 (Daylight) – Right turn joining, head on – Slight

16/09/2008 (Daylight) – Tail end with vehicle waiting to turn right – Slight

31/01/2012 (Daylight) – Right turn joining, head on – Serious
12/05/2012 (Daylight) – Tail end collision – Slight

7. Construction Programme & Operation

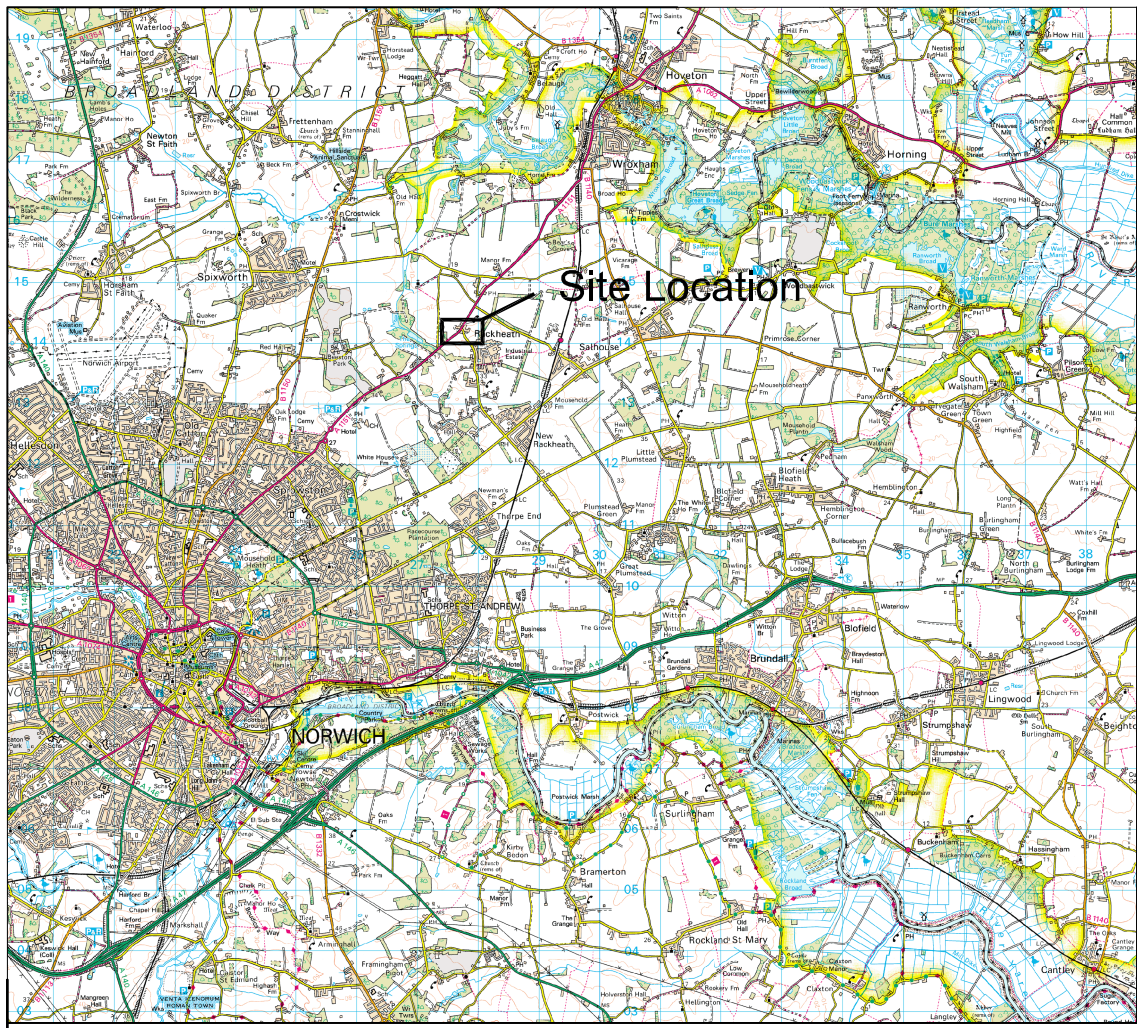

- (a) The scheme will form part of the NDR DCO application and will be delivered together with the mainline works.
- (b) Preliminary design is to be completed by the end of September 2013.
- (c) Detailed design - TBC.

8. Other Relevant Information

N/A

Part 2

A1151 Rackheath: Green Lane Junction
Improvement Stage 1 Safety Audit

26 September 2013

INTRODUCTION

This report contains the results of a Stage 1 Safety Audit carried out on the above scheme. The Audit was carried out at the request of Norfolk County Council Highways Group.

The Audit Team membership was as follows:-

Nevil Calder BSc(Hons) CEng MICE MCIHT MSoRSA Principal Consultant
(Audit Team Leader) Mott MacDonald

Kevin Allen BEng(Hons) IEng MCIHT MSoRSA Project Engineer
(Audit Team Member) Network Analysis + Safety
Norfolk County Council

Specialist Advisors:-

Andy Micklethwaite Casualty Reduction Officer
Norfolk County Council

The Audit took place at Carrow House on 26 September 2013. The audit comprised an examination of the Safety Audit submission document and a site inspection on 26 September 2013 by the Audit Team Leader. The weather was bright and the road surface dry.

The terms of reference are as described in Environment, Transport and Development Highways Service Manual Procedure SP03-07. The Auditors have examined and reported only on the road safety implications of the scheme as presented and have not verified the compliance of the design to any other criteria.

ITEMS RAISED AT PREVIOUS AUDIT

No previous safety audit.

ITEMS RAISED AT THIS STAGE 1 AUDIT

1.0 General

1.1 No comment

2.0 Alignment

2.1 Problem

Location: A1151 at closure point

Summary: potential conflict between mainline traffic and turning traffic

Proximity of the proposed turning head on Green Lane West to the A1151 carriageway presents a number of safety issues:-

- The lack of visual closure on the outside of a curve may mislead south-westbound drivers on A1151.
- Turning vehicles may appear to be on or entering the mainline, causing confusion/distraction to drivers on A1151. This will be exacerbated at night with the added risk of headlight dazzle.
- The narrow width between the turning head and A1151 would be easy to cross, encouraging abuse of the closure.

Recommendation

Provide a minimum 3.5m wide verge to A1151 free of obstruction. Behind this a physical closure should be provided in the form of a continuous hedgeline to give visual closure without posing a collision hazard to errant vehicles. An 'L' or 'Y' shaped turning head might better fit the remaining space.

2.2 Problem

Location: new alignment of Green Lane West

Summary: lack of forward visibility envelope

The new alignment departs from the old with a proposed left-hand curve of radius 180m; however no visibility splay is shown on the inside of the curve for north-westbound traffic.

Recommendation

Provide 120m forward visibility envelope. Any boundary hedge should be set back at least 1m from this to allow for future growth, and sufficient land should be acquired for this purpose.

2.3 Comment

Location: A1151

Summary: kerb profile

All proposed kerbing on A1151 should have a 45degree batter profile as this is more forgiving in event of impact on high speed roads.

3.0 Junctions

3.1 Problem

Location: A1151 proposed ghost island RTL

Summary: abrupt tapers increases risk of collision for northbound traffic

The development tapers at each end of the proposed ghost island right turn lane are too abrupt, with substandard tapers of around 1:11. This creates a sharp deflection in the path of south-westbound traffic, raising the risk of loss of control and run-off collisions with potentially serious outcomes.

Recommendation

Redesign the tapers to the TD42 standard of 1:25. With the ghost island being on an existing curve (radius 1 step below standard) it is important that the resulting outside channel line should be a smooth curve not a series of individual changes in direction.

3.2 Problem

Location: A1151 ghost island RTL

Summary: narrow lanes and substandard curve increase the risk of conflict

The proposed ghost island lies on an existing curve of radius 1 step below standard. The RTL will be heavily used by HGVs accessing the nearby industrial estate. In these circumstances the proposed relaxation of RTL width to 3.0m is considered to raise the risk of collision with potential for serious outcomes.

Recommendation

Increase the width of the central RTL to 3.5m to provide adequate lateral clearance on the curving alignment.

3.3 Problem

Location: new junction onto A1151

Summary: lack of channelising island in junction mouth reduces safety

Traffic islands in the mouth of minor roads at rural junctions have significant safety benefit. They are normally provided at all except simple junctions. They help to channelise and guide vehicular movements, shelter waiting vehicles and raise junction conspicuity.

Recommendation

Provide a channelising island in the junction mouth.

3.4 Problem

Location: new junction onto A1151

Summary: gradient of approach

The proposed diversion of Green Lane crosses land which is lower than adjacent A1151. However it is important to avoid a significant uphill gradient on immediate approach to the new junction as this creates delay/difficulty for vehicles pulling out, raising the risk of collision with main road traffic. This is particularly so for the frequent HGVs coming from the nearby industrial estate.

Recommendation

The first 15m of the new road from the junction should be level with A1151.

3.5 Comment

Location: junction of old Green Lane West with new alignment

Summary: lack of junction visibility splay

Visibility splays are not indicated for this junction and there is concern that adequate provision should be made.

Recommendation

Ensure visibility is available at 2.4m set-back - 120m is recommended to the left and 90m to the right (from the side road driver's perspective). Any proposed boundary hedge should be set back at least 1m from this to allow for future growth and sufficient land should be acquired for this purpose.

4.0 Non-motorised Users

4.1 No comment

5.0 Signs, Lighting and Markings

5.1 Comment

Location: A1151 proposed ghost island

Summary: potential overtaking through ghost island

There is an existing prohibitory double white line system in this vicinity due to restricted forward visibility. This system should be extended through the proposed ghost island in order to deter overtaking

AUDIT TEAM STATEMENT

We certify that this audit has been carried out in accordance with Norfolk County Council Environment, Transport and Development Procedures.

Part 2

Stage 1 Safety Audit, NDR Off Line
Improvements – Rackheath Junction,
Response Sheet

29 November 2013

NDR Off line Improvements – Rackheath Junction

RESPONSE SHEET

Problem (para no.)	Agree/ Disagree	Reasons/Proposals
2.1	Agree	Alternative solutions indicated on the drawings. This be addressed at later stage.
2.2	Agree	Green Lane West alignment is revised to improve the visibility after discussions with the NDR Team.
2.3		All materials not finalized at this stage.
3.1	Agree	The geometry of the ghost island is improved in accordance with the comments from NDR Team and further input from Casualty Reduction team.
3.2	Agree	The geometry of the ghost island is improved considering the comments from NDR Team and further input from Casualty Reduction team. Revised design shows an RTL lane with reducing from 3.5m to 3.1 at the junction.
3.3	Agree	Junction geometry revised giving consideration to the amount of turning movements, geometric requirements and land issues. A splitter island is provided. A second island required to separate the SB-left turning traffic is not provided because of possible negative impact on the capacity of A1151. Current design is agreed by NCC and Casualty Reduction team.
3.4		Design undertaken from OS map. The site visit and general topography is not likely to require steep slopes on the junction approach. This will be dealt at the detailed design stage.
3.5		The layout of the new simple T junction is improved as part of revisions to the Green Lane West alignment. Current design provides required visibilities.
5.1		The roadmarkings shown on the layouts are indicative. This will be dealt at the detailed design stage.

APPENDICES

- A Scheme Drawings
- B Photographs
- C
- D

1. Background

- (a) Traffic modelling work for the proposed NDR indicates that there will be an increase in traffic along Plumstead Road (C874). As a result Great and Little Plumstead Parish Council raised concerns about increase of traffic through Thorpe End. Therefore a series of highway improvements were investigated to help mitigate any increased traffic through Thorpe End.
- (b) The provision of a new footway in the northern verge of Plumstead Road will allow pedestrians to access the Thrope End shopping area or the existing zebra crossing to access the bus stop and on the southern side of Plumstead Road further to the west. In addition to this the provision of a mini-roundabout at the Plumstead Road/Broadland Drive will assist vehicles from exiting Broadland Drive onto Plumstead Road where difficulties are experienced at present.

2. Design Standards

- (a) Design speed adopted – Original speed limits to be maintained (Broadland Drive 20mph, Plumstead Road 30mph)
- (b) Any departures from standards, giving reasons – There are no departures from standards

3. Plans

(a) General Scheme Layout

A general scheme layout is included in Appendix A - Drawing No. 233906-ES-03-C-DR-00-XX-002

i. Junctions, including visibility splays

The scheme involves the realignment of the existing T-junction into a mini-roundabout to define priority and assist vehicles from exiting Broaland Drive. The existing visibility splay will be reduced by the introduction of the mini-roundabout, however it is proposed that this can be improved by the removal of the small tree on Broadland Drive as indicated on drawing no. 233906-ES-03-C-DR-00-XX-002

ii. Parking

N/A.

iii. Accesses:-

There is an existing access unto Thorpe End garage but this will not be affected by the proposed works.

iv. Levels/gradients:-

Mini-roundabout to be domed and with raised asphalt islands but proposed levels and gradients are to be kept as close to existing levels as possible

- v. Details of abutments, parapets, fences, existing signs, central barriers, crests, vehicle parking, and any other restriction to visibility:-**
Existing trees close to the junction restricts the visibility on Broadland Drive. Removal of small tree on Broadland Drive will improved the visibility splay
- vi. Accommodation works:-**
There are no known accommodation works at this stage.
- vii. Street lighting:-**
Existing street lighting to be revised following confirmed alignment of mini-around
- viii. Signing and lining details, including diagram numbers, sizes and mounting heights:-**
New road markings layout as shown on drawing no. 233906-ES-03-C-DR-00-XX-002 and designed in accordance with TSRGD 2002 and Chapter 5 of the Traffic Signs Manual. Signage design will be done as part of NDR.
- ix. Drainage information:-**
There is an existing drainage system at the junction and this will be and t may be necessary to carry out a drainage survey before detailed design stage.
- x. Kerbing details and surfacing information:-**
Junction will be resurfaced as part of the scheme.
- xi. Existing and proposed TROs:-**
All TROs will be done as part of NDR.
- xii. Safety fences/barriers:-**
N/A.
- xiii. Pedestrian provision, including refuges, guard railing, signing, dropped kerbs:-**
There is a proposal to provide a new 1.5m footway in the northern verge of Plumstead Road with drop kerbs at crossing points.
- xiv. Provision for cyclists:-**
N/A.
- xv. Equestrian provision:-**
N/A.
- xvi. Provision for disabled persons:-**
N/A. Existing pedestrian facilities will not be affected.
- xvii. Bus stops and lay-bys:-**
N/A.

xviii. Landscaping:-

None

xix. Service apparatus:-

Existing BT cables and water pipe may be affected by works See Appendix A – Drawing No. 233906-ES-03-C-DR-00-XX-100.

(b) Local Highway Network

A location plan showing the surrounding highway network is included in Appendix A – Drawing No. 233906-ES-03-C-DR-00-XX-001.

4. Site Photographs or Video Recording

Photographs are included in Appendix B.

5. Traffic Data

- (a) Route hierarchy status of all effected roads – Broadland Drive and Plumstead Road
- (b) Latest traffic counts, including turning movements where appropriate. Indication of presence of regular queuing or junctions operating near capacity –N/A.
- (c) Traffic forecast data – N/A.
- (d) Measured speed data – N/A.
- (e) Non vehicular movements – N/A.

6. Accident Data

There is no accident recorded at this junction

7. Construction Programme & Operation

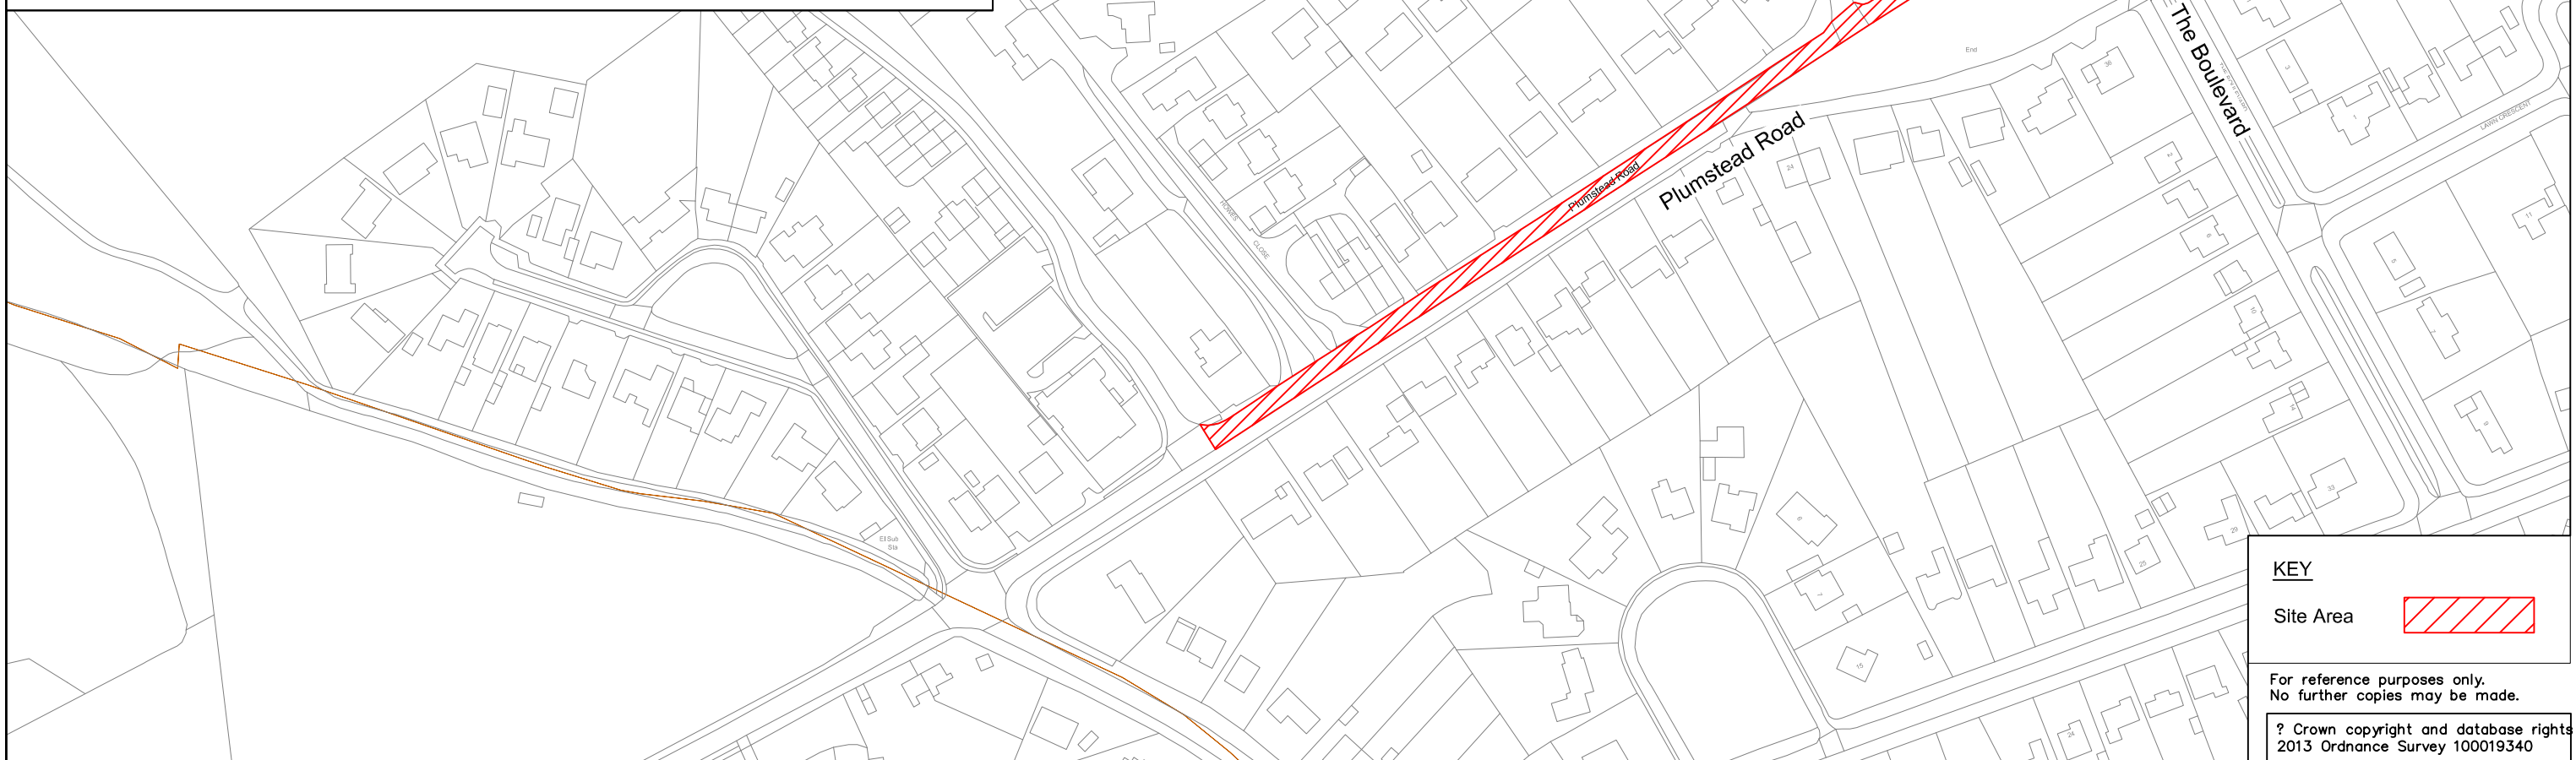

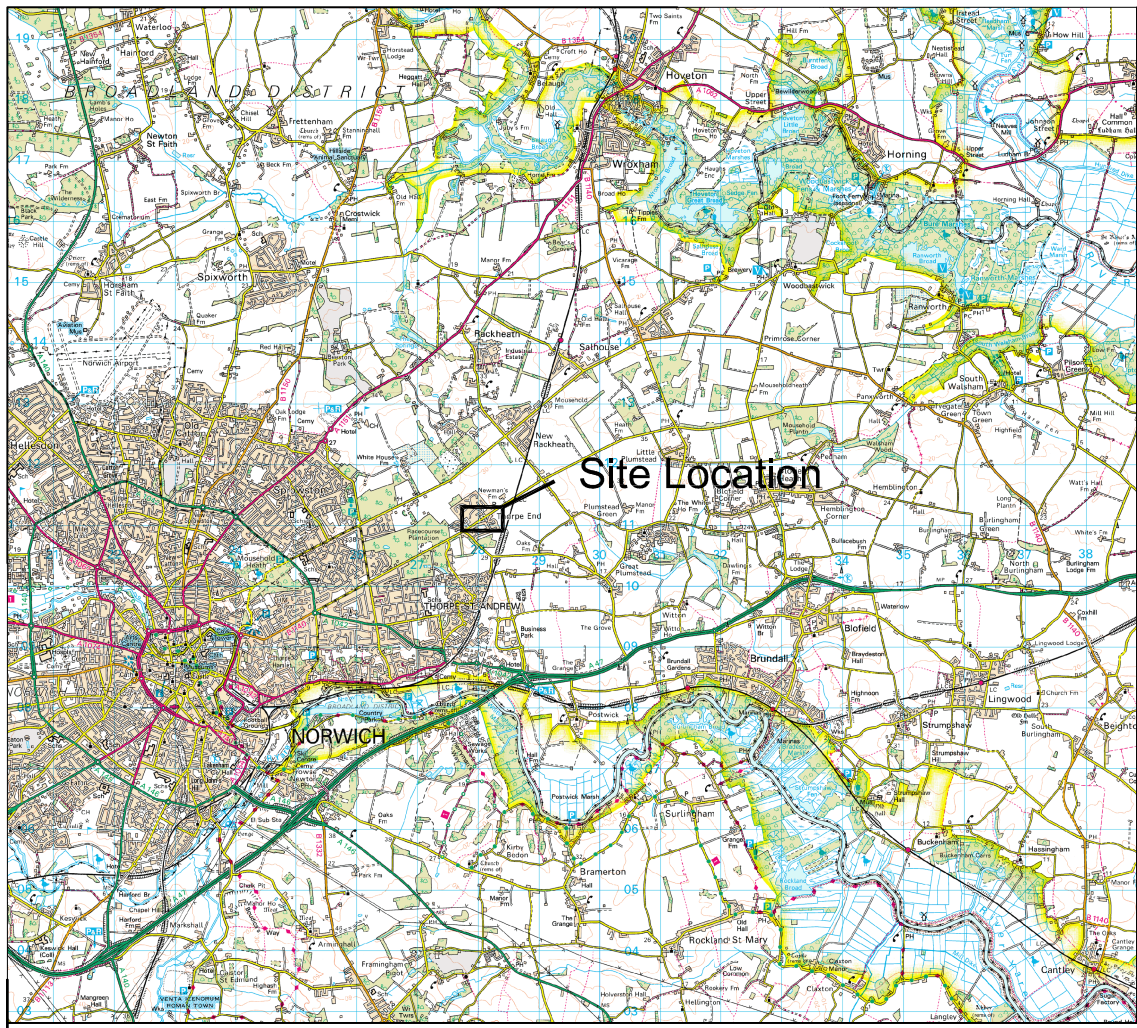

- (a) The scheme will form part of the NDR DCO application and will be delivered together with the mainline works.
- (b) Preliminary design is to be completed by the end of September 2013.
- (c) Detailed design - TBC

8. Other Relevant Information

Part 3

C874 Plumstead Road Thorpe End:
Highway Improvement Stage 1 Safety
Audit

25 September 2013

INTRODUCTION

This report contains the results of a Stage 1 Safety Audit carried out on the above scheme. The Audit was carried out at the request of Norfolk County Council Highways Group.

The Audit Team membership was as follows:-

Nevil Calder BSc(Hons) CEng MICE MCIHT MSoRSA Principal Consultant
(Audit Team Leader) Mott MacDonald

Kevin Allen BEng(Hons) IEng MCIHT MSoRSA Project Engineer
(Audit Team Member) Network Analysis + Safety
Norfolk County Council

Specialist Advisors:-

Andy Micklethwaite Casualty Reduction Officer
Norfolk County Council

The Audit took place at Carrow House on 25 September 2013. The audit comprised an examination of the Safety Audit submission document and a site inspection on 26 September 2013 by the Audit Team Leader. The weather was bright and the road surface dry.

The terms of reference are as described in Environment, Transport and Development Highways Service Manual Procedure SP03-07. The Auditors have examined and reported only on the road safety implications of the scheme as presented and have not verified the compliance of the design to any other criteria.

ITEMS RAISED AT PREVIOUS AUDIT

No previous safety audit.

ITEMS RAISED AT THIS STAGE 1 AUDIT

1.0 General

1.1 No comment

2.0 Alignment

2.1 No comment

3.0 Junctions

3.1 Comment

Location: proposed mini roundabout

Summary: low side road flows

No traffic flow data was provided with the submission. While overall flows are likely to be appropriate for a mini roundabout, there is concern that due to its residential nature, off-peak flows on Broadland Drive will be low. For regular drivers westbound on Plumstead Road this may affect their expectation of the need to give way. For safe operation of mini roundabouts, side road flows should generally not be less than 10% of main road flows.

3.2 Problem

Location: proposed mini roundabout eastbound approach

Summary: excessive visibility of adjacent entry leading to high approach speeds

Eastbound drivers approaching on Plumstead Road will have excessive visibility of any opposing westbound vehicles due to the straight highway layout. This can lead to early decision making of the need to give way and (in the absence of any opposing traffic) high entry speeds. This can result in conflict with any driver attempting to enter the roundabout from Broadland Drive.

Recommendation

Provide a kerbed splitter island on the eastbound entry to enforce greater lateral shift and encourage lower speeds.

4.0 Non-motorised Users

4.1 No comment

5.0 Signs, Lighting and Markings

5.1 Problem

Location: proposed mini roundabout

Summary: late awareness of mini roundabout due to low conspicuity

There is concern about conspicuity of the proposed mini roundabout within the long straight visual corridor of this stretch of Plumstead Road. This could lead to late driver awareness of the feature and late braking and overshoot collisions.

Recommendation

The kerbed island recommended in 3.2 above would help in this regard, as would a reflective post sited on the proposed build-out on the southern side of the circulatory area. Clear unobstructed siting of the mini roundabout signs is also crucial and the designer should give special consideration to night time conditions.

AUDIT TEAM STATEMENT

We certify that this audit has been carried out in accordance with Norfolk County Council Environment, Transport and Development Procedures.

APPENDIX A – Problem Location Plan

Not included due to limited nature of the scheme

APPENDIX B

Part 3

Stage 1 Safety Audit, NDR Off Line Improvements – Thorpe End, Response Sheet

29 November 2013

NDR Off line Improvements – Thorpe End

RESPONSE SHEET

Problem (para no.)	Agree/ Disagree	Reasons/Proposals
3.1		Traffic forecast on the minor road at the design year is expected to be more than 10% of the main line, based on the NATS/NDR model. The southern channel line on the WB approach of the road is realigned which will help reducing the speed of WB traffic and improving the expectation of the need to give way.
3.2	Agree	Traffic counts carried out and the mini roundabout geometry revised in accordance with the visibility requirements (for the side road) for the expected future traffic. This is agreed with the NCC and Casualty Reduction Team. Also the geometry of the splitter island roadmarking is improved to increase the deflection of EB traffic. Splitter islands are not found feasible due to narrow road width and the site constraints such as mature oak trees, existing bus stop and boundary issues.
5.1	Agree	The geometry of the splitter island road markings and the southern channel line is improved to reduce the approach speeds. Detailed design of the signs and road markings will be carried out considering this at later stage of the scheme.

Executive Summary

The aim of this safety audit is to bring together all the elements of the A47/A1042 Postwick Hub Junction and its associated works into one safety audit.

The audit will present some modifications to the scheme that have not previously been seen as part of the previous safety audit reports, including additional non motorised user (NMU) measures that have been developed following comments received from various NMU groups during the development of the scheme.

1.0 Background

- 1.0.1. The aim of this safety audit is to bring together all the elements of the Postwick Junction and its associated works into one safety audit.
- 1.0.2. The general layout for the Postwick Junction scheme and its associated works are shown in drawing number R1C150-MP-101A included in Appendix B. All references to elements of the junction in this report are based on figure 1 below.

Figure 1 - Schematic layout and naming convention

- 1.0.3. The section below aims to set out each element, how it ties into the proposed Postwick Junction improvements and the previous safety audits processes that it has been through.
- 1.0.4. In the course of the recent development of the project, there have been a number of modifications to the proposed scheme and its associated works

which have not been included in the previous safety audits. The significant modifications have been highlighted in section 1.8 below.

1.1. **The Postwick Junction**

- 1.1.1. The existing Postwick junction was constructed as part of the A47 Norwich Southern Bypass which opened in 1992. It is a grade separated junction linking the A47 trunk road to the A1074 Yarmouth Road leading to the east of Norwich. The Postwick junction provides access to the existing Broadland Business Park immediately to the north of the junction, and to the village of Postwick which lies to the south east. There is a single overbridge linking two roundabouts giving access to these areas. Slip roads on and off the trunk road link to these roundabouts. The westbound diverge slip road leaves the trunk road some way east of the rest of the junction, to join a section of the former trunk road, now the A1042 Yarmouth Road, which also gives access to the village of Postwick.
- 1.1.2. The existing Postwick junction has already been modified since its construction, with the enlargement of the Postwick North West roundabout (located on the north side of the A47) and the addition of segregated left turn lanes. The Highways Agency is concerned that increases in volumes of traffic using the junction could result in operational problems, and in particular that queues on the eastbound diverge slip road off the A47 could extend onto the A47 mainline carriageway, resulting in an unacceptable safety risk. Therefore the Highways Agency have made further development (which could lead to increased demand on this Postwick junction) in the vicinity of the existing Broadland Business Park or to the north east of Norwich, conditional upon the prior improvement of the Postwick Hub junction.
- 1.1.3. Stage 1 Safety Audits were carried out between November 2007 and October 2009 considering a number of different junction options. Thereafter the junction layout shown in R1C093-R1-1285H in Appendix A was submitted for a Stage 2 Safety Audit in January 2010. This audit aimed to provide final details of the proposed Postwick Junction prior to construction of the scheme later that year following the scheme being granted planning permission.

- 1.1.4. Following the January 2010 Audit, the Secretary of State requested in August 2010 that a Public Inquiry into the Slip and Side Roads Orders is held and therefore construction did not commence. The Public Inquiry into the Slip and Side Roads Orders will be held on 3 July 2013.
- 1.1.5. A further interim Stage 2 Safety Audit was then undertaken on the Park and Ride Signalised Junction in March 2013 following some minor changes to the layout and signal timings to optimise the junction following some further modelling work. The Park and Ride Signalised Junction layout submitted for the Safety Audit is shown in drawing R1C150-MP-636 included in Appendix A.
- 1.1.6. The purpose of this safety audit submission was to assess the Park and Ride signalised junction only, focusing on the general junction layout, phasing, traffic flows and queue lengths with details such as vehicle restraint systems, street lighting and earthworks not considered at that time.
- 1.2. Expansion of Postwick Park and Ride site**
- 1.2.1. A proposed scheme to provide 500 additional parking spaces at the Postwick Park & Ride was developed in 2009 to address capacity issues at the site and cater for future additional demand.
- 1.2.2. The scheme is part of the Norwich Area Transportation Strategy (NATS) policy to encourage long stay at Park & Ride site, freeing up city centre car parks for short stay shoppers and visitors, thus allowing for substantial numbers of commuter vehicles to be removed from Norwich city centre.
- 1.2.3. The proposed scheme included new access and egress arrangements for the Park and Ride site. This included a bus only entrance and exit at the proposed signalised junction with the general access and egress for vehicles being moved to a new roundabout at Oaks Lane.
- 1.2.4. The proposed layout shown on drawing number 249610-AD-023F Appendix A, underwent a Stage 2 Safety Audit in January 2010.
- 1.2.5. It is proposed to construct the new access road roundabout at Oaks Lane and the pedestrian/cyclist shared use facility at the same time as the Postwick

Junction improvement. The delivery of the extension of the parking facilities at the Park and Ride site will follow at a later date (currently projected to be 2015).

1.3. **Recent developments**

1.3.1. As discussed above, during the recent development of the scheme there have been a number of modifications made to the proposals that have not been included in the previous audits and are therefore now being presented in this safety audit for the first time.

1.3.2. The significant changes are highlighted in the paragraphs below and discussed further in the relevant section of the safety audit.

New Postwick Bridge

1.3.3. The previous Safety Audits submitted for the Postwick Junction scheme showed the cross section over the New Postwick Bridge as a 2.0m footway on the east side and a 2.0m wide hardened verge on the west side of the bridge, and a four lane 16.4m wide carriageway providing three lanes southbound and one lane northbound with the opposing traffic flows would be separated by a hatched central reserve.

1.3.4. Following feedback from local access groups, it has been highlighted that in addition to the walking link over the bridge, it could prove valuable to allow for the provision of a cycling link if this was incorporated into a sustainable transport route as part of the Northern Distributor Road scheme. Therefore the cross section over the bridge has now been changed to allow a 3m wide footway on the east side of the bridge. This has been achieved by reducing the hardened verge on the west side of the bridge to 1.0m. This will ensure that the bridge can accommodate such a route should this be progressed as part of a future NDR in the future.

Existing Eastbound Diverge Slip Road

1.3.5. Following feedback from various local access groups it has become evident that the existing slip road is currently being used informally by pedestrians and cyclists to access the service path over the A47 Viaduct and bridge over the

Norwich to Great Yarmouth railway line to gain access to Sustrans National Cycle Network Route 1 and Whitlingham Park.

- 1.3.6. Whilst upgrading the service path across the A47 viaduct is beyond the scope of this scheme, to ensure that cyclists are not disadvantaged by the proposed stopping up of the eastbound diverge slip road, the scheme could be changed to include a shared use facility along the line of the existing slip road. This would enable cyclists using the A47 eastbound to connect with the existing and proposed cycle network at the Postwick North West Roundabout.

Broadland Gate Roundabout

- 1.3.7. The Broadland Gate Roundabout submitted as part of January 2010 Stage 2 showed a standard 3 arm roundabout to provide access to the Broadland Gate Business Park.
- 1.3.8. Following this safety audit, this has now been modified to include segregated left turn lane for west bound traffic on Broadland Way into the Broadland Gate Business Park development as shown in drawing R1C150-MP-660 included in Appendix B.

Park and Ride extension

- 1.3.9. Since the Park and Ride Stage 2 Safety Audit in January 2010, two changes to the design have occurred which have not been previously audited.
- 1.3.10. These changes include the widening of the main access carriageway through the Park and Ride site to 6.0m as recommended in the January 2010 audit response to better accommodate two way traffic flow.
- 1.3.11. The layout submitted as part of this safety audit also include additional cycling measures to provide a link along the access road from the signalised junction to the neighbourhood route from Norwich to Brundall and Blofield as shown in the Norwich cycle map published in June 2010 included in Appendix C.

Brundall Low Road and Church Road Bus Stop

- 1.3.12. As part of the planning conditions for the park and ride extension, the existing bus stop on the A1042 Yarmouth on the northern boundary of the application site is to be moved to the junction of Brundall Low Road and Church Road. The location of the proposed bus stop was not submitted as part of the previous audits. The proposed location of the bus stop is shown in drawing 249610-AD-61 included in Appendix B.

Traffic Signs and Road markings

- 1.3.13. The traffic signs and road markings that were included as part of the Safety Audits in January 2010 and February 2013 have been updated and changed to reflect the latest developments in the scheme. The proposed traffic signs and road markings are shown in drawing R1C150-MP-663, 664 and 665 included in Appendix B.

1.4. Previous Safety Audit Reports

- 1.4.1. The above Safety Audit submissions discussed above in this section have not been included in the appendices of this report, but can be made available if required.

2.0 Scheme Description and Design Standards

- 2.1. The general layout for the Postwick Hub Junction scheme and its associated works are shown in drawings R1C150-MP101A, R1C150-MP-636A and R1C150-MP-660 to 665 included in Appendix B.
- 2.2. The Scheme will be subject to a 40mph speed limit other than on slip roads and the Park and Ride Access Road. Therefore the appropriate design speed is 70kph in accordance with DMRB design standard TD 9/93: Highway Link Design, paragraph 1.8, Table 2. The proposed speed limits are shown in drawings R1C150-MP-663, 664, 665 contained in Appendix B.
- 2.3. The slip road design speed is determined from the mainline A47 design speed, as the A47 is a national speed limit rural dual carriageway a design speed of 120kph applies, therefore the appropriate design speed for the slip road is 70kph in accordance with DMRB design standard TD 22/06: Layout of Grade Separated Junctions paragraph 4.5, Table 4/1.

2.4. Eastbound Diverge Slip Road

- 2.4.1. The proposed Eastbound diverge slip road passes under the existing Postwick Bridge and connects to the proposed Postwick North East Roundabout. The slip road has been designed to TD22/06 and is a 7.3m wide two lane carriageway with 2.5m verges and 1.0m carriageway edge hardstrips with a maximum gradient of 6%. The existing Eastbound diverge slip road and its associated segregated left turn lane will be closed as a result of the introduction of this new diverge slip road. The new slip road starts at the same location as the existing slip road, which is just off of the eastern end of the existing River Yare/Railway Bridge.
- 2.4.2. The nearest compliant layout that could be provided within the constraints for the new diverge slip road is a Layout Type B. This layout allows a taper diverge, where diverging traffic leaves the mainline A47 over a specified flare distance, the flare is followed by an auxiliary lane which is an additional lane at the side of the mainline to provide increased diverge opportunity and additional space for weaving traffic. This layout was submitted as a Departure from Standard in 2008 and approved in 2012.

2.5. **Eastbound Merge Slip Road**

- 2.5.1. The proposed Eastbound merge slip road is designed as per TD22/06 with a 3.7m wide single lane with a 2.0m nearside verge and 3.3m nearside hardshoulder, 0.7m offside carriageway edge hardstrip and 2.8m offside verge with a maximum gradient of 6%.
- 2.5.2. The nearest compliant layout that could be provided is a Type B Layout, which has an auxiliary lane followed by a taper merge over a specified flare distance.
- 2.5.3. This layout was submitted and approved by the Highways Agency as a Departure from Standard in 2008.
- 2.5.4. The provision of this slip road has resulted in the need to close the existing private means of access to The Grange property from the A47 trunk road.

2.6. **Westbound Diverge Slip Road**

- 2.6.1. There are no design changes proposed on the existing diverge from the A47 where the proposed Scheme design would tie into the existing westbound diverge slip road at Oak's Lane.

2.7. **Westbound Merge Slip Road**

- 2.7.1. The proposed Scheme ties into the existing westbound merge slip road after the Park and Ride signalised junction and retains the existing two-lane taper merge layout onto the A47. The existing layout is not a standard layout as per TD 22/06.
- 2.7.2. A Departure from Standard to retain the existing two-lane taper merge was submitted to the Highways Agency in 2012 and approved in January 2013.

2.8. **Postwick North East Roundabout**

- 2.8.1. The proposed eastbound diverge slip road connects into a proposed new at-grade North East roundabout. The roundabout is a 4-arm roundabout with an Inscribed Circle Diameter (ICD) of 70m and a 9.0m wide circulatory carriageway.

2.8.2. A segregated left turn lane at the proposed roundabout would be provided to cater for the left-turn manoeuvre from the eastbound diverge slip road into the proposed Business Park link road leading to the proposed Business Park roundabout.

2.9. **The Grange**

2.9.1. The Grange is a private residence to the north of the A47 which currently has a private means of access 200m east of the end of the existing eastbound merge slip road taper. This “entry only” access allows eastbound traffic to enter The Grange by turning left off the A47. This arrangement is unsatisfactory in terms of highway safety, creating a potential conflict with traffic joining the trunk road from the eastbound merge slip road. As the proposed eastbound diverge slip road would join the A47 further east than at present, it is proposed that this “entry only” private means of access will be stopped up as part of the Scheme. A new replacement private means of access via the new Postwick North East Roundabout is proposed.

2.10. **Business Park Link Road**

2.10.1. The proposed Business Park link road is an all-purpose dual two-lane carriageway linking the North East roundabout and the Business Park roundabout. Each carriageway would be in the form of a 7.3m carriageway comprising two running lanes 3.65m in width with a 1.0m hardstrip on the nearside and offside. The verges would be a minimum 2.5m in width and the central reserve would be 2.5m wide. A 1.0m wide footpath is proposed running along the eastern side of the Business Park Link Road.

2.11. **Business Park Roundabout**

2.11.1. The proposed Business Park link road connects into the proposed at-grade Business Park roundabout. The roundabout is a 2-arm roundabout with an ICD of 90m and a 12m wide circulatory carriageway.

2.12. **Broadland Gate Roundabout**

2.12.1. The Broadland Gate roundabout is a 3-arm roundabout with an ICD of 50m and a 9.0m wide circulatory carriageway and a segregated left turn lane for west

bound traffic into the Broadland Gate Business Park development. The roundabout is connected to the Business Park roundabout to the east, the proposed Broadland Gate Business Park to the south and to the existing Peachman Way roundabout to the west by the Broadland Gate link road.

2.13. **Broadland Gate Link**

2.13.1. The proposed Broadland Gate link road would be a single carriageway link road. The link road would be in the form of a 7.3m wide carriageway with 2.5m wide verges and no hardstrips. The carriageway width would increase on the approach to the roundabouts to provide additional lanes on the entry to the circulatory carriageway.

2.14. **New Postwick Bridge**

2.14.1. As discussed in section 1, the layout of the new Postwick Bridge has changed since the previous safety audits. A 3.0m hardened footway will be provided on the west side of the bridge. The proposed link road over the bridge will provide four 3.65m wide carriageway lanes, three lanes southbound and one lane northbound with opposing traffic flows separated by a hatched 1.8m central reserve.

2.14.2. The cross section over the bridge comprises 3.0m footway on the east side and a 1.0m wide hardened verge on the west side of the bridge, and the four lane 16.4m wide carriageway.

2.15. **Existing Postwick Bridge**

2.15.1. The scheme proposals over the existing Postwick bridge would utilise the existing bridge deck to provide a 3.0m shared use footway/cycleway on the west side of the bridge, a three lane 9.0m carriageway (two lanes southbound one lane northbound) and a 1.0m verge on the east side of the bridge.

2.15.2. The proposed lane widths are below the standard lane width of 3.65m as described in DMRB TD 27/05. DMRB TD 16/07 states at paragraph 7.24 that a minimum lane entry width of 3.0m should be provided on the approach to a roundabout and DMRB TD 50/04 states at paragraph 2.22 a minimum lane entry width of 3.0m should be provided on the approach to a signal controlled

junction. Therefore due to the short length over the bridge of 145m between junctions, the lane widths are considered acceptable as junction approach widths.

2.16. **Park and Ride Signalised Junction**

- 2.16.1. The existing southern roundabout would be replaced by a fully signalised junction. A drawing of the junction including traffic signal phasing diagrams is shown in drawing R1C150-MP-636A included in Appendix B.
- 2.16.2. The current access into the Park and Ride site will be restricted to bus only access and egress. General car access/egress would be via the new roundabout junction at Oaks Lane proposed as part of the extension of the existing Park and Ride site.
- 2.16.3. The method of control for the traffic signal installation is intended to react to the varying traffic demands throughout the day. The junction will incorporate queue detection to restrict excessive queues.
- 2.16.4. The access to the Park and Ride site, the A47 westbound merge slip road and the segregated right turn from the existing Postwick Bridge will include on demand crossing phases for pedestrians and cyclists.
- 2.16.5. The staging for the traffic signal layout is as follows:
- 2.16.6. Stage 1 - This allows traffic heading southeast bound over the existing Postwick bridge to turn right onto the westbound merge slip road, ahead and right for buses only into the park and ride site, ahead for traffic heading east towards the access to the Park and Ride site and Postwick, and left turn out of the Park and Ride site for buses only. In addition this stage allows pedestrian/cyclist to cross between the large traffic island and the Park and Ride site.
- 2.16.7. Stage 2 - This stage allows traffic heading southwest over the new Postwick bridge into the junction to turn right towards Norwich over the existing Postwick bridge, ahead and right onto the A47 westbound merge slip road, ahead for buses only into the park and ride site and left for traffic heading east towards the access for the Park and Ride site and Postwick. In addition this stage allows pedestrian/cyclists to cross between the existing Postwick bridge and the large

traffic island before the Park and Ride site and across the bus only exit from the Park and Ride site.

2.16.8. Stage 3 - This stage allows westbound traffic to travel ahead onto the A47 westbound merge slip road, ahead and right towards Norwich over the existing Postwick bridge and to turn right over the new Postwick bridge. In addition this stage allows pedestrian/cyclist to cross between the existing Postwick bridge and the large traffic island before the Park and Ride site, as well as across the bus only entry and exits from the Park and Ride site.

2.17. **Oaks Lane Roundabout**

2.17.1. A new roundabout is proposed at Oaks Lane as part of the extension to the existing Park and Ride site. The roundabout is a 4-arm roundabout with a 54m ICD and a 10.0m wide circulatory carriageway width. The eastern arm would connect to the existing A1042 Yarmouth Road, the south eastern arm would connect to Oak's Lane, the south western arm would provide a new access into the Park and Ride site, with the western arm continuing along the A1042 to the Park and Ride signalised junction.

2.18. **Postwick Park and Ride**

2.18.1. A new access to the Park and Ride site for general vehicles would be provided via the new roundabout at the junction of Oak Lane with the A1042 slip road from the A47. The new access road would be a minimum of 6.0m wide carriageway with two 3.0m carriageway lanes. The access road would be subject to a 10mph speed limit enforced by speed cushions as shown in drawings R1C150-MP-664 included in Appendix B.

2.18.2. Buses only would continue to enter and exit the site using the existing entry point via the proposed signalised junction during the morning peak until 11.30 am when they will enter via the new Oak Lane roundabout. Buses would continue to leave the site via the proposed signalised junction as described in section 2.15 above. A new section of bus only carriageway will allow buses to access the existing park and ride bus terminal. Passengers will be picked up and dropped off at the existing bus terminal along with a drop off only point adjacent to the proposed extension site.

- 2.18.3. To prevent unauthorised vehicular access into the Park and Ride site outside the hours of operation, a single arm field gate will be installed across the access to the site, with an automated exit barrier used across the exit carriageway.
- 2.18.4. To prevent unauthorised vehicular access to the access road to the proposed lagoon and access road adjacent to the existing bus terminal, lockable double steel farm gates will be used.
- 2.18.5. **Brundal Low Road/Church Road bus stop**
- 2.18.6. As part of the scheme to expand the park and ride site, the existing bus stop located on the A1042 Yarmouth Road between the existing Park and Ride entrance and Oaks Lane will be moved to the junction of Brundal Low Road and Church Road. The layout and location of the new bus stop and shelter are shown on 249610-AD-61 included in Appendix B.
- 2.19. **New Postwick Bridge**
- 2.19.1. The proposed bridge design is for a three span steel and concrete composite bridge, crossing the A47 Norwich Southern Bypass with a skew angle of 54 degrees.
- 2.19.2. One Departure from Standard has been identified and applied for, this relates to the omission of Abutment Galleries from the design. Abutment galleries are provided below expansion and rotational joints to facilitate inspection and maintenance.
- 2.19.3. DMRB BA 57/01 and BD 57/01: Design for Durability requires that abutment galleries are incorporated into the design. It is proposed that the provision of abutment galleries shall be omitted as it is considered that there is adequate safe access for inspection and maintenance of the bearings at the abutments, in addition it is considered that abutment galleries often constitute a confined space and are susceptible to vandalism and can constitute an additional maintenance liability. In addition it is noted that none of the existing bridge structures on the A47 Norwich Southern by-pass have abutment galleries. Instead it is proposed that the main beams should found directly onto the

bearing shelf with ballast wall immediately behind rather than providing an enclosed abutment gallery

2.19.4. Based on these criteria a Departure from Standard for the omission of Abutment Galleries was submitted to the HA and approved in 2010.

2.20. **Existing Postwick Bridge**

2.20.1. The works to the existing bridge fall into two parts, one is the modifications to construct a new off-slip lane between the north pier and abutment, the other is the works to the bridge deck associated with the revision of the carriageway / lane alignment over the bridge and the provision for cyclists.

2.20.2. It is proposed that a new eastbound diverge slip road is to be constructed between the north pier and abutment of the bridge, in order to do so the existing batter slope in front of the north abutment will need to be removed. In order to enable this, a new retaining wall structure would need to be constructed in front of the north abutment to ensure that it is supported and does not move when the fill that supports it is removed for the construction of the slip lane.

2.20.3. The works to the bridge deck are proposed in order to accommodate the re-alignment of the carriageway over the structure, to provide a 3.0m wide foot / cycleway on the west side with three 3.0m wide lanes for traffic. A new parapet, 1.40m high, on the west side of the bridge is required in order to accommodate cyclists on the new widened west side footway.

2.21. **Facilities for Non Motorised Users**

2.21.1. The details of proposed walking, cycling facilities are shown in drawing R1C150-MP-608 and 609 included in Appendix B.

2.21.2. To the east of the Scheme, an existing footpath (Postwick Footpath No. 2) runs south from Smee Lane along a field boundary to the A47, where it crosses the A47 at grade, and continues from the A47 to its terminus on the A1042 Yarmouth Road. There are currently steps either side of the A47 to access this crossing, the current condition of the steps indicates that this footpath is not well used.

- 2.21.3. As part of the proposed Scheme this length of Footpath No. 2 would be stopped up and diverted on a new alignment towards the proposed Business Park Roundabout and then southwards alongside the Business Park link road to a point where a safe crossing could be made across the new eastbound merge slip road. This route would continue across the new Postwick bridge over the A47. From the Park and Ride signalised junction the route would continue along the verge of the A1042 Yarmouth Road to the point where the existing Footpath No. 2 originally joined the A1042 Yarmouth Road.
- 2.21.4. The re-aligned Footpath No. 2 would consist of a 1.0m wide compacted sub-base footpath. Over the new Postwick bridge a 3.0m wide hardened surface would be provided to enable a future upgrade to a pedestrian/cyclist facility. The proposed facilities will remove the need for pedestrians to cross the A47 at grade, providing a significantly safer option.
- 2.21.5. Across the existing Postwick Bridge the current pedestrian and cycle facilities across would be altered, removing both the existing northbound and southbound on-carriageway facility for cyclists, and providing a shared use facility along the western side of the bridge, linking to the shared use facilities on Yarmouth Road and through the Postwick Park and Ride site. The new facilities proposed as part of the Park and Ride extension include a 3.0m wide off-carriageway shared use link from the Park and Ride signalised junction to Oak's Lane.
- 2.21.6. To cater for cyclists using the neighbourhood route from the A1042 Yarmouth Road, across the existing Postwick Bridge and onto Brundall Low Road, shown in the Norwich Cycle Map included in Appendix C, cyclists will be sign posted from the signalised junction along the proposed Park and Ride access road, bypassing the proposed barrier facilities via the arrangement shown in drawing R1C150-MP-609 included in Appendix B, leaving the site via the Oaks Lane Roundabout and continuing on carriageway (as the current situation) to Brundall Low Road.
- 2.21.7. As discussed in section 2.16 the Park and Ride signalised junction would also include signal controlled crossings with on-demand phases for pedestrians and cyclists.

- 2.21.8. As discussed in section 1.3, the existing eastbound diverge slip road is currently being used informally by pedestrians and cyclists to access the service path over the A47 Viaduct and bridge over the Norwich to Great Yarmouth railway line, to gain access to Sustrans National Cycle Network Route 1 and Whitlingham Park.
- 2.21.9. The current service path used by cyclists and pedestrians over the A47 Viaduct and bridge is 1.5m wide with a 0.8m hard strip between kerb edge and solid white line marking the edge of the carriageway. The service path is abutted along the edge of the viaduct by a 1.0m high parapet.
- 2.21.10. The width of the current layout does not comply with current design standards for a Non Motorised User (NMU) facility. The width would need to be a minimum of 2.0m for a pedestrian facility (TA 90/05 paragraph 7.4) and a minimum of 2.5m wide for a shared use pedestrian and cycle facility (TA 90/05 section 7) adjacent to a parapet with a 0.5m separation between the NMU route and the carriageway.
- 2.21.11. In combination with the cost of providing the recommended option above there are also concerns about the potential of lighting conflicts on unlit high-speed roads where the contra-flow cyclists would be extremely vulnerable unless there was considerable separation or lighting baffles and safety barriers throughout the entire length.
- 2.21.12. To ensure that cyclists are not disadvantaged by the proposed stopping up of the eastbound diverge slip road, it is proposed that a shared use facility will be provided on the line of the existing slip road. This would enable cyclists using the A47 eastbound to connect with the existing and proposed cycle network at the Postwick North West Roundabout and would therefore not be disadvantaged by the stopping up. For cyclists travelling westbound down the slip road, end of cycle route and cyclists dismount signs will be provided to inform users that the facility does not continue across the A47 viaduct. The proposed layout is shown in drawing number R1C150-MP-608, included in Appendix B.

3.0 Street lighting

- 3.1. The design of the Street lighting has been developed in accordance with the requirements of the DMRB. Therefore the proposed North East Roundabout, Broadland Gate Roundabout proposed Park and Ride signalised junction will be lit in accordance with TD51/03 and British Standard 5489-1:2013 Code of practice for the design of road lighting.
- 3.2. In accordance with TA 49/07, an initial assessment regarding the need to light the other sections of the proposed scheme has been undertaken. The assessment indicates that it would not be cost beneficial to light the 2 arm Business Park roundabout or the surrounding links, and as the distance between lit sections was sufficiently long enough (greater than 4 times the Stopping Sight Distance) then this section could remain unlit. All other locations would require lighting.
- 3.3. On the above basis the proposed road lighting scheme is shown in drawing R1C150-MP-663, 664 and 665 included in Appendix B.
- 3.4. Traffic signs and bollards will be illuminated as required in accordance with The Traffic Signs and Regulations and General Directions 2002.

4.0 Vehicle Restraint Systems

- 4.1. The development of the proposals for vehicle restraint systems (VRS) have been assessed and designed dependent on whether the section of the scheme forms part of the Trunk Road Network or the Local County Highway Network.
- 4.2. On the Trunk Road sections of the scheme, the provision of VRS has been assessed and designed in accordance with the DMRB TD19/06 and the Road Restraint Risk Assessment Process (RRRAP).
- 4.3. Where the scheme would form part of the local County Highway network, the provision of VRS has been assessed using the emerging "The Use of Vehicle Restraint Systems in Norfolk" guidance on County Roads developed by Norfolk County Council.
- 4.4. The proposed VRS design is shown in drawing R1C150-MP-663, 664 and 665 included in Appendix B.

5.0 Planned Development

- 5.1. There are a number of approved and committed developments in the area. These include the proposed Broadland Gate Business Park development, the proposed Brook Farm / Laurel Farm development, and the additional 1,000 dwellings identified in the Joint Core Strategy. The Broadland Gate Business Park is a significant development comprising a commercial zone of up to 42,000m² of B1 and B8 uses; a business village containing up to 4,500m² of A1, A2, A3 and A4 uses; a community zone comprising up to 7,500m² of C2, C3 and D1 uses; a hotel and leisure zone comprising up to 9,100m² of C1, A3, A4 and D2 uses; and a 1,200m² car showroom. It has planning approval, which is conditioned on, inter alia, provision of the Postwick Hub junction scheme. The Secretary of State for Transport has required that the BGBP, which would increase the traffic using the Postwick junction of the A47, cannot be occupied until the existing junction has been improved as proposed.
- 5.2. The Brook Farm / Laurel Farm development is a development proposal for the provision of 600 dwellings with a local centre incorporating 1,035 m² of A1 retail and a community hall and approximately 57,480 m² of B1, B2 or B8 (office, industrial, storage) employment uses, together with a link road and site for a railway halt on land to the north of the existing Broadland Business Park. The proposal has the benefit of a resolution to grant planning permission subject to a planning obligation and various planning conditions. One of the proposed conditions, as directed by the Secretary of State for Transport, is that the development cannot commence until the Scheme has been provided.
- 5.3. The Joint Core Strategy identifies significant potential for further development once the Postwick junction has been improved. This includes the business park expansion and housing development delivered by Broadland Gate Business Park and Brook Farm Laurel Farm, and at least 1,000 further dwellings.

6.0 Traffic Data

- 6.1. The proposed Scheme has been designed to provide a road network with sufficient capacity to cater for planned new development and in which proposed junctions operate adequately and avoid queuing back onto the A47 trunk road with the accompanying safety risk. The Scheme also provides capacity and flexibility so that the Postwick Hub junction would operate satisfactorily if the Northern Distributor Road (NDR) were to be connected to it.
- 6.2. A forecasting report has been produced showing the traffic flows and queue lengths, staging, phasing and signal timings for the whole of the Postwick Hub Junction.
- 6.3. The forecasting years are 2015, 2020 and 2030. Two traffic scenarios have been used, one is called 'Core' and the other is 'High' and the differences between the two scenarios are as follows:

Core Scenario

- Trip generation uses 85 percentile rates from TRICS 2012.
- Trip distribution based on a gravity model.
- Broadland Gate and Laurel Farm development sites are included.

High Scenario

- Trip generation extracted from the Postwick Transport Assessment Report.
- Trip distribution based on Postwick Transport Assessment Report.
- Broadland Gate, Laurel Farm and Brook Farm development sites were included.

- 6.4. The forecasting report can be made available to the audit team if required.

7.0 Amendments to existing TRO's

- 7.1. As part of the scheme amendments to two existing Traffic Regulation Orders are proposed.
- 7.2. A TRO will be brought forward to extend 40mph speed limit to a point east of the proposed new Park and Ride access roundabout at the junction with Oaks Lane as shown in drawing R1C150-MP-665 included in Appendix B.
- 7.3. A second TRO is proposed to convert the existing Park and Ride access to a Bus only access and egress as shown in drawing R1C150-MP-664 included in Appendix B.

8.0 Site Location

- 8.1. A plan showing the location of the scheme is shown in figure 2 below.

APPENDIX C

Norwich feels good on a bike...

... the pace is right to spot a bargain in a quirky shop or pause for a conversation with a friend in the park. The city's rich texture rolls out in front of you. The city is compact, making it manageable to ride from the edge to the centre in under twenty minutes. But you need to know where to go...

... welcome to the new cycle network.

It features five pedalways that cross the city from one side to the other and meet in the middle at St Andrews Plain. Two more encircle the city – one near the centre (the inner circuit), the other on the edge (the outer circuit). Each has a colour. The coloured pedalways are perfect for commuting and getting fit. They are complemented by neighbourhood routes that help you get around from your home to schools and shops, or they can be connected for longer journeys.

Norwich is yours to discover.

Happy pedalling!

How to use this map

Planning your route
The map has two sides. Use this side for planning your route. It shows where the pedalways go and how they relate to facilities so you can pick the best combination of routes. The main routes are coloured and the colours will be used on signs along the way. There is a larger scale inset map that shows the city centre.

Journey times and route conditions
Turn over to discover more about the five cross-city pedalways. The route lines have been straightened to show you how far your ride is. Each trip is centred on St Andrews Plain and the miles count by as you travel away from or towards it.
Details of the route conditions are shown on the line so you can see where busy traffic and cycle lanes are. It also shows traffic-free sections. These are usually shared with pedestrians so please ride courteously and be prepared to use your bell. The gradient of each pedalway is beneath each line.
All this information helps you to decide how much time you need for your journey.

More information
This map will be combined with signs and web-based information. We are also working to improve the network through building projects. These things will happen gradually, so if you want to keep up-to-date with developments or say how we can do better visit www.norwich.gov.uk or scan the code.

APPENDIX C

Postwick Hub Junction Stage 2 Safety Audit

10 April 2013

INTRODUCTION

This report contains the results of a Stage 2 Safety Audit carried out on the above scheme. The Audit was carried out at the request of Norfolk County Council Highways Group .

The Audit Team membership was as follows:-

Tim Young BSc, MCIHT, MSoRSA

Engineer

(Audit Team Leader)

Network Analysis + Safety

Norfolk County Council

Julian Fonseka EngTech, MCIHT, MSoRSA

Project Technician

(Audit Team Member)

Network Analysis + Safety

Norfolk County Council

Specialist Advisors:-

Andrew Micklethwaite

P2W Casualty Reduction Officer

Norfolk County Council

John Thomas

Engineer

ITS

Norfolk County Council

The Audit took place at County Hall on 10 April 2013. The audit comprised an examination of the Safety Audit submission document and a site inspection by the Audit Team Leader.

The terms of reference are as described in Environment, Transport and Development Highways Service Manual Procedure SP03-07. The Auditors have examined and reported only on the road safety implications of the scheme as presented and have not verified the compliance of the design to any other criteria.

ITEMS RAISED AT PREVIOUS AUDIT

All issues raised at the previous audit have been resolved.

ITEMS RAISED AT THIS STAGE 2 AUDIT

1.0 General

1.1 Comment – Location of Tree planting

Location – Throughout scheme

Please ensure that no trees provided as part of landscaping works are planted closer to the edge of the carriageway than 4.5m and that a rigorous maintenance regime is in place to prevent self-seeded trees from encroaching.

2.0 Alignment

2.1 Problem – Alignment of roundabout entry lanes

Location – Business Park north eastbound entries, Postwick North northbound entry, Oaks Lane east & westbound entries, Peachman Way westbound entry.

The alignment of the entry lanes at the above roundabouts is such that a vehicle is aimed at the central island rather than meeting it tangentially. If the entry lane alignment is not correct then vehicle paths may overlap while manoeuvring or a vehicle may strike the central island.

Recommendation

Check and adjust if necessary the alignment of entry lanes on the approach to the roundabouts within the scheme extents. The geometry of existing roundabouts on the periphery of the scheme should also be checked.

2.2 Problem – Length of merge on roundabout exit

Location – Westbound exit of Business Park roundabout

The predominant movement at this roundabout will be from south to west. The proposed layout is a dual carriageway on the Business Park link road which reduces to a single lane on the westbound exit. The westbound merge scales at approximately 20m, this appears too short and could result in vehicles striking the splitter island or being forcing into the oncoming lane whilst attempting to overtake.

Recommendation

Check that the length of the merge lane is appropriate to anticipated flows and increase its length if necessary to reduce the likelihood of conflict on the westbound exit. It may also be prudent to examine if the other merge tapers on the roundabouts within the scheme have sufficient capacity.

3.0 Junctions

3.1 Problem – Layout of segregated left turn lane

Location – Broadland Gate roundabout

The proposed layout for the Broadland Gate roundabout shows a segregated left turn lane, however only part of its layout is shown to the south. It is unclear how vehicles on the left turn lane will join the adjacent traffic lane. It is a black box item in TD51/03 that a merge can only be provided where 2 or more lanes on exit can be provided. If not a give way layout is required.

Recommendation

Provide a revised layout showing the full extent of the segregated left turn/the access road into Broadland Gate. This will allow the correct layout of segregated left turn to be determined from TD51/03 and if it should be a merge or give way arrangement.

3.2 Problem – Lane widths at roundabout give way line

Location – Northbound approach to Business Park roundabout

The proposed lane widths scale at approximately 5m each; this is greater than the 3m-3.5m stipulated in paragraph 7.24 of TD16/07. Wider lane widths encourage higher entry speeds onto the circulatory carriageway which can result in failure to give way from adjacent arms or loss of control type collisions.

Recommendation

To be read in conjunction with 2.2 above and 3.3 below. Reconsider the width of the northbound approach lanes. If this results in an impact on roundabout capacity then it may be possible to offset this against minor changes in the entry flair, angle and alignment.

3.3 Problem - Failure to give way collisions due to imbalanced flows

Location – Business Park roundabout

The proposed layout shows a 2 arm roundabout design for the Business Park roundabout. On opening, the dominant manoeuvres at this junction will be a left turn from the Business Park link road to the Broadland Gate link road and a vice versa right turn from the Broadland Gate to Business Park. The proposed geometry and width of the circulatory carriageway will allow this manoeuvre to be performed at high speed. Consequently drivers will become habituated to not giving way to the right which increases the risk of failure to give way should a driver wish to perform a u turn at the roundabout.

Recommendation

Redesign the geometry of the roundabout entry from the Business Park link road northbound entry to reflect the expected manoeuvres and reduce entry/circulatory speeds to reduce the risk of failure to give way.

3.4 Comment – Position of proposed bus stop

Location – Brundall Low Road

A new bus stop is proposed at the junction of Brundall Low Road and Church Road. Its position on the outside of the bend is such that a bus driver may find it difficult to align with the kerbs/barfaced paving. This would then make boarding and alighting from a bus more difficult for passengers with reduced mobility or those with pushchairs/buggies. The designer should consider if an alternative location can be chosen that has a better alignment.

4.0 Non-motorised Users

4.1 Problem – Shape of Tactile Paving

Location – Western side of Park and Ride junction

Tactile paving has been provided for the pedestrian crossing points (stages K and L) on the A47 (W) slip road. The layouts proposed for the central island are of the correct rectangular layout however; their opposites are missing the correct leg to form the L shape required. The reason the leg is important is that it provides tactile clues to blind and partially sighted pedestrians on where they may find the push button poles with rotating cones. They also give an indication to blind or partially sighted users of the direction from which traffic will be approaching.

Recommendation

Provide an appropriate tactile paving leg at these 2 locations to aid blind and partially sighted pedestrians. General convention is for it to extend to the rear of the footway/highway boundary however, in this instance that would result in an overly long and confusing layout. Therefore the designer's discretion should be used to determine the appropriate length at this location.

4.2 Problem – Uncontrolled crossing layout

Location – Within Park and Ride Site

2 uncontrolled pedestrian crossing points are located within the park and ride site. They are the primary pedestrian access from the park and ride to the new junction. The drawing supplied (R1C150-MP—363A) shows 2 rows of pedestrian studs delineating the crossing points. This layout is incorrect as it is potentially confusing for blind and partially sighted users. This is because the convention is to use pedestrian studs at controlled crossings only.

Recommendation

Remove the pedestrian studs from the uncontrolled crossing point. In addition as pedestrians have to cross 2 separate traffic lanes one of which being a bus only lane it may be prudent to provide appropriate 'look left' and 'look right' carriageway markings to alert pedestrians.

4.3 Comment – Westbound cyclist access to A47

Location – Old eastbound A47 slip road

The new shared use facility is designed to allow cyclists to slip off the A47 when eastbound and to access existing and proposed cycling facilities within Broadland Business Park and the Proposed Broadland Gates development. The new shared use

facility will also allow westbound cyclist's access to other parts of the Road Network via the service path. The service path is only 1.5m wide, therefore it is very important that cyclists receive a strong message that they should dismount at this point.

5.0 Signs, Lighting and Markings

5.1 Problem – Lack of circulatory lane markings increases risk of side swipe collisions

Location – Business Park/Broadland Gates/Postwick North and Broadland Way Roundabouts.

The four roundabouts above are not shown to have circulatory lane markings, whereas the Postwick Northeast roundabout does. Lane markings have the benefit of encouraging lower circulatory speeds and reduce the risk of side swipe collisions where 2 vehicles try and occupy the same piece of carriageway. In addition they also have benefits in terms of capacity as they allow a higher number of vehicles to use the junction.

Recommendation

Provide appropriate circulatory lane markings on all roundabouts to be constructed or affected by this scheme.

5.2 Comment – Illumination of signs ref TS063

Location – A1042 on island east of new P&R roundabout

2 new signs to diagram 610 are located on a refuge island to the east of the new P&R roundabout. Like other signs to diagram 610 within the scheme they are within a street lighting system. Under current regulations these signs require illumination to comply.

The designer should ensure that these and all signs to diagram 610 within the street lit sections of scheme are illuminated. This does not apply to those signs present on islands that contain a traffic signal head that faces in the same direction.

5.3 Problem – Business Park and Broadland Gate Link roads not fully illuminated

Location – East of Broadland Gate Roundabout and north of Postwick north east roundabout.

Sections of the Broadland Gate and Business Park link roads, including the Business Park roundabout are not illuminated. TD34/07 para 3.18 states that lighting should not terminate closer to the conflict point (the roundabout) than 1.5 times the stopping sight distance. In this case it would be 180m based on a 40mph design speed. Scaling from the plan (R1C150-MP-663) the proposed street lighting to the east of the Broadland Gate roundabout terminates at 120m.

Recommendation

Extend the proposed street lighting on the Broadland Gate link road to 180m. This would then terminate only 120m from the Business Park roundabout, which is less than the required 1.5 times the stopping sight distance in TD34/07. Therefore the Business Park roundabout should also be lit and as a consequence the Business Park link would also require lighting.

5.4 Problem – Position of signs on central islands (reference TS051 and 052)

Location – Various within scheme

Chevron signing and keep left roundels are being provided on the central islands of roundabouts within the scheme. The position of these signs is critical as they provide a 'target' that informs a driver of the point at which they must perform a sharp change of direction. They also aid drivers in understanding the layout of a junction and formulation of an appropriate approach speed. The positions shown of some of the sign arrangements are away from the direct line of sight of approaching drivers.

Recommendation

Check the positions of the sign arrangements on the central islands and ensure that drivers approaching can see them at a minimum of the stopping sight distance appropriate to the chosen design speed.

5.5 Problem – Destination markings on the carriageway

Location – Eastbound diverge slip road

Destination road markings have been proposed extensively within the signalised junction to aid driver's decision making through this complex layout. They have not been used elsewhere in the scheme but could be of benefit to drivers at other locations in addition to the proposed direction signing.

Recommendation

An example of where their use might be of benefit would be on the long eastbound diverge slip road where drivers have to decide whether or not to take the left turn slip road and also what lane they are required to be in on the Postwick Northeast roundabout.

5.6 Problem – Non-passively safe sign posts (ref TS024)

Location- A47 westbound off slip

The existing direction sign TS024 is to be retained however it is supported by a wide base post, presumably for illumination purposes. A sign in this location within a 60mph speed limit is not considered passively safe.

Recommendation

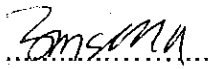

For consistency with other signing arrangements on the A47 slip roads within the scheme this one should also be made passively safe by the use of new posts. It may

also prudent to consider the adjacent sign (TS007) for conversion to passive posts in line with the Highways Agency policy.

AUDIT TEAM STATEMENT

We certify that this audit has been carried out in accordance with Norfolk County Council Environment, Transport and Development Procedures.

APPENDIX C

Postwick Hub Junction Stage 2 Safety Audit, Response Sheet

24 May 2013

RESPONSE SHEET

Problem (para no.)	Agree/ Disagree	Reasons/Proposals
1.1	Noted	All landscaping has been designed with a 4.5m setback from the carriageway.
2.1	Disagree	All alignments have been checked and are tangential to centre island except the northbound approach to the existing north west roundabout. Accident data does not indicate that there is an issue with entry.
2.2	Agreed	Exit taper to be widened.
3.1	Noted	The detailed design of the internal road layout is still to be completed and will form part of the reserved matters for the Broadland Gate Business Park planning application.
3.2	Agreed	Hatching will be provided adjacent to the splitter island resulting in a reduced entry width of 7.3m
3.3	Agreed	The circulatory width will be reduced to 8m by hatching. The width will be further reduced to 4.0m adjacent to the splitter islands again by providing hatching.
3.4	Agreed	The bus stop is to be located on the opposite side of the junction to aid bus alignment.
4.1	Agreed	Legs to be added to tactile crossings.
4.2	Agreed	Studs to be removed.
4.3	Noted	
5.1	Agreed	Circulatory lane markings will be provided.
5.2	Agreed	Signs will be illuminated.
5.3	Agreed	In line with the County's ongoing commitment to lower CO2 emissions it had been proposed not to light this section. The lighting had been designed one step below standard resulting in a reduced stopping sight distance of 135m. However, following the comments from the audit team the lighting will be extended as recommended.
5.4	Agreed	Location of signs to be reviewed and adjusted.
5.5	Agreed/ Noted	Markings on eastbound diverge will be provided. Suggest that other possible other locations to be reviewed/monitored post construction possibly at Stage 3.
5.6	Agreed	Passive posts on westbound diverge will be provided for TS024 & TS007.

1 Key Summary

- 1.1.1 Norfolk County Council adopted a preferred route for the Norwich Northern Distributor Road (known as the NDR) from the A1067 Fakenham Road at Attlebridge to the A47 at Postwick in September 2005. The highway alignment and geometry of the junctions were then developed in accordance with the highway standards, as far as reasonably practicable.
- 1.1.2 The purpose of this report is to outline the design approach adopted and departures from standards relating to the Design Manual for Roads and Bridges (DMRB) used by Norfolk County Council in the design of the mainline alignment of the NDR.
- 1.1.3 Compliance with the Design Manual for Roads and Bridges (DMRB) is mandatory for all Trunk Road works. Where it has not been possible to comply with the DMRB on the Trunk Road elements of the NDR scheme a departure from standard has been applied for. The details of these departures could be found in section 3 of this report. Four departure applications have been submitted and approved by the Highways Agency.
- 1.1.4 Where it has not been possible to comply with the DMRB on the local highway network sections of the NDR scheme the departures have been considered through the road safety audit process. The details of these departures could be found in section 4 of this report.

2 Introduction

2.1 The Scheme

- 2.1.1 This document is submitted in relation to the application for a Development Consent Order by Norfolk County Council to the Secretary of State, under the Planning Act 2008.
- 2.1.2 The Application is for the Norfolk County Council (Norwich Northern Distributor Road (A1067 to A47(T))) Order, to grant development consent for the construction of a new highway between the A1067 Fakenham Road and the A47 Trunk Road at Postwick and associated improvements to the existing highway network to the north and north east of Norwich
- 2.1.3 The majority of the junctions along the NDR are designed as at-grade roundabouts. Two grade-separated junctions are to be provided, one at the junction with the A140 and one where the NDR joins the A47(T). A signalised junction will be provided at the Postwick Park and Ride Junction.
- 2.1.4 Where the NDR joins the A47 Trunk Road at Postwick Junction, the new eastbound slip roads would become part of the trunk road network, with the remainder of the NDR incorporated into the local highway network.
- 2.1.5 The schematic layout of the NDR and the naming conventions for its component elements are illustrated in Appendix A.
- 2.1.6 Regulations 5 and 6 of the Infrastructure Planning (Applications: Prescribed Forms and Procedure) Regulations 2009 provide the statutory requirements for what must accompany a development consent application.
- 2.1.7 This document comprises part of the application documents and relates to Regulation 5(2)(q) of the Infrastructure Planning (Applications: Prescribed Forms and Procedure) Regulations 2009.
- 2.1.8 Norfolk County Council (NCC) has included this document to outline the design approach adopted and the departures from standards relating to the Design Manual for Roads and Bridges (DMRB) used by Norfolk County Council in the design of the mainline alignment of the NDR.

2.2 Design Development

- 2.2.1 The requirement for an NDR was first formally identified in 1992 following a review of transportation strategies for the Greater Norwich area. Extensive public consultation and stakeholder engagement has helped to inform the development of the scheme since then. The various consultations carried out are explained in sections 3 and 4 of the Pre-application Consultation Report (document reference 5.1) which forms part of the application.
- 2.2.2 The County Council adopted a preferred route for the NDR from the A1067 Fakenham Road at Attlebridge to the A47 at Postwick in September 2005. Since then the highway alignment and geometry of the junctions have been developed in accordance with the highway standards as far as reasonably practicable. This report explains the route alignment and outlines departures from standards relating to the Design Manual for Roads and Bridges (DMRB) used in the design of the mainline alignment of the NDR.
- 2.2.3 The Transport Assessment (document reference 5.5) explains the shortcomings of the existing road network on the northern side of Norwich and the need for improved strategic connections between the radial routes, the A47(T), and the existing and proposed development areas served by these roads (including Norwich International Airport and the employment clusters at Postwick and Rackheath). Chapter 3 of the Environmental Statement (document reference 6.1) explains the need for a new strategic route and the alternatives that have been considered. Any new strategic route serving the northern parts of Norwich and its rural hinterland needs to have a connection with the A47(T), which is the closest part of the national Strategic Road Network. Given the significance of existing and proposed employment and housing growth to the north east of the city, a location on the A47(T) to the east of Norwich is the most appropriate starting point for any such new route. Such a location would also be of most benefit for improving accessibility and connectivity between the employment opportunities within Norwich and the Great Yarmouth Enterprise Zone. The existing Postwick junction (which already serves the Park and Ride site and the employment cluster at Broadland Business Park and related business parks) is the optimum location on the A47(T).
- 2.2.4 The aim was to provide a strategic connection between the A47(T) at Postwick and as many of the radial routes as possible, addressing current transport problems and also serving planned growth to the north east of Norwich. As Chapter 3 of the Environmental Statement explains, substantial

environmental constraints have been identified to any route lying to the west of the A1067 Fakenham Road because of the presence of the ecologically sensitive Wensum Valley. However, assessment has shown that a route from Postwick as far as the A1067 would be achievable without undue environmental impact. Norwich International Airport lies adjacent to the A140 Cromer Road, and any route would need to avoid prejudicing the operational requirements of the Airport. These constraints essentially define the route corridor within which the road has to be aligned. The corridor chosen for the NDR connects the A47(T) at Postwick with the A1067 Fakenham Road and respects these constraints. Within the identified corridor, the alignment selected for the road as far as is practicable minimises its impact on existing communities, sensitive environmental areas, and heritage assets.

- 2.2.5 Changes were made to the emerging scheme proposals as a result of responses received to the various consultations. The more recent changes to the scheme resulting from consultation in 2012 and 2013 are explained in the Pre-application Consultation Report.
- 2.2.6 Environmental assessment has been undertaken in parallel with all stages of scheme development, in accordance with the DMRB. An Environmental Impact Assessment has been undertaken of the final scheme and the results recorded in an Environmental Statement (document reference 6.1 and 6.2) which forms part of the application.
- 2.2.7 The aim of the design process has been to avoid impacts where possible. Where that proved impractical, environmental mitigation measures were incorporated into the Scheme design via an iterative design process. The environment team was represented at design meetings and Scheme design thus evolved with regard to environmental and social considerations. The effectiveness of the process was supported and informed by parallel assessment activities and consultation.

2.3 Design Concept

- 2.3.1 The NDR has been designed using current design standards contained in the DMRB. The DMRB sets a standard of good practice that has been developed principally for Trunk Roads and motorways. It is for the local highway authority to decide on the extent to which the documents in the manual are appropriate when used for local road schemes.
- 2.3.2 Compliance with the DMRB is mandatory for all Trunk Road works. Where it has not been possible to comply with the DMRB on the Trunk Road elements

of the NDR scheme a departure from standard has been applied for. Four departure applications have been submitted to the Highways Agency. The departure submissions are explained in section 3.

- 2.3.3 Where it has not been possible to comply with the DMRB on the local highway network sections of the NDR the departures have been considered through the road safety audit process. The departures from standards are explained in section 4.

2.4 Road Design Standards and Design Speeds

- 2.4.1 All main line links will be designed to the Design manual for Roads and Bridges (DMRB):
- 2.4.2 TD 9/93: Highway Link Design
- 2.4.3 TD 27/05: Cross-Sections and Headrooms
- 2.4.4 TD 22/06: Layout of Grade Separated Junctions
- 2.4.5 TD 51/03: Segregated Left Turn Lanes and Subsidiary Deflection Islands at Roundabouts
- 2.4.6 Roundabouts are designed in accordance with the DMRB:
- 2.4.7 TD 16/07: Geometric design of roundabouts
- 2.4.8 The NDR mainline alignment has been designed using the design speeds shown in Appendix A. Based on these design speeds sections 3 and 4 set out any departures from standards required.
- 2.4.9 Postwick Junction will be subject to a 40mph speed limit other than on slip roads. A design speed of 70kph has been adopted in accordance with DMRB TD 9/93: Highway Link Design except on the existing and proposed bridge crossings where a lower design speed of 60kph has been adopted. The lower speed is appropriate due to the short length of the links between junctions.
- 2.4.10 The slip road design speed for both the A47 and A140 grade separated junctions is determined from the mainline design speed. Both the mainline carriageways are subject to design speed of 120kph. Therefore the appropriate design speed for the slip roads is 70kph in accordance with DMRB TD 22/06: Layout of Grade Separated Junctions paragraph 4.5, Table 4/1. The slip road design speed is 70kph when the slip road is less than 0.75km in length and provides a connection to the local highway at-grade, the

lower speed is appropriate as vehicles will be slowing down or accelerating away from the local highway junction.

- 2.4.11 The NDR mainline carriageway north of the Business Park Roundabout will be subject to the relevant national speed limit (70mph). Therefore a design speed of 120kph has been adopted for the majority of the NDR mainline carriageway, in accordance with DMRB TD 9/93: Highway Link Design.
- 2.4.12 A design speed of 100kph has been adopted on the link road between Salhouse Road and Plumstead Road Roundabouts. The section between the roundabouts, which crosses the railway line, is 1200m long. It is considered that the 85% speed would not exceed 100kph on this section and that this would consequently be an appropriate design speed to apply for this section only.
- 2.4.13 The NDR mainline carriageway joins the existing A1067 Fakenham Road at its western end, the section of new carriageway between the proposed Fakenham Road Roundabout and the tie-in is a single carriageway road and therefore a design speed of 100kph is appropriate.

3 A47 Trunk Road Design

3.1 Eastbound Diverge Slip Road

- 3.1.1 Due to the low downstream flow predicted for the A47 mainline, the diverge type is not specified in Figure 2/5 of TD22/06. The traffic flows (vph) from the latest traffic modelling and corresponding design requirements are summarised in Tables F1 and F2 of Appendix B. The tables show that in both AM and PM peaks the traffic flows are above the threshold of 1200 vph for a Type A layout in both scenarios, suggesting that a Type A layout would not be suitable and a Type B or Type D layout should be adopted.
- 3.1.2 Working within the existing physical constraints of the River Yare/Railway Bridge and the Existing Postwick Bridge, a Layout D for a diverge slip road would require the widening of the River Yare/Railway Bridge which was estimated to cost £42 million in 2008. The nearest compliant layout that could be provided within the constraints for the new diverge slip road is a Layout B Parallel Diverge. This layout allows a taper diverge, where diverging traffic leaves the mainline A47 over a specified flare distance. The flare is followed by an auxiliary lane which is an additional lane at the side of the mainline and would provide a greater weaving length along the slip road in advance of the segregated left turn proposed at the North East Roundabout than a preferred ghost island diverge Layout B. This layout was submitted and approved as a departure from standards.

3.2 Eastbound Merge Slip Road

- 3.2.1 Due to the low upstream flows predicted for the A47 mainline, the merge type is not specified in Figure 2/3 of TD22/06. A Type E or Type F merge layout would require an additional lane on the A47 mainline carriageway. The nearest compliant layout that could be provided within the constraints for the new merge slip road is Layout B. A Layout B comprises an auxiliary lane followed by a taper merge over a specified flare distance. A Layout B was submitted and approved as a departure from standards.
- 3.2.2 The traffic flows (vph) from the latest traffic modelling and corresponding design requirements are summarised in Tables F3 and F4 of Appendix B.
- 3.2.3 The departure from standards is justified as a fully compliant design would require an additional lane on the A47 extending 2.6km to the following junction with an estimated cost at the time of the departure submission of £30m.

3.3 Westbound Diverge Slip Road

- 3.3.1 No design changes are proposed on the existing westbound diverge from the A47. The existing diverge slip road is a Type A taper diverge.
- 3.3.2 The traffic flows (vph) from the latest traffic modelling and corresponding design requirements are summarised in Tables F5 and F6 of Appendix B. The capacity assessment shows that in the 2017 AM and PM peak and the 2032 AM peak a two lane slip road with hard strip should be provided in accordance with TD 22/06 table 3/1b. However when the vph flows are inserted into Figure 2/5 the flows for all scenarios fall within the threshold of 1,200 vph for a single lane slip road other than the 2032 AM peak where the vph flow is 1,222. The design team therefore feel that a Layout A comprising a single lane slip road with two lanes on the A47 main line would still be appropriate.

3.4 Westbound Merge Slip Road

- 3.4.1 The proposed Scheme ties into the existing westbound merge slip road after the Park and Ride signalised junction. It is proposed to retain the existing two-lane taper merge layout onto the A47. The existing layout is not a standard layout as per TD 22/06.
- 3.4.2 The traffic flows (vph) from the latest traffic modelling and corresponding design requirements are summarised in Tables F7 and F8 of Appendix B. The slip road flows require the provision of a two lane slip road however due to the low upstream mainline flow the merge type is not specified in TD 22/06 Figure 2/3.
- 3.4.3 The nearest compliant TD 22/06 layout F could not be provided, as a type F layout would require an additional lane on the A47 mainline carriageway.
- 3.4.4 No works are proposed to the westbound merge taper layout as part of the proposed Scheme but in view of paragraph 2.28 of TD 22/06 a departure from standards to retain the existing two-lane taper merge was submitted and approved. The departure approval requires the provision of a two lane taper Layout D which can be accommodated within the existing carriageway footprint with minor modification to the road markings.
- 3.4.5 The departure is justified as a fully TD 22/06 compliant design would require an additional lane on the A47 with widening of the River Yare bridge. Based on the 2008 departure submission for the eastbound diverge the additional cost of providing this third lane would be in the order of £42m.

3.5 Structures

- 3.5.1 The proposed bridge design is for a three span steel and concrete composite bridge, crossing the A47 Norwich Southern Bypass with a skew angle of 54 degrees. One departure from standard has been identified which relates to the omission of abutment galleries from the design. Abutment galleries are provided below expansion and rotational joints to facilitate inspection and maintenance. The departure from standards was submitted and approved.

4 Local Highway Network

4.1 Carriageway Design

4.1.1 The predicted flows for an opening year of 2017 base on the latest traffic modelling are shown in Table 1 below.

Section of NDR	2017 Annual Average Daily Traffic (AADT)
A1067 to Fir Covert Road	12,300
Fir Covert Road to Reepham Road	14,200
Reepham Road to Drayton Lane	19,000
Drayton Lane to A140	22,300
A140 to B1150	19,500
B1150 to A1151	27,100
A1151 to Salhouse Road	33,000
Salhouse Road to Plumstead Road	35,200
Plumstead Road to A47	32,900

Table 1 – Predicted NDR Annual Average Daily Traffic (AADT) flows at year of opening (2017)

4.1.2 TA 46/97 and TD 70/08 give recommendations for the opening year AADT flows for carriageway standards as follows:

- Single 7.3m with hard strips (S2) – up to 13,000 vehicles per day;
- Wide Single 10m with hard strips (WS2) – between 6,000 and 21,000 vehicles per day;
- Wide Single 2+1 carriageway with hard strips (WS2+1) – up to 25,000 vehicles per day;
- Dual 2 lane all purpose with hard strips (D2AP) – between 11,000 and 39,000 vehicles per day.

4.1.3 The predicted flows for the NDR are in excess of the recommended economic flow range for S2 with the exception of the section between the A1067 and Fir Covert Road.

4.1.4 The predicted flows for the NDR are in excess of the recommended economic flow range for WS2 and WS2+1 for the section between the B1150 and the A47. Whilst WS2 could be provided between the A1067 and Drayton Lane lengths of WS2 in excess of 2km require departure from standard approval (TD 9/93 section 1.28).

- 4.1.5 Although the safety performance of WS2 roads is better than standard S2, it is significantly poorer than for dual carriageways. TRL research indicates that WS2 roads have accident rates over 30% higher than D2AP. For accidents causing deaths and serious injury the rate is 100% higher. In addition, WS2 roads have a higher than expected percentage of accidents involving overtaking than S2. This collision type has a high risk of death or serious injury as the outcome.
- 4.1.6 The basic design principle of WS2+1 is to promote journey time reliability on long distance single carriageway roads. The NDR's primary purpose is a distributor road. It would be difficult to decide what direction you would provide the additional lane between the individual roundabout junctions. Also, WS2+1 would introduce route inconsistency and the safety performance would be worse than D2AP due to the lack of median barrier.
- 4.1.7 A D2AP would provide a consistent standard for the NDR, it would provide continuity of road type with the A47 Norwich Southern Bypass and would provide a superior performance in terms of link accidents and user costs.

4.2 Mainline Horizontal Design

- 4.2.1 Table 3 TD9/93 gives standards for horizontal curvature for the relevant design speeds.
- 4.2.2 Paragraph 3.4 TD9/93 states relaxations in standard may be made at the discretion of the designer of up to 4 steps below desirable minimum standard for all-purpose band B roads.
- 4.2.3 Paragraph 3.15 TD9/93 states transition curves shall be provided on curves the radius of which are less than that shown in table 3, Minimum R without elimination of Adverse Camber & Transitions.
- 4.2.4 Paragraph 3.16 TD9/93 states 'q' values for transition curves should not normally exceed the value of 0.3 m/sec³.
- 4.2.5 The horizontal alignment for the proposed mainline link roads are shown in Appendix C, based on the design speeds specified in section 2.4 there are no departures from standards required for the mainline horizontal alignment.

4.3 Mainline Vertical Design

- 4.3.1 Table 3 TD9/93 gives standards for vertical curvature for the relevant design speeds.

- 4.3.2 Paragraph 4.9 TD9/93 states relaxations in standard for crest curves may be made at the discretion of the designer of up to 3 steps below desirable minimum standard for all-purpose band B roads.
- 4.3.3 Paragraph 4.14 TD9/93 states relaxations in standard for sag curves may be made at the discretion of the designer of up to 1 step below the absolute minimum standard for all-purpose roads.
- 4.3.4 Paragraph 1.26 TD9/93 states relaxations below Desirable Minimum in vertical curvature for crest curves and Absolute Minimum for sag curves are not permitted on the immediate approaches to a junction as defined in paragraph 1.26.
- 4.3.5 Paragraph 4.2 TD 9/93 states that only gradients greater than 8% are considered as a departure from standards.
- 4.3.6 The vertical alignment for the proposed mainline link roads are shown in Appendix D, based on the design speeds specified in section 2.4 there are no departures from standards required for the mainline vertical alignment.

4.4 Mainline Cross Section

- 4.4.1 Paragraph 4.2 in TD27/05 states the standards for new carriageway paved widths.
- 4.4.2 The cross sections for the proposed mainline link roads are shown in Appendix E.
- 4.4.3 The proposed cross section along the length of the mainline design is in accordance with TD27/05 for carriageway, hardstrip and central reserve widths, in some cases verge width provision is 1.5m rather than the required 2.5m. In these situations the verge is reduced due to the need to accommodate a shallow drainage swale. The swales are generally 3.0m wide with 1 in 5 side slopes and a depth of 200mm.

4.5 Mainline Stopping Sight Distance

- 4.5.1 Table 3 TD9/93 gives standards for stopping sight distance (SSD) for the relevant design speeds.
- 4.5.2 Paragraph 2.8 TD9/93 states relaxations in standard may be made at the discretion of the designer of up to 3 steps below desirable minimum standard for all-purpose band B roads.

- 4.5.3 Paragraph 2.2 TD 9/93 states that the SSD shall be measured from a minimum driver's eye height of between 1.05m and 2m to an object height of between 0.26m and 2.0m both above the road surface. It shall be checked in both the horizontal and vertical plane, in the case of dual carriageways between any two points in the centre of each lane for both carriageways on the inside of the curve.
- 4.5.4 Paragraph 1.26 in TD9/93 states relaxations below desirable minimum are not permitted on the immediate approaches to junction as defined in paragraph 1.26.
- 4.5.5 The SSD for the proposed link roads are shown in Appendix F based on the design speeds specified in section 2.4 there is one departure from standards required for the mainline SSD.
- 4.5.6 The NDR passes under Middle Road bridge between Plumstead Road Roundabout (South) and the Business Park Roundabout. At this location the Stopping Sight Distance (SSD) is restricted to 2 steps below standard for westbound lane 2 vehicles due to the presence of the required Vehicle Restraint System (VRS) and the bridge pier within the central reservation. Two steps below desirable minimum would normally be considered a relaxation. The horizontal radius under the bridge is also 1 step below standard and therefore this combination of relaxations is a departure from standards. The departure is considered acceptable by the design team as the reduction in SSD will be a momentary visibility impairment only. Increased visibility will be achievable over the VRS and behind the bridge pier.

4.6 A140 Grade Separated Junction

- 4.6.1 Due to the low flows predicted at the junction the diverge type is not specified in Figure 2/5 of TD22/06 for either the eastbound or westbound diverges from the mainline NDR carriageway. The traffic flows (vph) from the latest traffic modelling and corresponding diverge slip road design requirements are summarised in Tables F1, F2, F5 and F6 of Appendix G. The tables show that in both AM and PM peaks the traffic flows are below the threshold of 1200 vph for a Type A layout in both scenarios, suggesting that a Type A layout would be suitable. A Type A layout has therefore been adopted.
- 4.6.2 For the eastbound and westbound merge slip roads the traffic flows (vph) from the latest traffic modelling and corresponding design requirements are summarised in Tables F3, F4, F7 and F8 of Appendix G. The tables show that the ideal layout for the merge slip roads is a Type E lane gain layout. A

Type E layout would provide a single lane merge slip road joining a one lane NDR mainline carriageway to form a two lane downstream mainline carriageway. However, for reasons of route continuity, the NDR mainline has been designed with two lanes throughout. Therefore the nearest compliant layout is a Type A single lane taper merge. A Type A layout has therefore been adopted as a departure from standards.

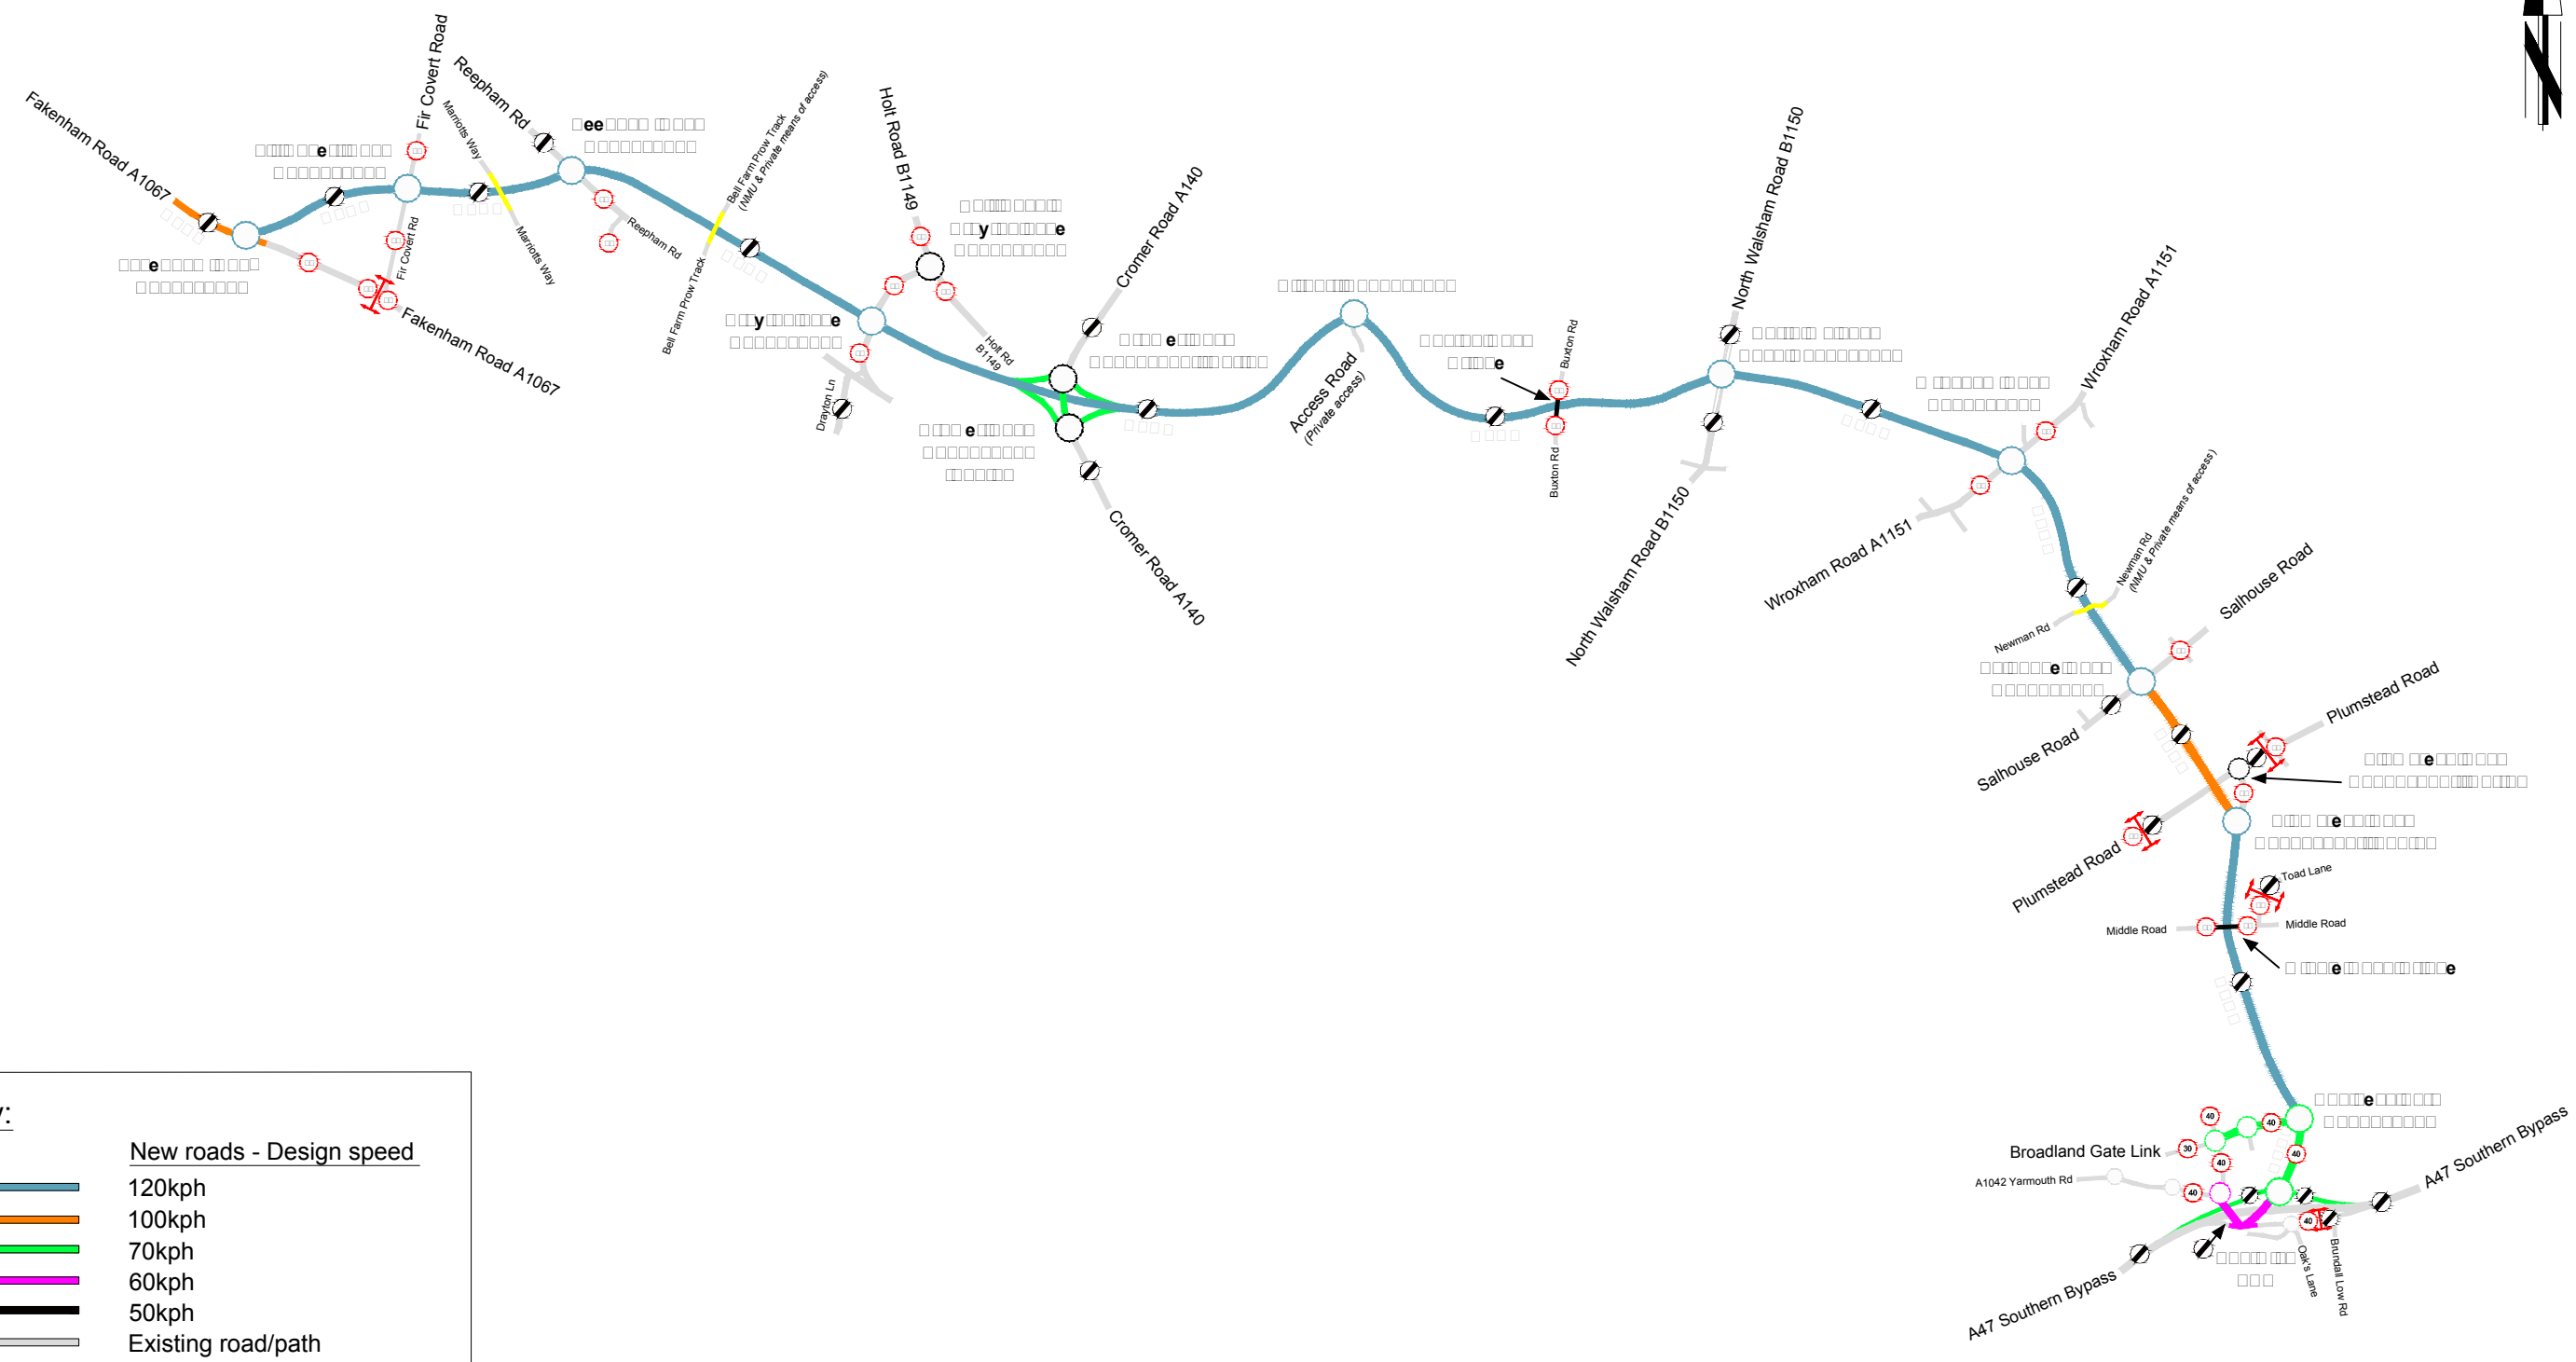

- 4.6.3 The westbound merge slip road has a two way section near the A140 Cromer Road Roundabout South. This is to allow access to a property and for maintenance vehicles to access the lagoon. Therefore the eastbound flow on the slip road will be extremely low. Paragraph 5.27 in TD22/06 states that two way slip roads must be dual carriageway with opposing traffic separated by a physical central reserve with vehicle restraint system. Due to the low opposing flow it is considered that a physical separation would result in an overdesigned layout. Therefore the two-way section of the slip road is a departure from standards and has been designed as a 7.3m wide two way carriageway. Signing will be provided to inform drivers of the layout ahead.

5 Conclusion

- 5.1.1 The proposed alignment follows the County Council's adopted preferred route for the NDR from the A1067 Fakenham Road at Attlebridge to the A47(T) at Postwick. The highway alignment and geometry of the junctions have been developed in accordance with the highway standards as far as reasonably practicable and with the objective of minimising its environmental impact within the available route corridor.
- 5.1.2 Compliance with the Design Manual for Roads and Bridges (DMRB) is mandatory for all Trunk Road works. Where it has not been possible to comply with the DMRB on the Trunk Road elements of the NDR scheme a departure from standards has been applied for. Four departure applications have been submitted to and approved by the Highways Agency. These departures are a result of working within the existing physical constraints of the River Yare/Railway Bridge and the Existing Postwick Bridge.
- 5.1.3 Where it has not been possible to comply with the DMRB on the local highway network sections of the NDR scheme the departures have been considered through the road safety audit process.
- 5.1.4 Two departures from standard are associated with the mainline alignment and two departures from standard are associated with the A140 grade separated junction. These departures have been reviewed during the road safety audit process and accepted by the independent safety audit team.

6 Appendices

Appendix A – R1C093-R1-4342 NDR Layout - Design Speeds

Key:

- New roads - Design speed
- 120kph
- 100kph
- 70kph
- 60kph
- 50kph
- Existing road/path
- Non motorised user (NMU) crossing
- Speed limit MPH/National
- Link road reference number

7 Glossary

crest curve	a vertical curve that rises to a high point
grade separated junction	a road junction where roads cross at different levels
hardstrip	a surfaced strip that abuts the carriageway edge
mainline	the carriageway carrying the main flow of traffic (generally passing straight through a junction or interchange)
merge/diverge	a layout where merging or diverging traffic joins or leaves the mainline carriageway
sag curve	a vertical curve that falls to a low point
slip road	a connector road within a junction between a mainline carriageway and the local highway network, or visa versa.
vehicle restraint system	a concrete or steel barrier installed alongside, or on the central reserve of, a road to restrain vehicles and minimise the risk of their collision with hazardous features.

This document is issued for the party which commissioned it and for specific purposes connected with the above-captioned project only. It should not be relied upon by any other party or used for any other purpose.

We accept no responsibility for the consequences of this document being relied upon by any other party, or being used for any other purpose, or containing any error or omission which is due to an error or omission in data supplied to us by other parties

This document is submitted in relation to the application for a proposed development by Norfolk County Council to the Planning Inspectorate, under the Planning Act 2008.

The application is for the Norfolk County Council (Norwich Northern Distributor Road (A1067 to A47(T))) Order, to grant development consent for the construction of a new highway running west-east between the A1067 Fakenham Road and the A47 Trunk Road at Postwick, including improvements to the existing highway network to the north and north east of Norwich.

This document comprises part of the application documents and relates to Regulation 5(2)(q) of the Infrastructure Planning (Applications: Prescribed Forms and Procedure) Regulations 2009.

PAGE NOT USED

Executive Summary

- 1 Norwich is the largest city in East Anglia and the economic centre for Norfolk. The success of 'Greater Norwich' - a wider area than the city alone extending to the districts of Broadland, Norwich and South Norfolk (see Figure 1.1 below - is vital to the economic success of Norfolk and of the East Anglian sub-region (Cambridgeshire, Norfolk and Suffolk). Greater Norwich is an area that has experienced growth, and is anticipated to experience further growth in population and economic activity. The proposed Norwich Northern Distributor Road (NDR) is part of long-term infrastructure planning to support the delivery of housing and jobs to the north and north-east of Norwich between Norwich International Airport and the proposed Postwick Hub.
- 2 The NDR is the subject of a direction which was given by the Secretary of State for Transport on 9 August 2013 under section 35 of the Planning Act 2008 (the Direction). The Direction stated that the proposed NDR is nationally significant and is to be treated as development for which development consent under the Planning Act 2008 is required. The effect of the Direction is that consent for the construction and operation of the NDR is required to be pursuant to a development consent order (DCO) granted by the Secretary of State for Transport under the Planning Act 2008. This report forms part of NCC's application for a DCO for the NDR.
- 3 The economic impact assessment of the proposed NDR is provided within the context of the Joint Core Strategy's (JCS) stated growth targets which are in place to guide the future of the Greater Norwich economy. The NDR is a key strategic piece of infrastructure and will play a key role in supporting the delivery of growth in housing and jobs over the next two decades. The JCS contains twelve over-riding objectives, which underpin the spatial vision of creating some 36,820 new homes and 27,000 new jobs between 2008 and 2026 in the Greater Norwich area (Joint Core Strategy, pages 20-23).
- 4 The purpose of this report is to provide an explanation of the relationship between the proposed NDR and sites earmarked for development and to assess the economic development impact of the NDR in terms of jobs and dwellings which are assessed on a site-by-site basis with respect to the influence of the NDR on bringing development forward. A separate report has been produced which focuses on transport economics and benefits (the NDR Economic Appraisal Report).

- 5 The NDR, including the Postwick Hub, will bring the very substantial benefits described in Section 5. As is shown in Table 5.3 of the main report, these benefits include:
- **4,358** net additional direct jobs arising from the development sites listed in this report;
 - when multiplier effects are included this figure (of 4,358) rises to **5,230** net additional jobs that would not otherwise arise in Greater Norwich;
 - **£1.099bn** of additional GVA is forecast to be generated by those **5,230** jobs over some 30 years;
 - **£966m** of net additional physical investment in roads, infrastructure and housing; and
 - an average of **426** construction jobs (rising to **511** when multiplier effects are included) in each of the years until development is complete (estimated at 2034).

1. Introduction

1.1 Study team

1.1.1 Mott MacDonald's Economic, Social & Market Research team was appointed by Norfolk County Council (NCC) in March 2013 to prepare an economic impact assessment of the Norwich Northern Distributor Road (hereafter referred to as the NDR).

1.2 Method of approach

1.2.1 The report presents the professional opinion of the study team. It considers the economic development impact of the NDR and provides evidence in support of the NDR; it also presents wider evidence of the relationship between road schemes and economic development. A range of techniques and approaches have been deployed in order to assess the potential economic development benefits of the NDR, including:

- a review of the local economic baseline for the study area;
- a review of relevant policy and strategy documents in relation to the NDR;
- a review of existing and proposed development sites that will be affected by the NDR;
- a summary assessment of net additional economic development impacts attributed to the NDR in terms of jobs created, Gross Value Added (GVA) and new dwellings constructed; and
- a review of evidence from academic and consultancy reports analysing the links between road improvements and economic benefits.

1.2.2 HM Treasury, through the Green Book: Appraisal and Evaluation in Central Government (2003 updated in July 2011) (the Green Book), has issued mandatory guidance on how cost-benefit analyses should be conducted by public sector bodies appraising proposals before funds are committed to a policy, programme or project. The Green Book provides general guidance on appraisal. The Treasury expects individual spending departments to use the Green Book's principles to develop detailed guidance in their respective spheres of activity. The Department for Transport (DfT) has developed detailed guidance for the assessment of transport projects that emphasises, for instance, savings in travel time and reductions in carbon emissions consequent on improvements in transport facilities. This guidance is set out in the DfT's WebTAG guidance, which is subordinate to the principles in the Green Book.

1.2.3 This report is concerned with the wider consequences of investment in NDR. An assessment of wider economic development benefits is required as part of the Green Book appraisal process where such benefits are deemed significant,

as is the case with the NDR. The Transport White Paper¹ also draws attention to the ways in which transport programmes can have a favourable impact on jobs and growth, through both the demand and supply side of the labour market. The aim of this report is to apply the Green Book and Transport White Paper approach in the context of wider economic development benefits associated with construction and operation of the NDR.

1.3 Description of the NDR

- 1.3.1 The Scheme (the Norwich Northern Distributor Road, known as “the NDR”) is a dual carriageway all-purpose strategic distributor road, to be classified as the A1270 Principal Road, which would link the A1067 Fakenham Road, near Attlebridge, to the A47 Trunk Road (T) at Postwick. This will be over a length of approximately 20.4 km. Refer to the General Arrangement Plans in document number 2.6.
- 1.3.2 1.2.1 From west to east, the scheme will start with a realignment of 750m of the A1067 Fakenham Road to the north of the existing carriageway, where the NDR (A1270) starts at a new at-grade roundabout junction, located to the west of Taverham. The NDR would then continue eastwards as a dual carriageway to its new at-grade roundabout junction with the C262 Fir Covert Road. From this roundabout, the NDR would then cross the Marriott’s Way (a permissive path providing a pedestrian, cycling and horse riding facility along the route of a disused railway) which will be taken across the NDR via a new bridge), to a new at-grade roundabout junction with the C261 Reepham Road. The NDR would then continue south eastwards, crossing Bell Farm Track/Horsford Restricted Byway No. 5 (which will be taken up over the NDR via a new Restricted Byway and private access accommodation bridge) before connecting with a new at-grade roundabout junction, just west of the existing C282 Drayton Lane, and which new roundabout will have two new link road connections, one with the C261 Reepham Road and one with the B1149 Holt Road, to replace the existing Drayton Lane.
- 1.3.3 1.2.2 From here, the NDR would then continue south eastwards to a new grade-separated junction (provision of a bridge over the NDR with slip roads to/from the NDR) with the A140 Cromer Road, located close to and just north west of Norwich International Airport. The provision of this grade-separated junction will require the stopping up of lengths of the B1149 Holt Road and Holly Lane (U57142), as well as a length of the A140 Cromer Road, which will be replaced by a new highway west of its existing position, which will be taken over the NDR and provide the connection for its four connecting slip roads.

¹ Creating Growth, Cutting Carbon: Making Sustainable Local Transport Happen, January 2011, Cm 7996

East of the A140, the NDR would continue as a dual carriageway, turning north eastwards around the northern boundary of the airport to a further new at-grade roundabout junction at the northern tip of the airport. The primary purpose of this roundabout is to allow the NDR to undertake a roughly 90 degree change of direction around the Airport site. From this roundabout, the NDR would continue south eastwards, skirting the north east boundary of the airport, before turning eastwards and passing under a new highway, which will be carried by bridge over the NDR, immediately to the east of the existing C246 Buxton Road, and which would provide the new connection for its realignment sections north and south of the NDR.

- 1.3.4 The route of the dual carriageway NDR would then continue eastwards through the north of Beeston Park. It would then connect with both the B1150 North Walsham Road and the A1151 Wroxham Road via a new at-grade roundabout at each location, before turning south eastwards and entering the north eastern section of Rackheath Park approximately 250 metres from the western end of Sir Edward Stracey Road (U57538). It would then continue south eastwards, passing under a new bridleway and access bridge across the NDR, some 200 metres south west of the junction of Newman Road (U57490) with Long's Crescent (U57852).
- 1.3.5 The NDR would then connect with the C283 Salhouse Road via a new at-grade roundabout, before rising up on an embankment (maximum height approximately 8.5 metres), to cross both the Norwich to Cromer & Sheringham rail line and the C874 Plumstead Road on individual bridges in close proximity, prior to a new at-grade roundabout on the NDR, which would connect it via a new link road to a further small at-grade roundabout on the C874 Plumstead Road.
- 1.3.6 The NDR route would then continue southwards, crossing under the C442 Middle Road (which would be raised to pass over the NDR, on its existing alignment, via a new bridge) before connecting with a new at-grade roundabout known as the Business Park Roundabout.
- 1.3.7 At this point a single carriageway link is provided westwards to the existing C829/C830 Broadland Way/C831 Peachman Way roundabout and includes an at-grade roundabout on the link road to the proposed Broadland Gate Business Park.
- 1.3.8 From the Business Park roundabout the NDR proceeds southwards as a dual carriageway to a new Postwick north east at-grade roundabout immediately north of the A47(T) Norwich Southern Bypass. This roundabout has links from a

new A47(T) eastbound diverge slip road and a new A47(T) eastbound merge slip road. The NDR continues over the A47(T) as a four lane carriageway, one lane north and three south, on a new bridge and terminates at its southernmost point at a signalised junction, which replaces the existing Park and Ride roundabout with the A1042 Yarmouth Road.

1.3.9 This signalised junction would provide further links:

- Directly to and from the park and ride site for buses;
- West to the existing Postwick North West roundabout, via the existing Postwick bridge over the A47(T);
- East to the proposed park and ride site entrance at the proposed Oak's Lane roundabout and further East to the Brundall Low Road junction with the A1042 Yarmouth Road to Postwick village; and
- West to the A47(T) via an existing westbound merge slip road.

1.3.10 The works at Postwick Junction, will include modifications to the existing Postwick north west roundabout (as a result of closing the existing eastbound diverge slip road) and to the existing A1042 Yarmouth Road overbridge of the A47(T), to provide revised traffic lanes and the provision of a shared use cycle/footway.

1.3.11 The route of the NDR that has been described above is, for the majority of its length, within Broadland District. It does, however, for a short stretch close to Norwich International Airport, fall within the administrative area of Norwich City Council. A very small part of the works at Postwick falls within the administrative area of The Broads Authority. The new road from west to east runs through the following parishes:

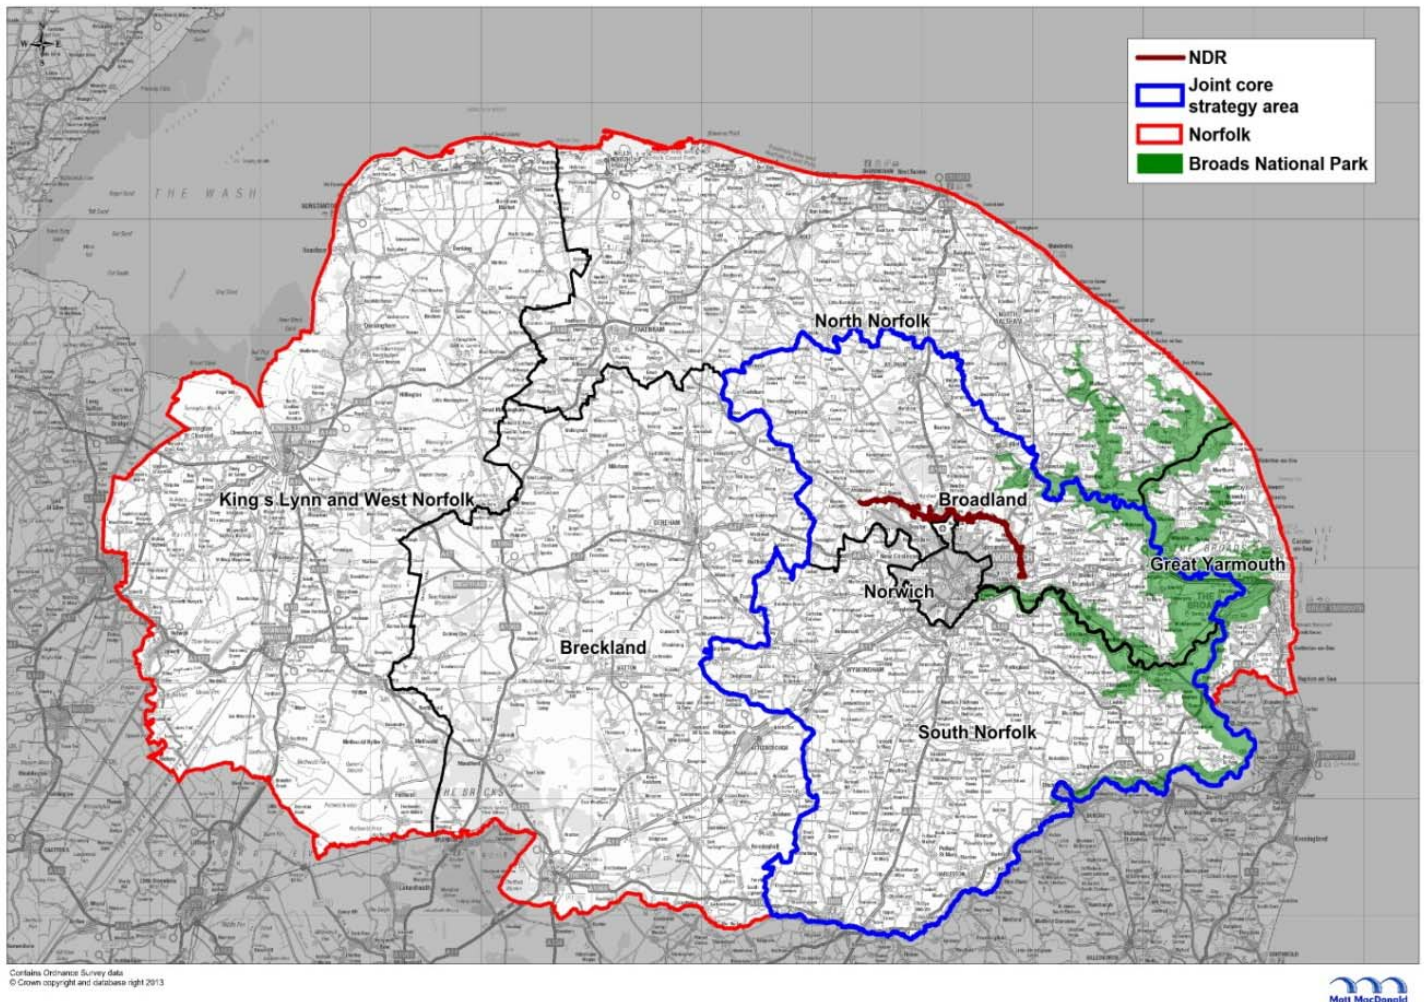

- Attlebridge;
- Taverham;
- Drayton;
- Horsford;
- Horsham St Faith and Newton St Faith;
- Spixworth;
- Beeston St Andrew;
- Sprowston;
- Rackheath;
- Great and Little Plumstead; and
- Postwick with Witton.

1.4 The study area

1.4.1 The core area subject to the impact of the NDR is defined as the JCS area (i.e. the combined administrative areas of Broadland District Council, Norwich City Council and South Norfolk Council), which is the strategic planning area within which planned growth is proposed to be accommodated. This area is the study area for the purposes of this report. Parts of Broadland, South Norfolk and a

very small area of Norwich are also covered by the Broads Authority (which is a separate planning authority in its own right) and these areas are not included within the JCS area boundary. However, as the Broads Authority Core Strategy has no separate jobs or housing targets, these boundary distinctions have no significance in the context of this report. Given the strategic importance of the NDR in the County of Norfolk, this report will also consider the wider role of the NDR in supporting growth in Norfolk more generally. Figure 1.1 below shows the location of the NDR and the local authority areas referred to in this report.

Figure 1.1 – NDR within study area (the JCS area) and local authority areas referred to in this report

1.5 Report structure

1.5.1 The remainder of the report is structured as follows:

- Section 2 – presents the economic baseline for the area.
- Section 3 – sets out the policy framework for the area.
- Section 4 – reviews the business consultation carried out in 2011.
- Section 5 – presents an assessment of the NDR's potential economic development benefits
- Section 6 – contains a summary of the NDR's potential economic development benefits.
- Appendix A – sets out the calculations of economic development benefit.
- Appendix B – provides an overview of the findings of studies considering the role of road schemes in supporting local economic development and growth.

2 Economic Baseline

2.1.1 This section provides an overview of the existing economic characteristics of the study area in terms of employment, business, skills, unemployment and deprivation. A range of indicators are used and mapped at Lower Layer Super Output Area (LSOA) level² for ease of comparing spatial patterns. However, given that Census 2011 data remains relevant and is based on a greater sample of population than other data sets which are based on surveys (for example Annual Population Survey, Business Register and Employment Survey) it has been used where relevant throughout this section.

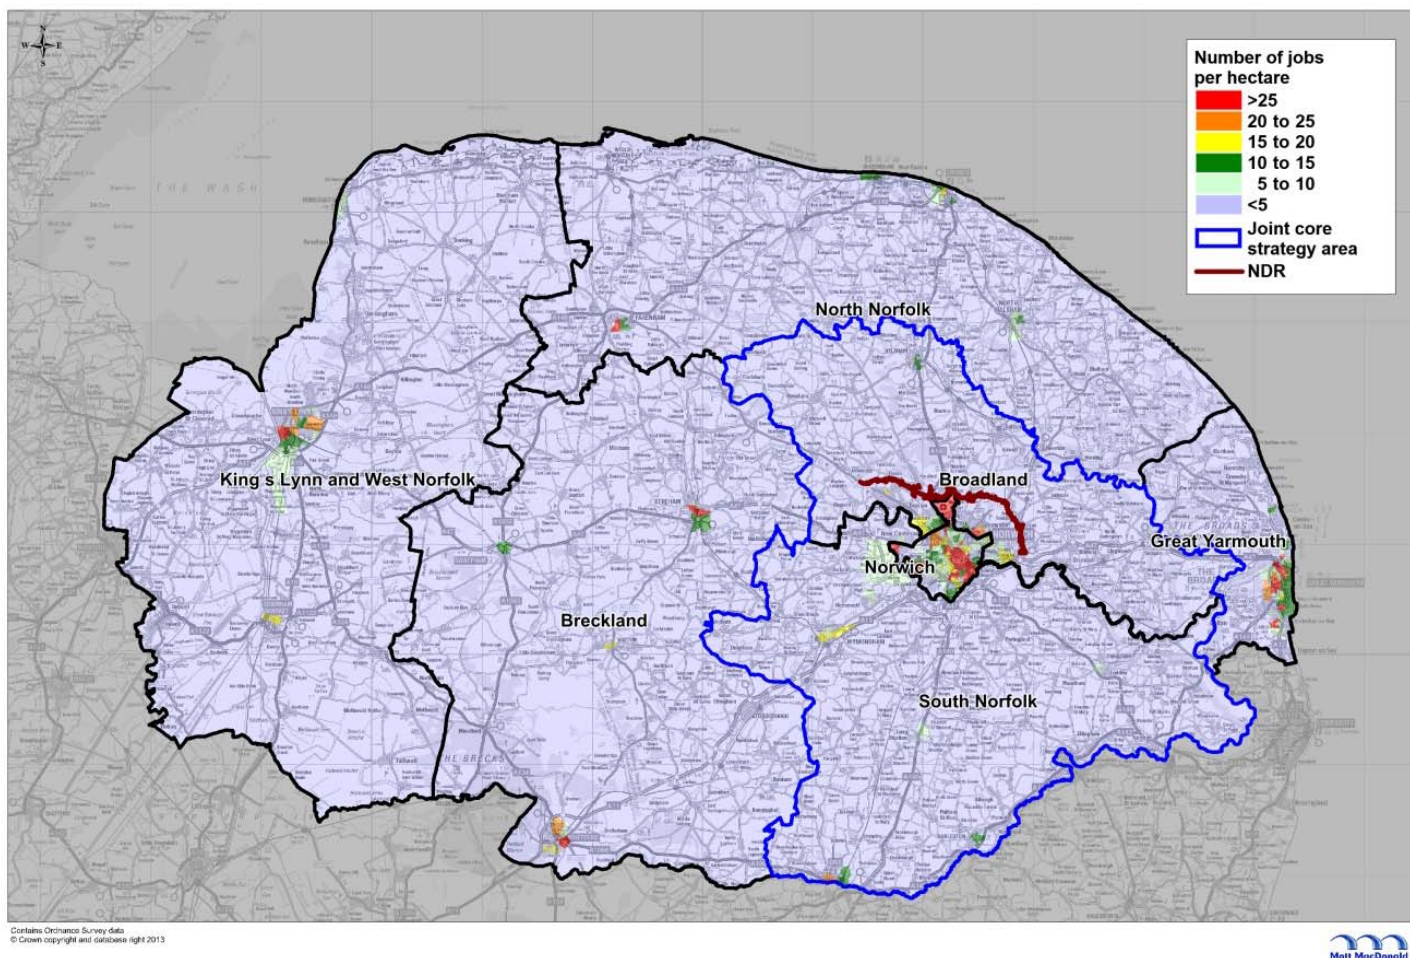

2.2 Employment and skills

Employment

2.2.1 Employment density, as shown in Figure 2.1, illustrates the significance of Norwich as a sub-regional employment hub. The city centre and Norwich Airport Industrial Estate are visible as concentrations of employment (as red areas on the map) in Figure 2.1. Broadland Business Park is visible (as a yellow area on the map) to the east of Norwich adjoining the eastern end of the NDR and the influence of Norwich Research Park (NRP) (as a light green area on the map) to the west of Norwich is clear. The NDR has the potential to support growth and development to the northeast of Norwich and increase employment density in that area by providing improved access to employment for residents of North Norwich and north-east Norfolk. Given its proximity to the Airport and scope to provide modern commercial space, northeast Norwich has the potential to be the prime location for future indigenous growth, inward investment and foreign direct investment. Companies looking for large premises on sites that are well connected to the strategic road network and to the Airport could be accommodated in that area. This is particularly the case if the companies are in growth sectors such as aerospace, advanced engineering and offshore energy due to the likelihood that they are operating in global markets and have greater need for international travel which can be facilitated through the Airport and particularly its routes to Amsterdam providing access to KLM's global network.

² A Lower Layer Super Output Area (LSOA) is a geographic area, built from 4 to 6 groups of contiguous Output Areas, automatically generated to be as consistent in population size as possible, for the purpose of reporting on small area statistics in England and Wales. LSOAs were created from 2001 Census data and a LSOA typically contains a minimum population of 1,000 and a mean population of 1,500. (Source: Office of National Statistics) Further information available at: <http://www.ons.gov.uk/ons/guide-method/geography/beginner-s-guide/census/super-output-areas--soas--index.html>

Figure 2.1 – Employment density, 2011

Source: Business Register and Employment Survey (BRES), 2011

Skills

2.2.2 In Figure 2.2 below, educational attainment and skills are presented based on the proportion of residents aged 16+ that have attained Level 4 (Bachelor degree) or above. It is shown that the higher densities of more highly skilled people live in central and southern parts of Norwich city, the northern part of South Norfolk (adjoining Norwich), however, there are also pockets of high density populations of highly skilled people within the north and north western Norfolk areas of Kings Lynn and West Norfolk, in the north of North Norfolk and in the north, east and west of Broadland.

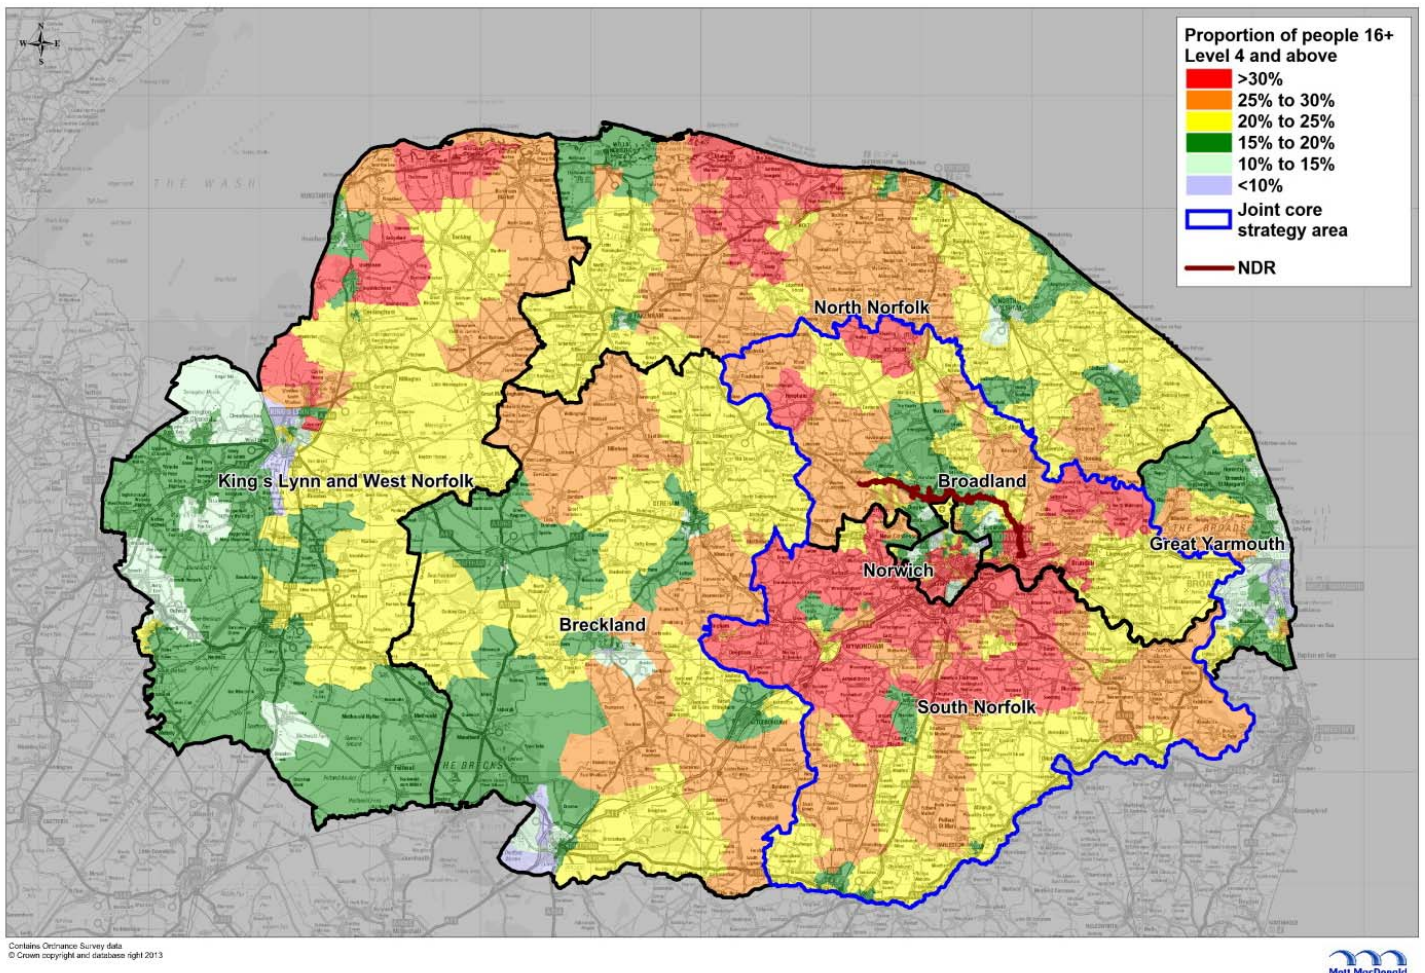

2.2.3 The spatial pattern around Norwich city and north parts of South Norfolk reflects the location of the University of East Anglia, and is similar to that observed in other university cities. It is also influenced by the housing market, location of employers employing highly-educated people (such as Norwich Research Park

(NRP)) and good connectivity between residential and employment areas. For the JCS area overall, 26% of residents have attained Level 4 qualifications and above (compared to 27.4% of residents in England as a whole).

- 2.2.4 In comparison, the proposed alignment of the NDR runs through an area of relatively lower skills (shown in green on the map). The enhanced connectivity which the NDR would bring to this area would provide improved access to employment opportunities for residents living to the north of the city, whilst also simultaneously providing businesses in that area with access to a wider and more highly educated/ skilled labour market catchment area. In order to ensure that residents with lower skill levels were able to seek new employment opportunities that arise in the area there would need to be parallel interventions to provide training and skills development courses for local residents in-line with the needs of businesses. An example of this is that in addition to the existing training organisations and facilities in the area (e.g. City College) a new University Technical College (with a particular focus on engineering and energy sector training) is to be built in Norwich. The goal of the University Technical College is to provide students with skills and qualifications to go either to university or to take up skilled employment at age 18 with a particular focus on the engineering and energy sectors. An £8m construction project is underway in Old Hall Road in Norwich to provide the facility which will open in September 2014 and a start has recently been made on recruiting students: the intake is to be 300 students in Year 1. It has the support of a number of significant employers. University of East Anglia sponsorship and the backing of the Transforming Education in Norfolk (TEN) Group (The TEN Group is a federation of educational institutions in Norfolk, all committed to excellence in education³.)

Figure 2.2 – Proportion of residents aged 16+ holding Level 4 qualifications and above, 2011

Source: Census 2011

Unemployment

2.2.5 Figure 2.4 indicates that there are concentrations of unemployment in the urban areas of Norwich (especially to the north of the city), Great Yarmouth, Thetford (especially to the north-west of the town) (in Breckland), and King's Lynn. Beyond these urban areas, the unemployment rate in the County is generally below 4%. Given the scale of national and global economic downturn since 2008, this suggests the area has demonstrated some resilience in comparison to other parts of the UK, perhaps influenced by a higher proportion of retirement age residents. A further feature of the Norfolk labour market is, however, the

much greater degree of part-time working than in the country as a whole⁴, suggesting a low pressure of labour demand. Although the alignment of the NDR generally passes through areas of low unemployment, it could provide improved access to employment opportunities for unemployed residents living in neighbourhoods to the central and northern areas of Norwich where unemployment is generally higher than the rest of the JCS area. For the JCS area, the unemployment rate at the Census 2011 was 4.2% with 11,864 people registered as unemployed⁵.

2.2.6 Since the 2011 Census, economic recovery has gradually been experienced throughout the UK and there has been an increase in employment rates and reduction in unemployment rates alongside an increase in average wage levels. In November 2013 the Office for National Statistics (ONS) reported (ONS, Labour Market Statistics, November 2013)⁶ reported that for the UK in July to September 2013:

- *“The employment rate for those aged from 16 to 64 was 71.8%, up 0.3 percentage points from April to June 2013 and up 0.6 from a year earlier. There were 29.95 million people in employment aged 16 and over, up 177,000 from April to June 2013 and up 378,000 from a year earlier.*
- *The unemployment rate was 7.6% of the economically active population, down 0.2 percentage points from April to June 2013 and from a year earlier. There were 2.47 million unemployed people aged 16 and over, down 48,000 from April to June 2013 and from a year earlier.*
- *The inactivity rate for those aged from 16 to 64 was 22.2%, down 0.2 percentage points from April to June 2013 and down 0.4 percentage points from a year earlier. There were 8.92 million economically inactive people aged from 16 to 64, down 69,000 from April to June 2013 and down 149,000 from a year earlier.*
- *Total pay rose by 0.7% compared with July to September 2012. Regular pay rose by 0.8% over the same period.”* (ONS, Labour Market Statistics, November 2013, p1)

2.2.7 Figure 2.3 shows the trend in the employment rate for the UK during the course of the recession.

⁴ Data from NOMIS (Annual Business Inquiry, Employee Analysis (2008), Available from: <https://www.nomisweb.co.uk/reports/imp/la/1967128599/report.aspx>) indicates 37% of workers in Norfolk are part-time compared to 31% nationally

⁵ Census 2011 data on unemployment is based on the 16-74 year old economically active population. This is a different measure than that used for reporting monthly unemployment rates by ONS. The Census data is included here because it can be mapped to LSOA level along with other data from the Census. An updated unemployment position for September 2013 is presented below but the two data sets are not directly comparable.

⁶ Available at <http://www.ons.gov.uk/ons/rel/lms/labour-market-statistics/november-2013/statistical-bulletin.html>

Figure 2.3 Employment rate (aged 16 to 64), seasonally adjusted

Source: ONS, Labour Market Statistics, November 2013, p5

2.2.8 The data in Table 2.1 below presents the unemployment position for Norfolk at September 2013. This is based on the 16-64 age group so is different and not directly comparable with the Census 2011 data:

- across Norfolk in September 2013, when there were 14,308 people registered as unemployed (an unemployment rate of 2.7%);
- in the JCS area (comprising the administrative areas of Broadland, Norwich and South Norfolk), which had 6,136 people aged 16-64 registered as unemployed in September 2013 (an unemployment rate of 4.1% in Norwich, 1.5% in Broadland and 1.7% in South Norfolk); and
- across England as a whole, where there were 1,078,299 people unemployed (an unemployment rate of 3.1%).

Table 2.1 – Claimant count unemployment rate, residents aged 16-64⁷, September 2013

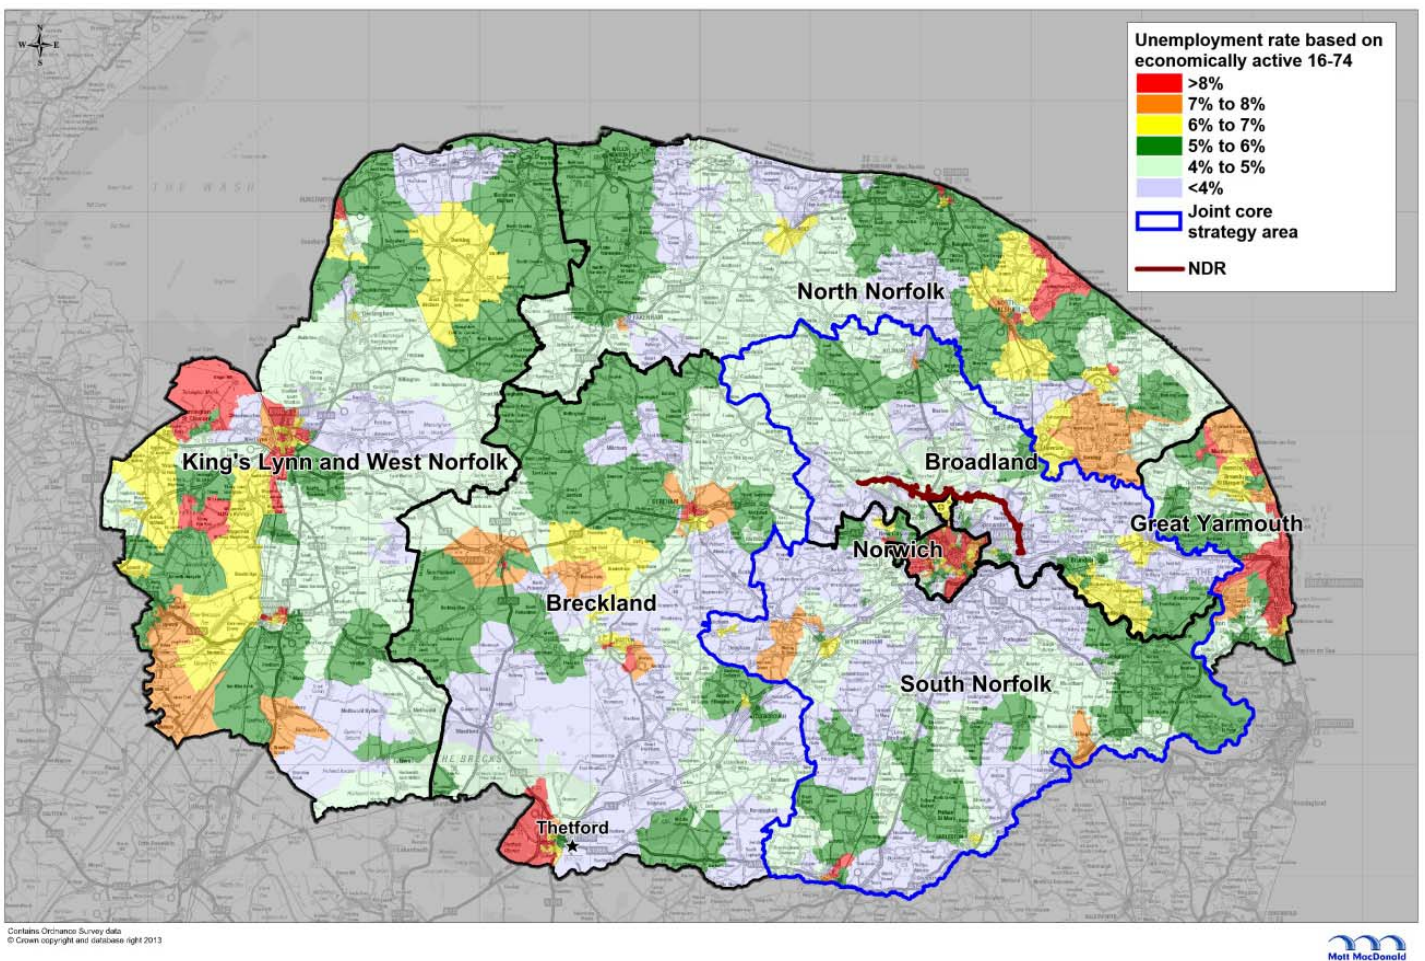

Area	Number of claimants	Unemployment rate (%)
Breckland	1,811	2.3
Broadland	1,151	1.5
Great Yarmouth	2,845	4.8

⁷ The September 2013 data is based on economically active residents aged 16-64 and is not directly comparable with unemployment from Census 2011 though it does provide a reflection on the current position

Area	Number of claimants	Unemployment rate (%)
King's Lynn & West Norfolk	2,355	2.7
North Norfolk	1,161	2.0
Norwich	3,737	4.1
South Norfolk	1,248	1.7
Norfolk (as a whole and comprising the 7 areas listed above)	14,308	2.7
England	1,078,299	3.1

Source: ONS via NOMIS (ONS official labour market statistics), Claimant count excludes Universal Credit (benefits) claimants

Figure 2.4 – Unemployment rate for economically active population aged 16-74⁸, 2011

⁸ See earlier note: 2011 (for economically active aged 16-74) unemployment data should not be directly compared with the 2013 (for economically active aged 16-64) unemployment data in this report.

Source: Census 2011

2.2.9 Table 2.2, below, supports the map set out in Figure 2.4 and presents Census-based unemployment figures for each district as well as regional and national comparators.

Table 2.2 - Unemployment as a proportion of economically active population (aged 16-74), 2011

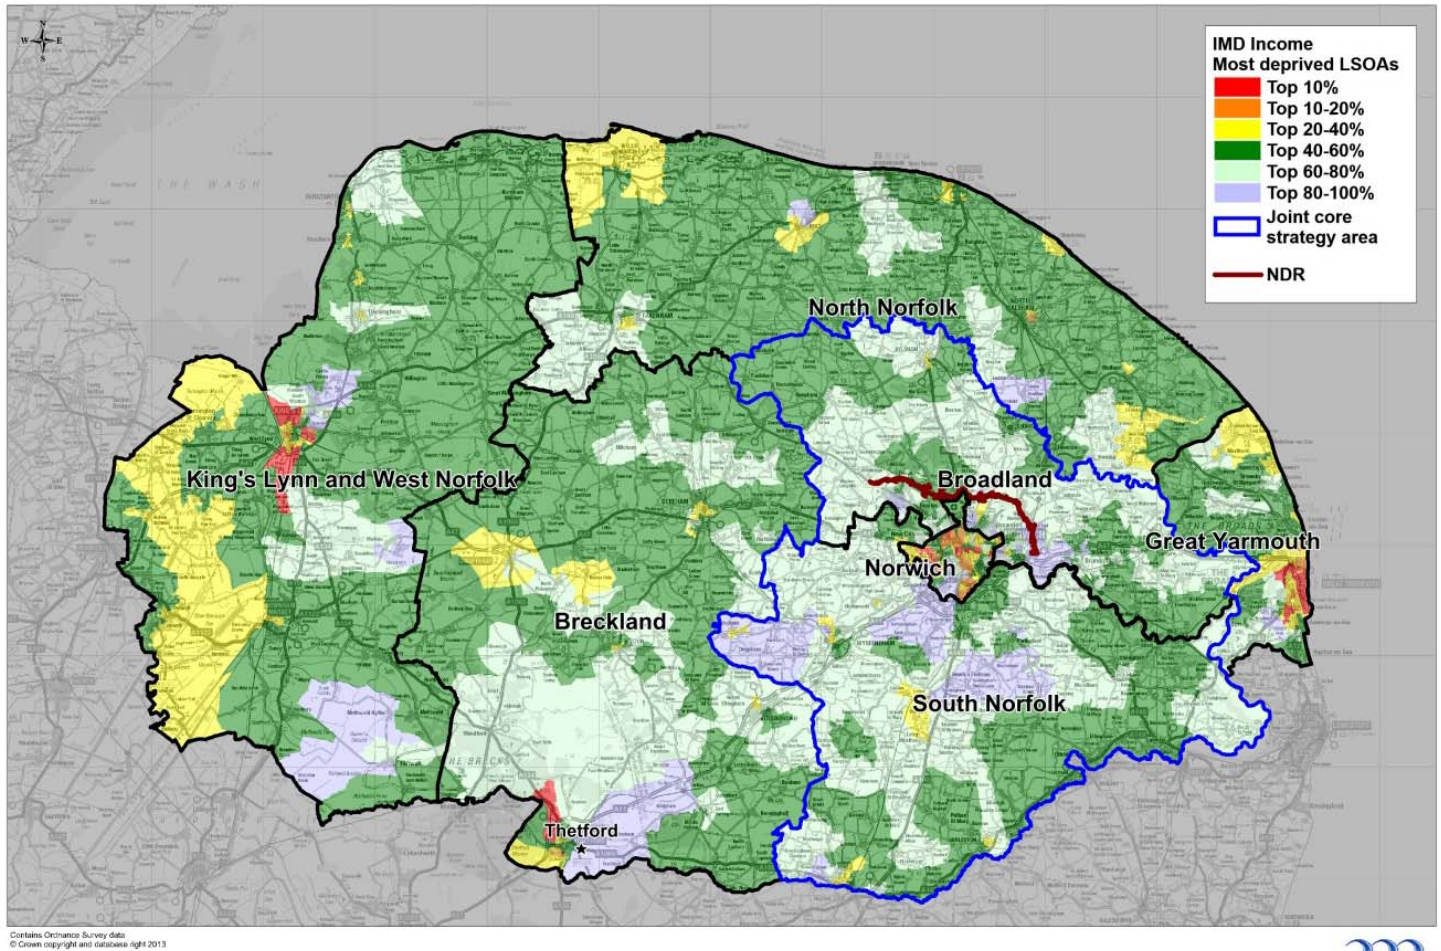

Area	Unemployment	Economically Active Population (aged 16-74)	% unemployed as Proportion of Economically Active
Breckland	3,728	65,029	5.7
Broadland	2,691	64,232	4.2
Great Yarmouth	4,754	46,018	10.3
King's Lynn & West Norfolk	4,436	71,704	6.2
North Norfolk	2,636	45,819	5.8
Norwich	6,348	68,772	9.2
South Norfolk	2,825	63,158	4.5
JCS Area	11,864	196,162	6.0
East of England	188,578	3,038,090	6.2
England	2,020,413	27,183,134	7.4

2.3 Income

2.3.1 Figure 2.5 below presents data from the Indices of Deprivation (IMD) (2010) based on income levels in each LSOA. Some parts of Norfolk, particularly South Norfolk, southern areas of King's Lynn and West Norfolk, and southern areas of Breckland, are relatively affluent when ranked against English LSOAs. At the other end of the scale, urban centres in Norfolk, particularly Norwich, Great Yarmouth, northern Thetford (in Breckland), and King's Lynn are within the 10% most deprived LSOAs in England when ranked on income levels notably to the north and northeast of Norwich city.

Figure 2.5 – IMD Income Bands, 2010

Source: IMD, 2010

2.4 Gross Value Added

2.4.1 The overall productivity of Norfolk’s economy is illustrated in Figure 2.6 below. It shows the county’s per capita contribution to national income (Gross Value Added (GVA) being the only measure of national income locally⁹) and the relative decline of Norfolk’s per capita GVA compared to the UK over the fifteen years shown.

⁹ Technically GVA relates to Gross Domestic Product (GDP), and even then the national level of GVA needs to be adjusted for taxes and subsidies to arrive at GDP. Moreover, GDP is only approximately equal to national income because the national income includes net income from overseas investments. There is, finally, an adjustment to be made in respect of ‘extra regio’, i.e. GVA arising in the UK but not in any particular area (this is mainly North Sea output). None of these technicalities need detain us here given the close correlation between national GVA, national GDP and national income, and the fact that, of the three, only GVA is available at sub-regional level..

Figure 2.6 – Headline GVA per head indices at current basic prices: UK, England and Norfolk, 1997-2011

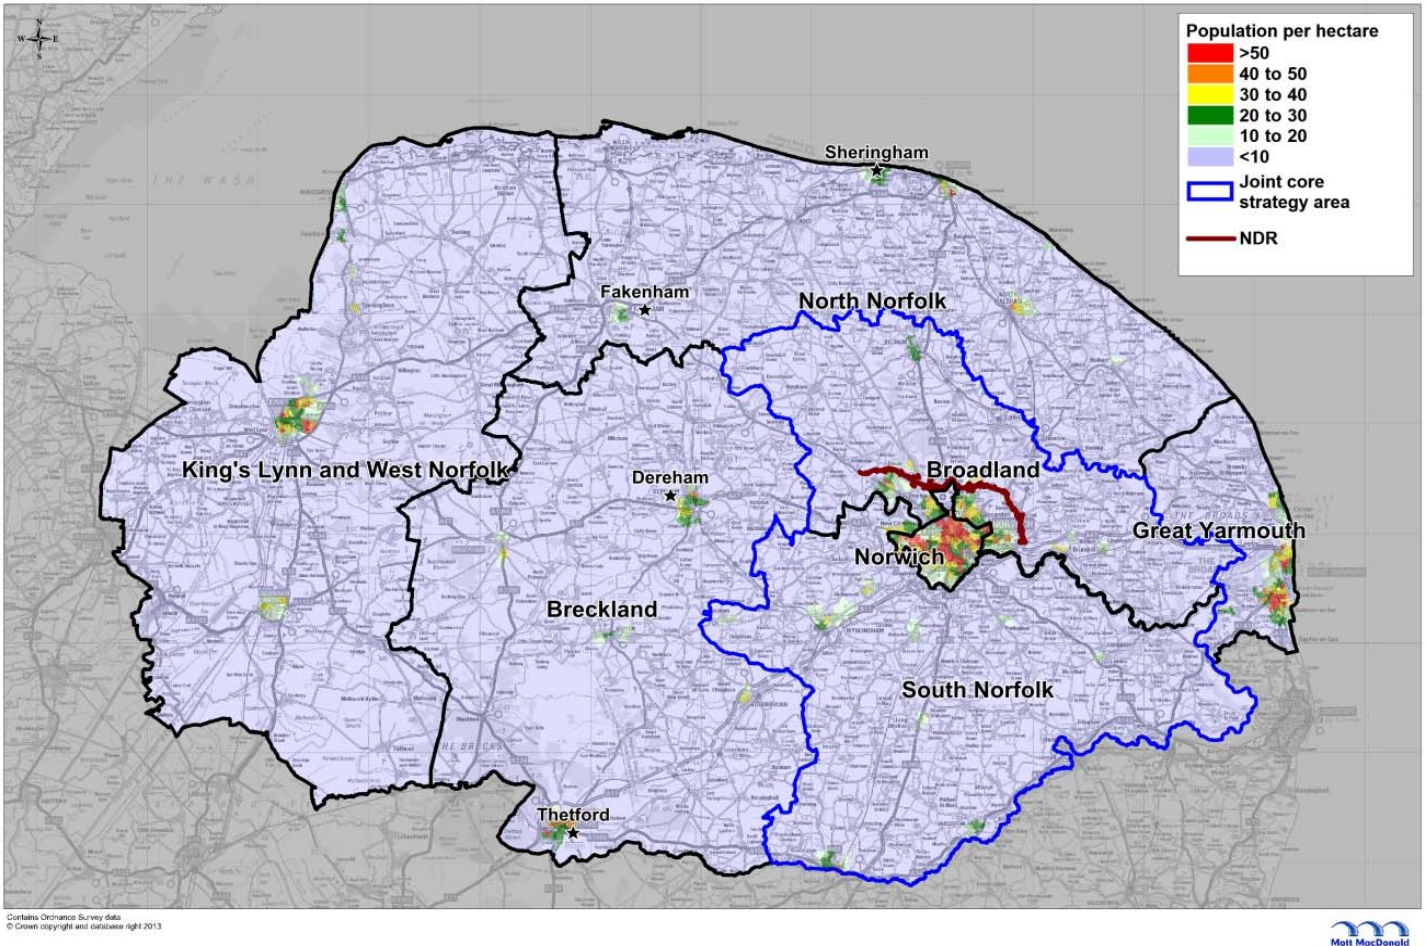

Source: Office for National Statistics

2.5 Population and deprivation

Population

2.5.1 Similar to employment density, population density is also generally low across Norfolk with the central and northern areas of Norwich recognisable as having the greatest concentrations of population, in addition to other urban centres within the county including Great Yarmouth (to the east), and areas surrounding King’s Lynn (Figure 2.7). Areas to the north and north-east of Norwich accommodate the next tier of more populous areas which is where future growth is being planned for and in close proximity to the NDR. Further economic growth is essential if population growth is to occur as the JCS anticipates. The NDR has a potential role to play in improving transport connections for workers around the Greater Norwich area, North Norfolk and Great Yarmouth

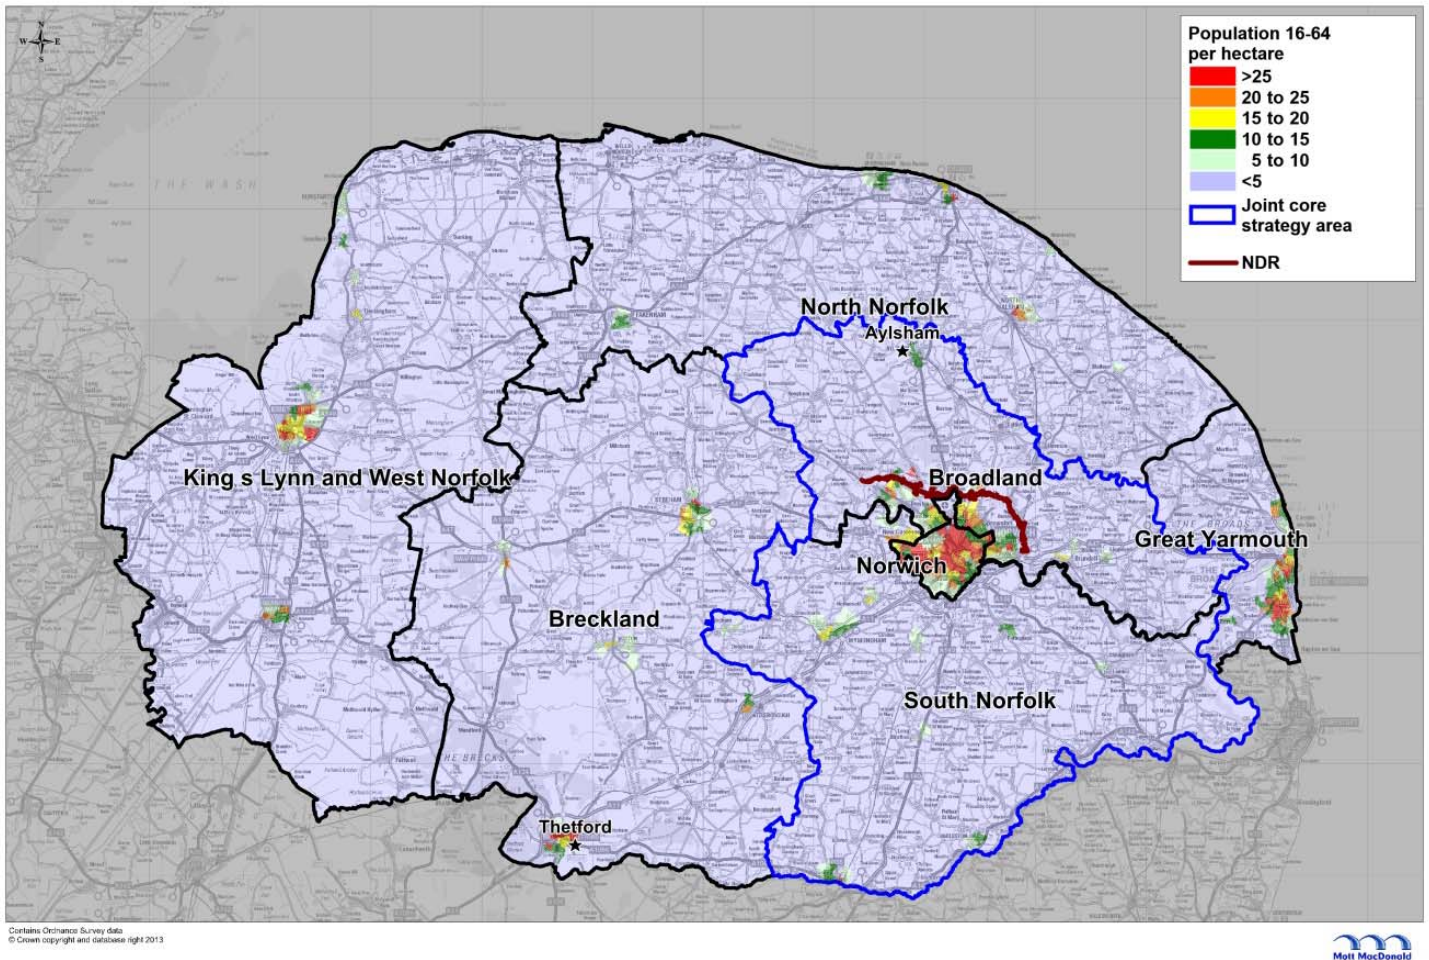

Figure 2.7 – Population density (total population), 2011

Source: Census, 2011

2.5.2 Moreover, in Figure 2.8 the relationship between residential areas with higher concentrations of working age residents (aged 16-64) and the NDR is shown. Again, high density populations are found within and around the urban centres across Norfolk including Norwich city, Great Yarmouth, Thetford and parts of King’s Lynn. In comparison to the rest of Norfolk, there are high concentrations of working age residents at the western and eastern ends of the NDR route as well as in the market town of Aylsham to the north. The NDR would benefit these people by improving access to employment opportunities that will arise along the route of the NDR, at Norwich International Airport and in Norwich city centre while, simultaneously, increasing the labour catchment available to businesses benefiting from improved transport connections due to the NDR.

Figure 2.8 – Population density (working age population aged 16-64 years), 2011

Source: Census, 2011

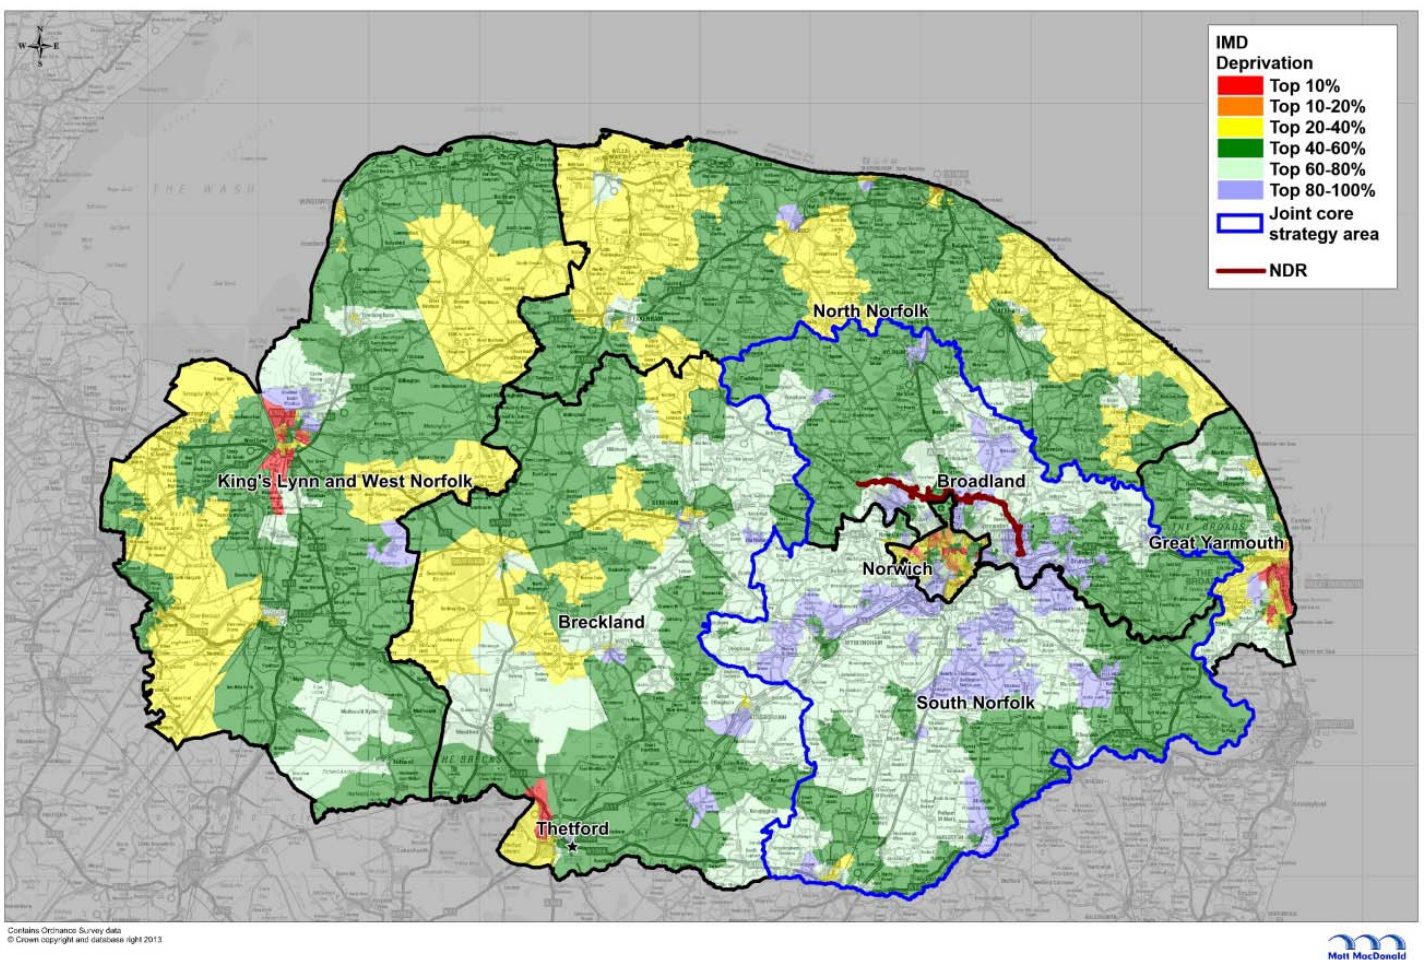

Deprivation

2.5.3 Deprivation is measured through the Government's Index of Multiple Deprivation (IMD), last updated in 2010¹⁰ and based on an overall ranking based on domain scores for: income; employment, health deprivation & disability; education, skills & training; barriers to housing & services; crime; and, living environment. Norwich's hinterland in the JCS area is characterised by large areas of relatively low deprivation. As with some of the other indicators reviewed in this section, the urban areas of Norwich, Great Yarmouth, King's Lynn and Thetford, as well as some of the littoral parts of North Norfolk, are characterised by relatively higher levels of multiple deprivation. Parts of central and northern Norwich have IMD scores ranking in the top 10% and top 11-20% of the most deprived LSOAs in England (see Figure 2.9 below), and many of

¹⁰ More details available at: <https://www.gov.uk/government/publications/english-indices-of-deprivation-2010>

the most deprived areas are in close proximity to the proposed alignment of the NDR. Residents of these areas should benefit from improved access to local employment opportunities that arise after the NDR's construction as employment sites are developed and businesses occupy the commercial space constructed. This has potential to reduce relative levels of deprivation by overcoming some of the barriers to labour market participation posed by travel costs providing that residents have requisite skills and qualifications to satisfy the needs of employers and compete in the labour market.

Figure 2.9 – Levels of deprivation by LSOA, 2010

Source: IMD, 2010

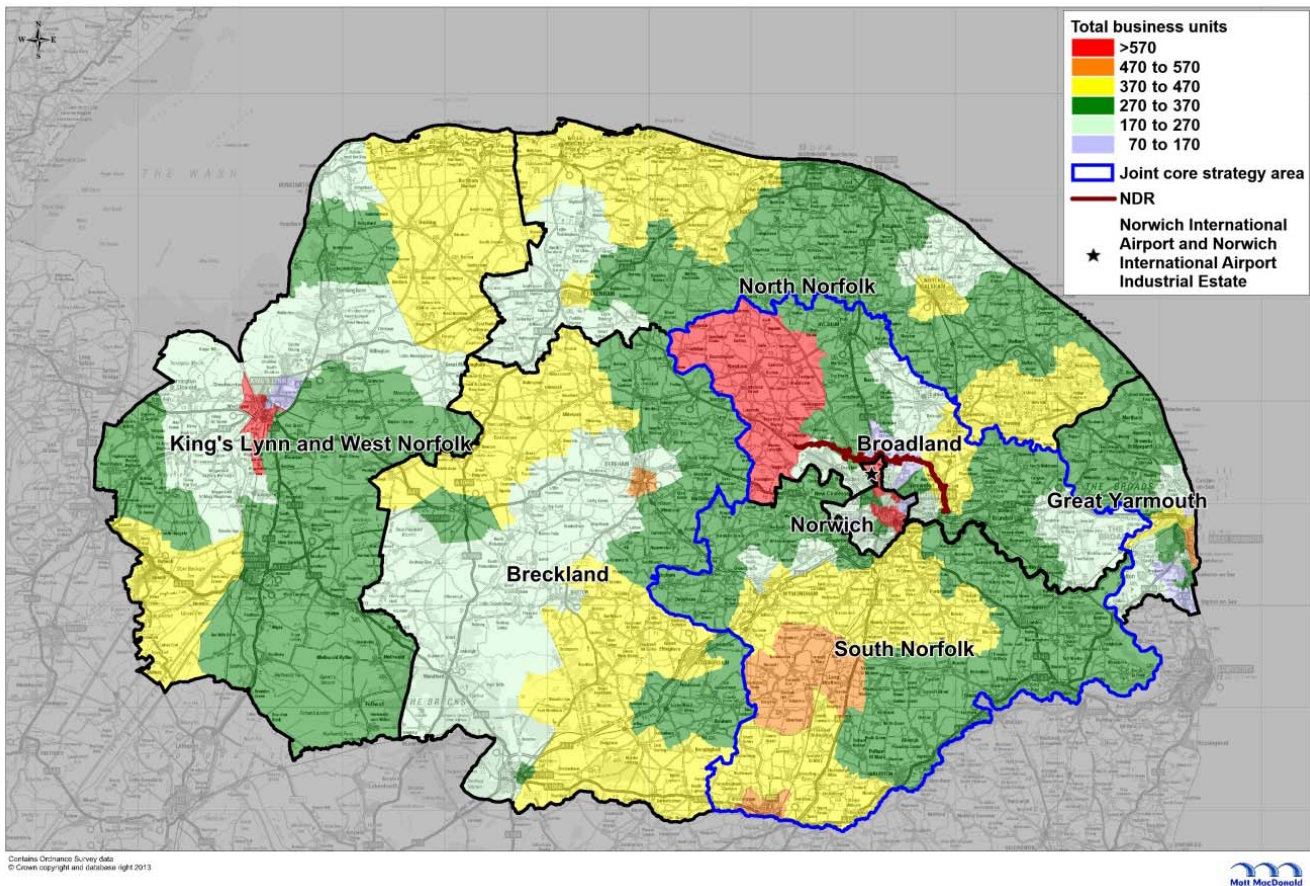

2.6 Businesses

Business units

2.6.1 Business units provide a measure of the number of businesses in an area based on address points for each individual business (so that any business with

more than one address e.g. multiple retailers, banks etc. will be included for each address they have). From the spatial pattern of business units shown in Figure 2.10 below, the importance of Norwich city centre, Norwich International Airport and Norwich Airport Industrial Estate relative to the rest of the county is clear. The alignment of the proposed NDR route passes through some areas to the north of Norwich with relatively low numbers of business units at present, a situation which should alter as the NDR influences business decisions about location and new development sites are opened up. This is certainly the experience of Broadland Business Park which has been very attractive to the market and filled up over time reflecting the shortage of Grade A office space in Norwich; the expectation is that the same process will occur on land made more accessible by the NDR. The comparatively sparse business base to the north of the city should be positively influenced by the NDR as it supports the development process and the improved connectivity it offers encourages businesses to locate on the north side of the city.

Figure 2.10 – Concentration of business units at LSOA level

Source: ONS

2.7 Land and property

Employment land

2.7.1 The Greater Norwich Employment Growth Study (2008)¹¹ provided a comprehensive review of the employment land portfolio and made a series of recommendations that support the NDR proposals and have subsequently begun to be implemented:

- There is a relative lack of a range of available and ready-to-use sites, with the main current opportunities of this kind only at the Broadland Business Park.
- The Norwich Research Park (NRP) is one of the greatest areas of potential and of significance on a regional and national scale. It therefore deserves higher priority in terms of achieving the assembly of land and realisation of infrastructure.
- There is a case for developing a new north city employment hub. This should seek to realise the economic potential of the airport and in the longer-term benefit from the proposed NDR.
- *“In relation to offices the **overall floorspace** requirement is estimated to be in the region of 300,000 sq m. We would recommend this be distributed most obviously as follows:*
 - *Norwich City Centre and the wider central area 100,000 sq m*
 - *Norwich Research Park 100,000 sq m, based on a floorspace plot ratio ‘ of about 1:4.*
 - *Broadland Business Park 50,000 sq m*

For the remaining 50,000 sq m, Arup suggested there are a number of options including:

- *Further space in the city centre and/or*
- *New allocations of business parks associated with housing allocations.*
- *Greater use of Longwater as an office park.”*

2.7.2 Proposals for employment land development and future economic growth are therefore focused on existing locations including the city centre, NRP and Broadland Business Park; in addition, the development of a new north city employment hub with the airport is suggested as a natural locus for development of employment land and future economic growth.

House prices

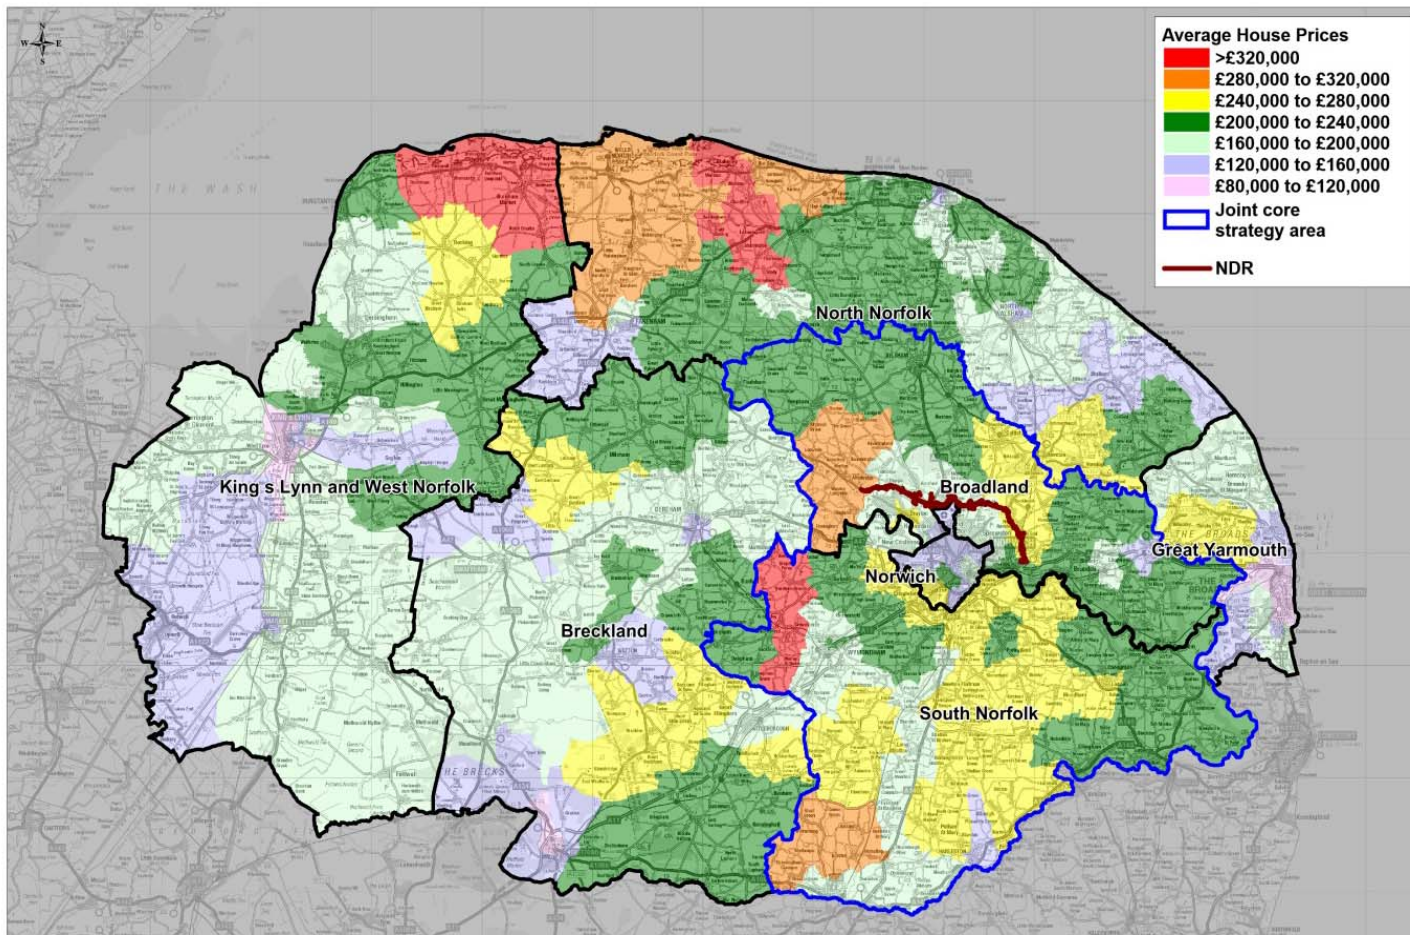

2.7.3 Data on average house prices provide an overview of the relative attractiveness of residential areas which is based on a composite range of factors linked to

¹¹ Commissioned by the Greater Norwich Development Partnership (May, 2008) Greater Norwich Employment Growth and Sites & Premises Study: Ove Arup & Partners Ltd

house type, access to schools, transport connections to employment and leisure opportunities as well as neighbourhood facilities. Connectivity between residential areas and opportunities in the wider travel-to-work-area (and beyond) is one factor involved in determining demand for housing.

- 2.7.4 Drawing on data related to the value of dwelling houses at the point of sale, Figure 2.11 reveals that northern areas of North Norfolk, King's Lynn and West Norfolk have particularly high value in comparison with the rest of Norfolk. There are also pockets of high value density in the north west of South Norfolk. In comparison, the northern parts of Norwich are valued at less than the surrounding area. Indeed, the northern fringes of the city present consistently lower value housing compared to the southern fringes. Improving the connectivity of neighbourhoods to the north of the city should provide a boost to housing demand and drive up property values in the area over time following construction of the NDR.

2.8 Summary

2.8.1 The economic baseline characteristics on which the NDR is to have an influence suggest that:

- The northern and north-eastern parts of Norwich are the least affluent and the most deprived parts of the JCS area, with higher concentrations of people that are unemployed.
- Parts of Norfolk to the north of Norwich are relatively less affluent and have lower average house prices than parts of Norfolk to the south of Norwich.
- The long-term trajectory over the next two decades is one of growth as set out in the JCS. NDR has been planned as a critical piece of infrastructure to support delivery of this growth.

¹² Average house prices based on price paid for a house between February 2012 to February 2013, available at : <http://www.landregistry.gov.uk/market-trend-data/public-data> Postcodes were used to identify location points for house sales which were used to allocate each sale to a specific LSOA which then enabled us to derive to derive an average house sale price for each LSOA

- The NDR will create opportunity for employment and housing growth to the north and north-east of Norwich, precisely the area where employment need is greatest and where a surplus of labour is available to meet demand from employers.
- A north city employment hub is recommended with the Airport providing a natural locus for this growth and the NDR acting as facilitator of future growth. The Airport is advancing its planned development through Norwich Aeropark to which the NDR will add impetus in future.

3.1 Policy Framework

3.1.1 This section provides a broad overview of the overarching policy framework in relation to the NDR and the communities it serves. The overview is presented at two spatial scales: national; and sub-regional/ local. We acknowledge that certain “targets” for growth used here are taken from the former Regional Spatial Strategy, however, these have been used in Norfolk as part of applicable Local Development Frameworks and therefore remain relevant. A list of the documents reviewed is set out in Table 3.1 below

Table 3.1 – Policy documents reviewed

National policy documents
<ul style="list-style-type: none"> • Department for Transport, Creating Growth, Cutting Carbon – Making Sustainable Transport Happen, 2011 • National Planning Policy Framework, 2012
Sub-regional and local policy documents
<ul style="list-style-type: none"> • Joint Core Strategy for Broadland, Norwich and South Norfolk, GNDP, 2011 • Joint Core Strategy Annual Monitoring Report, GNDP, 2011/12 • New Anglia Local Enterprise Partnership Business Plan • Delivering Economic Growth in Norfolk – The Strategic Role for Norfolk County Council, 2012/17 • Greater Norwich Economic Strategy 2009/14, GNDP, 2009 • Norwich Area Transportation Strategy , 2004 updated in 2010 • Norwich City Deal, Expression of Interest by Norwich City Council, 2013

3.2 National policy

Department for Transport: Creating Growth, Cutting Carbon - Making Sustainable Local Transport Happen, 2011

3.2.1 The DfT’s White Paper states the Government’s vision for local transport as being *‘for a transport system that is an engine for economic growth, but one that is also greener and safer and improves quality of life in our communities’* (Department for Transport: Creating Growth, Cutting Carbon - Making Sustainable Local Transport Happen, paragraph 1.3, page 11).

3.2.2 The White Paper acknowledges that *“Local transport faces a sustainability challenge - excess delay is costing our urban economies £11 billion per annum, and carbon emissions impose a cost to society of up to £4 billion per annum. The costs to the health of our communities are even greater – up to £25 billion per year on the costs of physical inactivity, air quality and noise, and £9 billion on road traffic accidents.”* (Department for Transport: Creating Growth, Cutting Carbon - Making Sustainable Local Transport Happen, Key Points, page 15).

3.2.3 Sustainable growth is one of the country's biggest challenges. Solutions need to jointly address economic, environmental and community values and aspirations for the future. The transport sector's role in this is hugely important – sustainable means of getting people to work and to services such as education and healthcare providers - as well as to leisure activities and shops, are crucial to quality of life as well as to enhancing people's spending power and choice.

- The White Paper also notes that "*congestion acts as a drag on the economy: a recent study placed the cost of excess delays in urban areas at £10.9 billion per annum (Department for Transport: Creating Growth, Cutting Carbon - Making Sustainable Local Transport Happen, paragraph 2.7, page 16, quoting Cabinet Office Strategy Unit et al., 2009, page 9).*" Similarly, on the supply-side of the economy, "*access to employment, education and healthcare, as well as ending child poverty, all have a key impact on life chances and social mobility, and ultimately on growth.*" (Department for Transport: Creating Growth, Cutting Carbon - Making Sustainable Local Transport Happen, paragraph 2.9).. The White Paper notes (Department for Transport: Creating Growth, Cutting Carbon - Making Sustainable Local Transport Happen, at paragraph 2.10, page 17) that various studies have revealed that: 2-out-of-5 jobseekers say lack of transport is a barrier to getting a job, and 1-in-4 jobseekers said the cost of transport is a significant issue; (Lucas, 2003);
- 6% of 16–24 year olds turn down training or further education because of transport problems; young people in rural areas, and those with learning difficulties and disabilities, are more likely to cite costs of transport as a constraint in pursuing post-16 learning; (Social Exclusion Unit, 2002); and
- In 2008, 44% of workless households did not have a car or van (compared with 22% of all households) (Office for National Statistics, 2008).

National Planning Policy Framework (NPPF), 2012

3.2.4 The Government introduced the National Planning Policy Framework in 2012 as a guide to how the planning system should be implemented in England, suggesting that the purpose of the planning system is to contribute to the achievement of sustainable development. The NPPF identifies three dimensions to sustainable development: economic, social and environmental and advises that "*these dimensions give rise to the need for the planning system to perform a number of roles*" (National Planning Policy Framework, paragraph 7, page 8) which is set out below:

- an economic role – contributing to building a strong, responsive and competitive economy, by ensuring that sufficient land of the right type is available in the right places and at the right time to support growth and innovation; and by identifying and coordinating development requirements, including the provision of infrastructure;

- a social role – supporting strong, vibrant and healthy communities, by providing the supply of housing required to meet the needs of present and future generations; and by creating a high quality built environment, with accessible local services that reflect the community’s needs and support its health, social and cultural well-being; and
- an environmental role – contributing to protecting and enhancing our natural, built and historic environment; and, as part of this, helping to improve biodiversity, use natural resources prudently, minimise waste and pollution, and mitigate and adapt to climate change including moving to a low carbon economy.

3.2.5 The NPPF sets out a series of themes that align with sustainable development. Those that align with the proposals for the NDR and wider growth and development in Greater Norwich are listed below:

- Building a strong, competitive economy (section 1).
- Ensuring the vitality of town centres (section 2).
- Supporting a prosperous rural economy (section 3).
- Promoting sustainable transport (section 4).
- Delivering a wide choice of high quality homes (section 6).

3.3 Sub-regional and local policy

Joint Core Strategy for Broadland, Norwich and South Norfolk, 2011

3.3.1 One of the principal local policy frameworks to emerge in recent years has been the Joint Core Strategy for Broadland, Norwich and South Norfolk adopted in March 2011 (JCS). Following a High Court Challenge part of the JCS was remitted but, supported by appropriate revised evidence, the remitted policies were resubmitted and were subject to public examination in July 2013. The Inspector has subsequently consulted on draft modifications that relate to contingency and clarity rather than the submitted locational policies. As of November 2013 the Inspector’s report is imminent but not yet available. At this late stage the part plan carries substantial weight for the purposes of this report.

3.3.2 The JCS was facilitated by the Greater Norwich Development Partnership (GNDP), and sets out an over-arching strategy for growth across the districts of Broadland, Norwich and South Norfolk. It also identifies key locations for growth and sets out policies to ensure that future development is sustainable.

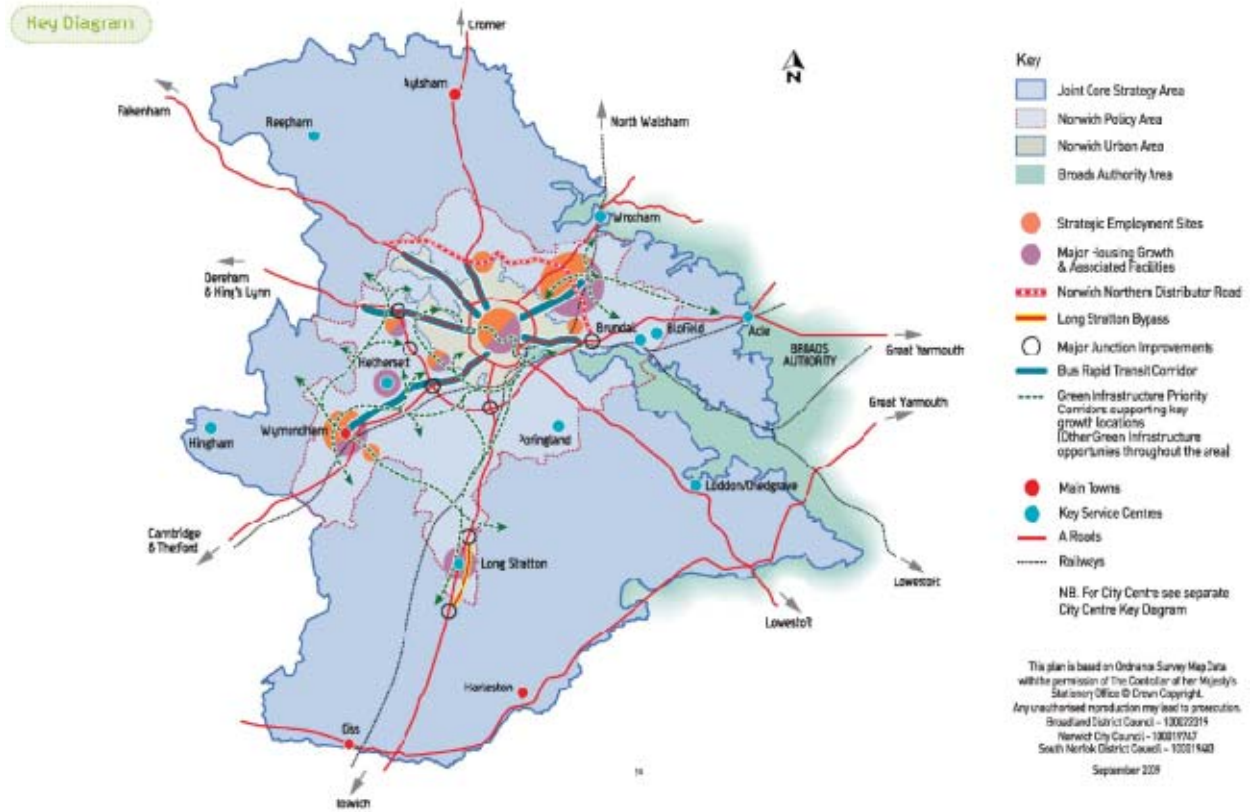

3.3.3 The JCS contains twelve over-riding objectives, which underpin the spatial vision of creating some 36,820 new homes and 27,000 new jobs between 2008 and 2026 in the Greater Norwich area. The recently examined part of the plan proposes a 10,000 dwelling mixed use urban extension into the Catton, Sprowston, Rackheath and Thorpe St Andrew 'growth triangle' to the northeast

of Norwich. The NDR has a role in supporting development in this area and in relation to the following spatial planning objectives of the JCS (Joint Core Strategy, pages 20-23):

- *“To allocate enough land for housing, and affordable housing, in the most sustainable settlements”* (Joint Core Strategy for Broadland, Norwich and South Norfolk Objective 2, page 20)– whereby new housing, employment, and services are planned in such a way that they are grouped together ensuring that the land is used efficiently and community needs are met
- *“To promote economic growth and diversity, and provide a wide range of jobs”* (Joint Core Strategy for Broadland, Norwich and South Norfolk, Objective 3, page 21) - this involves not only safeguarding existing employment sites but also allocating sufficient levels of land to meet the needs of growing businesses and inward investors.
- *“To promote regeneration and reduce deprivation”* (Joint Core Strategy for Broadland, Norwich and South Norfolk, Objective 4, page 21) - growth will be used to bring benefits to deprived neighbourhoods in Norwich and deprived towns, villages and rural settlements in the surrounding area
- *“To make sure people have ready access to services”* (Joint Core Strategy for Broadland, Norwich and South Norfolk, Objective 6, page 21) – the city centre provides a wide range of services and accessibility of the city centre will be maintained and enhanced. Wherever new homes and jobs are developed there will be a need to provide adequate supporting services.
- *“To enhance transport provision to meet the needs of existing and future populations while reducing travel need and impact”* (Joint Core Strategy for Broadland, Norwich and South Norfolk, Objective 7, page 21) - supports the co-location of housing and employment land uses alongside other community and service uses; also supports improved use of public transport, including the introduction of a bus rapid transit (BRT) system and recognises that the state of the strategic road network is fundamental to the health of the local economy.
- *“To encourage the development of healthy and active lifestyles”* (Joint Core Strategy for Broadland, Norwich and South Norfolk, Objective 11, page 23) - giving people better opportunities to make healthy travel choices as part of their daily lives, by providing “safe and direct cycle and pedestrian routes, and orbital bus services, to Broadland Business Park, Rackheath employment area, airport employment areas and to the surrounding countryside” (Joint Core Strategy for Broadland, Norwich and South Norfolk, page 57).

3.3.4 The JCS’ key diagram (incorporating the emerging JCS proposals) is set out in Figure 3.1 below and illustrates the critical importance of the NDR as a piece of strategic infrastructure supporting growth and development to the north and east of Norwich.

Figure 3.1 – JCS Key Diagram

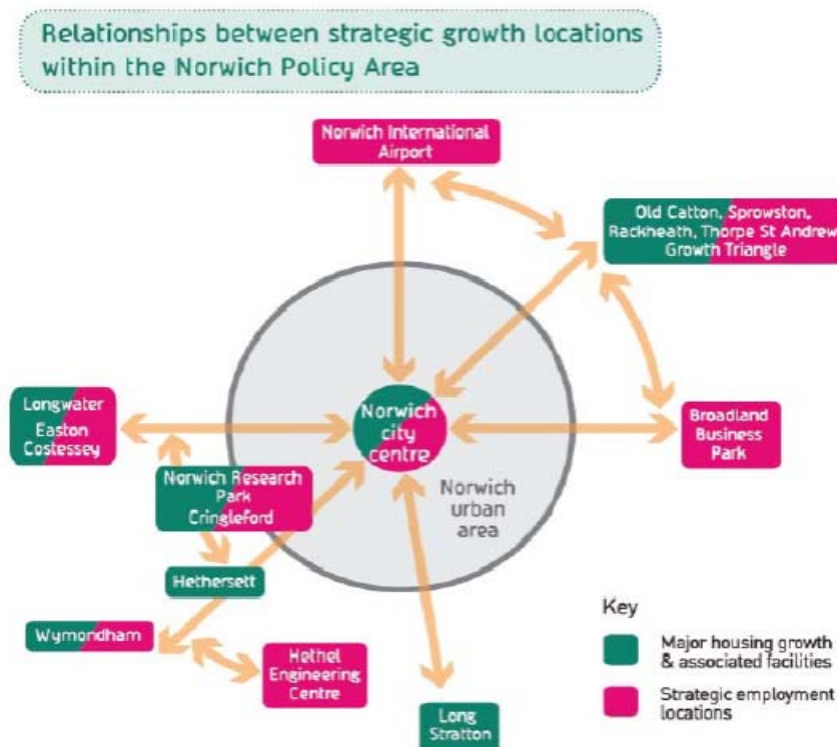

Source: Joint Core Strategy for Broadland, Norwich and South Norfolk, 2011(page 24)

3.3.5 Figure 3.2, below, shows the relationships between strategic growth locations in the Norwich Policy Area (NPA)¹³, which are located around the edge of the city. The NDR would contribute to the provision of connectivity between some of these locations, as is indicated by the arrows forming a quarter circle between Norwich International Airport and Broadland Business Park.

¹³ The Norwich Policy Area is defined by way of a plan in Appendix 4 of the JCS and sits within the JCS area. The NPA provides a focus for planning and co-ordinating Norwich related growth.

Figure 3.2 – JCS Strategic growth locations around Norwich

Source: JCS (page 53), 2011

JCS Annual Monitoring Report, 2011/12

3.3.6 In line with the 2011 JCS, this monitoring report provides an indication of how the GNDP area (also the study area for the purposes of this report) is performing against the objectives set out in the JCS and identifies key target performance against JCS objectives. It states that a number of targets have been met or worked towards, including:

- reduction of carbon emissions;
- proportion of new dwelling development on previously developed land is achieving target;
- improved national retail ranking for Norwich (from 11th to 9th); and
- overall relative deprivation has improved (JCS Annual Monitoring Report, paragraph 1.2, page 2)

3.3.7 In terms of achieving JCS objectives, the following targets remain challenging, arguably as a result of the economic downturn:

- housing completions have been below target since 2008;
- the number of new business start-ups has been below target;
- increased youth unemployment; and

- a reduction in public transport accessibility (JCS Annual Monitoring Report, paragraph 1.3, page 3).

3.3.8 In terms of spatial planning for housing, the majority of new homes will be built in the NPA – 33,000 out of the 36,820 between 2008 and 2026, with the remaining development being allocated to smaller sustainable settlements. Since 2008, net housing completions per annum in the NPA have fallen short of the 1,825 per annum target – 2008/09: 1,193; 2009/10: 923; 2010/11: 910; and 2011/12: 915. However, affordable housing completions in Norwich exceeded target levels in 2011/12 (at 61% actual as against a target of 33%) (JCS Annual Monitoring Report, Table 5, page 16).

3.3.9 In addition to this, the gross employment floor space developed between 2008 and 2012 across all employment types in the JCS area (Broadland, Norwich and South Norfolk) has fluctuated: 27,358 m² in 2008/09; 17,811 m² in 2009/10; 37,707 m² in 2010/11; and 26,914 m² in 2011/12. More specifically, Broadland has had the highest level of gross floor space development for employment at 51,871 m² across all employment types (JCS Annual Monitoring Report, Table 8 page 25).

3.3.10 Improvements to the Postwick Interchange at the A47(T) are “*essential to deliver permitted expansion of the Broadland Business Park and to enable wider developments to the northeast of Norwich*” (JCS Annual Monitoring Report, paragraph 2.1, page 130) where an urban extension is proposed but is dependent on new infrastructure. The planned improvements to the Postwick Interchange have been designed to accommodate the junction of the A47(T) with the eastern end of the proposed NDR.

New Anglia Local Enterprise Partnership (LEP) for Norfolk and Suffolk - Towards a Growth Plan, Consultation Draft, (July 2013)

3.3.11 Following the successful acceptance by Government of the New Anglia Local Enterprise Partnership proposals in 2011, the LEP has identified its areas of focus and has been developing its priorities. Towards a Growth Plan, Consultation Draft states that: “*investment to increase the capacity of the A14 and A47 and other roads is essential to enable growth. The Norwich Northern Distributor Road is vital to unlock the potential of Greater Norwich. To promote more sustainable travel, rail investment is also needed, notably on the Great Eastern Main Line and West Anglia Route to overcome capacity constraints*” (Towards a Growth Plan, Consultation Draft, paragraph 1.13, page 9).

3.3.12 The LEP is fully supportive of the GNDP and its aims which are embodied in the JCS and the Greater Norwich Economic Strategy¹⁴. The NDR is a key element of transport infrastructure and would facilitate delivery by the LEP of the expected growth in housing and employment that the area needs, and has the potential to achieve. It fits with the LEP ambitions to resolve some of the key challenges which are faced by inhabitants of the LEP's area:

- *“Below average skill levels in Norfolk and Suffolk.*
- *Low GVA and wages.*
- *An infrastructure deficit in the road and rail network, both East to West and North to South.*
- *Inadequate utilities infrastructure, which is actively hindering private sector investment.*
- *Poor Broadband coverage compared with most other parts of the country.*
- *Low business start-up numbers compared with national and regional averages.*
- *Significant areas of deprivation in urban, rural and coastal areas.”* (based on New Anglia LEP Towards A Growth Plan, paragraphs 1.13 – 1.22, pages 9-10).

3.3.13 The aims of the New Anglia LEP are:

- *“To ensure New Anglia is nationally and internationally competitive.*
- *To act as a catalyst to achieving sustainable economic growth and tackling barriers where they occur through:*
- *Enabling business start-up and growth.*
- *Developing existing growth sectors, clusters and supply chains.*
- *Championing infrastructure improvements to aid business productivity and the smooth functioning of local labour markets.*
- *Delivering action at the level that is meaningful and works for business.*
- *Facilitating business and local community engagement.*
- *Promoting skills and workforce development.”* (New Anglia LEP Business Plan Presentation, page 2).

3.3.14 The NDR directly addresses the local infrastructure deficit in the Norwich area and would facilitate the growth of 27,000 jobs by linking up key employment sites. It would also open up strategic access to north and northeast of Norfolk which will help address challenges and aims of the New Anglia LEP.

3.3.15 The LEP's aims for development reflect Norfolk County Council's economic growth strategy, identifying the NDR as a key element of transport infrastructure which will help to facilitate the current and forecasted rates of economic,

¹⁴ Greater Norwich Economic Strategy 2009/14, GNDP (2008)

employment and housing growth across northern Norfolk by creating links to key employment and strategic development sites.

Delivering Economic Growth in Norfolk – The Strategic Role for Norfolk County Council, 2012/17

3.3.16 Norfolk County Council (NCC) has produced an economic growth strategy to support Norfolk’s development 2012-17. In its first Priority Theme the strategy states that: *“maintenance of existing road network is critical and the rural nature of the county makes connectivity within and beyond the county a key priority. The Norwich Northern Distributor Route (NDR) (...) is vital to the continued economic success of the Greater Norwich area, also benefiting North Norfolk and Great Yarmouth”* (‘Delivering Economic Growth in Norfolk’ – The Strategic Role for Norfolk City Council, page 4).

3.3.17 Key challenges facing the implementation of this strategy include: addressing infrastructure constraints; securing infrastructure funding; encouraging business start-ups; securing investment from key growth sectors; tackling the mismatch between skills and employability (‘Delivering Economic Growth in Norfolk’ – The Strategic Role for Norfolk City Council, page 3-4).

3.3.18 Construction and operation of the NDR will significantly contribute towards the delivery of the following Priority Themes and Action Plans which are identified within Norfolk’s economic growth strategy (‘Delivering Economic Growth in Norfolk’ – The Strategic Role for Norfolk City Council, paragraph 5.2):

- “To provide support for growth and removing infrastructure constraints” (‘Delivering Economic Growth in Norfolk’ – The Strategic Role for Norfolk City Council, Theme 1 Section 5.2.1, page 14-16) - priorities include:
 - Roads and rail – Infrastructure Plan to define targets (June 2012)
 - Great Yarmouth ‘Third River Crossing’
 - Breckland riverside regeneration
 - West Norfolk – housing creation and College facility regeneration
 - North Norfolk and Norwich Research Park
 - Super-fast broadband - targeted at 30Mbps
- “To help businesses to start up and grow” (‘Delivering Economic Growth in Norfolk’ – The Strategic Role for Norfolk City Council, Section 5.2.2, page 16-20):
 - Business start-up scheme – targeted 400 new start-ups by 2013/14
 - Rural growth network – 1,200 individuals given advice; 400 businesses assisted; 150 new businesses started; 700 jobs created
 - Hethel Engineering Centre – targeted 40,000 ft² Advanced Manufacturing Centre built at Hethel by March 2013

- To improve perceptions of Norfolk's business offer and secure inward investment and growth in key sectors ('Delivering Economic Growth in Norfolk' – The Strategic Role for Norfolk City Council, Section 5.2.3, page 20-22)
 - Develop 'World Class Norfolk' campaign.
 - Work with UK Trade & Investment's Investment Services Team (UKTI IST) and other partners to deliver inward investment.
 - Work with UKTI IST and district partners to deliver Investor Development Programme.
 - Deliver a programme of visits to businesses outside UKTI criteria.
 - Produce a Sector Development Plan.
 - Work with local Councils to maximise offshore energy opportunities.
 - Maximise Enterprise Zone developments – targeted 80 new businesses by 2015.
 - Build on relationships with Essex and Suffolk County Councils.

- "To provide fair access to the public sector" (Delivering Economic Growth in Norfolk' – The Strategic Role for Norfolk City Council, Section 5.2.5, page 24):
 - Tendering opportunities are filtered through Contracts Finder website
 - Annual 'Meet the buyer' event established
 - Procurement process for smaller suppliers is less bureaucratic
 - Remove unnecessary requirements for high level insurance cover
 - Simplify processes for lower-value procurements

Greater Norwich Economic Strategy 2009/14

3.3.19 This strategy sets out the current economic vision and priorities for Greater Norwich to equip the area for facilitating its growth potential.

3.3.20 A number of key challenges to growth for the Greater Norwich area have been outlined in the strategy, and these are significant factors in determining the area's growth potential. These include (Greater Norwich Economic Strategy 2009/14, paragraph 1.51. page 13):

- the provision of sufficient jobs in accordance with population increases;
- a diverse economic base with varied knowledge sectors to create new employment;
- stimulate entrepreneurship, increasing business start-up rates;
- improving international, national and regional connectivity to promote sustainable transport; and
- the development of an appropriate range of employment sites.

3.3.21 As a focus for local growth, the sustained development of Greater Norwich is vital; the NDR development is closely aligned with the following main development objectives within this strategy:

- *“To strengthen the area’s economy, maximise diverse employment opportunities, and ensure that the businesses can flourish”* (Greater Norwich Economic Strategy 2009/14, Objective 1, page 16)– one of the priorities within this objective is to support the growth of the knowledge economy by encouraging key sectors and facilitating the attraction of businesses that can exploit the research potential of the local universities. The sectors identified include engineering, environment, and life sciences
- *“Ensure that the area has the necessary infrastructure and quality of environment to attract and retain investment and support business growth”* (Greater Norwich Economic Strategy 2009/14, Objective 3, page 17)- developing improved and sustainable transport and communications infrastructure to support planned growth and development; maintaining an appropriate supply of suitably located employment sites; and ensuring investment in required public utilities infrastructure.
- *“To raise the profile of Norwich as a high quality place to live, work and visit”* (Greater Norwich Economic Strategy 2009/14, Objective 4, page 17) - if the proposed development were to succeed it would help to develop a stronger image for the area, and act as a catalyst for further investment.

Norwich Area Transportation Strategy (NATS) (2004, updated in 2010¹⁵)

3.3.22 Norfolk County Council’s NATS presents a high level strategy for transport across the county of Norfolk and within Norwich, as well as key short, medium and long term transport delivery methods to realise the area’s growth potential. One of the main objectives of NATS is to ensure that transport services meet the needs of local people, businesses and visitors to support continued sustainability across the area minimising the adverse effect of journeys on people and the built and natural environment. NATS promotes travel choice, recognising the need to maintain the economic health of the Norwich area, and does not propose radical restrictions on vehicular access.

3.3.23 NATS recognises that the major growth in the area is likely to include a major urban extension to the north east of Norwich and growth of Norwich International Airport, and looks to provide the essential infrastructure needed to accommodate this growth, including the NDR.

3.3.24 The strategy identifies the following transport measures:

- a bus rapid transit network;
- improvements to a core bus network as well as integrated ticketing and improved information;
- city centre improvements;
- a package of cycling and walking improvements;
- specific rail service improvements;
- Smarter Choices initiatives; and

¹⁵As part of the development of Norfolk’s Third Local Transport Plan (LTP3), *Connecting Norfolk*, March 2011

- the NDR.

3.3.25 In terms of helping improve business performance; the NDR was highlighted as the most important scheme within NATS. It was demonstrated to be essential in providing the necessary capacity to enable continued improvements for buses, cyclists and pedestrians. When implemented, the NDR will provide relief to key radial routes and therefore additional capacity for the implementation of enhanced priority for buses, cyclists and pedestrians.

Norwich City Deal, Expression of Interest, January 2013

3.3.26 In November 2012 Norwich City Council and the New Anglia LEP were invited by Government to prepare an expression of interest for negotiating a City Deal. This was followed in February 2013 by the Cabinet Office announcing Greater Norwich's inclusion in the second round of City Deals.

3.3.27 In February 2013, the Cabinet Office announced it would work with 20 towns and cities, including the Greater Norwich area, as part of a second wave of City Deals. The first and second wave of deals was presented as an attractive package designed to:

- *“Give cities the powers and tools they need to drive local economic growth;*
- *Unlock projects or initiatives that will boost their economies; and*
- *Strengthen the governance arrangements for each city.”* (The Cabinet Office, Unlocking growth in Cities: City Deals – Wave 1, 2012, page 1).

3.3.28 An expression of interest was submitted to the Cabinet Office on 15 January 2013 following collaborative work involving Broadland, Norwich City, South Norfolk and Norfolk County partners on a plan to develop a Greater Norwich approach. An overview of the Expression of Interest is publicly available¹⁶ and its main objectives are summarised below:

3.3.29 The Expression of Interest sought to bring together the three strands of enterprise and innovation, skills, and infrastructure to exploit the growth potential of the internationally renowned Norwich Research Park (NRP), in order to develop it into a world-class science centre acting as a catalyst for economic growth:

- The intention is to build on private sector investment to expand the NRP to 55ha); such expansion is expected to bring much wider benefits, with the LEP confident a major transformational boost to the NRP will help stimulate growth to the whole Greater Norwich area.

¹⁶ <http://www.norwich.gov.uk/YourCouncil/Partnershipworking/Pages/CityDealForGreaterNorwich.aspx>

- Hand-in-hand with any major boost to the jobs market is the need for additional homes and infrastructure, including community facilities, transport connections and utilities. The LEP aims to help facilitate delivery of the 37,000 new homes proposed in the JCS.
- By working together and maximising the opportunities for government and private sector funding, as well as using new powers to be granted to the area authorities pursuant to the City Deal, the LEP will be set to accelerate the area's growth, so vital for economic recovery.
- As well as providing additional jobs, the LEP will also seek to play a role in addressing the mismatch, identified by local businesses as a local issue, between job opportunities and skills provision.

3.3.30 The LEP's ambition for the Norwich City Deal is to catch up on the 'lost decade' of lost jobs and output. Dynamic growth at the NRP will act as a catalyst to deliver:

- Accelerated local growth for national economic recovery.
- 40,000 new jobs, which is a major increase over the LEP's pre-recession projection (over a 30% increase) and a significant uplift to its current outlook.
- 37,000 new homes for Greater Norwich.
- 50% increase in knowledge based businesses.
- 30% increase in GVA above trend.
- An international flagship for life sciences enterprises. (paragraph D1, page 09).

3.3.31 The City Deal approach is expected to deliver enhanced jobs growth for Greater Norwich as Figure 3.3, below, indicates.

Figure 3.3 – Norwich City Deal - Greater Norwich Job Growth

Source: Greater Norwich City Deal, Expression of Interest, January 2013, page 3

- 3.3.32 The importance of infrastructure to supporting economic growth in Greater Norwich is reiterated through the City Deal submission. The public sector partners: Broadland District Council, Norwich City Council, Norfolk County Council and South Norfolk Council intend to “create infrastructure to support the expansion and growth of the NRP which in turn will release private sector investment and jobs in housing development to support business and employment growth” (GNCD – EOI, page 9). The JCS proposes that at least 37,000 new homes are to be delivered by 2026 (JCS, Spatial Planning Objective 2, page 20).
- 3.3.33 In recent years, housing growth stalled because of the global economic downturn. This generated a loss of confidence in the housing sector, uncertainty of delivery and lack of access to finance. The City Deal proposal will enable the public sector and its partners to put the JCS back on track post-recession (Greater Norwich City Deal, Expression of Interest, page 9). The benefits of growth are expected to spread across Norfolk and the New Anglia LEP area, through the supply chain, linking for example with the energy focussed Enterprise Zone in Great Yarmouth/ Lowestoft. City Deal objectives have the potential to both deliver and benefit from key infrastructure such as the NDR, A47 improvements and improvements in the Norwich-London rail service.
- 3.3.34 Having successfully passed the selection process, the City Deal partners subsequently engaged with ministers and government departments over a six-month period to negotiate the full scope of the deal for the area. The negotiation document (due to be publicly available in November 2013) is understood to have expanded the proposals to focus on three key locations for growth. In addition to Norwich Research Park, the aviation cluster is to be expanded at Norwich International Airport and a digital creative cluster is to be further developed in the city centre (based around Norwich University of the Arts). Alongside reaching an agreement on the measures required to deliver the ambitious plans for these locations/clusters, the LEP will also be seeking to have a greater influence over how national programmes for investment in skills, jobs, infrastructure and housing can be shaped to benefit the whole of the Greater Norwich area. A final decision will be made by Government in November 2013.
- 3.3.35 Whilst the NDR is to be built on the opposite side of the city to Norwich Research Park, the anticipated growth at Norwich Research Park is expected to give rise to additional growth across the Greater Norwich area. This will require enhanced transport infrastructure and transport connectivity.

3.4 Summary

- 3.4.1 The overarching policy framework for Norfolk, Greater Norwich and the JCS area is oriented towards growth and recognises the importance of infrastructure provision to support the occurrence of growth. An urban extension to the north-east of Norwich would deliver a lot of the growth identified in the JCS and the area around Norwich International Airport has potential for an aviation-related cluster to further develop in that area. The NDR is essential if this growth is to be delivered and, at the micro level, is critical in allowing sites to be brought forward. Consequently, the NDR is critical to the future development of Greater Norwich and to Norfolk's economy.

PAGE NOT USED

4.1 Business Consultation

- 4.1.1 During 2011, Mott MacDonald conducted consultation and engagement work with a range of Norfolk-based businesses. The process of consulting and engaging with the local business community was not intended to be a scientific exercise with a stratified sample used to produce quantifiable results. It was a qualitative exercise designed to gather local nuanced opinion from a range of businesses and business representatives e.g. Chamber of Commerce.
- 4.1.2 In total 39 businesses responded and provided an overwhelmingly positive and supportive response to proposals for the NDR. A summary of the consultation responses received is set out below, together with a number of representative statements from respondents (which have been anonymised for the purposes of reporting at the business community level rather than expressing a series of individual business concerns).

4.2 Summary of comments received

- 4.2.1 The main theme to emerge from respondents' comments was the need for improvement of traffic flow resulting in a reduction in journey time and fuel costs. Other themes included: economic benefits; a reduction in pollution levels; and improved livelihoods of local inhabitants. The following comments illustrate the general sentiment within the business organisations which were consulted:
- "I thoroughly support the bid to Government for funding for the Norwich Northern Distributor Road"
 - "I fully enthusiastically support the introduction of the Norwich Northern Distributor Road"
 - "I would like to show my strong support for the building of the Norwich Northern Distributor Road"
 - "We are pleased to offer our support for the proposed scheme"
 - "Me and my drivers would certainly welcome the NDR"
 - "I am very supportive of the NDR"
 - "I fully support the Norwich Northern Distributor Road bid"
 - "We support the NDR and welcome it"
 - "The construction of the Norwich Northern Distributor Road is the single most important road improvement in Norfolk"
 - "My view is that the NDR is way overdue so I am therefore fully supportive"
- 4.2.2 Furthermore, it was suggested from the business responses received that the NDR will improve traffic flow through and around Norwich and this may have multiple positive knock-on effects for local businesses and residents. Journey times are expected to be reduced which will therefore cut fuel costs and

improve business prospects for businesses located north of Norwich. Businesses such as distribution companies and taxi firms also predicted they would be able to increase productivity and therefore increase turnover following the NDR's construction.

- 4.2.3 Respondents also suggested that the NDR is vital to support the growth of the Greater Norwich and Norfolk area; some respondents predicted that the tourism industry will benefit significantly due to easier access into the city drawing in new visitors and a larger number of customers who currently travel elsewhere. It was suggested that in addition to attracting new clients and customers, new industries, such as the energy sector, could potentially start up in the area. This, in turn, would create more local employment within and around Norwich. Costs for the local councils are also predicted to be reduced due to a reduction in the need for repairs and maintenance of smaller roads that are not designed for the current usage levels, if traffic currently using those roads was redistributed onto the NDR.
- 4.2.4 More direct effects for local inhabitants of Norwich were predicted by some respondents to include a reduction in hazards associated with large vehicles using smaller village roads; it was mentioned in the consultation responses that currently larger vehicles than cars are traveling within close proximity to schools posing risk of accident. Respondents also noted that removing the current high traffic volumes in and around central Norwich is also expected to remove the assumed high noise and air pollution levels away from inhabitants of congested areas.
- 4.2.5 In contrast to the supportive responses; 3 of the 39 consultees expressed negative responses in relation to the NDR. The reasons for such negative responses were linked to opposition to the potential new housing developments associated with the NDR, such as Rackheath eco-town, and respondents said that they felt that damage to the existing countryside could not be justified.
- 4.2.6 In conclusion, a large proportion of respondents consulted (92%) expressed their full support for the NDR and gave varying examples of how the NDR would benefit the local area and/or business growth in that area.

4.3 Summary

- 4.3.1 The consultation responses provide a range of qualitative commentary that is, in the main, favourable to the NDR, and it is clear that the NDR is perceived to be a piece of infrastructure which will simultaneously support the growth of local businesses and encourage local economic development.

5.1 Assessment of the potential Impact of NDR on GVA and Employment

- 5.1.1 This section sets out an assessment of the favourable impact of the NDR on GVA and employment statistics in the study area as a result of development on land where conditions will become more favourable for development once the NDR has been constructed. Development of the various sites considered would, in the absence of the NDR, place greater and greater strain on the existing road infrastructure. Well before the end date (2026) for the JCS, congestion would require a planning-led halt to development.
- 5.1.2 We discuss 'additionality' later in this section, meaning the additional development and employment that would be created with, rather than without, the NDR. Although we consider additionality in relation to each development site identified in the study area, it seems probable that full development at any one site would be possible without the NDR, but that development of all sites would not be possible without the NDR. The judgments about additionality, which have been reached by Mott MacDonald in conjunction with NCC (planning and economic development officers) and those involved in the development and masterplanning of Norwich international Airport and Norwich Industrial Estate, should be read in this context and considered against the relevant policy objectives of the JCS.

5.2 Assessing the Impact

- 5.2.1 Traditional analysis of the benefits of road schemes concentrates on what may be called their 'transport' benefits, such as reductions in commuting times and accidents. Those benefits are monetised in accordance with established principles set out in the DfT's transport analysis guidance ('WebTAG') and the resulting money values, discounted over time, may be compared with the capital cost of the scheme being assessed.
- 5.2.2 In addition to such transport benefits, a road scheme will often enable a particular site to be developed, creating jobs and economic activity on that site. Such benefits have often in the past been excluded from the assessment of road schemes, in the belief that perfectly functioning markets might allow the benefits to arise anyway (though not necessarily in the same locations). But in current economic circumstances markets are manifestly not functioning with

textbook efficiency, and an express component of government transport policy is to support schemes that generate benefits in the form of additional jobs and economic activity, as well as transport benefits, by supporting a transport system “that is an engine for economic growth” (Department for Transport: Creating Growth, Cutting Carbon – Making Sustainable Local Transport Happen, 2011, paragraph 1.3). The Green Book states at paragraph 5.25 that *"In principle, appraisals should take account of all benefits to the UK. This means that as well as taking into account the direct effects of interventions, the wider effects on other areas of the economy should also be considered."*

- 5.2.3 This section of this report sets out an assessment of such wider economic development benefits which are forecast to arise in connection with the NDR.
- 5.2.4 The NDR will facilitate commercial and residential developments that would, at least in part, be unlikely to occur without the NDR, thereby generating increased investment and employment. The NDR will raise the level of employment in the study area, rather than merely bringing about changes in job locations without affecting the level of employment. Even where the NDR would facilitate development on particular sites that would not be possible (on these sites) in its absence, part of that development might potentially have arisen elsewhere in Norwich or the surrounding area: so not all of the gross jobs (i.e. the extra jobs created on the particular sites where development is facilitated by the NDR) will be ‘additional’, and as noted at the start of this section, the primary focus of this report is additionality.
- 5.2.5 The assessment of additionality based on forecasts rather than actual results (an ex ante appraisal) is inevitably more difficult than it is in an evaluation based on historic factual information (ex post evaluation) when occupiers and others can be surveyed about what they would have done in the absence of the intervention. In an ex ante appraisal, which is necessary in the present assessment of additionality for the NDR, the uncertainties inherent in such an assessment mean that a conservative approach should be taken, under which additionality is assessed at the low point of the plausible range. In consideration of this, a judgment has been made in consultation with NCC and (Norwich International Airport and Norwich Industrial Estate), about the extent of additionality attributable to the NDR, and this report is based on that judgment.
- 5.2.6 The NDR is anticipated to have a generally beneficial effect on the economy of Norwich and the JCS area. It will, for instance, improve transport connections between Norwich city centre and the remainder of the county of Norfolk and is

expected to promote city centre development; furthermore, it will substantially improve the connection between Great Yarmouth and Norwich International Airport - respectively the sea and land bases for much southern North Sea offshore energy activity - and thus it will help to promote development in Great Yarmouth as well as Norwich. Benefits realised at some distance from the NDR are, however, less obvious than those at sites on or very close to the NDR, and therefore this report does not seek to quantify additionality in relation to those sites; rather, their existence is noted as providing supplementary justification for the NDR.

- 5.2.7 Where, in closer proximity to the NDR, (quantified) additionality does arise, there are favourable knock-on effects on the local economy, as net additional workers spend part of their wages on local services and as new or larger firms increase their local purchases.
- 5.2.8 The overview of additionality set out above focuses on employment. But jobs vary widely from highly-paid professional jobs to minimum wage jobs. Wages are the main component of GVA, the balance of GVA being essentially profits, rent and interest. GVA is important locally and to national government, because an increase in GVA constitutes economic growth, a primary political objective in the current economic circumstances. It is perhaps especially important in Norfolk where GVA per capita, as was noted earlier (in section 2 drawing on ONS' GVA data), has been declining compared with the national average for a number of years. As well as quantifying multiplier and linkage effects, the approach adopted in this report estimates the effect on GVA of additional job creation in connection with the NDR, on the basis of norms for the industries in which jobs are considered likely to be created: a number of jobs on a retail park will, for instance, make a smaller contribution to GVA than that which would be made by the same number of jobs in a high-tech engineering facility.
- 5.2.9 GVA and employment patterns are likely to remain consistent for many years; once they arise they are likely to persist for several decades. In this report, GVA effects are evaluated over a 30 year period. Because GVA builds up over time (rather than the whole effect being felt at once), the average duration of the business activities generating the GVA, weighted by their discounted value, is some 15 years, which is a conservative estimate of the likely duration of those business activities. Total GVA resulting from a scheme may amount to a very large sum over 30 years, even after the substantial reduction occasioned by discounting at the suggested rate of 6% per annum. But such GVA must be 'earned' by the deployment of labour and capital. If, for instance, a road

scheme yields a discounted total GVA increment of £X over 30 years that is in current, post-recessionary, circumstances a benefit, but a smaller benefit than £X given the requirement to earn the GVA. This report aims to identify the GVA increment. The judgment as to whether that increment, in conjunction with the other benefits (and dis-benefits) of the proposed scheme, justifies the expenditure arising from the scheme's capital cost is a matter for the decision maker.

5.3 Relationship with JCS aspirations for growth

5.3.1 The JCS for Broadland, Norwich and South Norfolk was adopted in March 2011. It provides the essential context for an assessment of the economic impact of the NDR. The JCS is based upon anticipated growth in the economy and population of the UK and their likely implications for Norfolk and for the JCS authorities specifically. Its central targets ('grand challenges') are the provision between 2008 and 2026 of:

- 37,000 additional homes; and
- '27,000 new jobs of all types and levels in all sectors of the economy and for all the workforce.' (Joint Core Strategy, pages 20-23).

5.3.2 The JCS is an integrated strategy. Its objectives need to be taken forward simultaneously. For example, the employment objective is likely to be met only if other JCS objectives such as those for housing and workforce skills and the infrastructure necessary to support them are also met. In this context, the NDR is fundamental to the delivery of the JCS objectives of creating new homes and jobs. As well as facilitating employment and housing development, the NDR is expected to release capacity on the existing road network within Norwich to allow significant improvement to public transport, walking and cycling facilities.

5.3.3 The JCS states (Para 6.19) that '*completion of the Northern Distributor Road is fundamental to the full implementation of this Joint Core Strategy. In particular it is necessary to allow significant development in the growth triangle*', but the JCS also states (Para 7.13) that '*delay to, or non-delivery of, the NDR would not prevent the JCS provision of housing and employment development within the Norwich City and South Norfolk areas*'. However, it does also state (Para 7.14) that '*without the NDR the housing and employment growth in the Broadland part of the NPA cannot all be delivered*'.

5.3.4 The JCS was adopted in 2011, over two years ago, when various development proposals were at an embryonic stage. It is suggested, as a result of subsequent progress, that the split in the JCS between sites in Broadland District that require the NDR to enable them to come forward, and those sites in

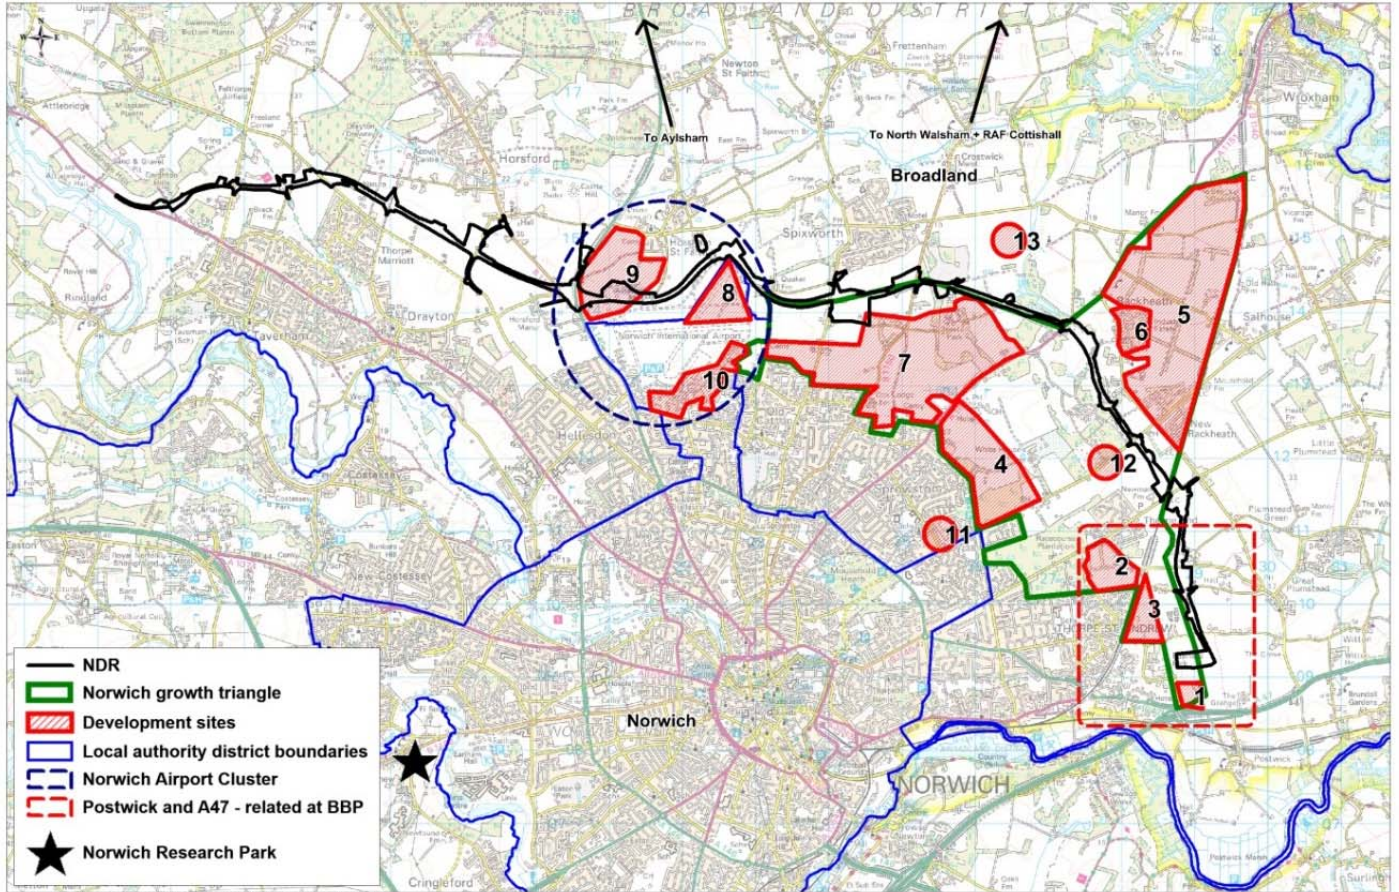

Norwich that do not, whilst remaining essentially valid, requires flexible interpretation in the light of further work on the requirements of the individual sites.

5.4 Development Sites

5.4.1 Through a review of the policy documents in Section 3 and discussion with Norfolk County Council economic development and planning staff, a list was drawn up of key sites where development was at least partly contingent on construction of the NDR. Those key sites form the basis of the impact assessment in the following sub-section of this report and they are shown numbered 1 to 13 on the plan in Figure 5.1 below, where they are also grouped within three sub areas:

- **Postwick** – sites 1, 2 and 3 that are also linked to the Postwick junction and A47 improvements (and which are located within the red dotted rectangular shaped boundary line on the plan).
- **Norwich Growth Triangle** – sites 4, 5, 6, 7 and sites 11, 12 and 13, which are located to the north-east of Norwich and which are included in the JCS as part of the urban extension (These sites (as well as the 3 Postwick sites) are located within the green solid roughly triangular shaped boundary line on the plan). (The Postwick sites are geographically located within the growth triangle boundary but they are identified in the JCS by a separate and separable policy – and were not allocated through the Growth Triangle policy.)
- **Norwich International Airport** – sites 8, 9 and 10, which are adjacent to, or related to, Norwich Airport and its operations (and which are located within the blue dotted circular shaped boundary line on the plan).

Figure 5.1 – Development sites and areas referred to in the economic impact analysis

5.4.2 Further information on each site is contained in Table 5.1 below. It should be noted that sites 12 and 13 are not site specific but relate to broader areas located between Postwick and Norwich International Airport at which development is likely to be influenced by the NDR.

5.4.3 An explanation of the quantitative benefits arising from those 13 sites is included in sub-section 5.5.2. below.

Table 5.1 – Sites included in the economic development impact assessment

Site name	Site description	Comment and JCS Reference
1.) Broadland Gate Business Park	Permission for extension of business park for predominantly B1 uses	Site is linked to Postwick Expansion referred to throughout JCS but particularly Appendix 8 (JCS, p. 146).
2.) Broadland Brook Farm	Permission for 600 dwellings	Site is linked to Postwick Linked to expansion of Broadland Gate Business Park. Expansion referred to throughout JCS but particularly Appendix 8 (JCS, p 146).
3.) Broadland Gate Laurel Farm	Permission for extension of business park for predominantly B1 uses	Site is linked to Postwick Linked to expansion of Broadland Gate Business Park. Expansion referred to throughout JCS but particularly Appendix 8 (JCS, p 146).
4.) Broadland Housing site – Blue Boar Lane	Existing permission, not yet implemented	Site is counted as gross only because it has planning permission in place ahead of the NDR. Site referred to in the JCS (page 56)
5.) Rackheath Ecotown	Planning framework is in place. Detailed planning and phasing still evolving	Part of urban extension Promoting economic growth at Rackheath included in the JCS (Objective 3, page 21).
6.) Rackheath Industrial Estate	Improvements brought forward under influence of NDR and Rackheath	Improvements to existing industrial estate
7.) Beyond Green Developments	Planning framework is in place. 3,500 dwelling mixed-use development. Benefits from resolution to permit, limited to 900 dwellings pre-NDR, with the remaining 2,600 dwellings dependent on the NDR coming forward	Part of urban extension
8.) Norwich Airport (Airport Site 4)	Land adjacent to the airport will be accessed by NDR	Aviation-related cluster – Norwich Aeropark

		Site being brought forward by Norwich Airport though NDR will assist in advancing the development timeframe Promoting economic growth at Norwich International Airport included in the JCS (Objective 3, page 21).
9.) Norwich Airport (Airport Site 3)	Land adjacent to the airport will be accessed by NDR	Aviation-related cluster Promoting economic growth at Norwich International Airport included in the JCS (Objective 3, page 21).
10.) Norwich Airport Industrial Estate	Existing industrial estate being masterplanned to support better use of existing employment land allocation to provide additional space	Aviation-related cluster and general employment uses
11.) Salhouse Road	Land in proximity to airport, NDR and existing employment uses	Aviation-related cluster and general employment uses
12.) Housing in North East Growth Triangle	Sprowston/ Thorpe St Andrew	Not site specific The growth triangle is referred to throughout the JCS including Policy 9 (page 50) and Policy 12 (page 67).
13.) Housing in Broadland part of NPA	Broadland	Not site specific (JCS, Policy 14, page 35).

5.5 NDR economic development benefits

5.5.1 Construction of the NDR will require prior or simultaneous implementation of the Postwick Hub Scheme (PHS). This report considers the effects of the NDR and the PHS schemes together on the economy of Greater Norwich and the wider county. The two schemes will have substantial effects on traffic flows in their immediate vicinity and in the wider city area, and these effects will yield benefits and costs; and the NDR and PHS will, of course, incur capital costs for their construction. The traffic effects and capital costs have been considered in

detail in the report focused on transport economic assessment and are therefore not considered further here¹⁷.

Qualitative benefits

5.5.2 A judgment has been made, drawing on consultation with local experts, that the NDR and the PHS, if implemented, will have wide-ranging, favourable effects on the economy of Norfolk, including favourable effects on Norwich city centre, Great Yarmouth and several settlements north of Norwich. These places are, however, some distance from, or otherwise not closely connected, to the two schemes. This report seeks to describe, rather than to quantify, the likely effects on them of the two schemes. The descriptions are set out below in Table 5.2.

Table 5.2 – NDR qualitative assessment of wider economic benefits

NDR's Influence	Description of qualitative benefit
<ul style="list-style-type: none"> • Strategic infrastructure 	<ul style="list-style-type: none"> • Greater Norwich is on a growth trajectory as the JCS clearly states; the north-east of Norwich is a key location for accommodating that growth yet its infrastructure is widely regarded as insufficient for a modern, growing economy. The introduction of the NDR will bring Norwich's strategic road infrastructure up to the standard of other core and major cities where road infrastructure has been a factor in distributing growth and development spatially. • In areas experiencing growth there can be a risk of the property market overheating if the supply of jobs and homes is not adequately planned for. The JCS sets the planning framework for growth and the NDR is a key strategic step in distributing the growth to north-east Norwich and so mitigating this risk.
<ul style="list-style-type: none"> • Norwich city centre – visitor economy 	<ul style="list-style-type: none"> • If traffic is removed from the city centre it will make the area more attractive as a place to live in, to invest in and to visit. There are likely to be benefits to property and land values as well as increases to visitor numbers over time as the area's attractiveness becomes more widely understood and appreciated. Other historic city centres with heritage and cultural attractions at their core have seen the benefit of removing traffic from the centre: Cambridge, Canterbury, Chester and York are prime examples, and Norwich would benefit from the ambience and attractiveness of a less congested core with the NDR in place • Simultaneously, visitor economy effects will stimulate additional

¹⁷ For further information please refer to the 'NDR – Economic Appraisal Report' which has been submitted as part of the DCO application documentation.

NDR's Influence	Description of qualitative benefit
	<p>consumption leading to job creation over time through multiplier effects as the central area attracts more people, whose dwell time is longer and who spend more money in the process. Increased demand from visitors could lead to an increase in the volume and quality of hotel accommodation in the city centre too, but this will be linked to demand and hotel operators' awareness of the market opportunity in the city.</p> <ul style="list-style-type: none"> • Increased visitor effect and the expenditure it injects into the local economy is often overlooked in terms of economic benefit because the jobs it creates are lower-paid, lower-skilled service sector jobs. This is true, but they are often precisely the type of jobs that many people seek as part of a portfolio approach to employment (i.e. multiple part-time jobs simultaneously) and are accessible to people with lower skills and educational attainment of which there are concentrations to the north of the city and in its northern hinterland.
<ul style="list-style-type: none"> • Norwich – visitor statistics 	<ul style="list-style-type: none"> • Data on the economic impact of tourism for Norwich City, 2010¹⁸ sets out headline figures for volume and value of tourism as at 2010 as follows: <ul style="list-style-type: none"> – Overall value of tourism to Norwich economy £432m – Total tourism-related employment, 7,357 jobs (13.9% of all employment) – Total number of trips 5.2m, of which 4.7m are day trips and 0.5m staying trips • Given the importance of day trips to the Norwich visitor economy, improved connectivity and journey reliability through construction of the NDR will be essential to preserving and growing the volume and value of tourism in future.
<ul style="list-style-type: none"> • Norwich city centre – retail offer 	<ul style="list-style-type: none"> • Norwich remains the primary shopping destination in the East of England according to a variety of published nationwide retail rankings based on varying criteria. For example, Norwich has consistently ranked in the top ten in Javelin Group's Venuescore¹⁹ publication (evaluating each venue in terms of their provisions of multiple retailers). 2013-14 has been the exception (ranked 13th) compared to previous rankings at number 5 and number 9 over the past decade. The city was the only East of England venue in the top ten in the Venuescore 2011-12 survey. This is a great improvement in comparison with its rank of 45 in 1989 (Hillier

¹⁸ Tourism South East (2010) Economic Impact of Tourism, Norwich City 2010 Results

¹⁹ Javelin Group 'Venuescore 2013-14 UK Shopping Venue Rankings'

NDR's Influence	Description of qualitative benefit
	<p>Parker, Shopping Centres of Great Britain, 1990).</p> <ul style="list-style-type: none"> • In 2006 Norwich was reported to generate £1.17 billion of retail spending annually, well ahead of its nearest regional competitors²⁰. The 2011 CACI rankings, which measure total consumer expenditure in retail destinations, place Norwich first in the region and tenth nationwide with £1.18 billion of consumer expenditure spent in the city. Experian's 2008 retail rankings, using a similar measure, placed Norwich thirteenth nationally, down from tenth in 2007, having been overtaken by Liverpool, Cardiff and Westfield (London), all of which have recently seen new retail development²¹. • Overall comparison goods spend in Norwich has risen significantly in the same period, up from £1.14 billion in 2007 to £1.38 billion in 2008. Data from the 2011 CACI Retail Footprint states Norwich has a total retail expenditure of £2.2 billion²². Norwich continues to hold its own as the premier retail destination in East Anglia and improved accessibility for shoppers will assist in preserving its position going forward.
<ul style="list-style-type: none"> • Norwich city centre property market 	<ul style="list-style-type: none"> • Direct cause and effect is difficult to state categorically, but development sites such as Anglia Square and Duke Street in Norwich could benefit from the NDR in an indirect way over time. The NDR would enhance their connectivity with and accessibility from the north, making them a more attractive proposition for investment. Duke Street has benefitted from new development (residential, hotel, car park) completed pre-recession and, in a recovering market over the next few years, the NDR could provide impetus for the remaining sites in the area to be developed. At the same time, there is expected to be an improvement in public transport including the proposed Bus Rapid Transit (BRT), for which capacity on the network is expected to be released by the NDR, and this would also improve connectivity and accessibility. • Anecdotal evidence from NCC's economic development team suggests that when Broadland Business Park was first opened it provided a boost to the city centre commercial office market as property owners in the city centre upgraded their offers to meet the competition from the new premises at Broadland. There is real scope for the same effects to be felt again as development in the NDR Corridor provides renewed impetus for developers and

NDR's Influence	Description of qualitative benefit
	property owners to see it as a catalyst for renewal and upgrade of existing city centre property.
<ul style="list-style-type: none"> Norwich Research Park (NRP) 	<ul style="list-style-type: none"> NRP is clearly a key driver of economic growth for Norwich and the sub-region. The NDR, and the enhanced public transport provision, including cross-city BRT facilitated by the NDR (as explained above), will improve links between the NRP and the north of the city, which will increase the supply of labour able to work at NRP in high skilled and low skilled jobs (this is important as the cost of travel to work is more significant for low skilled jobs and the NDR will help to improve access to the NRP from Norwich's less affluent neighbourhoods). Furthermore, the NDR will make areas to the north of Norwich more accessible as places to live for people working at NRP; this could have a stimulating effect on residential property prices to the north of Norwich which are suppressed compared to areas south of Norwich as illustrated in Section 2. As NRP grows and expands, as articulated in Section 3 (Norwich City Deal), the number of highly skilled and highly paid workers employed there will increase. Based on current patterns of behaviour it is highly likely that these newcomers to the area will seek to live in established higher-value residential areas to the south of Norwich, close to their peers and within easy commuting distance to NRP. This may lead to increased demand and inflated prices in those areas, a situation which could be alleviated through the NDR extending the area of housing search to the north of Norwich, the villages on the urban fringe and market towns in the city's northern hinterland.
<ul style="list-style-type: none"> Great Yarmouth and offshore energy 	<ul style="list-style-type: none"> Great Yarmouth is a centre for the North Sea's growing offshore energy sector industries. Links between Great Yarmouth and Norwich International Airport are important as offshore workers and contractors will be flying to Norwich International Airport from Aberdeen and Amsterdam then travelling on to Great Yarmouth by road, or being helicoptered offshore from the Airport. The offshore sector in the North Sea is set to expand as the Government issues further offshore wind licences. Presently there are about 1,800 turbines planned and this could grow to 3,300 in the future; with this growth there will also be a commensurate increase in workers travelling to and through the area; with the NDR providing part of the road link between Norwich Airport and Great Yarmouth, it will become an important route.
<ul style="list-style-type: none"> Norwich and offshore 	<ul style="list-style-type: none"> As the offshore renewables sector expands there will be demand for office space in the area. Great Yarmouth has disadvantages in

NDR's Influence	Description of qualitative benefit
energy	<p>terms of its office supply which could lead to increased demand for office space in Norwich from firms in this sector. The links between Norwich Airport and Great Yarmouth noted in the point above indicate that the NDR corridor is an ideal place for demand for office space to be met.</p> <ul style="list-style-type: none"> As part of the Northeast Growth Triangle, plans are being progressed by Beyond Green Developments (site 7 in Figure 5.1) for a sustainable urban extension which will provide employment space for environment-related businesses. Demand from offshore firms could be satisfied in this area while such uptake would also reinforce the sustainability credentials of the urban extension. There is already evidence of energy-related businesses being located in the JCS area with Aquaterra (which is involved in the design of offshore structures) employing about 1,200 people and having a base close to the Airport.
<ul style="list-style-type: none"> Aylsham 	<ul style="list-style-type: none"> Aylsham is an attractive market town to the north of Norwich and it will benefit from links to the NDR via the A140 where it will join the NDR west of Norwich International Airport. The Aylsham settlement has capacity for housing growth (c500 dwellings permitted) and its attractiveness will be enhanced by improved connectivity via the NDR to employment opportunities along the NDR corridor, including those at Broadland Business Park, Norwich Airport, Rackheath and NRP. Discussions with NCC's economic development team have referred to a 'Wymondham effect' potentially occurring in Aylsham; that is a repetition of the increase in development activity and property prices which occurred in the settlement of Wymondham, following improvements to the road infrastructure and connectivity with Norwich.
<ul style="list-style-type: none"> North Walsham 	<ul style="list-style-type: none"> North Walsham is an attractive market town to the north of Norwich that will benefit from links to the NDR via the B1150 where it will join the NDR near Spixworth. The 'Wymondham effect' described above for Aylsham is also anticipated to occur at North Walsham though the effects are expected to be less pronounced at North Walsham, which would still be connected to the NDR via a 'B' road or via the A1151 through Wroxham; either way the improved connectivity is notable but less pronounced.
<ul style="list-style-type: none"> Former RAF Coltishall 	<ul style="list-style-type: none"> The former RAF Coltishall site has a prison on site and demonstrates longer-term potential for employment uses, particularly large land-take uses of B2 or B8 category. NCC owns much of the site and has recently completed consultation on future uses. The NDR will improve access and connectivity to/from the

NDR's Influence	Description of qualitative benefit
	site via the B1150 making it more attractive for employment uses.
<ul style="list-style-type: none"> Norfolk tourism 	<ul style="list-style-type: none"> Norfolk's visitor economy is an important sector of the economy and the NDR will improve connectivity for tourists visiting the Norfolk Broads, north Norfolk coast, Great Yarmouth and Norwich as part of a visit. It is difficult to assess the influence the NDR may have on the volume and value of tourism in the area but connectivity within the area will be improved through the NDR and such improved connectivity can reasonably be expected to improve attractiveness of these renowned destinations to visitors. Improved connectivity will also serve to protect Norfolk's position as a visitor destination for all segments of the market. Access to Norfolk will be enhanced through improvements to the A47 and A11 (and the A14), but the NDR will also improve connectivity between Great Yarmouth and areas to the north of Norwich. This could improve day visitor trips to the seaside town from residents and visitors to areas north of Norwich, the Norfolk Broads and the north Norfolk coast. The NDR is therefore integral to the provision of greater intra-County connectivity enabling visitors to move around and between destinations with greater ease avoiding the need to travel through central Norwich unless they wish to.
<ul style="list-style-type: none"> Place making 	<ul style="list-style-type: none"> Northeast Norwich is proposed as a sustainable urban extension, to be brought forward on Ecotown principles (Rackheath (site 5 in Figure 5.1) and the Beyond Green Developments Ltd proposals (site 7 in Figure 5.1) draw on exemplar developments from around Europe (for example Stockholm). The principles underpinning these development proposals seek to ensure that the area will become a fully-functioning extension to Norwich and an exemplar of sustainable urban development. In itself, the area is likely to attract visitors in future who are interested in sustainable urban development and keen to understand the approach taken to this in Norwich. The NDR would be an important piece of infrastructure providing strategic access to these sites, and removal of traffic from the city centre, to allow the sustainable access and high quality environment on which the spatial development of the area is dependent.
<ul style="list-style-type: none"> Place competitiveness 	<ul style="list-style-type: none"> Modern urban economies require a mixed commercial property offer to make them attractive to a broad range of businesses and entrepreneurs. Norwich's property offer has successfully responded to changing demand, for example: <ul style="list-style-type: none"> Broadland Business Park has been a success and renewed impetus is expected to arise from the Postwick junction

NDR's Influence	Description of qualitative benefit
	<p>improvements.</p> <ul style="list-style-type: none"> – In close proximity to Broadland Business Park there are smaller business parks providing B1 accommodation (at Meridian Business Park and St Andrews Business Park) but these premises are full; – One of the development sites being advanced at the Airport (site 8 in Figure 5.1 (Airport Site 4)) is planned to accommodate the operations of KLM Air Livery currently based at Norwich Airport Industrial Estate. KLM Air Livery's move to purpose-built premises will support the Airport's planned expansion and make space available on the Airport Industrial Estate for additional aviation-related firms to move into. – At Norwich Airport new buildings are occupied by Klyne Aviation and Bond Aviation. • The above points indicate there is demand for well-connected B1 office space on Norwich's fringe, and demand from aviation-related businesses to be located in close proximity to the Airport.
<ul style="list-style-type: none"> • Norwich International Airport 	<ul style="list-style-type: none"> • Norwich International Airport currently has about 85,000 offshore helicopter movements per annum which involve workers travelling from Great Yarmouth to the Airport to fly to their offshore sites. Great Yarmouth can only accommodate about one-third of the total demand for helicopter flights by workers needing to fly offshore. The NDR would relieve pressure on the existing network between Great Yarmouth and the Airport and would provide an alternative to Norwich ring road as part of this journey. As the offshore sector grows, so demand for helicopter flights can reasonably be expected to increase too. • Norwich International Airport's catchment area is Norfolk extending into Cambridgeshire and Suffolk. Passengers driving to the Airport from the south will mostly come via the A11 and A140 and presently use the outer or inner ring roads to access the Airport. The NDR would provide an alternative route from the south, accessed via the A47 and Postwick. Passengers travelling from the north and east would also benefit from reduced journey times. • Interventions that can deliver passengers to the Airport more efficiently and reliably can influence airline decisions to operate routes from the Airport in future. KLM is increasing its city hopper flights from Norwich to Amsterdam from three to four per day and improved connectivity for passengers can support this type of growth and sustain it in future.

NDR's Influence	Description of qualitative benefit
<ul style="list-style-type: none"> • Growth 	<ul style="list-style-type: none"> • In a recent PwC report (PwC, Good Growth for Cities, A Report on Urban Economic Wellbeing from PwC and Demos, November 2013), Norwich was ranked tenth of the thirty-nine UK cities included in the Demos-PwC Good Growth for Cities Index (based on an indicator set including employment, health, income, skills, work-life balance, housing, sectoral balance, income distribution, transport and environment. The highest ranking cities were reported as performing relatively well on jobs, income and skills but less well on housing. • The report also noted that <i>“Delivering effective, efficient and sustainable urban infrastructure is essential to provide the city backbone from which economic success and prosperity can grow. With many cities in our index showing red flashing lights for indicators such as housing and transport, and with the UK at 24th place on the World Economic Forum’s league table for infrastructure, it is clear that more needs to be done to deliver and meet the needs of our citizens and businesses. Not only do cities in the UK need to upgrade failing and ageing infrastructure, but as technology drives mobility and connectivity, cities are also seeking to upgrade what they can offer residents and businesses and establish smart city systems that will position them as global leaders. (p23). The NDR is planned in response to this growth agenda.</i>

Quantitative benefits

5.5.3 The quantitative analysis carried out for this report has focused on specific development sites located on or close to the proposed line of the NDR, including the Postwick Hub, as described above in Figure 5.1 and Table 5.1. Some of the sites cannot be developed without the two schemes (NDR and PHS); others will be easier to develop with the two schemes; and two schemes are particularly associated with the PHS (Broadland Gate Business Park and the employment element of Brook Farm/ Laurel Farm) and appear to be contingent on that scheme only. There are development proposals for the sites ranging in detail from outlines to detailed plans. We estimate that collectively the sites could accommodate over 11,000 jobs, which is a substantial proportion of the 27,000 jobs anticipated in the Joint Core Strategy.

5.5.4 The methodology used to quantify economic development benefits arising from these sites in connection with the NDR is summarised below, and a summary of the analysis carried out is followed by discussion of the findings. A summary

table (Table 5.3) is included at the end of this section and is supplemented by the detailed tables of calculations appearing in Appendix A. To facilitate referencing, figures in the text below that are taken from Table 5.3 appear underlined and in ***italic bold***.

5.5.5 One element of the methodology is the conversion of gross effects (such as the jobs actually arising on a particular site) to net effects after allowing for deadweight or non-additionality (that is the possibility that some of the jobs arising would have arisen anyway elsewhere in the study area). The gross to net conversion for each site is based on the site's context and its potential for development, and has been discussed and agreed with NCC Planning and Economic Development officers as well as Norwich International Airport and Norwich Industrial Estate staff. The methodology is also based on the following assumptions:

- Phased job growth over a thirty-year period so that the cumulative build-up of jobs and development can be considered.
- Differentiation between higher and lower GVA employment for each site, based on informed discussion with NCC Planning and Economic Development officers.
- Use of a standard multiplier to determine the composite supply-chain and consumption effects of additional expenditure and economic activity in the area.
- Estimation of the capital expenditure to be injected into the area through the construction period and development of individual sites, and the corresponding extent of employment during development.

5.5.6 The results of this methodology are expressed as net additional jobs, GVA, investment effects at 2034 which is referred to as the steady state year (being the year at which the net additional growth attributable to the NDR is estimated to be fully achieved).

5.5.7 If the NDR and Postwick Hub schemes did not proceed, there would be fewer jobs on the sites, but some of the sites (including at Norwich International Airport and Broadland Business Park) would still accommodate significant employment growth; moreover, without the schemes some jobs that would have been located on sites in the vicinity of the NDR and Postwick Hub schemes would find alternative locations within Greater Norwich. This report suggests that the two schemes (NDR and PHS) will lead to about ***4,358***²³ net additional jobs being created within Greater Norwich by the year 2034. Further detail on the build-up of net jobs is provided at Appendix A (Table A.1, which shows net

²³ We provide exact numbers so that the arithmetic is clear. The inevitable uncertainties mean that these numbers should be regarded as no more than the centrepoints of wider ranges.

jobs figures for the sites shown on Figure 5.1 and listed in Table 5.1). Local expenditure resulting from the newly created jobs and from local purchasing by new or expanded firms will, it is estimated, raise total additional job creation from the **4,358** jobs mentioned above to **5,230** net additional jobs within the study area²⁴.

5.5.8 This report takes as background the JCS and the other relevant documents discussed in Section 3. Such documents are based in turn on forecasts for the national and regional economies and demographic forecasts. Job creation on the sites considered in this report is contingent upon those forecasts and upon other matters covered by the JCS, such as the need for appropriate workforce skills to satisfy employer requirements.

5.5.9 The sites considered in this report will require substantial investment in offices and other workplaces and ancillary facilities and are also forecast to accommodate some 10,000 new dwellings, of which it is estimated that about 7,000 will be additional. This high level of additionality is based on the view of NCC that few of the dwellings could be built in other locations within Greater Norwich in the JCS period to 2026 or in the period to 2034 which this assessment covers. Total additional investment in workplaces is estimated at **£122m**, based upon average investment of £28,000²⁵ for each of the **4,358** jobs; additional investment in housing is estimated at **£700m** (£100,000 per additional dwelling); and the capital cost of construction of the NDR and the PHS is estimated by NCC at **£144m**. These components yield a total of **£966m** of net additional investment during the period leading to steady state in 2034.

5.5.10 The **£966m** of additional investment will require an estimated **8,940** job-years of labour over the period 2014 to 2034, based upon conventional estimates of £100,000 per job-year in housing and commercial building and £200,000 per job-year in road construction. On average over the 21 years this will mean that **426** full-time equivalent workers are employed in construction. As with 'permanent' jobs, expenditure by these workers, and the purchase of supplies locally, will add modestly to the jobs total and the conservative estimate of the composite multiplier (1.2 – see above) used in this Report suggests that there

²⁴ In the absence of detailed information on multiplier and supply chain effects, this report has used a composite multiplier of 1.2, eg the 4,358 additional jobs on the sites in question are assumed to yield 5,230 jobs (4,358 X 1.2 = 5,230) following multiplier and supply chain effects. This figure of 1.2 is prudently low: the English Partnerships Additionality Guide (2008) suggests at its Table 4.8 a composite multiplier of 1.29 for B1/B2/B8 space; and the Department for Business Innovation and Skills (Occasional Paper, Number 1, 'Research to Improve the Assessment of Additionality' October 2009) suggests various numbers in its Chapter 7 on multipliers, but its Table X1 identifies a mean value from research for a sub-regional composite multiplier of 1.25.

²⁵ This figure of £28,000 depends heavily on the types of occupier attracted to the sites. The figure could be much more than £28,000, but in our judgment could not be less. Investment in building costs alone would exceed £28,000 per job reckoned at £1,500 per square metre and 20 square metres per job on average across industries.

will be 85 'multiplier' jobs in the local economy, making **511** (426 x 1.2) investment-related jobs in all, on average in the period 2014-2034. These jobs are assumed to cease once construction is complete on the attainment of steady state in 2034.

5.5.11 The activities briefly summarised above will lead to greater output (GVA) in the local economy. These effects have been assessed over a period of roughly 30 years, to 2047. At 2010 prices, but undiscounted, it is estimated that when steady-state is achieved (2034), local GVA will be **£187m** per annum greater with the schemes than without, as a consequence of the 5,238 additional jobs that will have been created by then. Table 5.3, in conjunction with the more detailed tables in Appendix A, analyses this increase as between additional GVA on the two Postwick sites (**£61m**), additional GVA on other sites (**£95m**), and additional GVA resulting from the composite multiplier (£31m=0.2 x (£61m+£95m)), all totalling **£187m** per annum.

5.5.12 GVA is usually expressed as an annual flow such as the figure of **£187m** per annum mentioned in the previous paragraph. But to compare it with one-off costs - such as the costs of the NDR and the PHS - it is desirable to take the total impact on GVA, summed over a period of years and appropriately discounted. At 2010 prices, discounted to the same year at 6%²⁶ and including multiplier effects, we estimate that additional GVA in total over the period to 2047 will be **£1,099m**, comprising **£916m** arising directly from additional employment at the various sites and a composite multiplier effect of £183m.

²⁶ HM Treasury's Green Book (Annex 6) specifies a social discount rate of 3.5%. But for the commercial activities expected to provide most of the jobs accommodated on the sites considered here, a long term real rate of return on commercial investments is more appropriate and this is generally put at around 6%, as indicated by average return on equities in the UK and USA reported in the authoritative Barclays Equity Gilt study, published annually since 1956.

Table 5.3 – Employment, GVA and investment effects – summary table

Type of Benefit Note that steady state is attained in 2034	Postwick Sites ²⁷	NDR Sites	Total
Primary Effects			
FTE gross jobs on sites listed in the text, in steady state (see Appendix A, Table A.1)	5,000	6,281	11,281
FTE additional jobs on sites listed in the text, in steady state (see Appendix A, Table A.1)	1,667	2,691	4,358
Additional GVA per year in steady state, £m, 2010 prices, undiscounted	61 ²⁸	95 ²⁹	156
Additional GVA from continuing activities in total to 2047, £m, 2010 prices, discounted at 6% (see Appendix A, Table A.5)	378	538	916
Primary Effects plus Multiplier Effects (multiplier value 1.2 – see main text and footnote above)			
FTE net additional jobs in steady state	2,000	3,229	5,230
Additional GVA per year in steady state, £m, 2010 prices, undiscounted	73	114	187
Additional GVA from continuing activities in total to 2047, £m, 2010 prices, discounted	454	646	1,099
Investment Effects			
Gross investment in road construction, £m, undiscounted, total (per NCC)			144
Gross commercial investment, £m, undiscounted, total	140	176	316
Gross housing investment, £m, undiscounted, total at £100,000 per dwelling (see Appendix A, Table A.1 for planned numbers of dwellings)			985
Net investment ³⁰ in road construction, £m, undiscounted, total			144
Net additional commercial investment, £m,	47	75	122

²⁷ The 'Postwick Sites' are Broadland Gate Business Park and Broadland Gate Laurel Farm. They are contingent on the Postwick Hub Scheme but could proceed without the NDR. The 'NDR Sites' are the remaining sites listed in Table 5.1.

²⁸ Postwick Hun Scheme Economic Appraisal Report

²⁹ See Appendix A, Table A.3

³⁰ Note that this is obviously 'additional'.

undiscounted, total at £28,000 per additional job (see main text)			
Net additional housing investment, £m, undiscounted, total at £100,000 per dwelling		700	700
Total net additional investment, £m, undiscounted	47	775	966
Net additional job-years of employment in construction at £100,000 per job year (housing and commercial) and £200,000 (roads)	467	7,753	8,940
Average investment-related employment 2014-2034	22	369	426
Employment through Investment Effects (multiplier value 1.2)			
Average investment-related employment 2014-2034	27	443	511

Note: the final digit in the figures in the Total column may be affected by rounding.

PAGE NOT USED

6.1 Summary

6.1.1 **Note:** Figures in this summary taken from Table 5.3 are underlined and in *italic* bold.

6.1.2 The NDR is a critical piece of infrastructure that is integral to the JCS aspirations for growth. The role of the NDR in supporting Greater Norwich's development is also apparent in the other land-use and economic development policy documents pertinent to the area, and this reinforces the integral role of the NDR. Similarly, the role of Norwich in the East of England economy is also important, particularly in terms of retail provision, tourism and offshore energy but also in providing key centres of economic activity such as Norwich Research Park and Norwich International Airport, all of which are expected to benefit from improved connectivity delivered through the NDR.

6.1.3 NCC currently estimates that construction costs of the NDR and the Postwick Hub will be some **£144m**. There will also be road maintenance and other operational costs during the 30 year period considered here, though they will be much less than the capital costs of construction. It is not the purpose of this report to assess costs in detail, or to combine the benefits considered here with the WebTAG benefits and detailed costs in a full cost-benefit analysis. The purpose of providing headline costs figures in this report is to enable decision makers to contrast the costs with the benefits considered here. The analysis in this report suggests that the quantifiable benefits identified exceed the costs of construction; and the full scale of benefit will be greater as there are also unquantifiable and qualitative benefits that are more difficult to assess precisely, but which are set out in Section 5 above.

6.2 Key economic benefits

6.2.1 The NDR, including the Postwick Hub, will bring the very substantial benefits described in Section 5. As is shown in Table 5.3, they include³¹:

- **4,358** net additional direct jobs arising from the development sites listed in this report;
- when multiplier effects are included this figure (of 4,358) rises to **5,230** net additional jobs that would not otherwise arise in Greater Norwich;
- **£1.099bn** of additional GVA is generated by those **5,230** jobs over some 30 years;

³¹ Exact figures, such as 4,358 jobs, are provided to allow tracking of the arithmetic. They should be regarded as no more than the centre points of wide ranges. For instance, 4,358 jobs might better be regarded as 4,000-5,000 jobs.

- **£966m** of net additional physical investment in roads, infrastructure and housing; and
- an average of **426** construction jobs (rising to **511** when multiplier effects are included) in each of the years until development is complete (estimated at 2034).

6.2.2 The benefits attributed to the NDR are substantial and reflect its potentially important role as strategic infrastructure to underpin economic growth in Greater Norwich over the next three decades and beyond. Moreover, to build on Greater Norwich's growth potential, the city needs an infrastructure that matches those already in place in competitor locations: most UK cities already have, or are implementing, road infrastructure which improves connectivity and links areas of employment opportunity with areas of employment need. The NDR is part of this strategic approach and, if implemented, could deliver benefits to the area's internationally renowned NRP, future inward investors, existing businesses, residents and visitors alike as well as supporting development in key growth sectors.

6.2.3 Simultaneously, there are also a range of qualitative benefits which have been discussed in the previous section. These are important and although they cannot be quantified, they do provide impetus for further economic growth and development in future. For instance; improved access to Broadland Business Park and Norwich International Airport can make development and location at these sites more attractive for businesses; the same is true for improved access and connectivity to the city centre for residents and visitors; and, the importance of reliable journey times between Great Yarmouth and the Airport in order to support the offshore energy sector is increasingly significant as offshore activity increases.

	12,681	11,281		4,358	10,893	9,850	7,000

Note: the Gross Jobs in the first column of figures were supplied by NCC. In some cases, they appeared to be greater than could easily be accommodated on the respective sites. As a matter of prudence, the lower figures in the second column of figures were agreed between Mott MacDonald and NCC as the basis for calculations.

* These two columns are replicated from the Postwick Hub Scheme Economic Appraisal Report (April 2013), p25

Note: Table A.2 shows gross figures for the Broadland Gate Business Park (BGBP) and Broadland Gate Laurel Farm (BGLF) to demonstrate consistency with the Postwick Hub Scheme Economic Appraisal Report. It shows net figures (i.e. figures after the deduction of estimated non-additionality (deadweight)) for BGBP and BGLF and for the other sites where job creation occurs. Phasing for BGBP and BGLF is replicated from the PHS Economic Appraisal Report. Phasing for Airport Site 4 is based on discussions with the Airport operator: their view is that the NDR will accelerate job creation but will not affect the final number of jobs on that site, so there are additional jobs in the early years but not in steady state. Phasing at other sites assumes that additional (i.e. NDR-induced) occupancy begins in 2018 and proceeds at a uniform rate until steady state is attained in 2034.

Table A.3 – Analysis of Jobs between High-GVA (£45,000) and Low-GVA (£29,000) jobs at 2011 Prices

Site No.	5	7	8	9	10	11

2047	43.9	13.9	0.0	34.9	0.8	1.6	95.1

Note 1: Table A.3 shows additional GVA by year at each of the non-Postwick sites, determined by multiplying the number of additional jobs taken from Table A.2 by average GVA per job as shown in the

fourth row of this Table (A.3). For instance, the 74 jobs at Rackheath in 2018 (Table A.2) are multiplied by £34,824 (A.3) to yield, following rounding, £2.6m of GVA in 2018 (A.3).

Note 2: The 2011 GVA per job figures of £45,000 for high-GVA jobs and £29,000 for low-GVA jobs are consistent with the figures used in the Postwick Hub Scheme Economic Appraisal Report; 2010 figures have been assumed to be 2% lower than in 2011. The proportion of high-GVA jobs at each site is based upon NCC's expectations of the type of occupier to be expected at the various sites. The remaining jobs (i.e. those that are not 'high-GVA') are taken to be low-GVA jobs.

Note 3: GVA for the two Postwick sites is not presented in Table A.3, but in Table A.5

Total	233.0	74.0	33.0	185.5	4.4	8.2	538.2
Additional GVA from BGBP and BGLF, per Postwick Economic Appraisal Report							378.0
Total							916.2

Note: Table A.5 shows discounted GVA arising from the non-Postwick sites derived by multiplying the GVA figure from Table A.3 by the discount factors in Table A.4. For instance the £22.6m of additional GVA (Table A.3) at Airport Site 3 in 2028 is multiplied by the discount factor of 0.35 for the year 2028 taken from Table A.4 to yield, following rounding, the £7.9m of additional discounted GVA shown in Table A.5. Additional discounted GVA at the two Postwick sites is calculated in the Postwick Economic Appraisal Report as £378m and, in Table A.5, this figure is added to the values from the non-Postwick sites to arrive at the overall total of £916.2m.

Appendix B. Roads and economic growth: a review of literature

B.1 Introduction

B.1.1 Although there is a significant amount of ex-ante appraisal work completed before investment is made in road schemes, the same cannot be said for ex-post appraisal of the benefits of road schemes. A body of international academic research has developed with a focus on assessing the economic benefits of highway infrastructure over long periods and some of this is reviewed here. In England, the Highways Agency produces analysis through its Post Opening Project Evaluation (POPE) process and this body of work is also referred to here.

B.2 Findings from POPE

B.2.1 POPE focuses on major schemes with a capital cost in excess of £10m. Individual POPE studies consider how much a scheme actually cost (outturn cost) compared to predicted costs. These costs include: construction costs, land, preparation and supervision costs. The study also calculates the (ex-post) benefits of the scheme and compares this to the (ex-ante) benefits which were forecast. All of the government's New Approach to Transport Appraisal (NATA) objectives are covered in the evaluation: environment, safety, economy, accessibility and integration. The economy element does not consider the wider economic benefits that may accrue outside the parameters of the transport scheme, at the margins of the infrastructure, so factors such as jobs, productivity and commercial development are not included. Nevertheless, the following summary points are made in regards to major schemes (2002 to 2009):

- The majority of schemes (76%) evaluated to date (2009) had delivered more than £2 of benefit per £1 invested.
- The average net benefit of major schemes ranges from £58m (for schemes evaluated over 30 years) to £79m (for schemes evaluated over 60 years) at 2002 prices (POPE Meta Report, Highways Agency, 2011)

B.2.2 Tables B.1 and B.2 provide a review of the POPE work reflecting on road schemes in the East of England (with some from a slightly wider area) based on POPE reports available on the Highways Agency website.

Table B.1 – POPE 30-year benefits of road schemes within the East of England

²First 10 years impact only.

Table B.2 – 60 year Post Opening Project Evaluation of benefits of road schemes within the East of England

East of England Schemes	60 Year Present Value Benefits, £			Benefit Cost Ratio		
	Pre-Scheme Forecast	Actual	Variance	Pre-Scheme Forecast	Actual	Variance
A10 Wadesmill	£106.6m	£121.1m	£14.5m	4.5	3.01	-1.5
A11 Attleborough	£68.7m	£88.9m	£20.2m	5.4	5.2	-0.2
M1 Junctions 6a to 10 Widening	£2,004.3m	£1,683.6m	-£320.7m	6.9	6.1	-0.8

Source: Highways Agency POPE Major Schemes Summary Reports

B.2.3 As can be seen from Table B.1 and Table B.2, all of the East of England schemes that have been evaluated to date were predicted to generate, and have shown, a considerable net benefit. All have resulted in a positive benefit cost ratio as well.

- B.2.4 The benefits vary in scale depending on the size of the project; and the variance with which forecast and actual benefits differ is relative to this. For example, the A120 Stansted to Braintree scheme was forecast to generate £646.4m worth of benefits over 30 years. After completion, the actual benefits accrued were equal to £1,215.8m (£569.4m more benefits than expected). This translated in the variance of Benefit Cost Ratio (BCR) for that scheme; BCR predicted at 4.1, but after completion recalculated at 12.1 (Highways Agency, POPE A120 Stansted – Braintree, page 3). This is almost a 300% increase in BCR. In comparison, a smaller scale scheme such as the Rushden Bypass, with an actual 30-year present value benefit of £39.7m displayed a much smaller change in BCR; reducing from a forecasted 2.6 to an actual 2.4 (Highways Agency, POPE A6 Rushden – Higham Ferrers Bypass, page 9).
- B.2.5 This change in variance is to be expected, as with the increase in scale of projects, the opportunity for inaccuracies and external influences also increases. It is important to note that in each of these schemes, though there may be differences between the forecast and actual benefits of the scheme, the economic BCR remains positive in each case.

B.3 Integration and Wider Economic benefits

- B.3.1 As mentioned previously, the POPE reports include some ex-post analysis on the integration benefits of a scheme (as one of the government's NATA objectives). The majority of these evaluated schemes comply with regional development and transport objectives. For example, the A6 Rushden scheme *“is broadly consistent with the delivery of key policies within the Northamptonshire Structure Plan and the East Northamptonshire Local Plan”* (Highways Agency, POPE A6 Rushden – Higham Ferrers Bypass, page 9). When asked whether the area is a better place to live following the opening of the bypass, 58% of residents agreed that it was, whilst only 15% disagreed (paragraph 6.43, page 58).
- B.3.2 Similarly, the A421 Great Barford Bypass resulted in the following evaluation: *‘The benefits offered align with key policy objectives set out in the latest Bedfordshire Local Transport Plan and the East Midlands Regional Spatial Strategy’*. These conclusions indicate that such large-scale transport schemes can be implemented in such a way that they complement regional and local transport objectives. In the case of the A120 Stansted to Braintree, the scheme not only delivered on integration objectives but also on wider economic benefits:

“The Essex LTP1 delivery report in particular has demonstrated that the A120 scheme has achieved its objective in terms of the integration objective. The scheme also contributes to other policies including the East of England Plan and the A12/A120 Route Management Strategy.” And “The scheme has provided new employment and regeneration opportunities as stated in the scheme objectives” (Highways Agency, POPE A120 Stansted – Braintree, page 3)³².

B.3.3 The A120 route is not the only scheme that has benefited the local economy beyond simply shorter travel time and increased safety; many have unlocked areas of employment, investment and enterprise; however such successes can be overlooked due to not being included within the monetary post-project evaluations. It is important to take these additional benefits into account as they can significantly impact on a local economy, especially in areas of stalled growth or where prevailing infrastructure acts as a hindrance to investment and trade.

B.3.4 In summary, the POPE reports provide an overview of the economic benefits delivered by road schemes but the evaluation process stops short of considering wider economic benefits. The scale of benefits is therefore likely to be greater than captured in the POPE work and this suggests that wider economic benefit assessment is an important element of the appraisal and evaluation process, though it remains an area of assessment that is generally given less prominence in appraisals.

B.4 Findings from Research Studies

B.4.1 In a study by Gibbons et al (2010)³³ it was noted that evaluation of the benefits of transport improvements has traditionally revolved around the measurement of direct benefits to users. Recent practice has begun to widen the scope to include a broad range of 'wider' economic benefits. These wider benefits (and costs) include spill overs between people and between firms that cause the aggregate benefits to diverge from the sum of the private user benefits (Gibbons et al, 2010:p2). Foremost amongst these measures is agglomeration, though there is a suggestion that the focus on agglomeration leads to localised benefits going undetected (Gibbons et al, 2010:p49).

B.4.2 The finding from this study is related to the potential accessibility changes and agglomeration benefits and there is no convincing evidence that the schemes of

³² Highways Agency: 'POPE of Major Schemes Summary Report – A120 Stansted to Braintree Report'

³³ Gibbons, S., Lyttikainen, T., Overman, H., Sanchis-Guarner, R. & Laird, J. (2010) Evaluating the productivity impacts of road transport schemes: London: Department for Transport

the scale included in this study (including all major road transport improvements between 1998 and 2003) have created any measurable agglomeration benefits of this type. The most likely explanation for this is that the changes in employment accessibility may be too small and geographically localised to generate detectable changes in agglomeration-related productivity (Gibbons et al: 2010, Main Findings).

- B.4.3 Nevertheless, Gibbons et al (2010:p3) suggest that it is only a small conceptual step from the observation that firms are more productive in more integrated and dense economies, to the conclusion that improvements in transport networks could improve productivity. Improvements to the road and rail networks bring firms closer to each other and firms closer to workers in terms of travel times and costs. This closer economic integration exposes firms to greater competition, improving productivity at the macro level, and improves the basis for agglomeration economies arising at the micro level.
- B.4.4 Focusing on the micro level, a study by Matson et al (2006)³⁴ primarily focused on landscape and countryside issues at the settlement level but does consider road by-pass schemes as case studies and provides the following summaries in relation to a review of ex-post evaluation work with a wider economic dimension:
- A27 Polegate Bypass
Too little significance had been given to the role of planned development driving trunk road improvements in the Polegate area. Although pressure for housing, commercial and business development did not feature in the justification of the scheme at public inquiry, they have subsequently taken on central importance in providing the case for further road expansion (Matson et al: 2006, p26).
 - A34 Newbury Bypass
The bypass has enabled edge-of-town development on the old road, most notably Vodafone's HQ. It also appears to have aided further development of industrial and business parks accessed via the old road (Matson et al: 2006, p28).
 - M65 Blackburn Southern Bypass
Local councils now regard widening of the M65 as essential to further industrial development. Blackburn with Darwen Borough Council called for widening between junctions 5 and 6 in their second Local Transport Plan in

³⁴ Matson, L., Taylor, I., Sloman, L. & Elliott, J. (2006) Beyond transport infrastructure: lessons for the future from recent road projects, London: CPRE and The Countryside Agency

order to facilitate the expansion of the Whitebirk site into a strategic regional investment location. This was supported by the North West Development Agency and promoted through the Draft NW Regional Spatial Strategy (Matson et al: 2006, p29).

- B.4.5 The Eddington Report (2006)³⁵ assessed the state of Britain’s national transportation infrastructure and whether problems in the transportation network affected productivity and economic performance. It concluded that major additions to the highway system were not required but that the *“Government should make sustained highway and other investments to improve the transportation network ‘in those places that are important for the U.K.’s economic success”* (The Eddington Transport Study, 2006:58).
- B.4.6 Mera (1973)³⁶ (cited in Lakshmanan (2010)³⁷) carried out the first study which found that public infrastructure—including transport and communications infrastructure— contributes to aggregate private production in ways similar to that of privately supplied inputs and that its impact on productivity could be assessed through the use of the production function framework. He divided Japan into eight regions, and concluded that from 1954 to 1963 (a period of intense reconstruction of the Japanese economy), investments in transport and communication substantially contributed to private production in the manufacturing and service sectors. The output elasticities of 0.35 for the manufacturing sector and about 0.40 for the service sector implied that a 1% increase in infrastructure stocks led respectively to 0.35% and 0.40% increases in the outputs of Japanese manufacturing and service sectors.
- B.4.7 In a far-reaching study completed in the USA by Shatz et al (2011)³⁸ a number of points were identified based on review and meta-analysis of existing studies. A summary of points emerging from the report are set out below:
- *“Highway infrastructure can affect the economy in a number of ways, nearly all of them related to increasing mobility. It can enable producers to reach markets more cheaply and to increase the size of their market area. It can enable workers to choose among a wider array of employment opportunities and to live farther from their workplaces. It can enable producers to have a broader choice of input suppliers. Related to lowering the costs of reaching markets or inputs, it can increase the speed with which producers can reach*

³⁸ Shatz, H.J., Kitchens, K.E., Rosenbloom, S. & Wachs, M. (2011) Highway infrastructure and the economy. Implications for federal policy. Santa Monica CA: The RAND Corporation

markets or inputs, allowing them to hold lower inventories and carry out just-in-time production.” (Shatz et al., 2011:p15).

- *“Researchers have found that, beyond the value of the interstate system, highway infrastructure has caused positive economic outcomes for those industries that use it more intensively.” (Keeler and Ying, (1988) cited in Shatz et al., (2011:p16)).*
- *“An early study of 28 metropolitan areas from 1980 to 1984 found quite a strong relationship between public capital (which included roadways but also such capital stock as sewerage, water supply, hospitals, and airports) and personal income (Duffy-Deno and Eberts, 1989). The authors found that a 10 percent increase in public investment (the annual spending on public capital) was associated with a 1.13 percent increase in metropolitan area personal income. Furthermore, a 1 percent increase in the public capital stock was associated with a 0.8 percent increase in personal income. They attributed the first effect to the employment and wages stemming from construction, and the second effect to the use of public capital as a productive input and consumption good.” (Shatz et al., 2011:29).*
- *“New interstates built in nonmetropolitan counties between 1969 and 1993 raised earnings in those counties by about 6 percent to 8 percent (Chandra and Thompson, 2000). These results differed by industry. Earnings in nonmetropolitan counties that did not receive interstates fell by 1 percent to 3 percent, again with differences by industries.” (Shatz et al., 2011:30).*
- *“Matching Appalachian counties with non-Appalachian counties, Lynch (2007) found that Appalachian counties served by the Appalachian Development Highway System (ADHS) tended to have statistically significant faster growth from 1969 to 2000 in total income (measured according to place of residence), total earnings (measured according to place of work), population, per capita income, retail trade, and services than their matched, non-Appalachian counties.” (Shatz et al., 2011:32).*
- *“Roads in China contributed strongly to growth of gross domestic product (GDP) per worker and to poverty reduction between 1982 and 1999 (Fan and Chan-Kang, 2008). Although the Chinese built both high-end roads, such as expressways, and low-end roads, such as narrow, single-lane roads, it was actually the low-end roads that made the greatest contributions both to GDP growth and poverty reduction. For example, increasing the length of high-end roads by 10 percent was associated with a 0.34 percent increase in GDP per worker, but increasing the length of low-end roads by the same proportion was associated with a 1.56 percent increase in GDP per worker.” (Shatz et al., 2011:39).*
- *“In an analysis of Indian roads between 1972 and 1993, Hulten, Bennathan, and Srinivasan (2003, as cited in Hulten, 2005) found that a 10 percent increase in national and state highways and district roads was related to a 4.4 percent increase in the level of productivity. In this case, in simplified*

- terms, productivity was estimated as the difference between the growth of manufacturing output and the growth of manufacturing inputs.” (Shatz et al., 2011:39).*
- *“In a study about Spain from 1964 to 1991, Moreno et al. (1997) focused on the link between infrastructure and regional growth. They found that infrastructure (as measured by the value of roads and highways, railways, harbours and maritime signalling, airports, water and sewage facilities, and urban structures) had a positive but modest effect on labour productivity. Whereas an increase in infrastructure of 1 percent was related to a 0.04 percent increase in labour productivity, an increase in private capital of 1 percent was related to a 0.5 percent increase in labour productivity.” (Shatz et al., 2011:39).*
 - *“Cadot, Röller, and Stephan (2005) researched transportation investment (rail, highways, and waterways) in 21 regions in France from 1985 to 1992, analyzing both the extent to which politics influenced public investment and public investment’s relationship with regional domestic product. They found that although politics heavily influenced transportation investment, and although such investment appeared not to be related to where it might be most productive, it still had a positive effect on domestic product.” (Shatz et al., 2011:40).*
 - *“Two papers reported the intriguing result that the quantity of infrastructure may not be the only important issue, or even the most important. Rather, infrastructure in better condition had large and positive effects on growth (Aschauer, 2000) and even outweighed the quantity of infrastructure in growth effects (Hulten, 1996).” (Shatz et al., 2011:41).*

B.5 Summary

- B.5.1 Research has identified positive effects of highway infrastructure on economic outcomes, in particular productivity and output. Broad measures of public infrastructure have a positive and significant effect on economic outcomes and highways have such an effect on productivity and output specifically.

	Appendix A – Letter from Highways Agency dated 3 December 2013	8

1 Key Summary

1.1 Consent has been obtained from the Highways Agency (HA):

1.1.1 to include Crown Land, comprising part of the existing A47 trunk road, in the proposed Development Consent Order for the Norwich Northern Distributor Road (NDR) in order to acquire any third party interests in such land;

1.1.2 to use Crown land temporarily, pursuant to an Agreement between the HA and Norfolk County Council (NCC) under Section 6 of the Highways Act 1980, to enable NCC to carry out works to connect the NDR to the A47(T) at Postwick, including:-

- a) construction and maintenance of the proposed new Postwick bridge over the A47(T);
- b) improving the existing Postwick bridge crossing the A47(T);
- c) improving and signalling the existing Postwick Park and Ride junction on the south side of the A47(T);
- d) carrying out works to close the existing eastbound merge and diverge A47(T) slip roads and subsequently re-opening part of the existing eastbound diverge A47(T) slip road to provide access for non-motorised users between the A47(T) and the A1042 Yarmouth Road (at the Postwick North West roundabout); and
- e) constructing new replacement eastbound merge and diverge A47(T) slip roads.

2 Introduction

- 2.1 This document is submitted in relation to the application for a Development Consent Order by Norfolk County Council to the Secretary of State, under the Planning Act 2008.
- 2.2 The Application is for the Norfolk County Council (Norwich Northern Distributor Road (A1067 to A47(T))) Order, to grant development consent for the construction of a new highway running west to east, to south, between the A1067 Fakenham Road and the A47 Trunk Road at Postwick, including improvements to the existing highway network to the north and north east of Norwich.
- 2.3 This document comprises part of the application documents and relates to Regulation 5(2)(q) of the Infrastructure Planning (Applications: Prescribed Forms and Procedure) Regulations 2009.
- 2.4 Norfolk County Council (NCC) has included this document in the application as evidence that the Highways Agency (HA) has granted agreement in principle to NCC to use Crown land for the purposes described in section 3 below, in order to facilitate delivery of the proposed NDR.

3 Consent from the Highways Agency

- 3.1 Where the use of land within and adjacent to the existing trunk road highway boundary is necessary for the delivery of the proposed NDR scheme, the areas of land in question have been included within the Development Consent Order. The purpose of this approach is to provide NCC with the opportunity to acquire any existing third party interests that need to be acquired to enable the NDR to be delivered. NCC does not intend to acquire the Secretary of State's interests in such land (which is categorised as Crown land for the purposes of the Planning Act 2008), but only the interests that others may have in such land.
- 3.2 The Highways Agency (HA) has been consulted on this approach and has confirmed that it has no objection in principle to the inclusion in the Development Consent Order for the NDR of land in the ownership of the Secretary of State for Transport, on the basis that NCC does not intend to acquire the Secretary of State's interest in such land.
- 3.3 The HA has also stated that it has no objection in principle to the use by NCC of Crown land to enable NCC to carry out works to connect the NDR to the A47(T) at Postwick. Such works, which are proposed to be carried out pursuant to an Agreement between the HA and NCC under section 6 of the Highways Act 1980, will comprise:
- a) the construction and maintenance of the proposed new Postwick bridge over the A47(T), such bridge to run from the proposed new Postwick North East Roundabout (on the north side of the A47(T)) to the existing Postwick Park and Ride Junction (which will be signalised as part of the works to which the Development Consent Order relates);
 - b) proposed improvements to be made to the existing Postwick bridge which currently crosses the A47(T) (and which runs from the existing Postwick North West Roundabout on the north side of the A47(T) to the existing Park and Ride Junction on the south side of the A47(T));
 - c) proposed signalisation and improvements to be made to the existing Postwick Park and Ride Junction on the south side of the A47(T);
 - d) the carrying out of works to close the existing eastbound merge and diverge A47(T) slip roads and subsequently re-opening part of the eastbound diverge slip road to provide access for non-motorised users between the

A47(T) and the A1042 Yarmouth Road where it joins the Postwick North West Roundabout; and

- e) proposed construction of new merge and diverge eastbound slip roads running from the proposed new Postwick North East Roundabout to the A47(T).
- 3.4 A letter from the Highways Agency confirming its agreement to the above is contained in Appendix A of this document.

For the attention of Mr Mark Kemp

Dear Mr Kemp

Norwich Northern Distributor Road – Application by Norfolk County Council for a Development Consent Order under the Planning Act 2008

The Norfolk County Council (Norwich Northern Distributor Road (A1067 to A47(T))) Order

1. Further to previous discussions in relation to the above, I can confirm that the Highways Agency has no objections in principle to:
 - (i) the inclusion of land, known and/or assumed to be in the ownership of the Secretary of State for Transport and categorised for the purposes of the Planning Act 2008 as 'Crown land', within the above mentioned Development Consent Order (DCO), on the basis that Norfolk County Council (NCC) does not intend to acquire the Secretary of State's interests but only the interests that others may have; and
 - (ii) permitting NCC to use Crown land temporarily to enable NCC to carry out the works which are described below:
 - a) construction and maintenance of the proposed new Postwick bridge over the A47, such bridge to run from the proposed new Postwick North East Roundabout (on the north side of the A47(T)) to the existing Postwick Park and Ride Junction (which will be signalled as part of the works to which the Order relates);
 - b) proposed improvements to be made to the existing Postwick bridge which currently crosses the A47(T) (and which runs from the existing Postwick North West Roundabout on the north side of the A47(T) to the existing Park and Ride Junction on the south side of the A47(T));

- c) proposed signalisation and improvements to be made to the existing Postwick Park and Ride Junction on the south side of the A47(T);
 - d) carrying out works to close the existing eastbound merge and diverge A47(T) slip roads and subsequently re-opening part of the eastbound diverge slip road to provide access for non-motorised users between the A47(T) and the A1042 Yarmouth Road where it joins the Postwick North West Roundabout; and
 - e) proposed construction of new merge and diverge eastbound slip roads running from the proposed new Postwick North East Roundabout to the A47(T).
2. The Agency acknowledges that the works described in paragraph 1(ii) above will be carried out by NCC pursuant to the terms of an Agreement between the Agency and NCC under Section 6 of the Highways Act 1980.
 3. In addition to the above, the Agency confirms that it has no objections in principle to the proposed future transfer of land from NCC to the Secretary of State for Transport, in connection with the works described in paragraph 1(ii)(e) above, such land being land on which the proposed new (replacement) eastbound merge and diverge A47(T) slip roads are to be constructed. The Agency acknowledges that the proposed future transfer of such land would only take effect once the land was in the ownership of NCC and the proposed new slip roads had been constructed thereon.
 4. The Agency would expect to be kept fully informed of the detail of any of the requirements mentioned above prior to and following the granting by the Secretary of State of any Development Consent Order in respect of the Norwich Northern Distributor Road.

Yours sincerely
