# 1 Legislation, Policy and Guidance

1.1.1 Table 1.1 to 1.3 summarises the applicable legislation, policy and guidance to Chapter 16: Geology and Soils.

*Table 1.1: Summary of Legislation*

Legislation	Summary	Chapter Reference
<b>The Environmental Protection Act 1990 (Ref 16A.1)</b>	<p>The Environmental Protection Act 1990 defines, within England, Wales and Scotland, the fundamental structure and authority for waste management and control of emissions into the environment. The Act was intended to strengthen pollution controls and support enforcement with heavier penalties.</p> <p>Part 2A of the Environmental Protection Act 1990 was inserted into that Act by s57 of the Environment Act 1995 and contains a regulatory regime for the identification and remediation of contaminated land. In addition to the requirements contained in the primary legislation, operation of the regime is subject to regulations and statutory guidance.</p> <p>The main objective underlying the introduction of the Part 2A contaminated land regime was to provide an improved system for the identification and remediation of land where contamination is causing unacceptable risks to human health or the wider environment, assessed in the context of the current use and circumstances of the land.</p> <p>It also works alongside planning rules to help ensure that this land is made suitable for use following development.</p> <p>Development of land will have to take into account Part 2A because a change in the use of the land may bring the development inside the statutory definition of contaminated land by creating new or different receptors and/or</p>	<p>This Chapter addresses the needs of the Environmental Protection Act 1990 through the ground investigation, human health risk assessments and preparation of a conceptual site model to assess source of contamination, receptors and pathways, culminating in an assessment of contaminant linkages. See Sections 16.3, 16.6, 16.7, 16.8 and Appendices 16B, 16C, 16D.</p>

Legislation	Summary	Chapter Reference
	pathways, resulting in new contaminant linkages.	
<b>Water Act 2003 (Ref 16A.2)</b>	The Water Resources Act 1991 replaced the corresponding sections of the Water Industry Act 1989. The Act sets out the responsibilities of the Environment Agency in relation to water pollution, resource management, flood defence, fisheries, and in some areas, navigation.	This Chapter addresses the needs of the Water Act 2003 by assessing the potential for water pollution in the risk assessments in Appendix 16C and Appendix 16D.
<b>The Construction (Design &amp; Management) Regulations (CDM 2015) (Ref 16A.3)</b>	The Construction (Design & Management) Regulations (CDM 2015) are the main set of regulations for managing the health, safety and welfare of construction projects (this includes the risks posed by contamination to construction workers and others who may be affected by the construction activities such as the general public and adjacent site users). CDM applies to all building and construction work and includes new build, demolition, refurbishment, extensions, conversions, repair and maintenance.	This Chapter addresses the needs of the CDM Regulations 2015 through assessing the risks posed by contaminants to construction workers and others who may be affected by the construction activities. See Appendices 16B and 16C.
<b>Environmental Permitting (England and Wales)</b>	The Environmental Permitting Regulations 2016 replace those parts of the Water Resources Act that relate to the regulation of discharges to controlled waters. Under the	This Chapter addresses the needs of the Environmental

<b>Regulations 2016 (Ref 16A.4)</b>	regulations, groundwater activities relate to inputs of pollutants to groundwater.	Permitting Regulations through the assessment of contamination and the controlled waters risk assessment which feeds into assessing input of pollutants to groundwater. See section 16.8 Appendix 16C and Appendix 16D

Table 1.2: Summary of Policy

Policy	Summary	Chapter Reference
<b>National Planning Policy Framework (Ref 16A.5)</b>	The NPPF Section 15 provides guidance on conserving and enhancing the natural environment and paragraphs 170 and 178 to 180 specifically reference contaminated land. Sub-sections (e) and (f) of Paragraph 170 of the NPPF states that: <i>“Planning policies and decisions should contribute to and enhance the natural and local environment by: e) preventing new and existing development from contributing to, being put at unacceptable risk from, or being adversely affected by, unacceptable levels of soil, air, water or noise pollution or land instability. Development should, wherever possible, help to improve local environmental conditions such as air and water quality, taking into account relevant</i>	This Chapter conforms to the policy framework by assessing soil and water pollution and land instability and proposing remediation / mitigation where appropriate. This Chapter assess whether the Principal

Policy	Summary	Chapter Reference
	<p><i>information such as river basin management plans; and</i></p> <p><i>f) remediating and mitigating despoiled, degraded, derelict, contaminated and unstable land, where appropriate”.</i></p> <p>Paragraph 178 of the NPPF states that:  <i>“Planning policies and decisions should ensure that:</i></p> <p><i>a) site is suitable for its proposed use taking account of ground conditions and any risks arising from land instability and contamination. This includes risks arising from natural hazards or former activities such as mining, and any proposals for mitigation including land remediation (as well as potential impacts on the natural environment arising from that remediation);</i></p> <p><i>b) after remediation, as a minimum, land should not be capable of being determined as contaminated land under Part 2A of the Environmental Protection Act 1990; and</i></p> <p><i>c) adequate site investigation information, prepared by a competent person, is available to inform these assessments”.</i></p> <p>Paragraph 179 of the NPPF states that:  <i>“Where a site is affected by contamination or land stability issues, responsibility for securing a safe development rests with the developer and/or landowner”.</i></p> <p>Paragraph 180 of the NPPF states that:  <i>“Planning policies and decisions should also ensure that new development is appropriate for its location taking into account the likely effects (including cumulative effects) of pollution on health, living conditions and the natural environment, as well as the potential sensitivity of the site or the wider area to impacts that could arise from the development”.</i></p>	<p>Application Site is suitable for the proposed use (in the context of this chapter) and the remediation proposed will result in the site not being capable of being determined as contaminated land under Part 2A of the Environmental Protection Act 1990. Adequate site investigation is available and has been used to inform these assessments. The Chapter assesses the likely effects of pollution on health and the natural environment and also assesses the impacts to the site and wider area from the development. See Sections</p>

Policy	Summary	Chapter Reference
		16.6, 16.7, 16.8, 16.9 and 16.11
<b>National Networks National Policy Statement (Ref 16A.6)</b>	<p>The NPS NN provides some guidance on assessing geology, soils and contamination in relation to biodiversity and ecological conservation, coastal change, noise and vibration, water quality and resources, land use and sets out how the impacts should be considered.</p> <p>Paragraph 5.168 of the NPS NN states:  <i>“For developments on previously developed land, applicants should ensure that they have considered the risk posed by land contamination and how it is proposed to address this”.</i></p>	<p>This Chapter conforms with the policy statement by assessing the likely significant effects on designated geological sites. It also assesses risks posed by land contamination (ground investigation and human health and controlled waters risk assessments) and includes remedial options for addressing the identified contamination. Land stability is also assessed. See Sections 16.6, 16.7, 16.8, 16.9 and 16.11</p>
<b>National Policy Statement for</b>	<p>The NPS for Ports, in Paragraph 5.13.8, likewise advises that developments on:</p>	<p>This Chapter conforms with the policy</p>

Policy	Summary	Chapter Reference
<b>Ports (Ref16A.7)</b>	<p><i>“... previously developed land.....should ensure that they have considered the risk posed by land contamination”.</i></p>	<p>statement by considering the risks posed by land contamination through ground investigation and human health and controlled waters risk assessments. See Sections 16.6, 16.7, 16.8, 16.9, 16.11</p>
<b>Great Yarmouth Borough Wide Local Plan (Ref 16A.8)</b>	<p>Policy INF18: In considering proposals involving hazardous development, in the vicinity of hazardous installations, or the development of contaminated sites, as shown on the proposals map, account will be taken of the amount, type and location of hazardous substances present, and the need for special precautions or restrictions to protect future users of the site and any other protected land.</p>	<p>This Chapter conforms to the requirements of the local plan by taking account of the amount, type and location of hazardous substances and the need for special precautions to protect future users of the site. See Sections 16.6 16.7, 16.8, 16.9 and 16.11 and Appendix 16B and</p>

Policy	Summary	Chapter Reference
		Appendix 16C.

Table 1.3: Summary of Guidance

Guidance	Summary	Chapter Reference
<b>Design Manual for Roads and Bridges, Volume 11, Section 3, Part 11, Geology and Soils. (Ref 16A.9)</b>	Part 11 of DMRB details the assessment of geology and soils in the context of road schemes which can have an impact on both the geology and the soils of an area. It is therefore important that the potential impacts of development on both the soil and the underlying rocks are fully considered. The converse also applies in that existing soil conditions of a site can impose constraints on a proposed development for example, where land which has been contaminated by wastes from some previous industrial use.	This Chapter conforms to the requirements of DMRB through assessment of the underlying geology and soils and contamination through the ground investigation and human health and controlled waters risk assessments. See Appendix 16B and Appendix 16C.
<b>BS 10175:2011 Code of Practice for the Investigation of Contaminated Land. (Ref 16A.10)</b>	This British Standard provides recommendations and guidance on how to investigate potentially contaminated land, or land with naturally elevated concentrations of potentially harmful substances, to determine or manage any risks. It allows users to:  Set the objectives of an investigation;	The ground investigation presented in Appendix 16C was undertaken in accordance with the

Guidance	Summary	Chapter Reference
	<p>Develop a strategy for the investigation;</p> <p>Identify risks arising from the presence of contamination;</p> <p>Design the different phases of the investigation;</p> <p>Carry out sampling, field testing and laboratory analysis;</p> <p>Conduct risk assessment of a potentially contaminated site.</p>	<p>requirements of BS10175.</p>
<p><b>Model Procedures for the Management of Land Contamination. (Ref 16A.11)</b></p>	<p>The Model Procedures for the Management of Land Contamination, CLR 11, have been developed to provide the technical framework for applying a risk management process when dealing with land affected by contamination. The process involves identifying, making decisions on, and taking appropriate action to deal with, land contamination in a way that is consistent with government policies and legislation within the UK.</p>	<p>The Desk Study Report (Appendix 16B) and the Ground Investigation Report, including the human health risk assessment (Appendix 16C) were undertaken in accordance with the requirements of CLR11.</p>
<p><b>Remedial Targets Methodology: Hydrogeological Risk Assessment for Land Contamination. (Ref 16A.12)</b></p>	<p>Assessment methodology for undertaking groundwater risk assessments.</p>	<p>The controlled waters risk assessment presented in Appendix 16C was undertaken in accordance</p>

Guidance	Summary	Chapter Reference
		with the requirements of the Remedial Targets Methodology document.
<b>Assessing risks posed by hazardous ground gases to buildings. (Ref 16A.13)</b>	Guidance on assessing the risks posed by hazardous ground gases, primarily methane and carbon dioxide to buildings. It consolidates good practice in investigation, the collection of relevant data and monitoring programmes in a risk-based approach to gas contaminated land. Two semi-quantitative methods are set out for the assessment of risk; one for low rise housing and one for all other development types.	The ground gas risk assessment in Appendix 16C was undertaken in accordance with CIRIA C665 by collecting and assessing ground gas monitoring data and calculating gas screening values. See Appendix 16C
<b>Guidance on the classification and assessment of waste (Ref 16A.14)</b>	Technical guidance on how to assess and classify waste.	A waste classification section within Appendix 16C presents the assessment of waste classification undertaken in accordance with Technical Guidance

---

---

Guidance	Summary	Chapter Reference
		WM3. Chapter 15 specifically deals with waste materials.

# 1 Introduction

## 1.1 Terms of Reference

1.1.1 WSP Ltd were commissioned by Norfolk County Council ('The Applicant') to prepare an Interpretative Environmental Desk Study in relation to the Great Yarmouth Third River Crossing ('the Scheme') to assess the potential environmental risks, constraints and liabilities associated with the Scheme. The first revision of this report dated July 2017 was prepared in advance of the Order Limits and the Scheme description being finalised and the construction Contractor being appointed. This version dated March 2019 updates these aspects and wholly supersedes the report dated July 2017.

## 1.2 Scheme Description

1.2.1 The Scheme involves the construction, operation and maintenance of a new crossing of the River Yare in Great Yarmouth. The Scheme consists of a new dual carriageway road, including a road bridge across the river, linking the A47 at Harfrey's Roundabout on the western side of the river to the A1243 South Denes Road on the eastern side. The Scheme would feature an opening span double leaf bascule (lifting) bridge across the river, involving the construction of two new 'knuckles' extending the quay wall into the river to support the bridge. The Scheme would include a bridge span over the existing Southtown Road on the western side of the river, and a bridge span on the eastern side of the river to provide an underpass for existing businesses, enabling the new dual carriageway road to rise westwards towards the crest of the new crossing.

1.2.2 If constructed, the Scheme would comprise the following principal elements:

- A new dual carriageway road, crossing the River Yare in an east-west orientation, comprising:
  - A new double-leaf bascule bridge providing an opening span to facilitate vessel movement within the river. This would include structures to support and accommodate the operational requirements of the bridge-opening mechanism, including counterweights below the level of the bridge deck. The bridge would be supported on driven piles;
  - New substructures, supported by driven piles, to support the double leaf bascule bridge within the existing quays either side of the river and within the river itself, requiring new permanent

- 
- 
- “knuckle” walls, creating cofferdams in the waterway to accommodate their construction;
- A new five-arm roundabout connecting the new dual carriageway road with Suffolk Road, William Adams Way and the western end of Queen Anne’s Road. Sections of the new five arm roundabout would be supported on driven piles where deep soft ground is encountered;
  - A single-span bridge over Southtown Road, with reinforced earth embankments joining that bridge to the new roundabout at William Adams Way. Southtown Road bridge and the reinforced earth embankments would be supported on driven piles;
  - A single-span bridge to provide an underpass on the eastern side of the river, with reinforced earth embankments joining that single span bridge to South Denes Road. The underpass and reinforced earth embankments would be supported on driven piles;
  - A new signalised junction connecting the new road with A1243 South Denes Road; and
- The closure of Queen Anne’s Road, at its junction with Suffolk Road, and the opening of a new junction onto Southtown Road providing vehicular and pedestrian access to residential properties and the MIND Centre and Grounds at the eastern end of Queen Anne’s Road;
  - Revised access arrangements for existing businesses onto the local highway network;
  - Dedicated provision for cyclists and pedestrians which ties into existing networks;
  - Implementation of part of a flood defence scheme along Bollard Quay that is proposed to be promoted by the Environment Agency, and works to integrate with the remainder of the flood defence scheme;
  - A control tower structure located immediately south of the crossing on the western side of the river. The control tower would facilitate the 24/7 operation of the opening span of the new double-leaf bascule bridge;
  - A plant room located on the eastern side of the river for the operation of the opening span of the new double-leaf bascule bridge;
  - The demolition of an existing footbridge on William Adams Way;
  - Associated changes, modifications and/or improvements to the existing local highway network;
  - Additional signage, including Variable Message Signs (VMS) at discrete locations, to assist the movement of traffic in response to network conditions and the openings / closings of the double-leaf bascule bridge;

- The relocation of existing allotments to compensate for an area to be lost as a result of the Scheme and other works, including those at the MIND Centre and Grounds; and
- New public realm, landscape, ecology and sustainable drainage measures;

**1.2.3** The Scheme also includes works to facilitate the construction, operation and maintenance of the above elements including:

- Creation of temporary construction sites and accesses from the public highway;
- Provision of new utilities and services and the diversion of existing utilities;
- Provision of drainage infrastructure, lighting and landscaping;
- Demolition of a number of existing residential and commercial / business properties; and
- Provision of small vessel waiting facilities to the north and south of the new crossing, either as floating pontoons or additional fendering to the existing berths, including any dredging and quay strengthening works that may be required.

## **1.3 Legislative Context**

**1.3.1** The presence of contaminants which may pose a risk to human health or the environment is a material planning consideration. In determining the application for development consent, the Examining Authority will consider whether the site is suitable for its new use. The responsibility for securing a safe development (including cumulative effects of pollution on human health receptors (identified in Table 3.2 below) and the potential sensitivity of the proposed development to adverse effects from pollution) rests with the developer and/or landowner. The Examining Authority is concerned with the site's proposed use rather than its current use.

**1.3.2** Section 57 of the Environment Act 1995, adds Part 2A (ss.78A-78YC) (Ref 16B.1) to the Environmental Protection Act 1990 (Ref 16B.2) and contains the legislative framework for identifying and dealing with contaminated land. Where development is undertaken on land which may be affected by contamination, the National Planning Policy Framework, paragraphs 170 and 178 to 180 considers pollution and remediation (Ref 16B.3).

## 1.4 Scope of Report

---

1.4.1 The objective of this study is to assess the potential environmental risks, constraints and liabilities associated with the Study Area (see Section 2.1 below) in respect of the Scheme.

1.4.2 The scope of work comprises:

- A site walkover undertaken by a suitably qualified Geo-Environmental Scientist;
- An interpretation of the information obtained from a Groundsure Report;
- A preliminary assessment of potential geo-environmental risks following the methodology of CLR11 (Ref 16B.4); and
- Recommendations for further investigation/actions if required.

---

---

## 2 Desk Study Research

### 2.1 Site Location

---

- 2.1.1** The irregular shaped Principal Application Site is located either side of the River Yare, immediately south of Great Yarmouth Town Centre. The Order Limits are presented on Drawing GYTRC-WSP-EGN-XX-DR-EN-0003 Figure 1.1 Site Location Plan (Regulation 5(2)(a)).
- 2.1.2** The Study Area for this desk study report is presented on Drawing GYTRC-WSP-EGN-XX-DR-EN-0128 Figure 16.1 Interpretative Environmental Desk Study – Study Area Boundary (Regulation 5(2)(a)) and comprises an area larger than the Order Limits for the Principal Application Site. This was to encompass a suitable Rochdale Envelope in the early stages of the project. A buffer of approximately 500m (not shown on Drawing GYTRC-WSP-EGN-XX-DR-EN-0128 Figure 16.1 Interpretative Environmental Desk Study – Study Area Boundary (Regulation 5(2)(a)) was also included to capture potential Sites of Special Scientific Interest (SSSI's) and other sensitive receptors as well as landfills and other potentially contaminative current and historical uses in the surrounding area that could influence the Principal Application Site.
- 2.1.3** The Satellite Application Sites have not been included within this study as they are existing highway and developed areas and do not include significant excavations or ground penetration which could influence / affect geology and soils.

### 2.2 Site Setting and Description

---

- 2.2.1** A walkover was undertaken by a qualified WSP Geo-Environmental Engineer on 12th July 2017. Photographs and a photograph location plan are presented in Annex A.
- 2.2.2** The Study Area is split into two unequal parts by the River Yare which flows from north to south through the Study Area. For the purposes of this report, reference is made to eastern and western areas to distinguish information related to the eastern side of the River Yare and the western side of the River Yare.
- 2.2.3** The eastern area is densely developed and includes:

- commercial / industrial properties including oil / gas storage sites (including ASCO Ltd (Annex A, photograph 5) and Butler Fuels Ltd on the quayside,
- Barrack Road gas works (Annex A, photograph 1 and photograph 2) site adjacent to the eastern boundary),
- an operating port facility with associated hard standing and warehouses / depots (Annex A, photograph 9),
- residential properties (predominantly in the northern part of the area),
- a petrol filling station,
- car dealership.

**2.2.4** The western area includes:

- hard standing quayside,
- the major A47 dual carriageway,
- William Adams Way highway,
- residential properties (Annex A, photograph 4),
- commercial properties including car and caravan sales,
- a petrol station, oil and gas storage facilities (ASCO Ltd within the quayside close to William Adams Way – Annex A, photograph 9),
- docks and port facilities,
- military properties (air training corps),
- community facilities and public open space (Annex A, photograph 11 and 13),
- Allotments (Annex A photograph 13).

**2.3 Adjacent Land Use**

**2.3.1** Table 2.1 below summarises the adjacent land uses.

*Table 2.1: Summary of Adjacent Land Uses*

Direction	Surrounding Land Use
<b>North</b>	Predominantly commercial / industrial with some residential properties on the west side of the river and predominantly residential properties with a few

Direction	Surrounding Land Use
	commercial properties on the east side of the river.
<b>East</b>	Predominantly residential properties with occasional commercial properties and a community centre.
<b>South</b>	Commercial / industrial properties on the east side of the river and residential properties, commercial properties and a recreation ground on the west side of the river.
<b>West</b>	Commercial / industrial properties.

## 2.4 Environmental Designations and Ecology

- 2.4.1 The Study Area is wholly located within a nitrate vulnerable zone. Two other environmentally sensitive areas are located within 500m of the Study Area;
- Outer Thames Estuary, approximately 465m to the east of the Study Area; and
  - Broads, approximately 390m to the west of the Study Area.

## 2.5 Site History

- 2.5.1 The history of the Study Area has been assessed from a review of historical Ordnance Survey maps from the GroundSure report presented in Annex B. A summary is presented below. A more detailed history, including the adjacent and surrounding land is presented in Annex C.

### Eastern Area

- 2.5.2 The earliest map provided by GroundSure dated 1883 indicates the eastern area of the Study Area to be densely developed predominantly with commercial / industrial properties including a gasworks, boat building yard and an icehouse. Some residential properties were marked but generally the area is dominated by industry. This eastern area has generally remained a commercial / industrial area up to the present day. Various industries have been present including fish canning, oilskin production, chemical factory and unspecified depots, warehouses and factories.

## Western Area

- 2.5.3** The earliest map provided by GroundSure dated 1883 indicates the western area of the Study Area to be less developed than the eastern area. The majority of the development was present adjacent to the River Yare and comprised a mix of residential properties and commercial / industrial sites such as an iron works, rope walk, gas works and malhouses. Beyond, towards the western boundary was agricultural land.
- 2.5.4** By 1906, a railway line running north-south was constructed towards the western boundary and by 1926 / 1927, formal gardens and allotments are present towards the centre of the Study Area. A shoe factory is marked adjacent to Queen Anne's Road in 1949 and by 1966 is relabelled as a printing works.
- 2.5.5** By 1978, the railway line had been dismantled and commercial / industrial units had started to be developed in the far west of the Study Area and beyond. By 1988, the former rail route had started to be redeveloped as a dual carriageway and by 2002 the current major highway routes had been established.

## 2.6 Geology

---

### Superficial

- 2.6.1** The British Geological Survey (BGS) website ([www.bgs.ac.uk](http://www.bgs.ac.uk)) indicates the Study Area is underlain by a variety of superficial deposits;
- South west - peat of the Breydon Formation,
  - North – clay and silt of the Breydon Formation,
  - Eastern part beyond the River Yare – sand and gravel of the North Denes Formation.
  - Within the River Yare - Clay and silt tidal river or creek deposits.

### Solid

- 2.6.2** The BGS website ([www.bgs.ac.uk](http://www.bgs.ac.uk)) indicates the bedrock underlying the Study Area is sand and gravel of the Crag Group.

### Ground Workings

- 2.6.3** GroundSure records a number of historical ground workings within the Study Area, all associated with the quay / wharf immediately adjacent to the River Yare.

## BGS Boreholes

2.6.4 GroundSure reports 107 borehole records within the Study Area but some are confidential and cannot be viewed on the BGS website – [www.bgs.ac.uk](http://www.bgs.ac.uk). A summary of the locations within the Study Area is presented in Table 2.2 below.

Table 2.2: Summary of Historical BGS Boreholes

Borehole Ref	Location	Summary
<b>TG50NW27</b>	Close to junction between William Adams Way and Suffolk Road.	Made ground to 2m depth overlying silt, sand and clay.
<b>TG50NW164</b>	Close to junction between William Adams Way and Suffolk Road.	Ash fill to approximately 4ft 6' depth overlying clay (with peat layers) sand and gravel.
<b>TG50NW429</b>	Close to junction between William Adams Way and Suffolk Road.	Fill to 1.05m depth overlying clay, sand, silt and peat.
<b>TG50NW26</b>	Close to junction between William Adams Way and Suffolk Road.	Made ground to 1,2m depth overlying silt, sand, clay (with peat) and gravel.
<b>TG50NW185</b>	Close to junction between William Adams Way and Suffolk Road.	Made ground to approximately 1ft depth overlying clay, silt, sand, peat and gravel.
<b>TG50NW28</b>	Close to junction between William Adams Way and Suffolk Road.	Topsoil overlying clay, peat and sand.
<b>TG50NW472</b>	William Adams Way close to A12 roundabout	Topsoil overlying clay, sand, silt and peat.
<b>TG50NW29</b>	Close to junction of Suffolk Road and Queen Annes Road.	Topsoil overlying clay, sand, silt and peat.
<b>TG50NW184</b>	Junction of Queen Annes Road and Suffolk Road.	Made ground to approximately 3ft 6 depth overlying clay, sand, silt , peat and gravel.
<b>TG50NW4</b>	Adjacent to Suffolk Road, north of Queen Annes Road	Made ground to 1.07m depth overlying clay, sand, silt, peat and gravel.

Borehole Ref	Location	Summary
<b>TG50NW582</b>	Southtown Road, adjacent to the River Yare.	300mm thickness of asphalt and concrete over made ground to 2.2m depth. Underlying natural strata is sand and gravel,
<b>TG50NW587</b>	Southtown Road, adjacent to the River Yare.	300mm thickness of asphalt and concrete over made ground to 3.0m depth. Underlying natural strata is silt, sand and gravel
<b>TG50NW581</b>	Southtown Road, adjacent to the River Yare.	200mm thickness of asphalt and concrete over made ground to 2.2m depth. Underlying natural strata is sand and gravel.
<b>TG50NW586</b>	Southtown Road, adjacent to the River Yare.	400mm thickness of asphalt and concrete over made ground to 2.2m depth. Underlying natural strata is silt (with peat), sand and gravel
<b>TG50NW368</b>	Quayside on the eastern side of the River Yare.	180mm thickness of reinforced concrete over made ground to 1.2m depth. Underlying natural strata is sand and silt.
<b>TG50NW342</b>	Quayside on the eastern side of the River Yare.	300mm thickness of reinforced concrete over made ground to 6.6m depth. Underlying natural strata is sand and gravel.
<b>TG50NW344</b>	Quayside on the eastern side of the River Yare.	300mm thickness of reinforced concrete over made ground to 1.0m depth. Underlying natural strata is sand and gravel.

---

## 2.7 Hydrogeology

---

- 2.7.1 The superficial deposits underlying the Study Area to the east of the River Yare are classified as a Secondary (A) Aquifer with permeable layers. These are defined by the Environment Agency as permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers.
- 2.7.2 The superficial deposits underlying the Study Area to the west of the River Yare are classified as unproductive.
- 2.7.3 The underlying bedrock is classified as a Principal Aquifer. These are defined by the Environment Agency as layers of rock or drift deposits that have high intergranular and/or fracture permeability - meaning they usually provide a high level of water storage. They may support water supply and/or river base flow on a strategic scale.
- 2.7.4 The GroundSure report (Annex B) indicates the Study Area is not within a Source Protection Zone.
- 2.7.5 There are no groundwater abstraction points within the Study Area but there is one approximately 71m from the north-west corner of the Study Area as follows: Licence no. AN/034/0015/020 expires in 2030 and is authorised for a maximum daily volume of 210m<sup>3</sup> and an annual volume of 60,000m<sup>3</sup>. The abstraction is authorised for laundry use.

## 2.8 Hydrology

---

- 2.8.1 The River Yare is the only watercourse recorded in the Study Area and within 500m of the Study Area.
- 2.8.2 There are no active surface water abstraction licences within 2km of the Study Area. There is one historical abstraction licence 443m to the north of the Study Area that expired in 2015 (licence no. AN/034/0015/013).
- 2.8.3 There are no potable water abstraction licences within 2km of the Study Area.

## 2.9 Waste Management Facilities

---

- 2.9.1 No active Environment Agency landfill sites are present within 1km of the Study Area.
- 2.9.2 One historic Environment Agency landfill site is present within 1km of the Study Area; Site reference WD709a, approximately 450m to the west of the Study Area. Licenced to accept inert, industrial, commercial and household

---

---

waste and operated by Great Yarmouth Council. The last record of the site held by GroundSure is dated 1974.

- 2.9.3** No BGS/DoE non-operational landfill sites are present within 1km of the Study Area.
- 2.9.4** No Local Authority recorded landfill sites within 1km of the Study Area.
- 2.9.5** GroundSure records one Environment Agency licensed waste site in the Study Area and eight sites within 250m of the Study Area (although there are multiple records for each):
- Within the Study Area (south west corner) - waste management licence 71429; EA/EPR/CP3094NZ/V003. Household, commercial and industrial waste transfer station for between 25,000t and 75,000t, operated by Thurtle Walter.
  - 13m from the south west corner of the Study Area – waste management licence 71417; EA/EPR/FP3394NJ/A001. Household, commercial and industrial waste transfer station for less than 25,000t, operated by Folkes Plant and Aggregate Ltd.
  - 53m from the south west corner of the Study Area – waste management licence 70532; EA/EPR/YP3229NB/A001. Special waste transfer station for greater than 75,000t, operated by Paul Clements.
  - 108m from the south east corner of the Study Area – waste management licence 71491; EA/EPR/AB3801UE/S002. Asbestos waste transfer station. Licence surrendered in 2016.
  - 150m from the south west corner of the Study Area – waste management licence 103802; EA/EPR/EB3535AM/V002. Inert and excavation waste

transfer and treatment for less than 25,000t, operated by E E Green and Son Ltd.

- 163m from the north west corner of the Study Area – waste management licence 70505; EA/EPR/KP3898VU/V002. Special waste transfer station for less than 25,000t, operated by Biffa Waste Services Ltd.
- 183m from the north west corner of the Study Area – waste management licence 70536; EA/EPR/YP3799NF/V002. Special waste transfer station for less than 25,000t, operated by C+L Waste Oil Collection.
- 229m from the north west corner of the Study Area – waste management licence 70535; EA/EPR/YP3199NQ/S004. Special waste transfer station. Licence surrendered in 2007.

## 2.10 Environmental Permits, Incidents and Registers

2.10.1 Records of active environmental permits or registers within the Study Area and within 250m are detailed below.

### Part A(1) And IPPC Authorised Activities

2.10.2 No records within the Study Area, but there are three active records within 250m of the Study Area each with multiple entries:

- 167m from the north west corner of the Study Area – Great Yarmouth Wm Resource Centre, EPR/zp3637rm. Operated by Augean North Sea Services Ltd. Records are present for three different processes – disposal or recovery of hazardous waste; disposal of greater than 50t/day of non-hazardous waste involving physio-chemical treatment; and temporary storage of hazardous waste.
- 187m from the northern boundary of the Study Area – Great Yarmouth Oil Reclamation Facility, EPR/np3038mb, WP3437RY. Operated by C&L Waste Oil Collection. Records are present for two different processes - disposal or recovery of hazardous waste; and temporary storage of hazardous waste.

### List 2 Dangerous Substances Inventory Sites

2.10.3 No active records within the Study Area but one active record within 250m of the Study Area is reported by GroundSure (see Annex B): 44m from the north west corner – UK Waste Management Ltd, authorised for chromium, copper, lead, nickel, zinc discharged to the North Sea.

### Part A(2) and Part B Activities and Enforcements

2.10.4 Three current permits are recorded within the Study Area and five current permits within 250m of the Study Area:

- 
- Part B permit - L J Steward for unloading of petrol into storage at service station, South Quay Service Station Southgate Road.
  - Part B permit - L J Steward for unloading of petrol into storage at service station, Southtown Road Service Station Southtown Road.
  - Part B permit – CEBO (UK) Ltd for use of bulk cement at Gas House, Quay North, Malthouse Lane.

2.10.5 There are a further five permits within 250m of the Study Area for various processes – use of bulk cement (four permits) and one permit for ‘other metal process’.

### Licensed Discharge Consents

2.10.6 There are four active consents within the Study Area for discharge to the River Yare and three consents within 250m of the Study Area for discharge to the River Yare. A number of revoked records are reported by GroundSure but these are not listed here:

- Three records within the Study Area relate to water company discharge - sewage discharge from storm overflow (two records) and sewage discharge pumping station (one record).
- One record within the Study Area relates to a trade discharge for site drainage (contaminated surface water).
- Two records outside the Study Area – 41m east and 189m south east relate to sewage discharge for final / treated effluent (not water company related).
- One record 203m to the south east of the Study Area relates to water company sewage discharge from storm overflow.

### Water Industry Referrals

2.10.7 Two records within the Study Area (Weatherford UK Ltd and Great Yarmouth Port Company) and two records within 250m (Total Reclaim Systems Ltd 13m south east of the Study Area and Biffa Waste Services Ltd 167m north of the Study Area) are reported by GroundSure.

### Planning Hazardous Substance Consents and Enforcements

2.10.8 One approved record is reported within the Study Area for Transco Plc. No further details are provided.

### COMAH and NIHHS Sites

2.10.9 There are two records within the Study Area and one record outside the Study Area:

- British Gas Historical Notification of Installations Handling Hazardous Substances ‘NIHHS’ site located on the east side of the Study Area.
- ASCO UK Ltd Current Control of Major Accident Hazards (COMAH) site located within the Study Area close to the southern boundary adjacent to the River Yare.
- ASCO UK Ltd current COMAH site located 15m to the south of the Study Area adjacent to the east bank of the River Yare.

### National Incidents Recording System, List 2

2.10.10 Three pollution incidents within the Study Area and one incident within 250m of the Study Area are recorded:

- The three incidents within the Study Area related to pollution from food and drink (minor water impact), inorganic chemical or product (no impact) and tyres (minor land impact).
- The incident 230m to the south of the Study Area related to solvents (minor air impact).

## 2.11 Natural Ground Hazards

2.11.1 Table 2.3 below summarises the natural ground subsidence findings presented in the GroundSure report.

*Table 2.3: Summary of Natural Ground Hazards*

Natural Hazard	Hazard Potential
<b>Shrink Swell Clay</b>	Negligible – majority of the Study Area.  Low – narrow corridor in the centre of the Study Area associated with the River Yare.
<b>Landslides</b>	Very Low
<b>Dissolution of Soluble Rocks</b>	Negligible
<b>Compressible Ground</b>	Very Low – majority of the Study Area.

Natural Hazard	Hazard Potential
	<p>Moderate - narrow corridor in the centre of the Study Area associated with the River Yare.</p> <p>Negligible – far eastern part of the Study Area.</p> <p>High – Two distinct areas on the southern boundary to the west of the River Yare.</p>
<b>Collapsible Deposits</b>	Negligible
<b>Running Sand</b>	<p>Very Low - majority of the Study Area.</p> <p>Moderate – narrow corridor in the centre of the Study Area associated with the River Yare.</p>

## 2.12 Mining, Extraction and Natural Cavities

2.12.1 The Study Area is not in an area likely to be affected by historical mining, coal mining, non-coal mining, natural cavities, brine extraction, gypsum extraction, tin mining or clay mining.

## 2.13 Radon

2.13.1 The GroundSure report indicates the Study Area is not in a radon affected area and any new buildings if required as part of the proposed development do not require radon protection measures.

## 2.14 Part 2A Determination

2.14.1 GroundSure does not record any sites determined as contaminated land under Part2A of the Environmental Protection Act 1990.

---

## 2.15 Unexploded Ordnance

---

2.15.1 A review of the potential for unexploded ordnance (UXO) has been obtained from Zetica Ltd and is presented in Annex D. The assessment indicates the Great Yarmouth area is a high bomb risk. Any intrusive works should take the potential for UXO into consideration when planning and undertaking works.

## 2.16 Existing Reports

---

2.16.1 WSP Ltd has not been made aware of any existing reports within the Study Area related to contaminated land.

## 2.17 Ground Model

---

2.17.1 The Study Area is generally level and densely developed. Published geology indicates superficial deposits comprise peat (south west), clay and silt (north), sand / gravel (east) and clay / silt tidal river / creek deposits within the River Yare. Bedrock underlying the Study Area is sand and gravel of the Crag Group.

2.17.2 Historical mapping indicates the Study Area, particularly either side of the River Yare, has been developed by industry since at least 1883. Some residential properties have been present and the far western area was developed later compared to the eastern part of the Study Area. Identified historical industry includes three gasworks, boat building, icehouse, iron works, railways, maltings, rope walk, saw mill / timber yard, allotments, oilskin works, fish caning, various unspecified depots, warehouses and factories, numerous unspecified sites with tanks, shoe factory and printing works. Many of these historical uses could have resulted in potentially significant sources of contamination being present.

## 2.18 Potential Contaminant Linkages

---

### Potential Sources

2.18.1 Table 2.4 below summarises the potential sources of contamination.

**Table 2.4: Potential Sources**

Ref.	Primary Source	Expected Distribution	Likely Contaminants
<b>S1</b>	Potentially Contaminated Made Ground	Made ground is expected site wide, but contamination is likely to be in discontinuous pockets associated with differing historic industrial uses.	Heavy metals, asbestos, hydrocarbons, polychlorinated biphenyls, organotins and organochloride pesticides, ammonia, polyaromatic hydrocarbons, volatile and semi-volatile organic compounds.
<b>S2</b>	Potentially Contaminated Silt	Within the River Yare or immediately adjacent within the historic quayside area. Potential for mobilisation during the construction works or scoured due to changes in waterflow post construction.	Heavy metals, organotins, polychlorinated biphenyls, hydrocarbons, organochloride pesticides, ammonia, polyaromatic hydrocarbons, volatile and semi-volatile organic compounds.

### Potential Receptors

2.18.2 Table 2.5 below details the potential receptors.

**Table 2.5: Potential Receptors**

Ref.	Receptor	Description
<b>R1</b>	Site users	Pedestrians and maintenance workers
<b>R2</b>	Adjacent site users	Residents (including children) and users of nearby properties (visitors and employees)
<b>R3</b>	Controlled waters	Principal and Secondary (A) aquifers and surface watercourses
<b>R4</b>	On site infrastructure / ecology	Buildings, foundations, buried services and ecology (eg trees and plants in landscaping areas)
<b>R5</b>	Marine ecology	Vertebrates and invertebrates within the River Yare and the adjacent sea.

### Potential Pathways

2.18.3 Table 2.6 below details the potential pathways.

**Table 2.6: Potential Pathways**

Ref.	Pathway	Description
<b>P1</b>	Direct contact	Soil contaminants could come into direct contact with the site users.
<b>P2</b>	Ingestion	Soil derived contaminants could be ingested.
<b>P3</b>	Inhalation of fugitive dust	During dry dusty conditions, contaminated dust could be inhaled by site users and adjacent site users.
<b>P4</b>	Leaching and vertical / lateral migration of contaminants	Contaminants could leach and migrate into the underlying aquifers and the surface watercourse including as a result of construction activities such as piling.
<b>P5</b>	Migration and inhalation of landfill / ground gas	Ground / landfill gas could be generated by fill materials

## 2.19 Risk Evaluation

- 2.19.1** Each potential contaminant linkage is identified in Table 3.3 below. This assumes redevelopment with no remediation. An evaluation of the risk that each contaminant linkage poses to the Scheme has been undertaken in general accordance with CIRIA guidance document (Ref 16B.5). Risk classification matrices are presented in Annex E.
- 2.19.2** The evaluation and the resultant actions identified are based on the available information presented within this report.

**2.19.3** During construction, there is a potential for short term risk to site users and adjacent site users (including construction workers and the general public). These should be assessed and mitigated by the construction Contractor under the CDM 2015 Regulations (Ref 16B.6).

**2.19.4** Table 2.7 below details the potential pathways.

*Table 2.7: Summary of Potential Contaminant Linkages*

1. Hazard Identification		2. Hazard Assessment		3. Risk Estimation		4. Risk Evaluation	5. Managing the Risks
Contaminant Source	Receptor	Pathway	Consequence of Risk Being Realised	Probability of Risk Being Realised	Classification	Discussion / Action Required	
<b>S1. Potentially Contaminated Made Ground</b>	R1. Site Users	P1. Direct Contact	Medium	Unlikely	Low	Due to the previous uses across the Study Area, an environmental ground investigation was undertaken to assess the potential contaminant linkages identified in this table.	
		P2. Ingestion	Medium	Unlikely	Low		
		P3. Inhalation of Fugitive Dust	Medium	Low	Moderate		
		P5. Migration and Inhalation of Landfill / Ground Gas	Minor	Unlikely	Very Low		
	Minor		Unlikely	Very Low			
	R2. Adjacent Site Users	P3. Inhalation of Fugitive Dust	Medium	Low	Moderate		
			R3. Controlled Waters	P4. Leaching and Vertical / Lateral Migration of Contaminants	Severe		Likely
	R4. Site Infrastructure	P1. Direct Contact	Mild	Likely	Moderate / Low		
R5. Marine Ecology	Severe		Likely	High			
	P2. Ingestion	Severe	Likely	High			

1. Hazard Identification		2. Hazard Assessment		3. Risk Estimation		4. Risk Evaluation	5. Managing the Risks
Contaminant Source	Receptor	Pathway	Consequence of Risk Being Realised	Probability of Risk Being Realised	Classification	Discussion / Action Required	
		P4. Leaching and Vertical / Lateral Migration of Contaminants	Severe	Likely	High		
<b>S2. Potentially Contaminated Silt</b>	R3. Controlled Waters	P4. Leaching and Vertical / Lateral Migration of Contaminants	Severe	Likely	High		
	R4. Site Infrastructure	P1. Direct Contact	Mild	Low	Low		
	R5. Marine Ecology		Severe	Likely	High		
		P2. Ingestion	Severe	Likely	High		
		P4. Leaching and Vertical / Lateral Migration of Contaminants	Severe	Likely	High		

## **2.20 Potential Waste and Sustainability Considerations**

---

**2.20.1** Surplus soils may be generated during the Scheme construction works. It is possible that these would need to be disposed of offsite to a suitably licensed facility if they cannot be proven to meet the requirements for re-use within The Scheme under a Materials Management Plan (to be secured as part of a CoCP (document reference 6.16) under Requirement 5 of the DCO (document reference 3.1).

## **2.21 Safety, Health and Environmental Considerations**

---

**2.21.1** With respect to any further ground investigation, the Study Area should be classified in accordance with the “Guideline Notes for the Safe Investigation by Drilling of Landfills and Contaminated Land” (Ref 16B.7). This document makes recommendations for carrying out site investigation on landfills and potentially contaminated ground. Appendix IV of the guidance sets out a record of assessment for potentially contaminated sites, to be completed as part of the ground investigation contract.

**2.21.2** Site personnel involved with any intrusive works, including site investigations, construction or maintenance works should be appropriately qualified with experience of working on potentially contaminated sites. Those working in close proximity to fill materials should wear appropriate personal protective equipment. A reasonable standard of hygiene should be maintained.

## **2.22 Ground Investigation**

---

**2.22.1** A ground investigation was recommended in the July 2017 version of this report. This was subsequently undertaken in 2017 / 2018 to inform the baseline assessment for the Geology and Soils Chapter 16 of the Environmental Statement (document reference 6.1). The ground investigation included sampling and chemical testing of the major strata encountered together with gas and groundwater monitoring. The findings are presented in the Interpretative Environmental Ground Investigation Report dated March 2019 presented as Appendix 16C of the Environmental Statement.

---

---

## 3 Conclusions

### 3.1 Key Findings

---

- 3.1.1 The desk study has indicated that the Study Area was reasonably well developed by the late 1800's with some residential properties but mostly commercial / industrial development, particularly the area immediately bounding the River Yare.
- 3.1.2 The Study Area is expected to be underlain by demolition and fill material which could be contaminated. Ground gas / landfill gas may be generated by the fill material and could migrate to impact adjacent site users and infrastructure.
- 3.1.3 From the information reviewed above, contaminated made ground is expected but is unlikely to be sufficiently contaminated or sufficiently widespread to pose a significant constraint for an infrastructure project such as this.
- 3.1.4 Due to the potential for contaminated made ground and / or silts to be present within the Study Area derived from a variety of former industrial uses, the potential for environmental liabilities are considered to be; **high** for controlled waters and marine ecology receptors and in the range **Moderate** to **Very Low** for site users, adjacent site users and infrastructure receptors. The high risks are associated with the controlled waters and marine ecology receptors. It is unknown if historic remedial works occurred during redevelopment at any of the potentially contaminative sites such as the iron works or the gas works and this could reduce the potential for environmental liabilities.

## 4 Limitations

- 4.1.1 Only publicly accessible areas were assessed during the walkover.
- 4.1.2 This report is presented to Norfolk County Council in respect of the Scheme and may not be used or relied on by any other person or by the client in relation to any other matters not covered specifically by the scope of this Report.
- 4.1.3 Notwithstanding anything to the contrary contained in the report, WSP Limited is obliged to exercise reasonable skill, care and diligence in the performance of the services required by Norfolk County Council and WSP Limited shall not be liable except to the extent that it has failed to exercise reasonable skill, care and diligence, and this report shall be read and construed accordingly.
- 4.1.4 This report has been prepared by WSP Limited. No individual is personally liable in connection with the preparation of this report. By receiving this report and acting on it, the client or any other person accepts that no individual is personally liable whether in contract, tort, for breach of statutory duty or otherwise.
- 4.1.5 The brief includes an assessment of the previous site usage by review of the sources identified in this report. These effectively provide snapshots of the site through time and although a consistent sequence of site usage has been deduced from these records, the possibility of some activity carried out on the site not being identified on these records cannot be excluded.
- 4.1.6 New information, changed practices or new legislation may necessitate revised interpretation of the report after the date of its submission.

1.5 Additional Information – Historical Garage and Motor Vehicle Repair Database	32
1.6 Potentially Infilled Land	34
2. Environmental Permits, Incidents and Registers Map	36
2. Environmental Permits, Incidents and Registers	37
2.1 Industrial Sites Holding Licences and/or Authorisations	37
2.1.1 Records of historic IPC Authorisations within 500m of the study site	37
2.1.2 Records of Part A(1) and IPPC Authorised Activities within 500m of the study site	37
2.1.3 Records of Red List Discharge Consents (potentially harmful discharges to controlled waters) within 500m of the study site	41
2.1.4 Records of List 1 Dangerous Substances Inventory Sites within 500m of the study site	41
2.1.5 Records of List 2 Dangerous Substance Inventory Sites within 500m of the study site	41
2.1.6 Records of Part A(2) and Part B Activities and Enforcements within 500m of the study site	42
2.1.7 Records of Category 3 or 4 Radioactive Substances Authorisations	44
2.1.8 Records of Licensed Discharge Consents within 500m of the study site	44
2.1.9 Records of Water Industry Referrals (potentially harmful discharges to the public sewer) within 500m of the study site	50
2.1.10 Records of Planning Hazardous Substance Consents and Enforcements within 500m of the study site	51
2.2 Dangerous or Hazardous Sites	51
2.3 Environment Agency/Natural Resources Wales Recorded Pollution Incidents	52
2.3.1 Records of National Incidents Recording System, List 2 within 500m of the study site	52
2.3.2 Records of National Incidents Recording System, List 1 within 500m of the study site	53
2.4 Sites Determined as Contaminated Land under Part 2A EPA 1990	53
3. Landfill and Other Waste Sites Map	54
3. Landfill and Other Waste Sites	55
3.1 Landfill Sites	55
3.1.1 Records from Environment Agency/Natural Resources Wales landfill data within 1000m of the study site	55
3.1.2 Records of Environment Agency/Natural Resources Wales historic landfill sites within 1500m of the study site	55
3.1.3 Records of BGS/DoE non-operational landfill sites within 1500m of the study site	55
3.1.4 Records of Landfills from Local Authority and Historical Mapping Records within 1500m of the study site	56
3.2 Other Waste Sites	56
3.2.1 Records of waste treatment, transfer or disposal sites within 500m of the study site	56
3.2.2 Records of Environment Agency/Natural Resources Wales licensed waste sites within 1500m of the study site	59
4. Current Land Use Map	67
4. Current Land Uses	68
4.1 Current Industrial Data	68
4.2 Petrol and Fuel Sites	82
4.3 National Grid High Voltage Underground Electricity Transmission Cables	83
4.4 National Grid High Pressure Gas Transmission Pipelines	83

5. Geology	84

# Overview of Findings

For further details on each dataset, please refer to each individual section in the main report as listed. Where the database has been searched a numerical result will be recorded. Where the database has not been searched '-' will be recorded.

<b>Section 1: Historical Industrial Sites</b>	On-site	0-50	51-250	251-500
1.1 Potentially Contaminative Uses identified from 1:10,000 scale mapping	104	25	64	92
1.2 Additional Information – Historical Tank Database	176	28	71	93
1.3 Additional Information – Historical Energy Features Database	92	33	37	53
1.4 Additional Information – Historical Petrol and Fuel Site Database	0	0	0	0
1.5 Additional Information – Historical Garage and Motor Vehicle Repair Database	28	2	30	8
1.6 Potentially Infilled Land	23	2	18	38

<b>Section 2: Environmental Permits, Incidents and Registers</b>	On-site	0-50m	51-250	251-500
2.1 Industrial Sites Holding Environmental Permits and/or Authorisations				
2.1.1 Records of historic IPC Authorisations	0	0	0	0
2.1.2 Records of Part A(1) and IPPC Authorised Activities	0	0	21	0
2.1.3 Records of Red List Discharge Consents	0	0	0	0
2.1.4 Records of List 1 Dangerous Substances Inventory sites	1	0	0	1
2.1.5 Records of List 2 Dangerous Substances Inventory sites	0	2	2	5
2.1.6 Records of Part A(2) and Part B Activities and Enforcements	3	2	5	6
2.1.7 Records of Category 3 or 4 Radioactive Substances Authorisations	0	0	1	0
2.1.8 Records of Licensed Discharge Consents	15	3	8	15
2.1.9 Records of Water Industry Referrals	2	1	1	0
2.1.10 Records of Planning Hazardous Substance Consents and Enforcements within 500m of the study site	1	0	1	0
2.2 Records of COMAH and NIHHS sites	2	1	0	0
2.3 Environment Agency/Natural Resources Wales Recorded Pollution Incidents				
2.3.1 National Incidents Recording System, List 2	3	0	1	9
2.3.2 National Incidents Recording System, List 1	0	0	0	0
2.4 Sites Determined as Contaminated Land under Part 2A EPA 1990	0	0	0	0

Section 3: Landfill and Other Waste Sites	On-site	0-50m	51-250	251-500	501-1000	1000-1500
<b>3.1 Landfill Sites</b>						
3.1.1 Environment Agency/Natural Resources Wales Registered Landfill Sites	0	0	0	0	0	Not searched
3.1.2 Environment Agency/Natural Resources Wales Historic Landfill Sites	0	0	0	1	0	1
3.1.3 BGS/DoE Landfill Site Survey	0	0	0	0	0	0
3.1.4 Records of Landfills in Local Authority and Historical Mapping Records	0	0	0	0	0	0
<b>3.2 Landfill and Other Waste Sites Findings</b>						
3.2.1 Operational and Non-Operational Waste Treatment, Transfer and Disposal Sites	2	0	11	1	Not searched	Not searched
3.2.2 Environment Agency/Natural Resources Wales Licensed Waste Sites	2	3	15	5	5	5

Section 4: Current Land Use	On-site	0-50m	51-250	251-500
4.1 Current Industrial Sites Data	106	47	167	Not searched
4.2 Records of Petrol and Fuel Sites	2	0	0	1
4.3 National Grid Underground Electricity Cables	0	0	0	0
4.4 National Grid Gas Transmission Pipelines	0	0	0	0

Section 5: Geology	
5.1 Are there any records of Artificial Ground and Made Ground present beneath the study site?	Yes
5.2 Are there any records of Superficial Ground and Drift Geology present beneath the study site?	Yes
5.3 For records of Bedrock and Solid Geology beneath the study site see the detailed findings section.	

Section 6: Hydrogeology and Hydrology	0-500m					
6.1 Are there any records of Strata Classification in the Superficial Geology within 500m of the study site?	Yes					
6.2 Are there any records of Strata Classification in the Bedrock Geology within 500m of the study site?	Yes					
	On-site	0-50m	51-250	251-500	501-1000	1000-2000
6.3 Groundwater Abstraction Licences (within 2000m of the study site)	0	0	1	0	0	1
6.4 Surface Water Abstraction Licences (within 2000m of the study site)	0	0	0	1	0	0
6.5 Potable Water Abstraction Licences (within 2000m of the study site)	0	0	0	0	0	0
6.6 Source Protection Zones (within 500m of the study site)	0	0	0	0	Not searched	Not searched
6.7 Source Protection Zones within Confined Aquifer	0	0	0	0	Not searched	Not searched
6.8 Groundwater Vulnerability and Soil Leaching Potential (within 500m of the study site)	2	0	0	1	Not searched	Not searched

## Section 6: Hydrogeology and Hydrology

0-500m

	On-site	0-50m	51-250	251-500	501-1000	1000-1500
6.9 Is there any Environment Agency/Natural Resources Wales information on river quality within 1500m of the study site?	No	No	No	No	No	No
6.10 Detailed River Network entries within 500m of the site	1	0	0	0	Not searched	Not searched
6.11 Surface water features within 250m of the study site	Yes	Yes	Yes	Not searched	Not searched	Not searched

## Section 7: Flooding

7.1 Are there any Environment Agency Zone 2 floodplains within 250m of the study site?	Yes					
7.2 Are there any Environment Agency/Natural Resources Wales Zone 3 floodplains within 250m of the study site	Yes					
7.3 What is the Risk of flooding from Rivers and the Sea (RoFRaS) rating for the study site?	High					
7.4 Are there any Flood Defences within 250m of the study site?	No					
7.5 Are there any areas benefiting from Flood Defences within 250m of the study site?	No					
7.6 Are there any areas used for Flood Storage within 250m of the study site?	No					
7.7 What is the maximum BGS Groundwater Flooding susceptibility within 50m of the study site?	Limited potential					
7.8 What is the BGS confidence rating for the Groundwater Flooding susceptibility areas?	Low					

## Section 8: Designated Environmentally Sensitive Sites

	On-site	0-50m	51-250	251-500	501-1000	1000-2000
8.1 Records of Sites of Special Scientific Interest (SSSI)	0	0	0	0	0	3
8.2 Records of National Nature Reserves (NNR)	0	0	0	0	0	0
8.3 Records of Special Areas of Conservation (SAC)	0	0	0	0	0	0
8.4 Records of Special Protection Areas (SPA)	0	0	0	1	0	1
8.5 Records of Ramsar sites	0	0	0	0	0	1
8.6 Records of Ancient Woodlands	0	0	0	0	0	0
8.7 Records of Local Nature Reserves (LNR)	0	0	0	0	0	1
8.8 Records of World Heritage Sites	0	0	0	0	0	0
8.9 Records of Environmentally Sensitive Areas	0	0	0	1	0	1

Section 8: Designated Environmentally Sensitive Sites	On-site	0-50m	51-250	251-500	501-1000	1000-2000
8.10 Records of Areas of Outstanding Natural Beauty (AONB)	0	0	0	0	0	0
8.11 Records of National Parks	0	0	0	0	1	1
8.12 Records of Nitrate Sensitive Areas	0	0	0	0	0	0
8.13 Records of Nitrate Vulnerable Zones	1	0	0	0	0	1
8.14 Records of Green Belt land	0	0	0	0	0	0

## Section 9: Natural Hazards

9.1 What is the maximum risk of natural ground subsidence?	High
9.1.1 What is the maximum Shrink-Swell hazard rating identified on the study site?	Low
9.1.2 What is the maximum Landslides hazard rating identified on the study site?	Low
9.1.3 What is the maximum Soluble Rocks hazard rating identified on the study site?	Negligible
9.1.4 What is the maximum Compressible Ground hazard rating identified on the study site?	High
9.1.5 What is the maximum Collapsible Rocks hazard rating identified on the study site?	Very Low
9.1.6 What is the maximum Running Sand hazard rating identified on the study site?	Moderate
9.2 Radon	
9.2.1 Is the property in a Radon Affected Area as defined by the Health Protection Agency (HPA) and if so what percentage of homes are above the Action Level?	The property is not in a Radon Affected Area, as less than 1% of properties are above the Action Level.
9.2.2 Is the property in an area where Radon Protection are required for new properties or extensions to existing ones as described in publication BR211 by the Building Research Establishment?	No radon protective measures are necessary.

## Section 10: Mining

10.1 Are there any coal mining areas within 75m of the study site?	No
10.2 Are there any Non-Coal Mining areas within 50m of the study site boundary?	No
10.3 Are there any brine affected areas within 75m of the study site?	No

# Using this report

The following report is designed by Environmental Consultants for Environmental Professionals bringing together the most up-to-date market leading environmental data. This report is provided under and subject to the Terms & Conditions agreed between Groundsure and the Client. The document contains the following sections:

## 1. Historical Industrial Sites

Provides information on past land uses that may pose a risk to the study site in terms of potential contamination from activities or processes. Potentially Infilled Land features are also included. This search is conducted using radii of up to 500m.

## 2. Environmental Permits, Incidents and Registers

Provides information on Regulated Industrial Activities and Pollution Incidents as recorded by Regulatory Authorities, and sites determined as Contaminated Land. This search is conducted using radii up to 500m.

## 3. Landfills and Other Waste Sites

Provides information on landfills and other waste sites that may pose a risk to the study site. This search is conducted using radii up to 1500m.

## 4. Current Land Uses

Provides information on current land uses that may pose a risk to the study site in terms of potential contamination from activities or processes. These searches are conducted using radii of up to 500m. This includes information on potentially contaminative industrial sites, petrol stations and fuel sites as well as high pressure gas pipelines and underground electricity transmission lines.

## 5. Geology

Provides information on artificial and superficial deposits and bedrock beneath the study site.

## 6. Hydrogeology and Hydrology

Provides information on productive strata within the bedrock and superficial geological layers, abstraction licenses, Source Protection Zones (SPZs) and river quality. These searches are conducted using radii of up to 2000m.

## 7. Flooding

Provides information on river and coastal flooding, flood defences, flood storage areas and groundwater flood areas. This search is conducted using radii of up to 250m.

## 8. Designated Environmentally Sensitive Sites

Provides information on the Sites of Special Scientific Interest (SSSI), National Nature Reserves (NNR), Special Areas of Conservation (SAC), Special Protection Areas (SPA), Ramsar sites, Local Nature Reserves (LNR), Areas of Outstanding Natural Beauty (AONB), National Parks (NP), Environmentally Sensitive Areas, Nitrate Sensitive Areas, Nitrate Vulnerable Zones and World Heritage Sites and Scheduled Ancient Woodland. These searches are conducted using radii of up to 2000m.

## 9. Natural Hazards

Provides information on a range of natural hazards that may pose a risk to the study site. These factors include natural ground subsidence and radon..

## 10. Mining

Provides information on areas of coal and non-coal mining and brine affected areas.

## 11. Contacts

This section of the report provides contact points for statutory bodies and data providers that may be able to provide further information on issues raised within this report. Alternatively, Groundsure provide a free Technical Helpline (08444 159000) for further information and guidance.

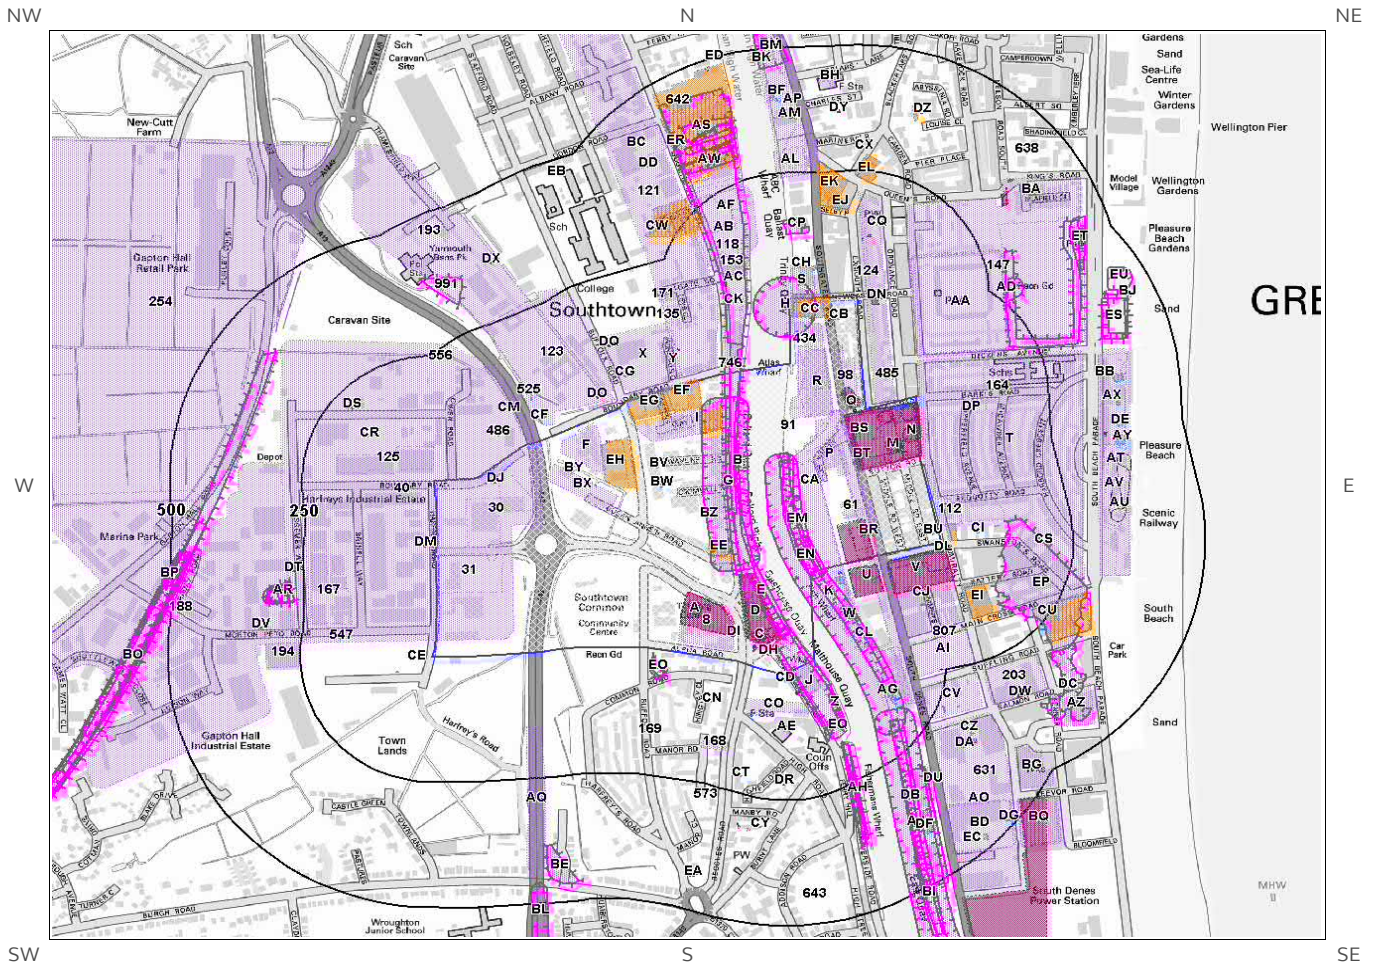

### Note: Maps

Only certain features are placed on the maps within the report. All features represented on maps found within this search are given an identification number. This number identifies the feature on the mapping and correlates it to the additional information provided below. This identification number precedes all other information and takes the following format -Id: 1, Id: 2, etc. Where numerous features on the same map are in such close proximity that the numbers would obscure each other a letter identifier is used instead to represent the features. (e.g. Three features which overlap may be given the identifier "A" on the map and would be identified separately as features 1A, 3A, 10A on the data tables provided).

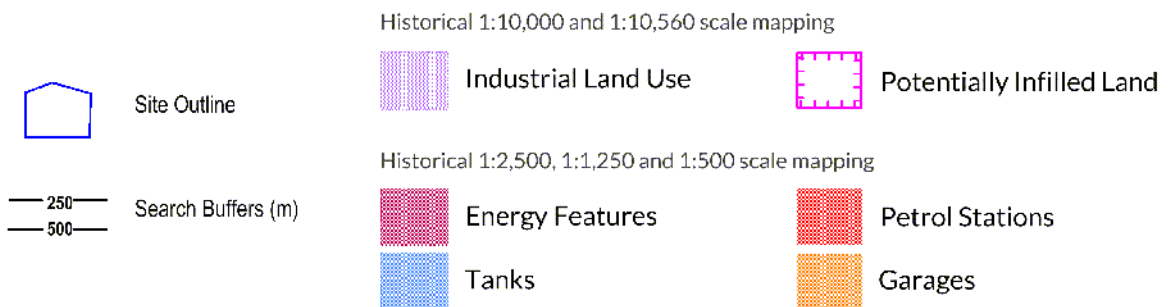

Where a feature is reported in the data tables to a distance greater than the map area, it is noted in the data table as "Not Shown".

All distances given in this report are in Metres (m). Directions are given as compass headings such as N: North, E: East, NE: North East from the nearest point of the study site boundary.

# 1. Historical Land Use

## 1.2 Additional Information – Historical Tank Database

The systematic analysis of data extracted from High Detailed 1:1,250 and 1:2,500 scale historical maps provides the following information.

Records of historical tanks within 500m of the search boundary:

368

## 1.4 Additional Information – Historical Petrol and Fuel Site Database

The systematic analysis of data extracted from High Detailed 1:1,250 and 1:2,500 scale historical maps provides the following information.

Records of historical petrol stations and fuel sites within 500m of the search boundary: 0

Database searched and no data found.

## 1.5 Additional Information – Historical Garage and Motor Vehicle Repair Database

The systematic analysis of data extracted from High Detailed 1:1,250 and 1:2,500 scale historical maps provides the following information.

Records of historical garage and motor vehicle repair sites within 500m of the search boundary: 68

# 2. Environmental Permits, Incidents and Registers

## 2.1 Industrial Sites Holding Licences and/or Authorisations

Searches of information provided by the Environment Agency/Natural Resources Wales and Local Authorities reveal the following information:

### 2.1.1 Records of historic IPC Authorisations within 500m of the study site:

0

Database searched and no data found.

### 2.1.2 Records of Part A(1) and IPPC Authorised Activities within 500m of the study site:

21

The following Part A(1) and IPPC Authorised Activities are represented as points on the Environmental Permits, Incidents and Registers Map:

ID	Distance (m)	Direction	NGR	Details
113K	167	N	651840 306180	Operator: Biffa Waste Services Ltd Installation Name: Great Yarmouth Wm Resource Centre Epr/rp3636sr Process: DISPOSAL OR RECOVERY OF HAZARDOUS WASTE WITH A CAPACITY EXCEEDING 10 TONNES PER DAY INVOLVING PHYSICO-CHEMICAL TREATMENT Permit Number: JP3336EE Original Permit Number: RP3636SR EPR Reference: - Issue Date: 15/1/2014 Effective Date: 15/1/2014 Last date noted as effective: 2017-04-01 Status: Superseded

## 2.1.9 Records of Water Industry Referrals (potentially harmful discharges to the public sewer) within 500m of the study site:

4

The following Water Industry Referral records are represented as points on the Environmental Permits, Incidents and Registers Map:

ID	Distance (m)	Direction	Address	Permission reference	Local Authority	First Date Received	Last Date Received	Status
135 O	0	On Site	WEATHERFORD UK LIMITED, HARFREY'S ROAD, HARFREY'S IND EST, GREAT YARMOUTH, NORFOLK, NR31 0LS	CA3653	GREAT YARMOUTH BOROUGH COUNCIL	01-Jul-2010	08-Oct-2016	EFFECTIVE
136 P	0	On Site	GREAT YARMOUTH PORT COMPANY, ATLAS TERMINAL, SOUTHGATES ROAD, GREAT YARMOUTH, NORFOLK, NR30 3LL	SCE0092C 2	NORFOLK	01-Jan-2015	08-Oct-2016	EFFECTIVE
137 Q	13	SE	TOTAL RECLAIM SYSTEMS LIMITED, TOTAL RECLAIM HOUSE, ADMIRALTY ROAD, GREAT YARMOUTH, NORFOLK, NR30 3PU	SCE0097C 2	NORFOLK	04-Jan-2013	08-Oct-2016	EFFECTIVE
138 K	167	N	BIFFA WASTE SERVICES LTD, BESSEMER WAY, HARFEYS IND EST, GREAT YARMOUTH, NORFOLK, NR31 0LX	BL8830	GREAT YARMOUTH BOROUGH COUNCIL	01-Jun-2003	08-Oct-2016	EFFECTIVE

## 2.1.10 Records of Planning Hazardous Substance Consents and Enforcements within 500m of the study site:

2

The following records are represented as points on the Environmental Permits, Incidents and Registers Map:

ID	Distance (m)	Direction	Application Reference Number	NGR	Application Status	Application Date	Address	Details	Details of Enforcement Action
139R	0	On Site	No Details	652738 306121	Approved	No Details	Transco Plc, Southgates Road, Great Yarmouth, NR30 3DR	No Details	Enforcement: No Enforcements Notified Date of Enforcement: No Enforcements Notified Comment: No Enforcements Notified
140S	171	NW	HSC/0001	652131 306327	Historical Consent	20/06/1994	Ventureforth Estates Ltd, Ventureforth House, Great Yarmouth Business Park, Suffolk Road, Great Yarmouth	Storage of ammonium nitrate.	Enforcement: No Enforcements Notified Date of Enforcement: No Enforcements Notified Comment: No Enforcements Notified

## 2.2 Dangerous or Hazardous Sites

Records of COMAH & NIHHS sites within 500m of the study site:

3

The following COMAH & NIHHS Authorisation records provided by the Health and Safety Executive are represented as polygons or buffered points on the Environmental Permits, Incidents and Registers Map:

ID	Distance (m)	Direction	Company	Address	Operational Status	Tier
104	0	On Site	British Gas	British Gas, Southgates Road, Great Yarmouth	Historical NIHHS Site	-
105N	0	On Site	Asco UK Limited	Asco UK Limited, Gas House Quay, Southtown Road, Great Yarmouth, Norfolk, NR30 3LX	Current COMAH Site	COMAH Lower Tier Operator
106G	15	S	ASCO UK Limited	ASCO UK Limited, Great Yarmouth, South Denes, Great Yarmouth, Norfolk, NR30 3LX	Current COMAH Site	COMAH Lower Tier Operator

## 2.3 Environment Agency/Natural Resources Wales Recorded Pollution Incidents

### 2.3.1 Records of National Incidents Recording System, List 2 within 500m of the study site:

13

The following NIRS List 2 records are represented as points on the Environmental Permits, Incidents and Registers Map:

ID	Distance (m)	Direction	NGR	Details	
1	0	On Site	652080 305800	Incident Date: 23-Mar-2002 Incident Identification: 67348 Pollutant: General Biodegradable Materials and Wastes Pollutant Description: Food and Drink	Water Impact: Category 3 (Minor) Land Impact: Category 4 (No Impact) Air Impact: Category 4 (No Impact)
2	0	On Site	652038 305831	Incident Date: 17-Sep-2003 Incident Identification: 190491 Pollutant: Inorganic Chemicals/Products Pollutant Description: Other Inorganic Chemical or Product	Water Impact: Category 4 (No Impact) Land Impact: Category 4 (No Impact) Air Impact: Category 4 (No Impact)
3F	0	On Site	652393 305828	Incident Date: 22-Aug-2003 Incident Identification: 184276 Pollutant: Specific Waste Materials: Specific Waste Materials Pollutant Description: Tyres: Vehicles and Vehicle Parts	Water Impact: Category 4 (No Impact) Land Impact: Category 3 (Minor) Air Impact: Category 4 (No Impact)
4	230	N	652677 306610	Incident Date: 19-Jul-2003 Incident Identification: 175140 Pollutant: Organic Chemicals/Products Pollutant Description: Solvents	Water Impact: Category 4 (No Impact) Land Impact: Category 4 (No Impact) Air Impact: Category 3 (Minor)
5	268	S	652860 305630	Incident Date: 03-Nov-2002 Incident Identification: 118445 Pollutant: Sewage Materials Pollutant Description: Storm Sewage	Water Impact: Category 3 (Minor) Land Impact: Category 4 (No Impact) Air Impact: Category 4 (No Impact)
6A	314	N	652546 306692	Incident Date: 22-Nov-2001 Incident Identification: 44483 Pollutant: Atmospheric Pollutants and Effects: Contaminated Water Pollutant Description: Smoke: Firefighting Run-Off	Water Impact: Category 4 (No Impact) Land Impact: Category 4 (No Impact) Air Impact: Category 3 (Minor)
7A	314	N	652546 306692	Incident Date: 22-Nov-2001 Incident Identification: 44483 Pollutant: Atmospheric Pollutants and Effects Pollutant Description: Smoke	Water Impact: Category 4 (No Impact) Land Impact: Category 4 (No Impact) Air Impact: Category 3 (Minor)
8A	314	N	652546 306692	Incident Date: 22-Nov-2001 Incident Identification: 44483 Pollutant: Contaminated Water Pollutant Description: Firefighting Run-Off	Water Impact: Category 4 (No Impact) Land Impact: Category 4 (No Impact) Air Impact: Category 3 (Minor)
9	412	NW	652242 306687	Incident Date: 05-Apr-2002 Incident Identification: 69833 Pollutant: General Biodegradable Materials and Wastes Pollutant Description: Animal and Vegetable Oil	Water Impact: Category 4 (No Impact) Land Impact: Category 4 (No Impact) Air Impact: Category 4 (No Impact)
10	447	N	652400 306810	Incident Date: 10-Jan-2002 Incident Identification: 51678 Pollutant: Oils and Fuel Pollutant Description: Gas and Fuel Oils	Water Impact: Category 3 (Minor) Land Impact: Category 4 (No Impact) Air Impact: Category 4 (No Impact)

ID	Distance (m)	Direction	NGR	Details	
11	471	E	653200 306330	Incident Date: 21-Nov-2002 Incident Identification: 122176 Pollutant: Oils and Fuel Pollutant Description: Mixed/Waste Oils	Water Impact: Category 1 (Major) Land Impact: Category 1 (Major) Air Impact: Category 4 (No Impact)
12	477	S	652323 305182	Incident Date: 11-Sep-2001 Incident Identification: 30255 Pollutant: Agricultural Materials and Wastes Pollutant Description: Solid Manure	Water Impact: Category 4 (No Impact) Land Impact: Category 4 (No Impact) Air Impact: Category 4 (No Impact)
13J	500	N	652457 306874	Incident Date: 16-Nov-2002 Incident Identification: 121239 Pollutant: Sewage Materials Pollutant Description: Crude Sewage	Water Impact: Category 3 (Minor) Land Impact: Category 4 (No Impact) Air Impact: Category 4 (No Impact)

# 3. Landfill and Other Waste Sites

## 3.1 Landfill Sites

3.1.1 Records from Environment Agency/Natural Resources Wales landfill data within 1000m of the study site:

0

Database searched and no data found.

3.1.2 Records of Environment Agency/Natural Resources Wales historic landfill sites within 1500m of the study site:

2

The following landfill records are represented as either points or polygons on the Landfill and Other Waste Sites map:

ID	Distance (m)	Direction	NGR	Details	
15	451	W	651200 305600	Site Address: Gapton Hall Site, Between Harfeys Road and Burgh Road, Great Yarmouth Waste Licence: - Site Reference: WD 709a Waste Type: Inert, Industrial, Commercial, Household Environmental Permitting Regulations (Waste) Reference: -	Licence Issue: Licence Surrendered: Licence Holder Address: - Operator: County Council Licence Holder: Great Yarmouth Council First Recorded: 30-Jun-1973 Last Recorded: 31-Dec-1974
16	1020	NW	650900 307300	Site Address: Cobholm Tip, Farm Lane, Humberstone, Great Yarmouth, Norfolk Waste Licence: Yes Site Reference: WD 506, WR 764, NFK/LS/060/0 Waste Type: Inert, Industrial, Commercial, Household Environmental Permitting Regulations (Waste) Reference: AZ1/L/VIN001	Licence Issue: 02-Jan-1974 Licence Surrendered: Licence Holder Address: Humberstone Farm, Southtown, Great Yarmouth, Norfolk Operator: Gt Yarmouth Borough Council Licence Holder: W H Vincent First Recorded: 31-May-1905 Last Recorded: 31-Dec-1995

3.1.3 Records of BGS/DoE non-operational landfill sites within 1500m of the study site:

0

Database searched and no data found.

### 3.1.4 Records of Landfills from Local Authority and Historical Mapping Records within 1500m of the study site:

0

Database searched and no data found.

## 3.2 Other Waste Sites

### 3.2.1 Records of waste treatment, transfer or disposal sites within 500m of the study site:

14

The following waste treatment, transfer or disposal sites records are represented as points on the Landfill and Other Waste Sites map:

ID	Distance (m)	Direction	NGR	Details		
1A	0	On Site	651890 305707	Type of Site: Waste Recycling Centre Site Address: East Coast Waste, Harfreys Road, Harfreys Industrial Estate, GREAT YARMOUTH, Norfolk, NR31 0LS	Planning Application Reference: 06/07/0901/F Date: -	Further Details: Scheme comprises raise roof of waste recycling centre. An application (ref: 06/07/0901/F) for detailed planning permission was granted by Great Yarmouth B.C. Planning decision obtained Data Source: Historic Planning Application Data Type: Point
2A	0	On Site	651890 305707	Type of Site: Waste Recycling Centre Site Address: East Coast Waste, Harfreys Road, Harfreys Industrial Estate, GREAT YARMOUTH, Norfolk, NR31 0LS	Planning Application Reference: 06/07/0901/F Date: -	Further Details: Scheme comprises raise roof of waste recycling centre. An application (ref: 06/07/0901/F) for detailed planning permission was granted by Great Yarmouth B.C. Planning decision obtained Data Source: Historic Planning Application Data Type: Point

ID	Distance (m)	Direction	NGR	Details	
3B	74	S	652669 305759	Type of Site: Waste Transfer Station Site Address: 52 South Denes Road, GREAT YARMOUTH, Norfolk, NR30 3PR	Planning Application Reference: 6/95/593/F Date: -  Further Details: Comprises the installation of four new tanks totalling 82,000 gals for a new waste transfer station. Scheme comprises the installation of four new tanks totalling 82,000 gals for a new waste transfer station to control waste and cleaning within a containment area. This will include security fencing, loading areas and bollards. NEW INFORMATION: We are now advised that the land will be sold with the advantage of planning approval. An application (ref: 6/95/593/F) for Detailed Planning permission was submitted to Great Yarmouth B.C. on 3rd July 1995. Data Source: Historic Planning Application Data Type: Point
4B	74	S	652670 305759	Type of Site: Waste Transfer Station Site Address: ASCO UK Ltd, South Denes Road, GREAT YARMOUTH, Norfolk, NR30 3QF	Planning Application Reference: 06/98/0582/F Date: 01/05/1999  Further Details: Construction of a waste transfer station. The work will involve the construction of a waste transfer station which will include a recycling centre. Also included is a main storage building with roller shutters, laboratory, changing rooms, mess and powerwash bays, portable buildings, toilets, offices and storage tanks. An application (ref: 06/98/0582/F) for Detailed Planning permission was granted by Great Yarmouth B.C. on 4th September 1998. Data Source: Historic Planning Application Data Type: Point

ID	Distance (m)	Direction	NGR	Details		
5	212	S	651877 305425	Type of Site: Waste Transfer Station Site Address: Harfreys Road Industrial Site, GREAT YARMOUTH, Norfolk, NR30	Planning Application Reference: 98/0011 Date: 01/05/1998	Further Details: Improvements to works included 4 bulk storage tanks 2 x 5,000 gallons and 1 x 10,000 gallons and 1 x 12,000 gallons. Relocation of canopy tent and re-concreting of part of the yard with a new drainage system. Improvements to works included 4 bulk store tanks 2 x 5,000 gallons and 1 x 10,000 gallons and 1 x 12,000 gallons. Relocation of canopy tent and re-concreting of part of the yard with a new drainage system. NEW INFORMATION: Detailed plans approved by Norfolk County Council on the 3rd March, 1998. An application (ref: 98/0011) for Detailed Planning permission was granted by Great Yarmouth B.C. on 3rd March 1998. Data Source: Historic Planning Application Data Type: Point

# 4. Current Land Uses

## 4.1 Current Industrial Data

Records of potentially contaminative industrial sites within 250m of the study site: 320

The following records are represented as points on the Current Land Uses map.

ID	Distance (m)	Direction	Company	NGR	Address	Activity	Category
1H	0	On Site	Simpsons Skoda	652263 305982	Simpsons Skoda, Unit 1, Suffolk Road, Great Yarmouth, NR31 0LN	New Vehicles	Motoring
2D	0	On Site	3 Sun Group	652140 306084	3 Sun Group, 3sun House, Boundary Road, Great Yarmouth, NR31 0FB	Electronic Equipment	Industrial Products
3A	0	On Site	Kirkley Tyres & Wheels	652355 306146	Kirkley Tyres & Wheels, 126, Southtown Road, Great Yarmouth, NR31 0JZ	Vehicle Repair, Testing and Servicing	Repair and Servicing
4A	0	On Site	BP Service Station	652355 306146	BP Service Station, 126, Southtown Road, Great Yarmouth, NR31 0JZ	Petrol and Fuel Stations	Road and Rail
5B	0	On Site	Stalwart Signs & Industrial Supplies Ltd	652752 306021	Stalwart Signs & Industrial Supplies Ltd, Anglian House, Admiralty Road, Great Yarmouth, NR30 3DY	Special Purpose Machinery and Equipment	Industrial Products
6B	0	On Site	Discount Sheds & Stables	652752 306021	Discount Sheds & Stables, Anglian House, Admiralty Road, Great Yarmouth, NR30 3DY	Garden Goods	Consumer Products
7F	0	On Site	Suffolk Road Motoring Services	652250 306086	Suffolk Road Motoring Services, Unit 8-9, Suffolk Road, Great Yarmouth, NR31 0LN	Vehicle Repair, Testing and Servicing	Repair and Servicing
8C	0	On Site	J D Moore	652362 306101	J D Moore, 128, Southtown Road, Great Yarmouth, NR31 0LA	Vehicle Repair, Testing and Servicing	Repair and Servicing
9C	0	On Site	Southtown Cars	652362 306101	Southtown Cars, 128, Southtown Road, Great Yarmouth, NR31 0LA	Secondhand Vehicles	Motoring
10	0	On Site	L G Perfect	651878 305826	L G Perfect, Harfreys Road, Great Yarmouth, NR31 0JL	Vehicle Repair, Testing and Servicing	Repair and Servicing
11R	0	On Site	Afordable Cars	652621 306224	Afordable Cars, 41a, Southgates Road, Great Yarmouth, NR30 3LL	Secondhand Vehicles	Motoring
12	0	On Site	Weatherford UK	651890 305776	Weatherford UK, Harfreys Road, Great Yarmouth, NR31 0LS	Special Purpose Machinery and Equipment	Industrial Products
13E	0	On Site	Pumping Station	652180 306105	Pumping Station, NR31	Water Pumping Stations	Industrial Features

ID	Distance (m)	Direction	Company	NGR	Address	Activity	Category

### 4.3 National Grid High Voltage Underground Electricity Transmission Cables

This dataset identifies the high voltage electricity transmission lines running between generating power plants and electricity substations. The dataset does not include the electricity distribution network (smaller, lower voltage cables distributing power from substations to the local user network). This information has been extracted from databases held by National Grid and is provided for information only with no guarantee as to its completeness or accuracy. National Grid do not offer any warranty as to the accuracy of the available data and are excluded from any liability for any such inaccuracies or errors.

Records of National Grid high voltage underground electricity transmission cables within 500m of the study site: 0

Database searched and no data found.

---

### 4.4 National Grid High Pressure Gas Transmission Pipelines

This dataset identifies high-pressure, large diameter pipelines which carry gas between gas terminals, power stations, compressors and storage facilities. The dataset does not include the Local Transmission System (LTS) which supplies gas directly into homes and businesses. This information has been extracted from databases held by National Grid and is provided for information only with no guarantee as to its completeness or accuracy. National Grid do not offer any warranty as to the accuracy of the available data and are excluded from any liability for any such inaccuracies or errors.

Records of National Grid high pressure gas transmission pipelines within 500m of the study site: 0

Database searched and no data found.

---

# 5. Geology

## 5.1 Artificial Ground and Made Ground

The database has been searched on site, including a 50m buffer.

Lex Code	Description	Rock Type
MGR-ARTDP	MADE GROUND (UNDIVIDED)	ARTIFICIAL DEPOSIT
MGR-ARTDP	MADE GROUND (UNDIVIDED)	ARTIFICIAL DEPOSIT

## 5.2 Superficial Ground and Drift Geology

The database has been searched on site, including a 50m buffer.

Lex Code	Description	Rock Type
NRD-XSV	NORTH DENES FORMATION	SAND AND GRAVEL
BRYD-P	BREYDON FORMATION	PEAT
BRYD-XCZ	BREYDON FORMATION	CLAY AND SILT
BRYD-XCZ	BREYDON FORMATION	CLAY AND SILT
TRD-XCZ	TIDAL RIVER OR CREEK DEPOSITS	CLAY AND SILT
HPGL-S	HAPPISBURGH GLACIGENIC FORMATION	SAND
BSA-S	BLOWN SAND	SAND

## 5.3 Bedrock and Solid Geology

The database has been searched on site, including a 50m buffer.

Lex Code	Description	Rock Type
CRAG-XSV	CRAG GROUP	SAND AND GRAVEL

(Derived from the BGS 1:50,000 Digital Geological Map of Great Britain)

# 6. Hydrogeology and Hydrology

## 6.1 Aquifer within Superficial Deposits

Are there records of strata classification within the superficial geology at or in proximity to the property? Yes

From 1 April 2010, the Environment Agency/Natural Resources Wales's Groundwater Protection Policy has been using aquifer designations consistent with the Water Framework Directive. For further details on the designation and interpretation of this information, please refer to the Groundsure Enviro Insight User Guide.

The following aquifer records are shown on the Aquifer within Superficial Geology Map (6a):

ID	Distance (m)	Direction	Designation	Description
1	0	On Site	Secondary A	Permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers. These are generally aquifers formerly classified as minor aquifers
8	0	On Site	Unproductive	These are rock layers or drift deposits with low permeability that have negligible significance for water supply or river base flow
2	3	W	Secondary A	Permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers. These are generally aquifers formerly classified as minor aquifers

## 6.2 Aquifer within Bedrock Deposits

Are there records of strata classification within the bedrock geology at or in proximity to the property? Yes

From 1 April 2010, the Environment Agency/Natural Resources Wales's Groundwater Protection Policy has been using aquifer designations consistent with the Water Framework Directive. For further details on the designation and interpretation of this information, please refer to the Groundsure Enviro Insight User Guide.

The following aquifer records are shown on the Aquifer within Bedrock Geology Map (6b):

ID	Distance (m)	Direction	Designation	Description
1	0	On Site	Principal	Geology of high intergranular and/or fracture permeability, usually providing a high level of water storage and may support water supply/river base flow on a strategic scale. Generally principal aquifers were previously major aquifers

## 6.3 Groundwater Abstraction Licences

Are there any Groundwater Abstraction Licences within 2000m of the study site?

Yes

The following Abstraction Licences records are represented as points, lines and regions on the Aquifer within Bedrock Geology Map (6b):

ID	Distance (m)	Direction	NGR	Details
3	71	N	651820 306080	Status: Active Licence No: AN/034/0015/020 Details: Laundry Use Direct Source: Ground Water Source Of Supply Point: Wellpoints At The Laundry, Portland Lane, Great Yarmouth Data Type: Point Name: Camplings Limited Annual Volume (m <sup>3</sup> ): 60000 Max Daily Volume (m <sup>3</sup> ): 210 Original Application No: NPS/WR/024446 Original Start Date: 1/12/2016 Expiry Date: 31/3/2030 Issue No: 1 Version Start Date: 1/12/2016 Version End Date:
Not shown	1187	NE	653140 307460	Status: Historical Licence No: 7/34/15/*G/0220 Details: Make-Up or Top Up Water Direct Source: Ground Water Source Of Supply Point: Wellpoint At Gt Yarmouth Data Type: Point Name: B & M LEISURE Annual Volume (m <sup>3</sup> ): - Max Daily Volume (m <sup>3</sup> ): - Original Application No: - Original Start Date: 1/3/1997 Expiry Date: - Issue No: 100 Version Start Date: 1/3/1997 Version End Date:

## 6.4 Surface Water Abstraction Licences

Are there any Surface Water Abstraction Licences within 2000m of the study site?

Yes

The following Surface Water Abstraction Licences records are represented as points, lines and regions on the Aquifer within Bedrock Geology Map (6b):

ID	Distance (m)	Direction	NGR	Details
5	443	N	652372 306914	Status: Historical Licence No: AN/034/0015/013 Details: Hydraulic Testing Direct Source: Surface Water Source Of Supply Point: River Yare At Berth 28, Great Yarmouth Data Type: Line Name: INTERSERVE CONSTRUCTION LIMITED Annual Volume (m <sup>3</sup> ): 4000 Max Daily Volume (m <sup>3</sup> ): 100 Application No: NPS/WR/014706 Original Start Date: 16/12/2013 Expiry Date: 31/3/2015 Issue No: 1 Version Start Date: 16/12/2013 Version End Date:

## 6.5 Potable Water Abstraction Licences

Are there any Potable Water Abstraction Licences within 2000m of the study site?

No

Database searched and no data found.

## 6.6 Source Protection Zones

Are there any Source Protection Zones within 500m of the study site?

No

Database searched and no data found.

---

## 6.7 Source Protection Zones within Confined Aquifer

Are there any Source Protection Zones within the Confined Aquifer within 500m of the study site?

No

Historically, Source Protection Zone maps have been focused on regulation of activities which occur at or near the ground surface, such as prevention of point source pollution and bacterial contamination of water supplies. Sources in confined aquifers were often considered to be protected from these surface pressures due to the presence of a low permeability confining layer (e.g. glacial till, clay). The increased interest in subsurface activities such as onshore oil and gas exploration, ground source heating and cooling requires protection zones for confined sources to be marked on SPZ maps where this has not already been done.

Database searched and no data found.

---

## 6.8 Groundwater Vulnerability and Soil Leaching Potential

Is there any Environment Agency/Natural Resources Wales information on groundwater vulnerability and soil leaching potential within 500m of the study site?

Yes

Distance (m)	Direction	Classification	Soil Vulnerability Category	Description
0	On Site	Major Aquifer/High Leaching Potential	HU	Soil information for urban areas and restored mineral workings. These soils are therefore assumed to be highly permeable in the absence of site-specific information.
0	On Site	Major Aquifer/High Leaching Potential	HU	Soil information for urban areas and restored mineral workings. These soils are therefore assumed to be highly permeable in the absence of site-specific information.
487	W	Major Aquifer/High Leaching Potential	H1	Soils which readily transmit liquid discharges because they are shallow or susceptible to rapid flow directly to rock, gravel or groundwater.

---

## 6.9 River Quality

Is there any Environment Agency/Natural Resources Wales information on river quality within 1500m of the study site?

No

Database searched and no data found.

---

6.9.2 Chemical Quality:

Database searched and no data found.

---

**6.10 Detailed River Network**

Are there any Detailed River Network entries within 500m of the study site? Yes

The following Detailed River Network records are represented on the Hydrology Map (6e):

ID	Distance (m)	Direction	Details
1	0	On Site	River Name: River Yare Welsh River Name: - Alternative Name: - River Type: Primary River Main River Status: Currently Undefined

---

## 6.11 Surface Water Features

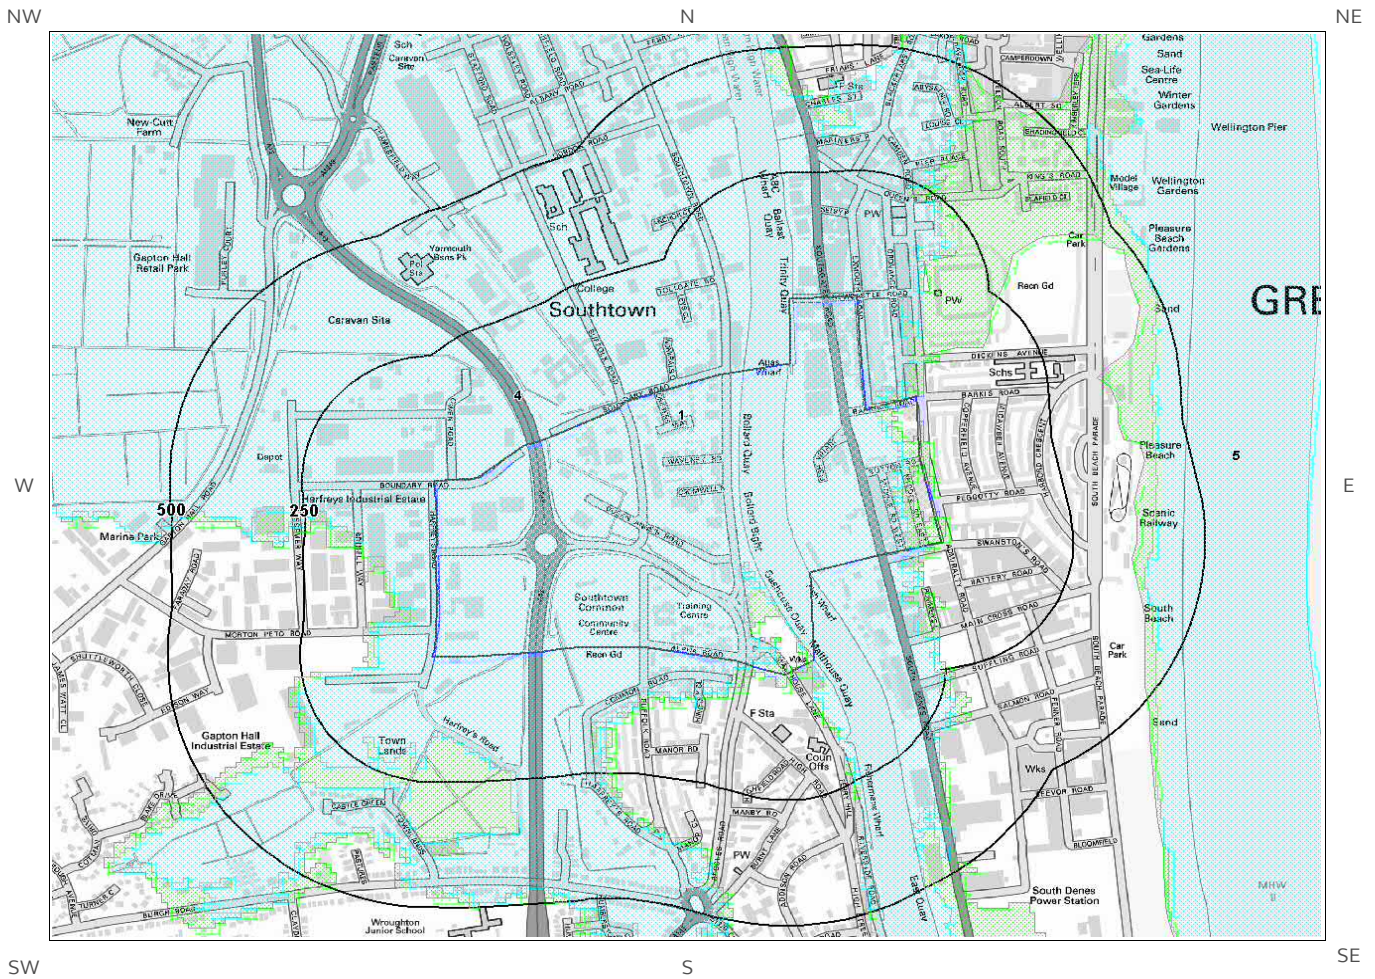

Are there any surface water features within 250m of the study site?

Yes

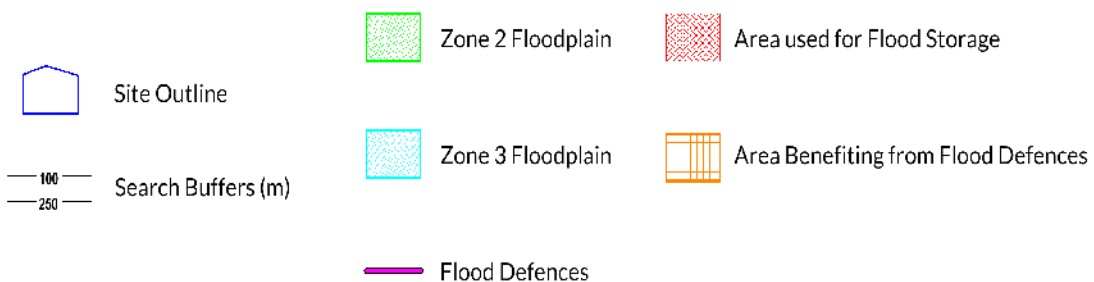

The following surface water records are not represented on mapping:

Distance (m)	Direction
0	On Site
0	On Site
0	On Site
0	On Site
0	On Site
0	On Site

Ordnance Survey license 100035207.

# 7 Flooding

## 7.1 River and Coastal Zone 2 Flooding

Is the site within 250m of an Environment Agency/Natural Resources Wales Zone 2 floodplain? Yes

Environment Agency/Natural Resources Wales Zone 2 floodplains estimate the annual probability of flooding as between 1 in 1000 (0.1%) and 1 in 100 (1%) from rivers and between 1 in 1000 (0.1%) and 1 in 200 (0.5%) from the sea. Any relevant data is represented on Map 7a – Flood Map for Planning:

ID	Distance (m)	Direction	Update	Type
1	0	On Site	19-Jun-2017	Zone 2 - (Fluvial /Tidal Models)

## 7.2 River and Coastal Zone 3 Flooding

Is the site within 250m of an Environment Agency/Natural Resources Wales Zone 3 floodplain? Yes

Zone 3 shows the extent of a river flood with a 1 in 100 (1%) or greater chance of occurring in any year or a sea flood with a 1 in 200 (0.5%) or greater chance of occurring in any year. Any relevant data is represented on Map 7a – Flood Map for Planning.

ID	Distance (m)	Direction	Update	Type
1	0	On Site	19-Jun-2017	Zone 3 - (Fluvial Models)

## 7.3 Risk of Flooding from Rivers and the Sea (RoFRaS) Flood Rating

What is the highest risk of flooding onsite? High

The Environment Agency/Natural Resources Wales RoFRaS database provides an indication of river and coastal flood risk at a national level on a 50m grid with the flood rating at the centre of the grid calculated and given above. The data considers the probability that the flood defences will overtop or breach by considering their location, type, condition and standard of protection.

RoFRaS data for the study site indicates the property is in an area with a High (1 in 30 or greater) chance of flooding in any given year.

Any relevant data within 250m is represented on the RoFRaS Flood map. Data to 50m is reported in the table below.

ID	Distance (m)	Direction	RoFRaS flood Risk
1	0.0	On Site	Low
2	0.0	On Site	Low

3	0.0	On Site	Low
4	0.0	On Site	Low
5	0.0	On Site	Low
6	0.0	On Site	Very Low
7	0.0	On Site	Low
8B	0.0	On Site	Low
9	0.0	On Site	Medium
10	0.0	On Site	Low
11	0.0	On Site	Low
12A	0.0	On Site	Medium
13A	0.0	On Site	Medium
14B	0.0	On Site	Medium
15B	0.0	On Site	Medium
16	0.0	On Site	High
17	5.0	E	Low
18	30.0	S	Low

---

## 7.4 Flood Defences

Are there any Flood Defences within 250m of the study site? No  
Database searched and no data found.

---

## 7.5 Areas benefiting from Flood Defences

Are there any areas benefiting from Flood Defences within 250m of the study site? No

---

## 7.6 Areas benefiting from Flood Storage

Are there any areas used for Flood Storage within 250m of the study site? No

---

## 7.7 Groundwater Flooding Susceptibility Areas

7.7.1 Are there any British Geological Survey groundwater flooding susceptibility areas within 50m of the boundary of the study site? Yes

Does this relate to Clearwater Flooding or Superficial Deposits Flooding? Clearwater Flooding

Notes: Groundwater flooding may either be associated with shallow unconsolidated sedimentary aquifers which overlie unproductive aquifers (Superficial Deposits Flooding), or with unconfined aquifers (Clearwater Flooding).

### 7.7.2 What is the highest susceptibility to groundwater flooding in the search area based on the underlying geological conditions?

Limited potential

Where limited potential for groundwater flooding to occur is indicated, this means that although given the geological conditions there may be a groundwater flooding hazard, unless other relevant information, e.g. records of previous flooding, suggests groundwater flooding has occurred before in this area, you need take no further action in relation to groundwater flooding hazard.

---

## 7.8 Groundwater Flooding Confidence Areas

What is the British Geological Survey confidence rating in this result?

Low

Notes: Groundwater flooding is defined as the emergence of groundwater at the ground surface or the rising of groundwater into man-made ground under conditions where the normal range of groundwater levels is exceeded.

The confidence rating is on a threefold scale - Low, Moderate and High. This provides a relative indication of the BGS confidence in the accuracy of the susceptibility result for groundwater flooding. This is based on the amount and precision of the information used in the assessment. In areas with a relatively lower level of confidence the susceptibility result should be treated with more caution. In other areas with higher levels of confidence the susceptibility result can be used with more confidence.

# 8. Designated Environmentally Sensitive Sites Map

© Crown copyright and database rights 2017.  
Ordnance Survey license 100035207.

# 8. Designated Environmentally Sensitive Sites

Presence of Designated Environmentally Sensitive Sites within 2000m of the study site? Yes

## 8.1 Records of Sites of Special Scientific Interest (SSSI) within 2000m of the study site:

3

The following Site of Special Scientific Interest (SSSI) records provided by Natural England/Natural Resources Wales are represented as polygons on the Designated Environmentally Sensitive Sites Map:

ID	Distance (m)	Direction	SSSI Name	Data Source
Not shown	1794	NW	Breydon Water	Natural England
4	1848	NW	Breydon Water	Natural England
Not shown	1949	NW	Breydon Water	Natural England

## 8.2 Records of National Nature Reserves (NNR) within 2000m of the study site:

0

Database searched and no data found.

## 8.3 Records of Special Areas of Conservation (SAC) within 2000m of the study site:

0

Database searched and no data found.

## 8.4 Records of Special Protection Areas (SPA) within 2000m of the study site:

2

The following Special Protection Area (SPA) records provided by Natural England/Natural Resources Wales are represented as polygons on the Designated Environmentally Sensitive Sites Map:

ID	Distance (m)	Direction	SPA Name	Data Source
1	465	E	Outer Thames Estuary	Natural England

ID	Distance (m)	Direction	SPA Name	Data Source
2A	1794	NW	Breydon Water	Natural England

### 8.5 Records of Ramsar sites within 2000m of the study site:

1

The following Ramsar records provided by Natural England/Natural Resources Wales are represented as polygons on the Designated Environmentally Sensitive Sites Map:

ID	Distance (m)	Direction	Ramsar Site Name	Ramsar Site Status	Data Source
6A	1794	NW	Breydon Water	Listed	Natural England

### 8.6 Records of Ancient Woodland within 2000m of the study site:

0

Database searched and no data found.

### 8.7 Records of Local Nature Reserves (LNR) within 2000m of the study site:

1

The following Local Nature Reserve (LNR) records provided by Natural England/Natural Resources Wales are represented as polygons on the Designated Environmentally Sensitive Sites Map:

ID	Distance (m)	Direction	LNR Name	Data Source
7	1797	NW	Breydon Water	Natural England

### 8.8 Records of World Heritage Sites within 2000m of the study site:

0

Database searched and no data found.

## 8.9 Records of Environmentally Sensitive Areas within 2000m of the study site:

2

The following Environmentally Sensitive Area records produced by DEFRA are represented as polygons on the Designated Environmentally Sensitive Sites Map:

ID	Distance (m)	Direction	ESA Name	Data Source
12	392	W	Broads	Natural England
Not shown	1839	W	Broads	Natural England

## 8.10 Records of Areas of Outstanding Natural Beauty (AONB) within 2000m of the study site:

0

Database searched and no data found.

## 8.11 Records of National Parks (NP) within 2000m of the study site:

2

The following National Park records provided by Natural England/Natural Resources Wales are represented as polygons on the Designated Environmentally Sensitive Sites Map:

ID	Distance (m)	Direction	NP Name	Data Source
8	754	NW	The Broads	Natural England
Not shown	1839	W	The Broads	Natural England

## 8.12 Records of Nitrate Sensitive Areas within 2000m of the study site:

0

Database searched and no data found.

### 8.13 Records of Nitrate Vulnerable Zones within 2000m of the study site:

2

The following Nitrate Vulnerable Zone records produced by DEFRA are represented as polygons on the Designated Environmentally Sensitive Sites Map:

ID	Distance (m)	Direction	NVZ Name	Data Source
10	0	On Site	Existing	DEFRA
Not shown	1839	W	Existing	DEFRA

### 8.14 Records of Green Belt land within 2000m of the study site:

0

Database searched and no data found.

# 9. Natural Hazards Findings

## 9.1 Detailed BGS GeoSure Data

BGS GeoSure Data has been searched to 50m. The data is included in tabular format. If you require further information on geology and ground stability, please obtain a **Groundsure Geo Insight**, available from our [website](#). The following information has been found:

### 9.1.1 Shrink Swell

What is the maximum Shrink-Swell\* hazard rating identified on the study site? Low

The following natural subsidence information provided by the British Geological Survey is not represented on mapping:

Hazard
Ground conditions predominantly medium plasticity. Do not plant trees with high soil moisture demands near to buildings. For new build, consideration should be given to advice published by the National House Building Council (NHBC) and the Building Research Establishment (BRE). There is a possible increase in construction cost to reduce potential shrink-swell problems. For existing property, there is a possible increase in insurance risk, especially during droughts or where vegetation with high moisture demands is present.

### 9.1.2 Landslides

What is the maximum Landslide\* hazard rating identified on the study site? Low

The following natural subsidence information provided by the British Geological Survey is not represented on mapping:

Hazard
Possibility of slope instability problems after major changes in ground conditions. Consideration should be given to stability if changes to drainage or excavations take place. Possible increase in construction cost to reduce potential slope stability problems. Existing property no significant increase in insurance risk due to natural slope instability problems.

### 9.1.3 Soluble Rocks

What is the maximum Soluble Rocks\* hazard rating identified on the study site? Negligible

The following natural subsidence information provided by the British Geological Survey is not represented on mapping:

Hazard
Soluble rocks are present, but unlikely to cause problems except under exceptional conditions. No special actions required to avoid problems due to soluble rocks. No special ground investigation required, and increased construction costs or increased financial risks are unlikely due to potential problems with soluble rocks.

\* This indicates an automatically generated 50m buffer and site.

### 9.1.4 Compressible Ground

What is the maximum Compressible Ground\* hazard rating identified on the study site?

High

The following natural subsidence information provided by the British Geological Survey is not represented on mapping:

---

**Hazard**

Very significant potential for compressibility problems. Avoid large differential loadings of ground. Do not drain or de-water ground near the property without technical advice. For new build consider possibility of compressible ground in ground investigation, construction and building design. Consider effects of groundwater changes. Construction may not be possible at economic cost. For existing property probable increase in insurance risk from compressibility especially if water conditions or loading of the ground change significantly.

---

### 9.1.5 Collapsible Rocks

What is the maximum Collapsible Rocks\* hazard rating identified on the study site?

Very Low

The following natural subsidence information provided by the British Geological Survey is not represented on mapping:

---

**Hazard**

Deposits with potential to collapse when loaded and saturated are unlikely to be present. No special ground investigation required or increased construction costs or increased financial risk due to potential problems with collapsible deposits.

---

### 9.1.6 Running Sand

What is the maximum Running Sand\*\* hazard rating identified on the study site?

Moderate

The following natural subsidence information provided by the British Geological Survey is not represented on mapping:

---

**Hazard**

Significant potential for running sand problems with relatively small changes in ground conditions. Avoid large amounts of water entering the ground (for example through pipe leakage or soak-aways). Do not dig (deep) holes into saturated ground near the property without technical advice. For new build consider the consequences of soil and groundwater conditions during and after construction. For existing property possible increase in insurance risk from running sand, for example, due to water leakage, high rainfall events or flooding.

---

## 9.2 Radon

### 9.2.1 Radon Affected Areas

Is the property in a Radon Affected Area as defined by the Health Protection Agency (HPA) and if so what percentage of homes are above the Action Level?      The property is not in a Radon Affected Area, as less than 1% of properties are above the Action Level.

---

---

\* This indicates an automatically generated 50m buffer and site.

Is the property in an area where Radon Protection are required for new properties or extensions to existing ones as described in publication BR211 by the Building Research Establishment?  No radon protective measures are necessary.

# 10. Mining

## 10.1 Coal Mining

Are there any coal mining areas within 75m of the study site? No

Database searched and no data found.

---

## 10.2 Non-Coal Mining

Are there any Non-Coal Mining areas within 50m of the study site boundary? No

Database searched and no data found.

---

## 10.3 Brine Affected Areas

Are there any brine affected areas within 75m of the study site? No  
Guidance: No Guidance Required.

---

# Overview of Findings

The Groundsure Geo Insight provides high quality geo-environmental information that allows geo-environmental professionals and their clients to make informed decisions and be forewarned of potential ground instability problems that may affect the ground investigation, foundation design and possibly remediation options that could lead to possible additional costs.

The report is based on the BGS 1:50,000 and 1:10,000 Digital Geological Map of Great Britain, BGS Geosure data; BRITPITS database; Non-coal mining data and Borehole Records, Coal Authority data including brine extraction areas, PBA non-coal mining and natural cavities database, Johnson Poole and Bloomer mining data and Groundsure's unique database including historical surface ground and underground workings.

For further details on each dataset, please refer to each individual section in the report as listed. Where the database has been searched a numerical result will be recorded. Where the database has not been searched '-' will be recorded.

## Section 1: Geology 1:10,000 Scale

1.1 Artificial Ground	1.1 Is there any Artificial Ground/ Made Ground present beneath the study site at 1:10,000 scale?	Yes
1.2 Superficial Geology and Landslips	1.2.1 Is there any Superficial Ground/Drift Geology present beneath the study site at 1:10,000 scale?*	No
	1.2.2 Are there any records of landslip within 500m of the study site boundary at 1:10,000 scale?	No
1.3 Bedrock, Solid Geology and Faults	1.3.1 For records of Bedrock and Solid Geology beneath the study site* see the detailed findings section.	
	1.3.2 Are there any records of faults within 500m of the study site boundary at 1:10,000 scale?	No

## Section 2: Geology 1:50,000 Scale

2.1 Artificial Ground	2.1.1 Is there any Artificial Ground/ Made Ground present beneath the study site?	Yes
	2.1.2 Are there any records relating to permeability of artificial ground within the study site*boundary?	Yes
2.2 Superficial Geology and Landslips	2.2.1 Is there any Superficial Ground/Drift Geology present beneath the study site?*	Yes
	2.2.2 Are there any records of permeability of superficial ground within 500m of the study site?	Yes
	2.2.3 Are there any records of landslip within 500m of the study site boundary?	No
	2.2.4 Are there any records relating to permeability of landslips within the study site* boundary?	No

## Section 2: Geology 1:50,000 Scale

### 2.3 Bedrock, Solid Geology and Faults

2.3.1 For records of Bedrock and Solid Geology beneath the study site\* see the detailed findings section.

2.3.2 Are there any records relating to permeability of bedrock ground within the study site boundary?

Yes

2.3.3 Are there any records of faults within 500m of the study site boundary?

No

## Section 3: Radon

### 3. Radon

3.1 Is the property in a Radon Affected Area as defined by the Health Protection Agency (HPA) and if so what percentage of homes are above the Action Level?

The property is not in a Radon Affected Area, as less than 1% of properties are above the Action Level.

3.2 Radon Protection

No radon protective measures are necessary.

## Section 4: Ground Workings

	On-site	0-50m	51-250	251-500	501-1000

# 1:10,000 Scale Availability

1\_10,000 Availability Legend

© Crown copyright and database rights 2017.  
 Ordnance Survey license 100035207.

# Availability of 1:10,000 Scale Geology Mapping

The following information represents the availability of the key components of the 1:10,000 scale geological data.

ID	Distance	Artificial Coverage	Superficial Coverage	Bedrock Coverage	Mass Movement Coverage
1	0.0	No deposits are mapped	No coverage	No coverage	No coverage

Guidance: The 1:10,000 scale geological interpretation is the most detailed generally available from BGS and is the scale at which most geological surveying is carried out in the field. The database is presented as four types of geology (artificial, mass movement, superficial and bedrock), although not all themes are mapped or available on every map sheet. Therefore a coverage layer showing the availability of the four themes is presented above.

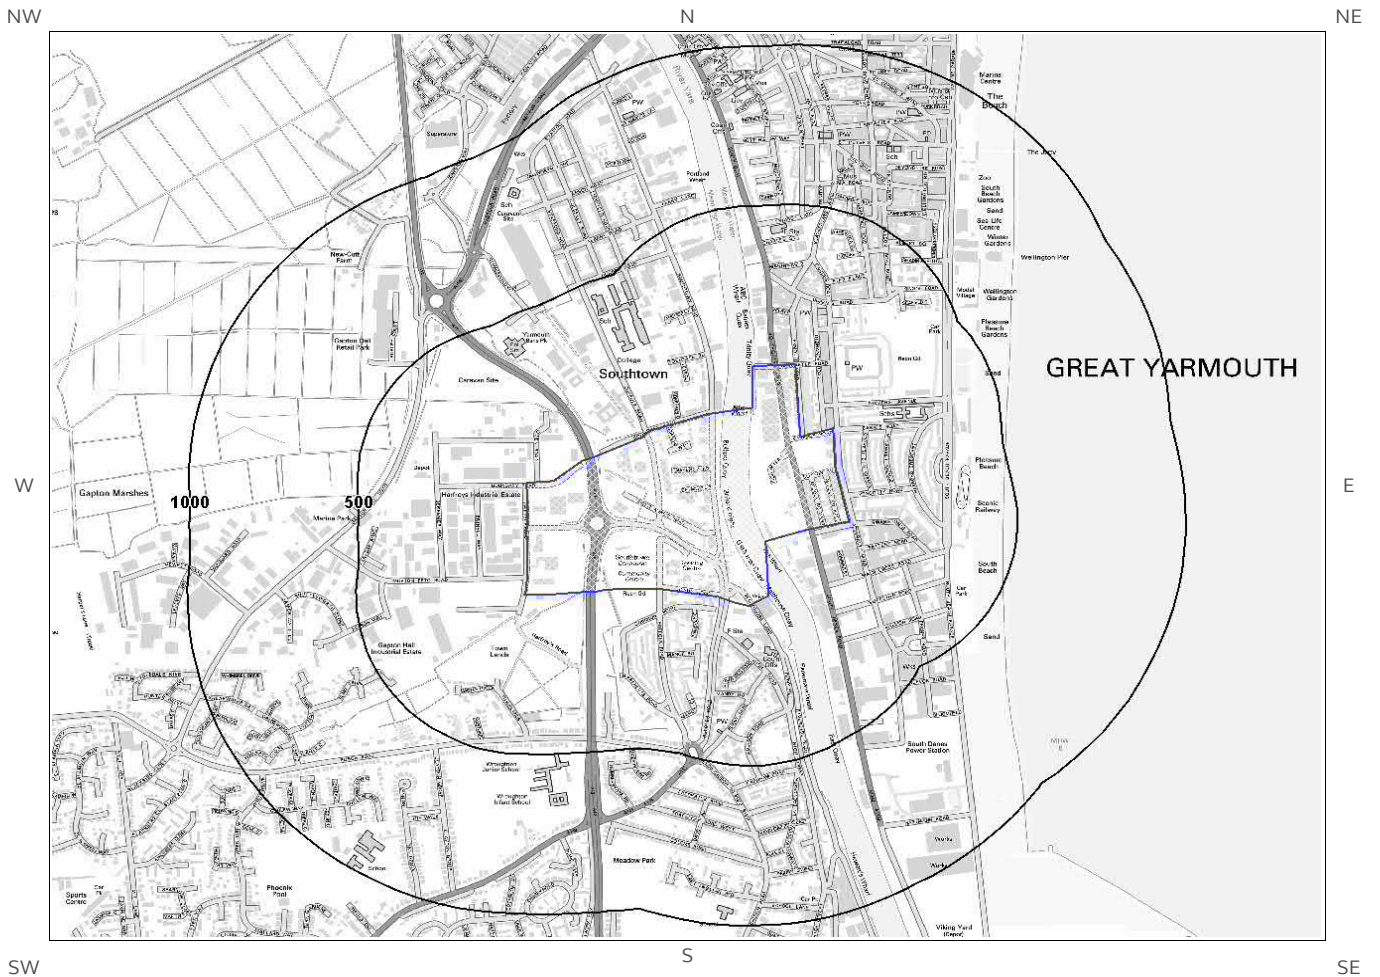

The definitions of coverage are as follows:

Geology	Full Coverage	Partial Coverage	No Coverage
Bedrock	The whole tile has been mapped	Some but not all the tile has been mapped	No coverage
Superficial	The whole tile has been mapped	Some but not all of the tile has been mapped	No coverage
Artificial	Some deposits are mapped on this tile	-	No deposits are mapped
Mass Movement	Some deposits are mapped on this tile	-	No coverage

# 1 Geology (1:10,000 scale).

# 1.1 Artificial Ground Map (1:10,000 scale)

**Artificial Ground Legend**

© Crown copyright and database rights 2017.  
Ordnance Survey license 100035207.

# 1. Geology 1:10,000 scale

## 1.1 Artificial Ground

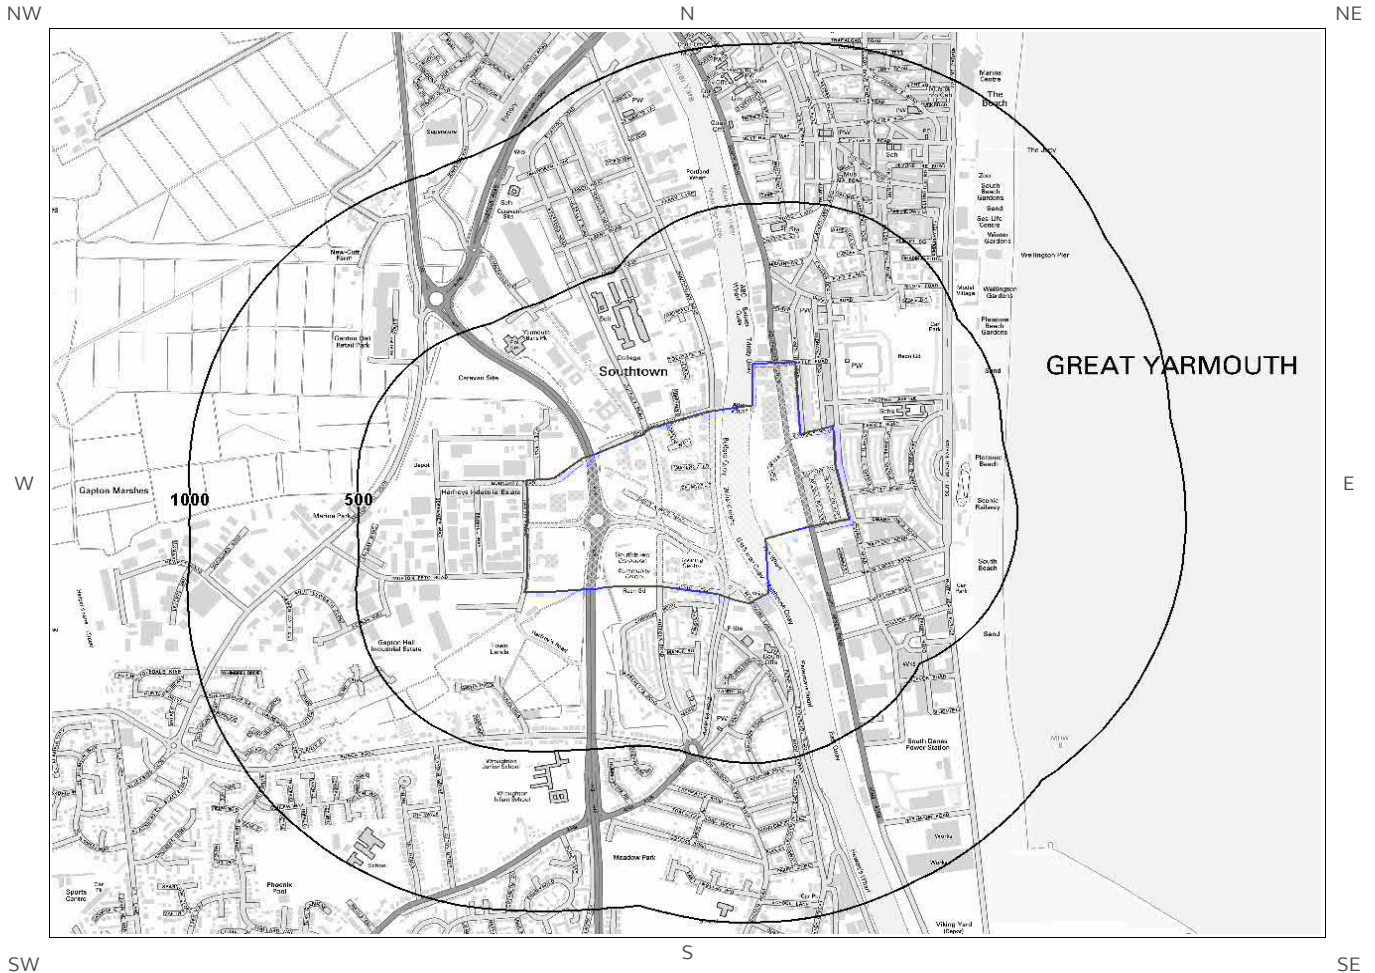

The following geological information represented on the mapping is derived from 1:10,000 scale BGS Geological mapping.

Are there any records of Artificial/ Made Ground within 500m of the study site boundary at 1:10,000 scale? No

Database searched and no data found.

---

# 1.2 Superficial Deposits and Landslips Map (1:10,000 scale)

# 1.2 Superficial Deposits and Landslips

The following geological information represented on the mapping is derived from 1:10,000 scale BGS Geological mapping

## 1.2.1 Superficial Deposits/ Drift Geology

Are there any records of Superficial Deposits/ Drift Geology within 500m of the study site boundary at 1:10,000 scale? No

Database searched and no data found.

---

## 1.2.2 Landslip

Are there any records of Landslip within 500m of the study site boundary at 1:10,000 scale? No

Database searched and no data found.

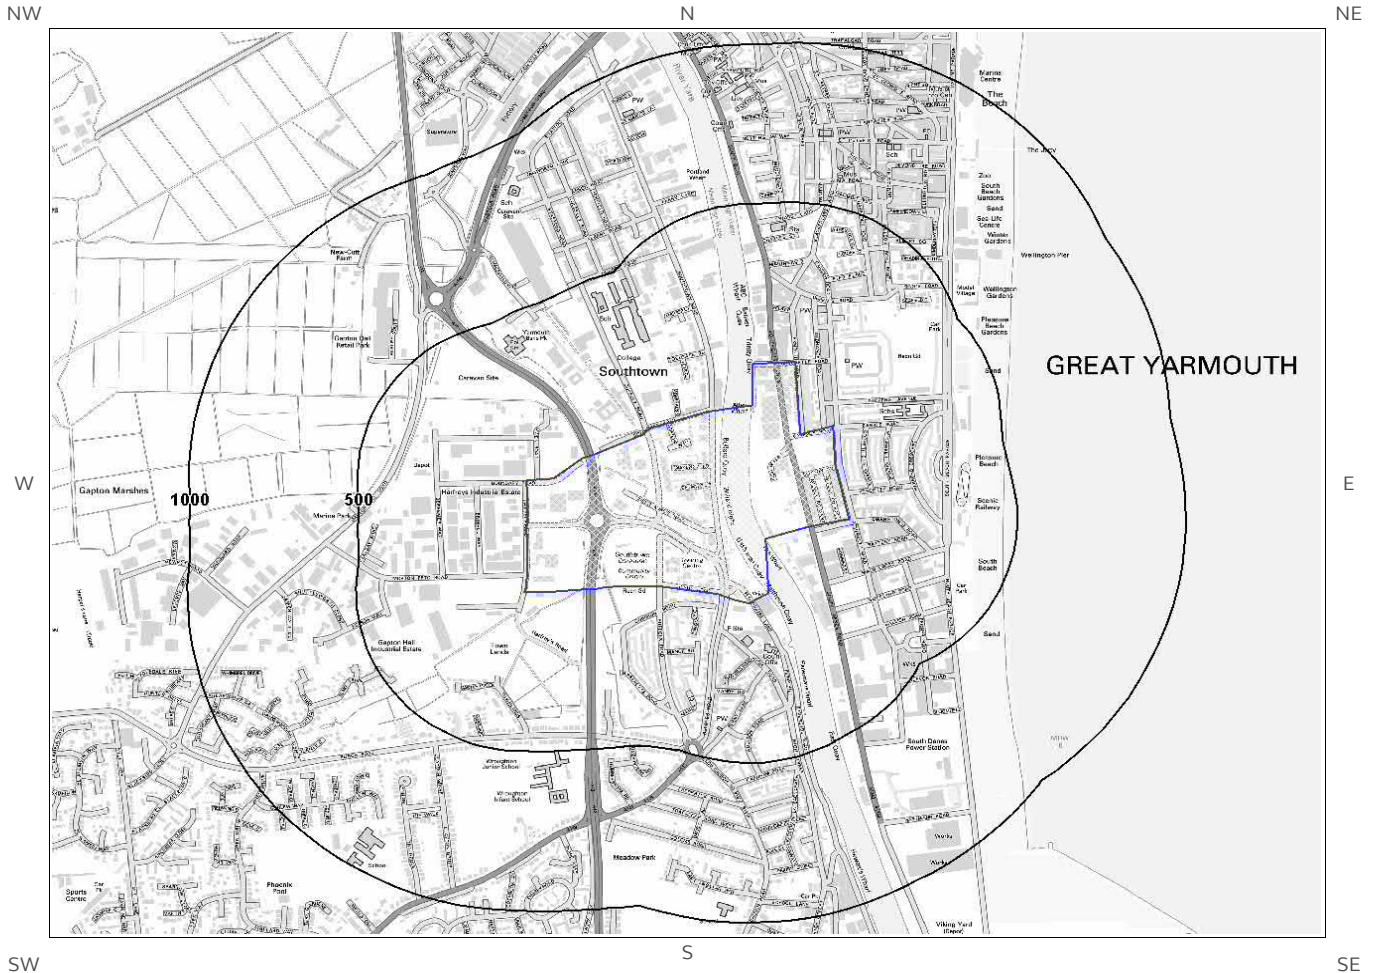

The geology map for the site and surrounding area are extracted from the BGS Digital Geological Map of Great Britain at 1:10,000 scale

This Geology shows the main components as discrete layers, these are: Artificial / Made Ground, Superficial / Drift Geology and Landslips. These are all displayed with the BGS Lexicon code for the rock unit and BGS sheet number. Not all of the main geological components have nationwide coverage.

---

# 1.3 Bedrock and Faults Map (1:10,000 scale)

**Bedrock and Faults Legend**

© Crown copyright and database rights 2017.  
Ordnance Survey license 100035207.

## 1.3 Bedrock and Faults

The following geological information represented on the mapping is derived from 1:10,000 scale BGS Geological mapping.

### 1.3.1 Bedrock/ Solid Geology

Records of Bedrock/Solid Geology within 500m of the study site boundary at 1:10,000 scale.

Database searched and no data found at this scale.

---

### 1.3.2 Faults

Are there any records of Faults within 500m of the study site boundary at 1:10,000 scale? No

Database searched and no data found at this scale.

The geology map for the site and surrounding area are extracted from the BGS Digital Geological Map of great Britain at 1:10,000 scale.

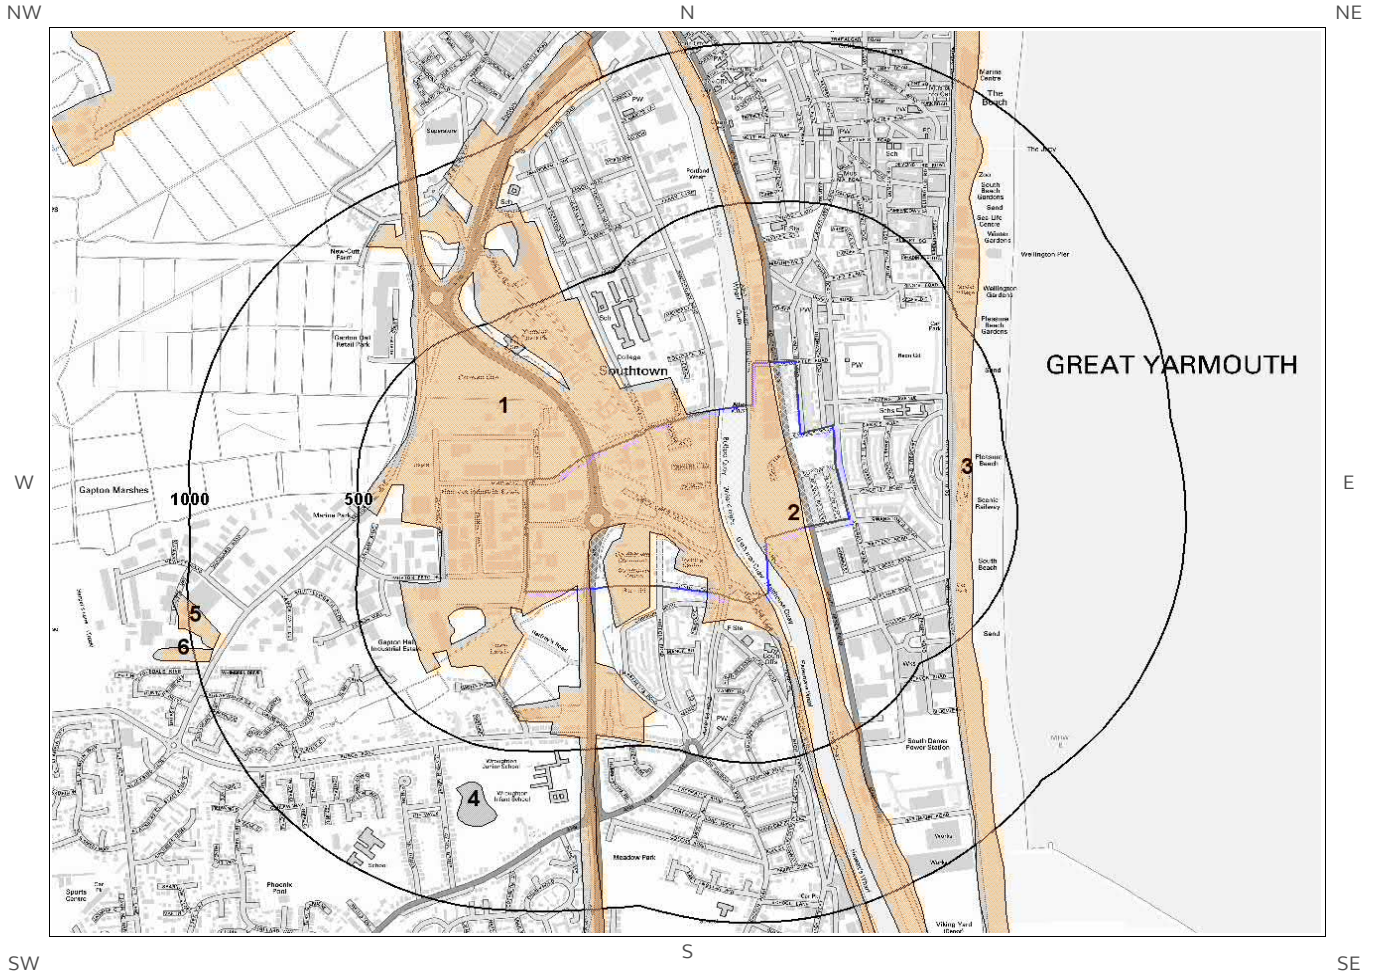

This Geology shows the main components as discrete layers, these are: Bedrock/ Solid Geology and linear features such as Faults. These are all displayed with the BGS Lexicon code for the rock unit and BGS sheet number. Not all of the main geological components have nationwide coverage.

## 2. Geology 1:50,000 scale

### 2.1 Artificial Ground

The following geological information represented on the mapping is derived from 1:50,000 scale BGS Geological mapping, Sheet No: 162

#### 2.1.1 Artificial/ Made Ground

Are there any records of Artificial/ Made Ground within 500m of the study site boundary? Yes

ID	Distance (m)	Direction	LEX Code	Description	Rock Description
1	0.0	On Site	MGR-ARTDP	MADE GROUND (UNDIVIDED)	ARTIFICIAL DEPOSIT
2	0.0	On Site	MGR-ARTDP	MADE GROUND (UNDIVIDED)	ARTIFICIAL DEPOSIT
3	300.0	E	MGR-ARTDP	MADE GROUND (UNDIVIDED)	ARTIFICIAL DEPOSIT

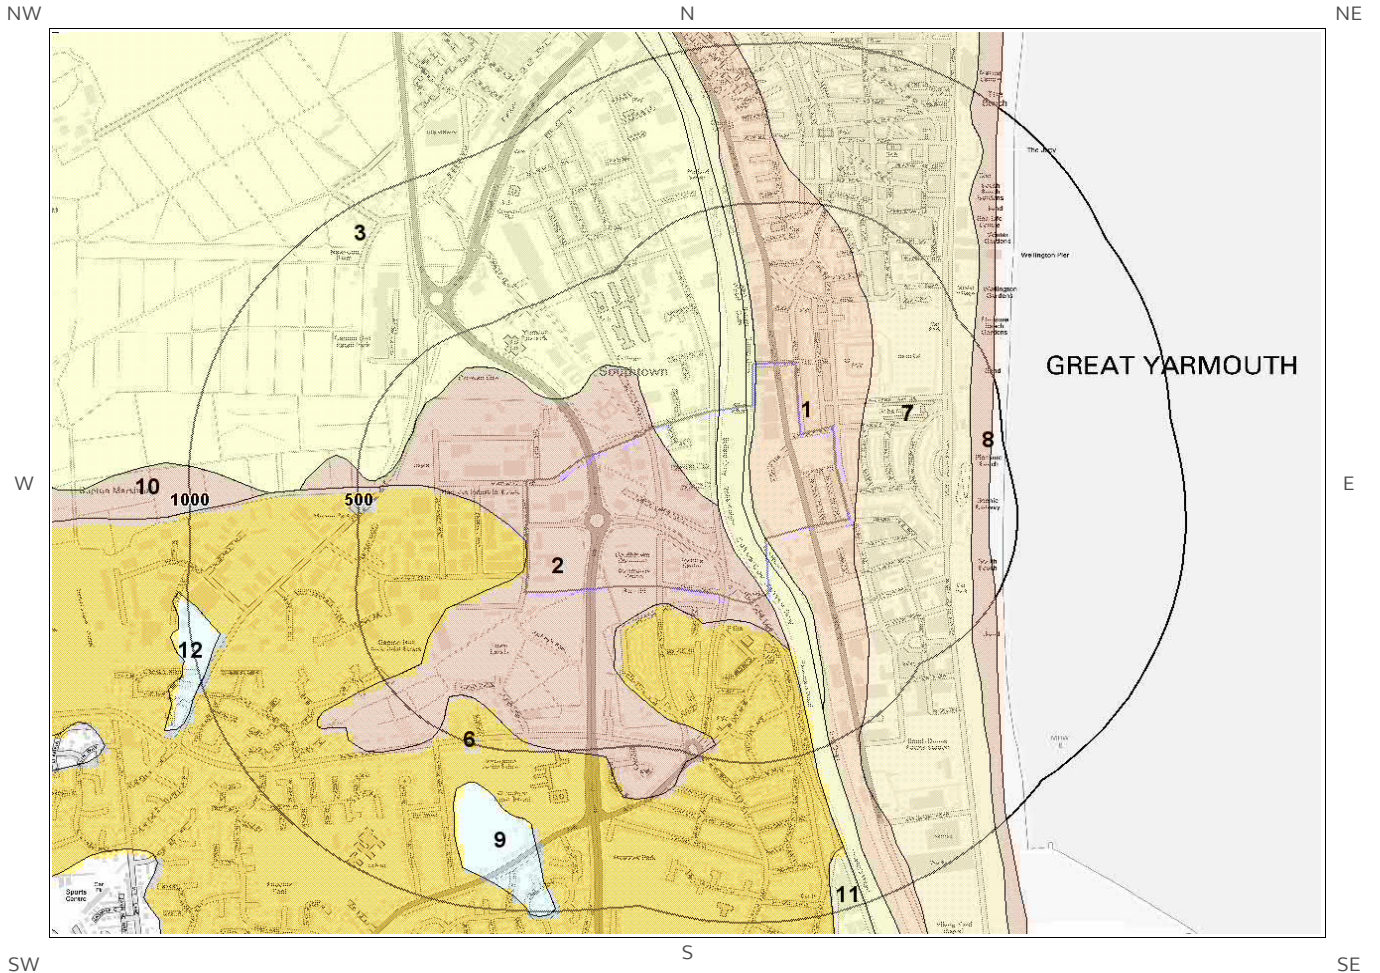

#### 2.1.2 Permeability of Artificial Ground

Are there any records relating to permeability of artificial ground within the study site boundary? Yes

Distance (m)	Direction	Flow Type	Maximum Permeability	Minimum Permeability
0.0	On Site	Mixed	Very High	Low
0.0	On Site	Mixed	Very High	Low

# 2.2 Superficial Deposits and Landslips Map (1:50,000 scale)

**Ground Workings Legend**

© Crown copyright and database rights 2017.  
Ordnance Survey license 100035207.

# 2.2 Superficial Deposits and Landslips

## 2.2.1 Superficial Deposits/ Drift Geology

Are there any records of Superficial Deposits/ Drift Geology within 500m of the study site boundary? Yes

ID	Distance	Direction	LEX Code	Description	Rock Description
1	0.0	On Site	NRD-XSV	NORTH DENES FORMATION	SAND AND GRAVEL
2	0.0	On Site	BRYD-P	BREYDON FORMATION	PEAT
3	0.0	On Site	BRYD-XCZ	BREYDON FORMATION	CLAY AND SILT
4	0.0	On Site	BRYD-XCZ	BREYDON FORMATION	CLAY AND SILT
5	0.0	On Site	TRD-XCZ	TIDAL RIVER OR CREEK DEPOSITS	CLAY AND SILT
6	3.0	W	HPGL-S	HAPPISBURGH GLACIGENIC FORMATION	SAND
7	16.0	E	BSA-S	BLOWN SAND	SAND
8	366.0	E	MBD-XSV	MARINE BEACH DEPOSITS	SAND AND GRAVEL

## 2.2.2 Permeability of Superficial Ground

Are there any records relating to permeability of superficial ground within the study site boundary? Yes

Distance (m)	Direction	Flow Type	Maximum Permeability	Minimum Permeability
0.0	On Site	Mixed	Low	Very Low
0.0	On Site	Intergranular	Low	Very Low
0.0	On Site	Mixed	Low	Very Low
0.0	On Site	Mixed	Low	Very Low
0.0	On Site	Intergranular	Very High	High
3.0	W	Intergranular	High	High
16.0	E	Intergranular	High	High

### 2.2.3 Landslip

Are there any records of Landslip within 500m of the study site boundary?

No

Database searched and no data found.

The geology map for the site and surrounding area are extracted from the BGS Digital Geological Map of Great Britain at 1:50,000 scale.

This Geology shows the main components as discrete layers, there are: Artificial/ Made Ground, Superficial/ Drift Geology and Landslips. These are all displayed with the BGS Lexicon code for the rock unit and BGS sheet number. Not all of the main geological components have nationwide coverage.

---

### 2.2.4 Landslip Permeability

Are there any records relating to permeability of landslips within the study site boundary?

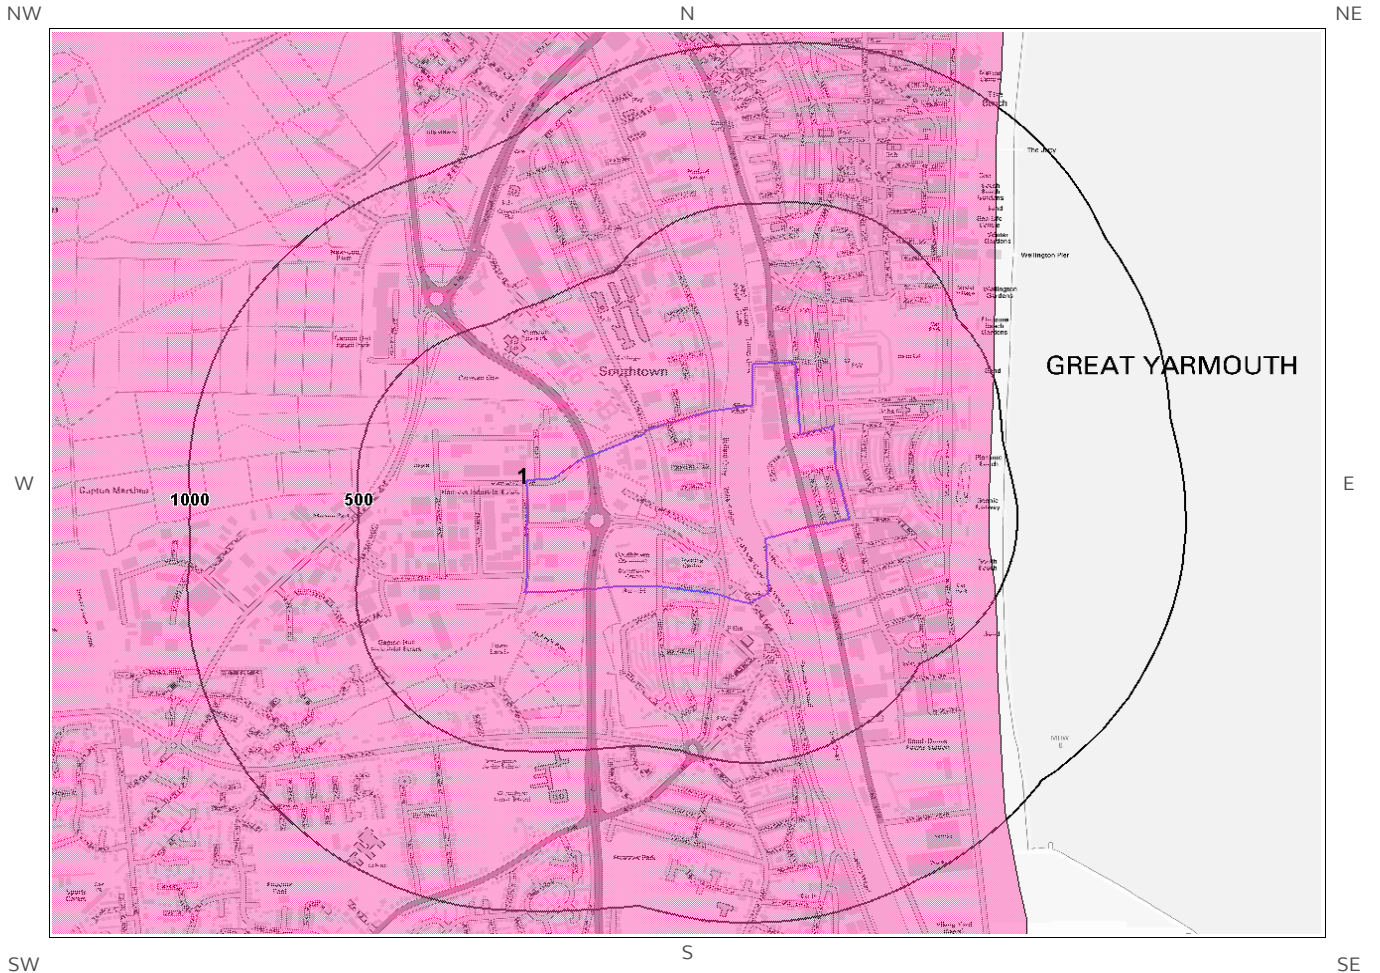

No

Database searched and no data found.

---

## 2.3 Bedrock, Solid Geology & Faults

The following geological information represented on the mapping is derived from 1:50,000 scale BGS Geological mapping, Sheet No: 162

### 2.3.1 Bedrock/Solid Geology

Records of Bedrock/Solid Geology within 500m of the study site boundary:

ID	Distance	Direction	LEX Code	Rock Description	Rock Age
1	0.0	On Site	CRAG-XSV	CRAG GROUP - SAND AND GRAVEL	-

### 2.3.2 Permeability of Bedrock Ground

Are there any records relating to permeability of bedrock ground within the study site boundary? Yes

Distance	Direction	Flow Type	Maximum Permeability	Minimum Permeability
0.0	On Site	Intergranular	Very High	High

### 2.3.3 Faults

Are there any records of Faults within 500m of the study site boundary? No

Database searched and no data found.

The geology map for the site and surrounding area are extracted from the BGS Digital Geological Map of Great Britain at 1:50,000 scale.

This Geology shows the main components as discrete layers, these are: Bedrock/Solid Geology and linear features such as Faults. These are all displayed with the BGS Lexicon code for the rock unit and BGS sheet number. Not all of the main geological components have nation wide coverage.

# 3 Radon Data

## 3.1 Radon Affected Areas

Is the property in a Radon Affected Area as defined by the Health Protection Agency (HPA) and if so what percentage of homes are above the Action Level?      The property is not in a Radon Affected Area, as less than 1% of properties are above the Action Level.

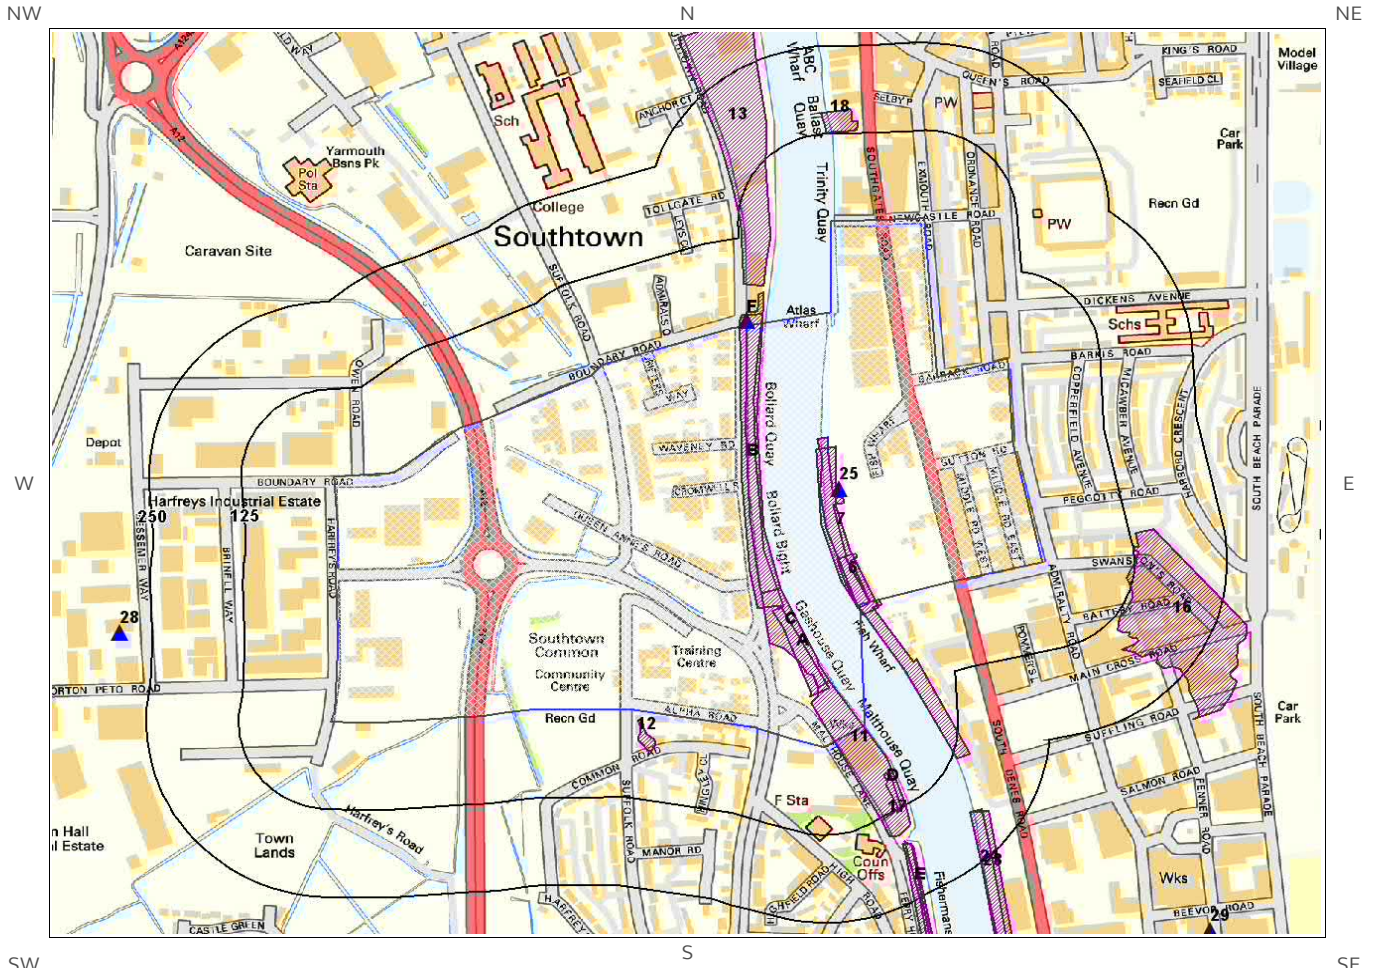

---

## 3.2 Radon Protection

Is the property in an area where Radon Protection are required for new properties or extensions to existing ones as described in publication BR211 by the Building Research Establishment?      No radon protective measures are necessary.

---

21E	172.0	SE	652636 305385	Quay	1904

ID	Distance (m)	Direction	NGR	Use	Date
22E	172.0	SE	652636 305385	Quay	1946
23	188.0	SE	652776 305268	Quay	1952
24	188.0	SE	652742 305367	Quay	1978

## 4.2 Historical Underground Working Features derived from Historical Mapping

This data is derived from the Groundsure unique Historical Land Use Database. It contains data derived from 1:10,000 and 1:10,560 historical Ordnance Survey Mapping and includes some natural topographical features (Shake Holes for example) as well as manmade features that may have implications for ground stability. Underground and mining features have been identified from surface features such as shafts. The distance that these extend underground is not shown.

Are there any Historical Underground Working Features within 1000m of the study site boundary? No

Database searched and no data found.

## 4.3 Current Ground Workings

This dataset is derived from the BGS BRITPITS database covering active; inactive mines; quarries; oil wells; gas wells and mineral wharves; and rail deposits throughout the British Isles.

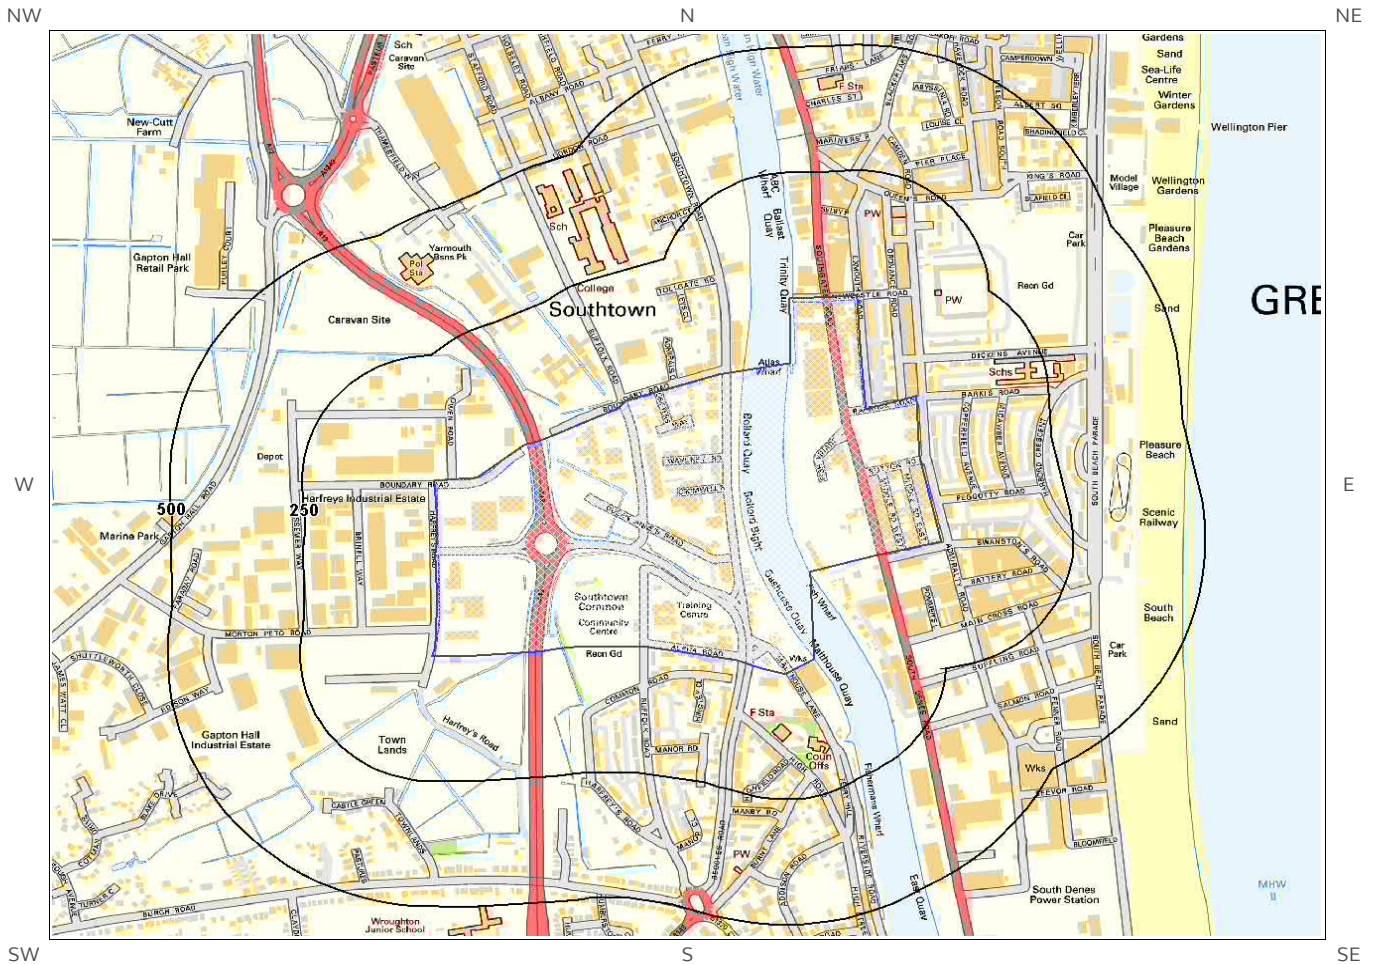

Are there any BGS Current Ground Workings within 1000m of the study site boundary? Yes

The following Current Ground Workings information is provided by British Geological Survey:

ID	Distance (m)	Direction	NGR	Commodity Produced	Pit Name	Type of working	Status
25	0.0	On Site	652525 305995	Crushed Rock	Berth 4 Great Yarmouth Docks	Sea, river or canal wharf where mineral commodities are unloaded and stored	Active
26F	6.0	N	652400 306235	Crushed Rock	Great Yarmouth Wharf	Sea, river or canal wharf where mineral commodities are unloaded and stored	Inactive
27F	6.0	N	652400 306235	Secondary	Great Yarmouth Wharf	Sea, river or canal wharf where mineral commodities are unloaded and stored	Inactive
28	294.0	W	651553 305790	Sand & Gravel	Harfrey's Farm Pit	A surface mineral working. It may be termed Quarry, Sand Pit, Clay Pit or Opencast Coal Site	Ceased
29	549.0	SE	653026 305365	Sand	Nelson Sand Pit	A surface mineral working. It may be termed Quarry, Sand Pit, Clay Pit or Opencast Coal Site	Ceased
Not shown	686.0	S	651666 304999	Clay & Shale	Lilypit Cottage Pit	A surface mineral working. It may be termed Quarry, Sand Pit, Clay Pit or Opencast Coal Site	Ceased
Not shown	766.0	S	651860 304897	Clay & Shale	Lily Pit	A surface mineral working. It may be termed Quarry, Sand Pit, Clay Pit or Opencast Coal Site	Ceased
Not shown	911.0	N	652250 307250	Secondary	Yeoman Wharf	Sea, river or canal wharf where mineral commodities are unloaded and stored	Active

# 5 Mining, Extraction & Natural Cavities Map

Mining, Extraction and Natural Cavities Legend

© Crown copyright and database rights 2017.  
Ordnance Survey license 100035207.

# 5 Mining, Extraction & Natural Cavities

## 5.1 Historical Mining

This dataset is derived from Groundsure unique Historical Land-use Database that are indicative of mining or extraction activities.

Are there any Historical Mining areas within 1000m of the study site boundary? No

Database searched and no data found.

---

## 5.2 Coal Mining

This dataset provides information as to whether the study site lies within a known coal mining affected area as defined by the coal authority.

Are there any Coal Mining areas within 1000m of the study site boundary? No

Database searched and no data found.

---

## 5.3 Johnson Poole and Bloomer

This dataset provides information as to whether the study site lies within an area where JPB hold information relating to mining.

Are there any JPB Mining areas within 1000m of the study site boundary? No

The following information provided by JPB is not represented on mapping: Database searched and no data found.

---

## 5.4 Non-Coal Mining

This dataset provides information as to whether the study site lies within an area which may have been subject to non-coal historic mining.

Are there any Non-Coal Mining areas within 1000m of the study site boundary? No

Database searched and no data found.

---

## 5.5 Non-Coal Mining Cavities

This dataset provides information from the Peter Brett Associates (PBA) mining cavities database (compiled for the national study entitled “Review of mining instability in Great Britain, 1990” PBA has also continued adding to this database) on mineral extraction by mining.

Are there any Non-Coal Mining cavities within 1000m of the study site boundary? No

Database searched and no data found.

---

## 5.6 Natural Cavities

This dataset provides information based on Peter Brett Associates natural cavities database.

Are there any Natural Cavities within 1000m of the study site boundary? No

Database searched and no data found.

---

## 5.7 Brine Extraction

This data provides information from the Coal Authority issued on behalf of the Cheshire Brine Subsidence Compensation Board.

Are there any Brine Extraction areas within 1000m of the study site boundary? No

Database searched and no data found.

---

## 5.8 Gypsum Extraction

This dataset provides information on Gypsum extraction from British Gypsum records.

Are there any Gypsum Extraction areas within 1000m of the study site boundary? No

Database searched and no data found.

---

## 5.9 Tin Mining

This dataset provides information on tin mining areas and is derived from tin mining records. This search is based upon postcode information to a sector level..

Are there any Tin Mining areas within 1000m of the study site boundary? No

Database searched and no data found.

---

This dataset provides information on Kaolin and Ball Clay mining from relevant mining records.

Are there any Clay Mining areas within 1000m of the study site boundary?

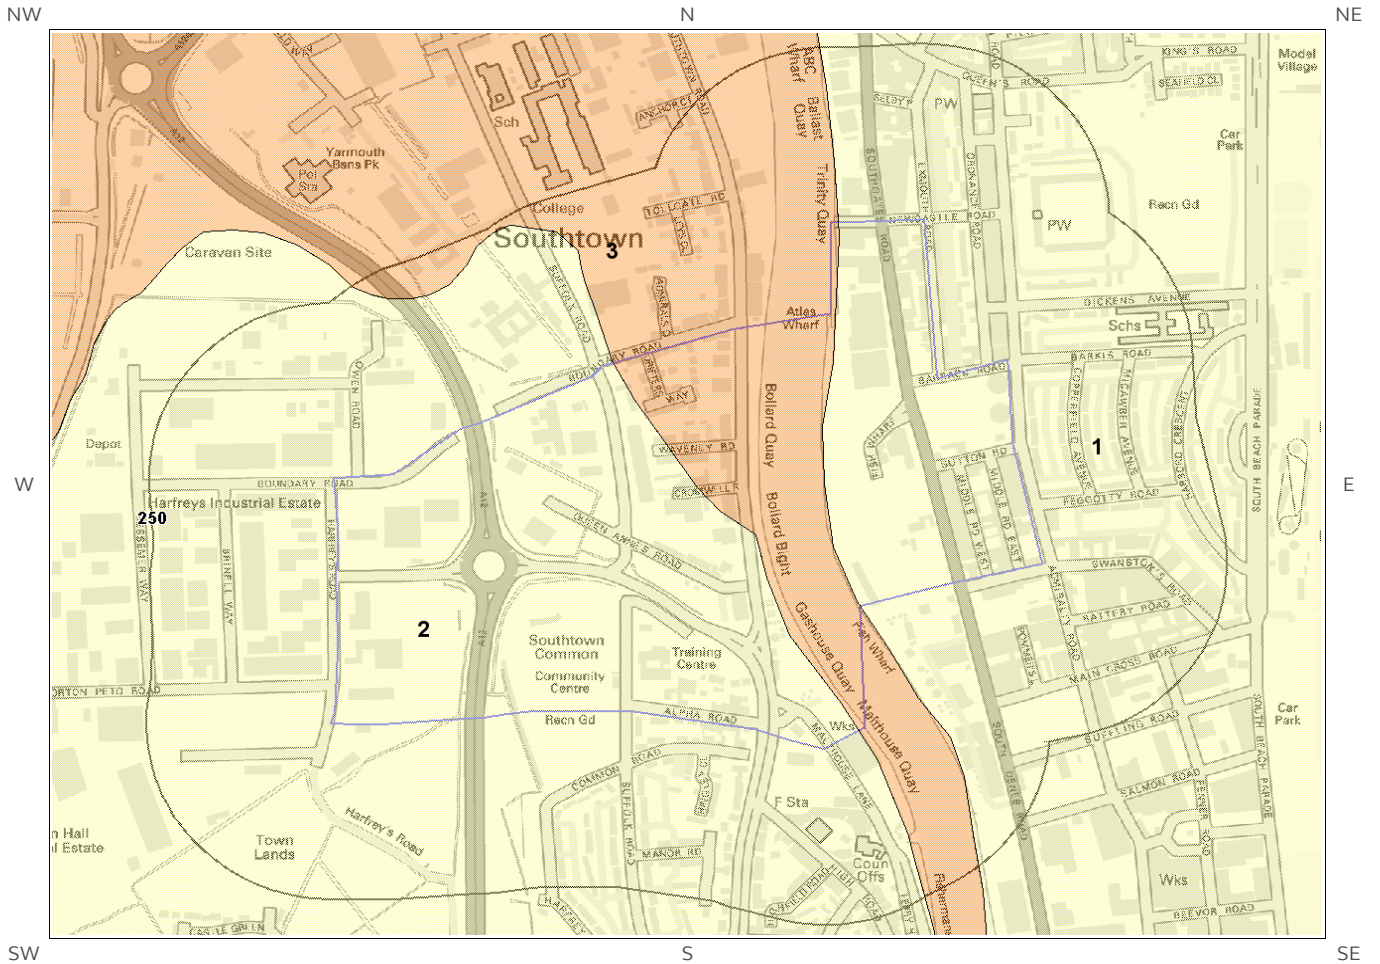

No

Database searched and no data found.

---

# 6 Natural Ground Subsidence

The National Ground Subsidence rating is obtained through the 6 natural ground stability hazard datasets, which are supplied by the British Geological Survey (BGS).

The following GeoSure data represented on the mapping is derived from the BGS Digital Geological map of Great Britain at 1:50,000 scale.

What is the maximum hazard rating of natural subsidence within the study site\*\* boundary? High

## 6.1 Shrink-Swell Clays

The following Shrink Swell information provided by the British Geological Survey:

ID	Distance (m)	Direction	Hazard Rating	Details
1	0.0	On Site	Negligible	Ground conditions predominantly non-plastic. No special actions required to avoid problems due to shrink-swell clays. No special ground investigation required, and increased construction costs or increased financial risks are unlikely likely due to potential problems with shrink-swell clays.
2	0.0	On Site	Negligible	Ground conditions predominantly non-plastic. No special actions required to avoid problems due to shrink-swell clays. No special ground investigation required, and increased construction costs or increased financial risks are unlikely likely due to potential problems with shrink-swell clays.
3	0.0	On Site	Low	Ground conditions predominantly medium plasticity. Do not plant trees with high soil moisture demands near to buildings. For new build, consideration should be given to advice published by the National House Building Council (NHBC) and the Building Research Establishment (BRE). There is a possible increase in construction cost to reduce potential shrink-swell problems. For existing property, there is a possible increase in insurance risk, especially during droughts or where vegetation with high moisture demands is present.

\* This includes an automatically generated 50m buffer zone around the site

The following Landslides information provided by the British Geological Survey:

ID	Distance (m)	Direction	Hazard Rating	Details
1	0.0	On Site	Very Low	Slope instability problems are unlikely to be present. No special actions required to avoid problems due to landslides. No special ground investigation required, and increased construction costs or increased financial risks are unlikely due to potential problems with landslides.
2	16.0	E	Low	Possibility of slope instability problems after major changes in ground conditions. Consideration should be given to stability if changes to drainage or excavations take place. Possible increase in construction cost to reduce potential slope stability problems. Existing property - no significant increase in insurance risk due to natural slope instability problems.

### 6.3 Ground Dissolution of Soluble Rocks

The following Ground Dissolution information provided by the British Geological Survey:

ID	Distance (m)	Direction	Hazard Rating	Details
1	0.0	On Site	Negligible	Soluble rocks are present, but unlikely to cause problems except under exceptional conditions. No special actions required to avoid problems due to soluble rocks. No special ground investigation required, and increased construction costs or increased financial risks are unlikely due to potential problems with soluble rocks.

### 6.4 Compressible Deposits

The following Compressible Deposits information provided by the British Geological Survey:

ID	Distance (m)	Direction	Hazard Rating	Details
1	0.0	On Site	Very Low	Very low potential for compressible deposits to be present. No special actions required to avoid problems due to compressible deposits. No special ground investigation required, and increased construction costs or increased financial risks are unlikely due to potential problems with compressible deposits.
2	0.0	On Site	Very Low	Very low potential for compressible deposits to be present. No special actions required to avoid problems due to compressible deposits. No special ground investigation required, and increased construction costs or increased financial risks are unlikely due to potential problems with compressible deposits.
3	0.0	On Site	Moderate	Significant potential for compressibility problems. Avoid large differential loadings of ground. Do not drain or de-water ground near the property without technical advice. For new build - consider possibility of compressible ground in ground investigation, construction and building design. Consider effects of groundwater changes. Extra construction costs are likely. For existing property - possible increase in insurance risk from compressibility, especially if water conditions or loading of the ground change significantly.

ID	Distance (m)	Direction	Hazard Rating	Details
4	0.0	On Site	Negligible	No indicators for compressible deposits identified. No special actions required to avoid problems due to compressible deposits. No special ground investigation required, and increased construction costs or increased financial risks are unlikely due to potential problems with compressible deposits.
5	0.0	On Site	High	Very significant potential for compressibility problems. Avoid large differential loadings of ground. Do not drain or de-water ground near the property without technical advice. For new build - consider possibility of compressible ground in ground investigation, construction and building design. Consider effects of groundwater changes. Construction may not be possible at economic cost. For existing property - probable increase in insurance risk from compressibility especially if water conditions or loading of the ground change significantly.
6	0.0	On Site	High	Very significant potential for compressibility problems. Avoid large differential loadings of ground. Do not drain or de-water ground near the property without technical advice. For new build - consider possibility of compressible ground in ground investigation, construction and building design. Consider effects of groundwater changes. Construction may not be possible at economic cost. For existing property - probable increase in insurance risk from compressibility especially if water conditions or loading of the ground change significantly.
7	0.0	On Site	High	Very significant potential for compressibility problems. Avoid large differential loadings of ground. Do not drain or de-water ground near the property without technical advice. For new build - consider possibility of compressible ground in ground investigation, construction and building design. Consider effects of groundwater changes. Construction may not be possible at economic cost. For existing property - probable increase in insurance risk from compressibility especially if water conditions or loading of the ground change significantly.
8	50.0	S	Negligible	No indicators for compressible deposits identified. No special actions required to avoid problems due to compressible deposits. No special ground investigation required, and increased construction costs or increased financial risks are unlikely due to potential problems with compressible deposits.

## 6.5 Collapsible Deposits

The following Collapsible Rocks information provided by the British Geological Survey:

ID	Distance (m)	Direction	Hazard Rating	Details
1	0.0	On Site	Negligible	No indicators for collapsible deposits identified. No actions required to avoid problems due to collapsible deposits. No special ground investigation required, or increased construction costs or increased financial risk due to potential problems with collapsible deposits.
2	3.0	W	Very Low	Deposits with potential to collapse when loaded and saturated are unlikely to be present. No special ground investigation required or increased construction costs or increased financial risk due to potential problems with collapsible deposits.

## 6.6 Running Sands

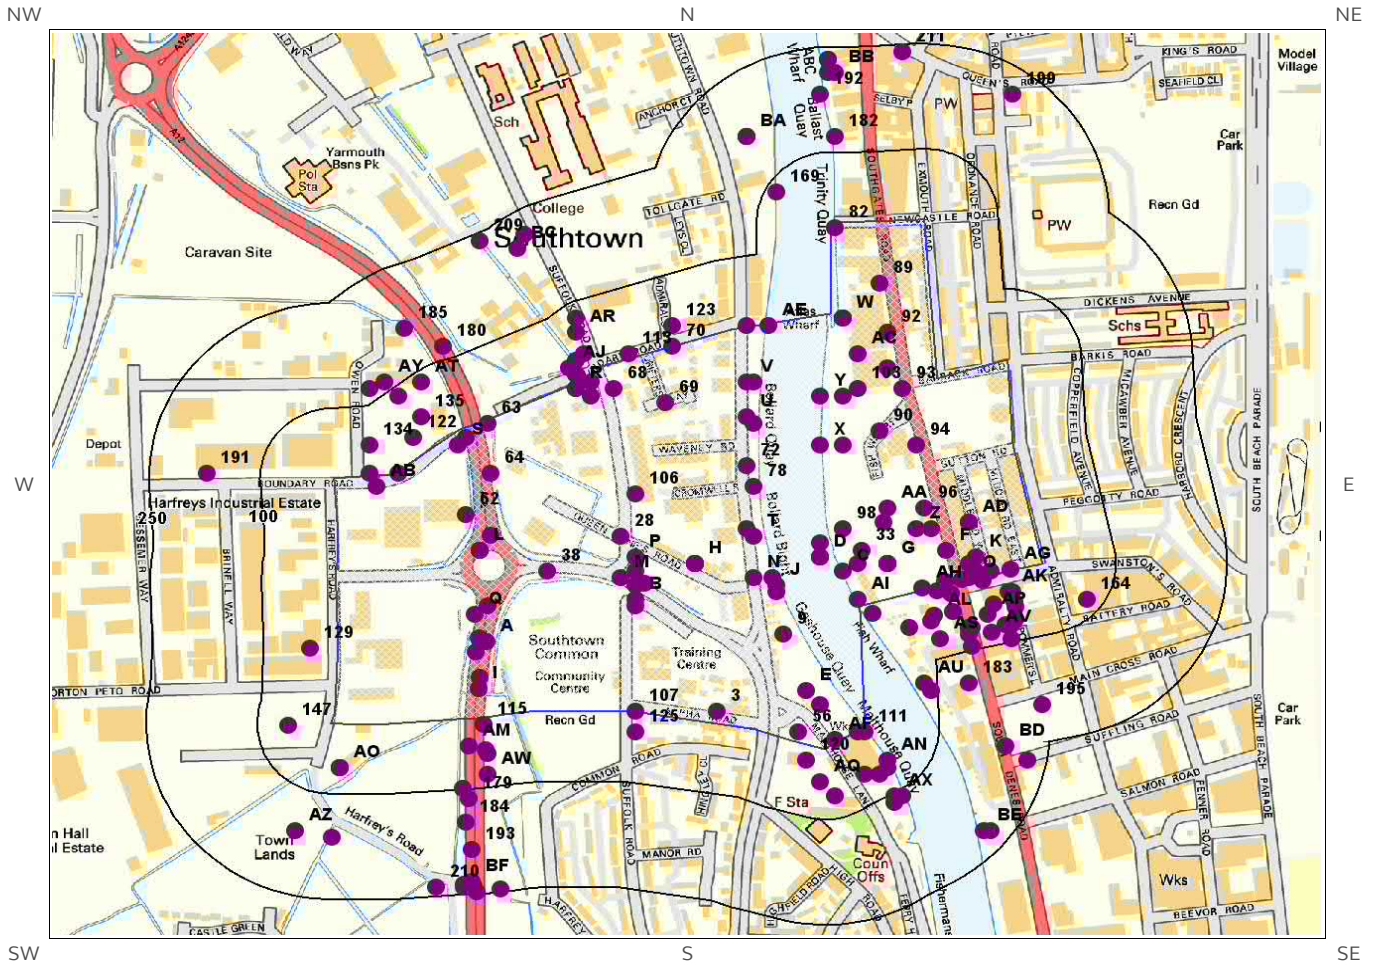

The following Running Sands information provided by the British Geological Survey:

ID	Distance (m)	Direction	Hazard Rating	Details
1	0.0	On Site	Very Low	Very low potential for running sand problems if water table rises or if sandy strata are exposed to water. No special actions required, to avoid problems due to running sand. No special ground investigation required, and increased construction costs or increased financial risks are unlikely due to potential problems with running sand.

ID	Distance (m)	Direction	Hazard Rating	Details
2	0.0	On Site	Very Low	Very low potential for running sand problems if water table rises or if sandy strata are exposed to water. No special actions required, to avoid problems due to running sand. No special ground investigation required, and increased construction costs or increased financial risks are unlikely due to potential problems with running sand.
3	0.0	On Site	Moderate	Significant potential for running sand problems with relatively small changes in ground conditions. Avoid large amounts of water entering the ground (for example through pipe leakage or soak-aways). Do not dig (deep) holes into saturated ground near the property without technical advice. For new build - consider the consequences of soil and groundwater conditions during and after construction. For existing property - possible increase in insurance risk from running sand, for example, due to water leakage, high rainfall events or flooding.
4	1.0	N	Negligible	No indicators for running sand identified. No special actions required to avoid problems due to running sand. No special ground investigation required, and increased construction costs or increased financial risks are unlikely due to potential problems with running sand.
5	16.0	E	Low	Possibility of running sand problems after major changes in ground conditions. Normal maintenance to avoid leakage of water-bearing services or water bodies (ponds, swimming pools) should reduce likelihood of problems due to running sand. For new build - consider possibility of running sand into trenches or excavations if water table is high or sandy strata are exposed to water. Avoid concentrated water inputs to site. Unlikely to be an increase in construction costs due to potential for running sand. For existing property - no significant increase in insurance risk due to running sand problems is likely.
6	50.0	S	Low	Possibility of running sand problems after major changes in ground conditions. Normal maintenance to avoid leakage of water-bearing services or water bodies (ponds, swimming pools) should reduce likelihood of problems due to running sand. For new build - consider possibility of running sand into trenches or excavations if water table is high or sandy strata are exposed to water. Avoid concentrated water inputs to site. Unlikely to be an increase in construction costs due to potential for running sand. For existing property - no significant increase in insurance risk due to running sand problems is likely.

# 9 Railways and Tunnels

## 9.1 Tunnels

This data is derived from OpenStreetMap and provides information on the possible locations of underground railway systems in the UK - the London Underground, the Tyne & Wear Metro and the Glasgow Subway.

Have any underground railway lines been identified within the study site boundary? No

Have any underground railway lines been identified within 250m of the study site boundary? No

Database searched and no data found.

*Any records that have been identified are represented on the Railways and Tunnels Map.*

---

This data is derived from Ordnance Survey mapping and provides information on the possible locations of railway tunnels forming part of the UK overground railway network.

Have any other railway tunnels been identified within the site boundary? No

Have any other railway tunnels been identified within 250m of the site boundary? No

Database searched and no data found.

*Any records that have been identified are represented on the Railways and Tunnels Map.*

---

## 9.2 Historical Railway and Tunnel Features

This data is derived from Groundsure's unique Historical Land-use Database and contains features relating to tunnels, railway tracks or associated works that have been identified from historical Ordnance Survey mapping.

Have any historical railway or tunnel features been identified within the study site boundary? Yes

Have any historical railway or tunnel features been identified within 250m of the study site boundary? Yes

*Any records that have been identified are represented on the Railways and Tunnels Map.*

### 9.3 Historical Railways

This data is derived from OpenStreetMap and provides information on the possible alignments of abandoned or dismantled railway lines in proximity to the study site.

Have any historical railway lines been identified within the study site boundary? Yes

Have any historical railway lines been identified within 250m of the study site boundary? Yes

Distance (m)	Direction	Status
0	On Site	Abandoned
0	On Site	Abandoned
0	On Site	Dismantled

Multiple sections of the same track may be listed in the detail above  
*Any records that have been identified are represented on the Railways and Tunnels Map.*

### 9.4 Active Railways

These datasets are derived from Ordnance Survey mapping and OpenStreetMap and provide information on the possible locations of active railway lines in proximity to the study site.

Have any active railway lines been identified within the study site boundary? No

Have any active railway lines been identified within 250m of the study site boundary? No

Database searched and no data found.

Multiple sections of the same track may be listed in the detail above  
*Any records that have been identified are represented on the Railways and Tunnels Map.*

### 9.5 Railway Projects

These datasets provide information on the location of large scale railway projects High Speed 2 and Crossrail 1 .

Is the study site within 5km of the route of the High Speed 2 rail project? No

Is the study site within 500m of the route of the Crossrail 1 rail project? No

*Further information on proximity to these routes, the project construction status and associated works can be obtained through the purchase of a Groundsure HS2 and Crossrail 1 Report.*

The route data has been digitised from publicly available maps by Groundsure. The route as provided relates to the Crossrail 1 project only, and does not include any details of the Crossrail 2 project, as final details of the route for Crossrail 2 are still under consultation.

Please note that this assessment takes account of both the original Phase 2b proposed route and the amended route proposed in 2016. As the Phase 2b route is still under consultation, Groundsure are providing information on both options until the final route is formally confirmed. Practitioners should take account of this uncertainty when advising clients.

## Annex C: Site History

---

Map	Scale.	On Site	Off Site
1958	1:10,560	No significant changes.	No significant changes.
1958	1:2,500	No significant changes.	No significant changes.
1965	1:2,500	Partial coverage. Fish canning factories labelled in the eastern area waterfront.	No significant changes.
1963-1968	1:2,500	In the eastern area, a haulage depot is marked adjacent to the gas works and one of the fish curing factories is now labelled as a chemical factory. In the western area, the shoe factory is partly labelled as a printing and music publishing works.	No significant changes.
1966-1968	1:1,250 / 1:2,000	Along the northern boundary, three garages are marked.	No significant changes.
1970-1975	1:1,250 / 1:2,000	A builders merchants is marked towards the north west corner.	An oil pipeline construction depot is marked close to the north west corner.
1975-1977	1:1,250 / 1:2,000	The two gas holders on the southern boundary gasworks are no longer marked and the site is labelled as a depot.	No significant changes.
1976-1981	1:1,250 / 1:2,000	No significant changes.	No significant changes.
1978	1:10,000	Former boat building yard in the east area is now developed as a warehouse. The gasworks in the west area adjacent to the River Yare is no longer marked but one gas holder is marked nearby. Factory and works have been developed on the western boundary. The railway line towards the western boundary is marked as dismantled.	The hospital has been renamed St Nicholas Hospital. Significant development in most directions; – to the south east development appears to be commercial industrial; to the north a school and depots are now marked and the saw mill is now labelled as a timber shed; to the west a large number of commercial / industrial buildings and now marked with three labelled as warehouses. The railway to the north and south is labelled as dismantled.
1975-1978	1:1,250 / 1:1,2000	Precast concrete works labelled in the north west corner of the site.	At this scale, the commercial / industrial buildings are labelled as factory, warehouse, works, store, workshop and depot. No further indication of use is provided. A works adjacent to the north west corner of the site includes a number of tanks.
1984-1986	1:1,250 / 1:1,2000	No significant changes.	Two large tanks are marked close to the southern boundary of the eastern area.
1988	1:10,000	Some layout changes have occurred in the eastern area and three depots are labelled. Two gas holders are still marked. In the western area, the route of the railway is being developed as a dual carriageway and the large roundabout currently in the centre of the site is marked including the spur roads off to the east and west. Formal gardens are now marked as a recreation ground but do also include an adult training centre.	The commercial / industrial buildings to the west are labelled as Harfreys Industrial Estate and the depots to the north are now marked as Yarmouth Business Park. A dual carriageway follows the route of the former railway offsite to the north west.

## Annex D: Zetica UXO Risk

# BOMB MAP USERS' GUIDE

## Sources of information and explanation of bomb risk

### Why?

Unexploded bombs (UXB) still present a risk to construction projects long after the end of the Second World War (WWII). UXBs often entered the ground unnoticed at high velocity and penetrated to a depth of several metres. Here they remain – vulnerable to disturbances from construction work. Beyond the depth of shallow excavation work, the greatest risk is to piling, drilling and probing crews. A piling rig could repeatedly hit a UXBs with considerable force before the crew realises an obstruction has been impacted. It could then be up to 72 hours before the detonator activates.

### Who?

The responsibility for avoiding UXB risk usually lies with construction companies or house builders particularly those who are redeveloping urban sites. In addition, project engineering or environmental consultants are expected to advise their clients of a site's history. Other interested parties include those organisations whose employees are physically at most risk from intrusive works, normally piling companies, drillers or probing operators.

### How?

UXB risk should be assessed for every site, but especially those in known heavily bombed areas or those situated near war-time strategic installations that were priority targets for enemy aircraft, for example, airfields. Zetica's regional bomb risk map is therefore a first point of reference from which the relative, potential abundance of UXBs can be judged. Consultants then advise their clients that an ordnance-risk desk study is required, which they may obtain from external sources. Construction companies or house builders who assess their own risk could choose to come direct to Zetica.

### When?

Do not wait for the piling or drilling company to be on site before thinking about UXB risk – it will inevitably cause delays and higher costs. Request the regional bomb risk map from Zetica as soon as a site is being considered, and then use it to help you or your clients to decide if an ordnance-risk desk study is required.

### Where?

Maps can be obtained for any county in England, Scotland, Wales or Northern Ireland – or for any London borough. They can help determine the areas that were most heavily bombed – but no part of the country should be considered 100% safe from UXB risk. Even remote rural areas can have a high risk if, for example, they were locations for decoy airfields or beacons that were lit to fool enemy pilots into thinking they had located a burning city that had been successfully hit by others in the raid.

### How to use this regional map

This map is designed to give you an indication of the potential risk from UXBs in your area. If you are conducting work that involves excavation, piling or other disturbance of the ground, then you should use the map to identify the category of risk for your site.

The risk boundaries are a guide, compiled from data based on the political areas for which records are held; being just outside a high-risk area does not mean there is no UXB risk. You should use the map to assist in your decision of whether to investigate the UXB risk further.

### Information on the regional risk remaining from UXBs in the UK

Zetica has built the largest UXB database of its kind in the UK. It includes a unique digital library of bomb census data, and maps showing key strategic points and bombing densities from the First and Second World Wars. The main sources of information include records from central government (Public Records Office), the Ministry of Defence, and the German Luftwaffe.

Using information from this database, Zetica has published maps of UXB risk on a regional, county and borough scale. The maps indicate relative degrees of UXB risk based on available records for bombing densities and known targeted areas for regions within the UK. The risk is broken down into individual boroughs, towns or cities. The data are based on the historical boroughs and are then overlaid onto the modern map. It is important to note that more-detailed research may be required for individual sites, particularly where proximity to a potential WWII target means the local risk may be higher.

### High risk

Areas designated as high risk are those that show a high density of bombing hits (50+ bombs per 1000 acres) and abundant potential WWII targets. In high-risk regions, further action to mitigate UXB risk is considered essential.

### Moderate risk

Moderate-risk regions are those that show a bomb density of between 11 and 50 bombs per 1000 acres and that may contain potential WWII targets. Action to mitigate the risk is considered essential, albeit more likely that a reduced scope of work is required compared with that needed for high-risk regions.

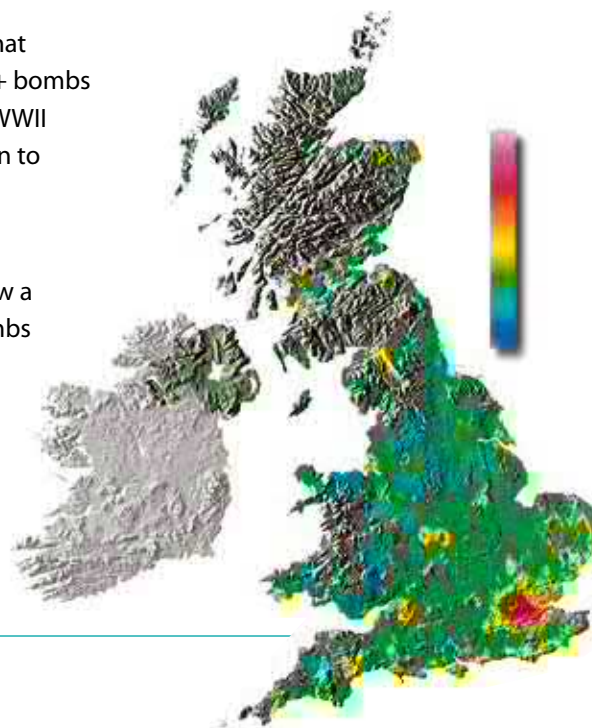

### Low risk

Low-risk regions are those with a bombing density of up to 10 bombs per 1000 acres. These areas are considered to have a significant but low UXB risk. In general, further action to mitigate the risk is considered prudent, although not essential. Care is required when assessing the risk for specific sites where the risk may be higher because of local wartime activity.

### Other WWII targets

Other regions with the risk of UXBs are key strategic points as defined by the government during WWII as representing potential enemy targets. Where these exist outside areas mapped as high, moderate or low risk, a site-specific assessment of the UXB risk may be required.

### Relative UXB risk across UK

### What to do if...

#### ...you have a site that has a potential UXB risk

In the absence of current legislation requiring you to address the risk from UXBs, your responsibilities under health and safety legislation and regulations such as construction design and management require that you address all identified risks. The first stage is to request further advice from a professional adviser such as Zetica, or to gain more site-specific information by commissioning an ordnance-risk desk study. Then a strategy to deal with the risk can be established that is tailored to your proposed work.

#### ...you find a suspect item or require advice

If during site works you find a suspect (ordnance-related) item, it is very important that you do not touch or move it (even if it has already been moved by an excavator). If it is clearly ordnance related, then dial 999 and ask for the police. Ensure that the area around the item is kept as clear as possible without placing yourself at risk. If you are unsure and do not wish to cause undue alarm, or you just require some advice, then you can call Zetica. We have experienced qualified UXB specialists on hand who can offer support and advice during any site works.

More-detailed procedures should be established in advance if you are in an area where the risk of finding a UXB is shown to be significant (moderate to high).

#### Site-specific desktop studies

Zetica is able to provide high-quality, site-specific UXB risk information for any residential, industrial or commercial property in the UK. These desktop studies provide details of the bombing density within an area and for the site itself, in order to indicate the risks of UXBs still being present. A risk assessment is provided to facilitate informed decision making on whether any further risk mitigation measures are required.

## Annex E: Risk Classification Matrixes

---

## Probability of Risk Being Realised (C552 CIRIA, 2001)

Probability of risk being realised	
Classification	Definition
<b>High Likelihood</b>	There is a pollution linkage and an event that either appears very likely in the short term and almost inevitable over the long term, or there is evidence at the receptor of harm or pollution.
<b>Likely</b>	There is a pollution linkage and all the elements are present and in the right place, which means that it is probable that an event will occur. Circumstances are such that an event is not inevitable, but possible in the sort term and likely over the long term.
<b>Low Likelihood</b>	There is a pollution linkage and circumstances are possible under which an event could occur. However, it is by no means certain that even over a longer period such event would take place, and is less likely in the shorter term.
<b>Unlikely</b>	There is a pollution linkage but circumstances are such that it is improbable that an event would occur even in the very long term.

## Risk Classification Matrix (C552 CIRIA, 2001)

Risk classification matrix					
(CIRIA C552, 2001, page 82)		Consequence			
		Severe	Medium	Mild	Minor
Probability	High Likelihood	Very High	High	Moderate	Moderate/Low
	Likely	High	Moderate	Moderate/Low	Low
	Low Likelihood	Moderate	Moderate/Low	Low	Very Low
	Unlikely	Moderate/Low	Low	Very Low	Very Low

## Risk Classification Definitions (C552 CIRIA, 2001)

Risk classification definitions	
<b>Very High</b>	There is a high probability that severe harm could arise to a designated receptor from an identified hazard, OR, there is evidence that severe harm to a designated receptor is currently happening. This risk, if realised, is likely to result in a substantial liability. Urgent investigation (if not undertaken already) and remediation are likely to be required.
<b>High</b>	Harm is likely to arise to a designated receptor from an identified hazard. Realisation of the risk is likely to present a substantial liability. Urgent investigation (if not undertaken already) is required and remedial works may be necessary in the short term and are likely over the longer term.
<b>Moderate</b>	It is possible that harm could arise to a designated receptor from an identified hazard. However, it is either relatively unlikely that such harm would be severe, or if any harm were to occur it is more likely that the harm would be relatively mild. Investigation (if not already undertaken) is normally required to clarify the risk and to determine the potential liability. Some remedial works may be required in the longer term.
<b>Moderate / Low</b>	
<b>Low</b>	It is possible that harm could arise to a designated receptor from an identified hazard, but it is likely that this harm, if realised, would at worst normally be mild.
<b>Very Low</b>	There is a low possibility that harm could arise to a receptor. In the event of such harm being realised it is not likely to be severe.

## 1 Introduction

- 1.1.1 An assessment of contaminated land including associated risks, constraints and liabilities has been undertaken to support a DCO application and design of the Great Yarmouth Third River Crossing ('the Scheme').
- 1.1.2 This report has been prepared with the factual ground investigation information available at the time of reporting. The groundwater assessments in Sections 5 and 6, and the gas assessment in Section 6, are based on data collected during monitoring visits between 1st June and 20th December 2018.

### 1.2 Scheme Description

---

- 1.2.1 The Scheme involves the construction, operation and maintenance of a new crossing of the River Yare in Great Yarmouth. The Scheme consists of a new dual carriageway road, including a road bridge across the river, linking the A47 at Harfrey's Roundabout on the western side of the river to the A1243 South Denes Road on the eastern side. The Scheme would feature an opening span double leaf bascule (lifting) bridge across the river, involving the construction of two new 'knuckles' extending the quay wall into the river to support the bridge. The Scheme would include a bridge span over the existing Southtown Road on the western side of the river, and a bridge span on the eastern side of the river to provide an accommodation underpass for existing businesses, enabling the new dual carriageway road to rise westwards towards the crest of the new crossing.

### 1.3 Project Scope

---

- 1.3.1 To assist in meeting the terms of reference as stated in Section 1.1, the scope of the study in this report comprises:

- 
- Generic quantitative risk assessment (GQRA) of potentially sensitive receptors with respect to ground and groundwater contamination.
  - Refinement of the preliminary conceptual site model (CSM) that was developed in the WSP Ltd Interpretative Environmental Desk Study Report (presented as Appendix 16B to the Environmental Statement).
  - Piling Works Risk Assessment (presented as Appendix 16D to the Environmental Statement).
  - Provision of recommendations with respect to the management and mitigation of potential ground contamination constraints or liabilities which are identified.

1.3.2 A geotechnical assessment has also been undertaken for outline pile foundation and highway design purposes which will be reported separately.

## 1.4 Legislative Context and Guidance

---

1.4.1 The project was undertaken in the legislative and policy context of:

- The Planning Act 2008 (Ref 16C.1)
- National Policy Statement for National Networks (Ref 16C.2)
- National Policy Statement for Ports (Ref 16C.3)
- The National Planning Policy Framework (Ref 16C.14)

1.4.2 The following good practice and statutory guidance was considered and the contaminated land assessment was undertaken in general accordance with:

- Environment Agency ‘Model Procedures for the Management of Land Contamination’, CLR11 (2004) (Ref 16C.5);
- British Standard ‘Investigation of Potentially Contaminated Sites – Code of Practice’, BS EN 10175:2011 (Ref 16C.6);
- British Standard ‘Code of Practice for Ground Investigations’, BS 5930:2015 (Ref 16C.7);
- CIRIA ‘Contaminated Land Risk Assessment. A guide to good practice’, C552 (2001) (Ref 16C.8);
- Defra ‘Environmental Protection Act 1990: Part 2A Contaminated Land Statutory Guidance’, PB13735 (2012) (Ref 16C.9); and
- CIRIA ‘Assessing Risks Posed by Hazardous Ground Gases to Buildings’, C665 (2007) (Ref 16C.10).

## 1.5 Sources of information

1.5.1 The following sources of information were used in the production of this report.

*Table 1.1: Sources of Information*

Source	Report
<b>Reports</b>	Factual Report October 2007 prepared by Norfolk Partnership Laboratory. Interpretative Environmental Desk Study Report dated March 2019 (presented as Appendix 16B to the Environmental Statement)
<b>Public Information</b>	British Geological Survey BGS ‘Geology of Britain’ online viewer. Environment Agency website
<b>Notes:</b>	The report contains British Geological Survey materials ©NERC 2018 and Environment Agency information ©Environment Agency and database right.

## 2 Site Description and Current Use

### 2.1 Site Description and Current Use

- 2.1.1** For the purposes of this report, the term Study Area is used to define the area within the Principal Application Site within which the ground investigation was undertaken. No site investigation works were undertaken within the Satellite Application Sites as no significant excavation / construction works are proposed in these areas that would interact / affect soils, geology or contamination.
- 2.1.2** The Principal Application Site is currently occupied by highways, vacant land, residential properties, public space, commercial / industrial businesses and the River Yare. Further details are provided in the Interpretative Environmental Desk Study Report (presented as Appendix 16B of the Environmental Statement).
- 2.1.3** Table 2.1 below summarises the details presented in the WSP Interpretative Environmental Desk Study Report dated March 2019 (Appendix 16B) that are relevant to the contamination assessment. Further details are presented in the Chapter 2: Description of the Scheme in the Environmental Statement (document reference 6.1).

*Table 2.1: Summary of Site Details*

Detail	Comment
<b>Principal Application Site Description and Current Use</b>	<p>The flat site is split into two parts by the River Yare which flows from north to south through the Principal Application Site.</p> <p>The eastern part of the Principal Application Site is densely developed, predominantly with commercial / industrial properties including oil / gas storage sites, an operating port facility with associated hard standing and warehouses / depots. Other uses include residential properties (predominantly in the northern part of the area), a petrol filling station and car dealership.</p> <p>The western part of the Principal Application Site includes a hard</p>

Detail	Comment
	standing quayside, the major A12 dual carriageway, William Adams Way highway, residential properties, commercial properties including car and caravan sales, a petrol station, oil and gas storage facilities, docks and port facilities; military properties (air training corps), community facilities and public open space and allotments.
<b>Setting and Surrounding Area</b>	<p>North; Predominantly commercial / industrial with some residential properties on the west side of the river and predominantly residential properties with a few commercial properties on the east side of the river.</p> <p>East; Predominantly residential properties with occasional commercial properties and a community centre.</p> <p>South; Commercial / industrial properties on the east side of the river and residential properties, commercial properties and a recreation ground on the west side of the river.</p> <p>West; Commercial / industrial properties.</p>
<b>Topography and Ground Cover</b>	The Principal Application Site is generally flat and is largely hard standing predominantly associated with quayside in the eastern areas and roads and properties in the western area.
<b>Drainage &amp; Flooding</b>	<p>The River Yare is recorded as a Primary River.</p> <p>Much of the Principal Application Site is within the Zone 3 floodplains. Away from the River Yare the risk of flooding from the</p>

Detail	Comment
	river and the sea is generally low and then very low at the western end of the Principal Application Site.
<b>Embankments &amp; Slopes</b>	None of any significance.
<b>Trees &amp; Vegetation (including invasive species)</b>	<p>The only vegetation recorded during the walkover were landscaping hedges and bushes / scrubs.</p> <p>No invasive species were confirmed during the walkover, although due to access restrictions at some locations, not all of the Principal Application Site was accessible. Ecological surveys have been undertaken and are reported in Chapter 8: Nature Conservation within the Environmental Statement (document reference 6.1).</p>
<b>Foundations, Retaining Walls &amp; Basements</b>	There is the significant possibility of foundations, retaining walls and basements being present due to current and former buildings.
<b>Visual Observations of Contamination or Ground Subsidence</b>	No visual signs of contamination were noted during the walkover although petrol stations and oil / gas storage facilities were observed and could include contamination.
<b>Geology</b>	The regional BGS 1:50,000 geological map and information available on the BGS on-line Geology of Britain Viewer ( <a href="http://www.bgs.ac.uk">www.bgs.ac.uk</a> ) indicates the Superficial Geology immediately underlying the Principal Application Site within the Order Limits boundary varies as follows:

Detail	Comment
	<ul style="list-style-type: none"> <li>• South west of the River Yare - peat of the Breydon Formation,</li> <li>• North west of the River Yare – clay and silt of the Breydon Formation,</li> <li>• East of the River Yare – sand and gravel of the North Denes Formation.</li> <li>• Within the River Yare - clay and silt Tidal River or Creek Deposits.</li> </ul> <p>The BGS 1:50,000 geological map indicates that the Crag Group (sand and gravel) comprises the underlying geology across the Principal Application Site.</p>
<b>Hydrogeology and Hydrology</b>	<p>The River Yare splits the Order Limits in two and is recorded as a Primary River. At this point it is estuarine and is not separated from the sea by any locks. No other surface water features are present.</p> <p>No surface water or potable surface water abstractions are present within 2km of the Order Limits.</p> <p>The North Denes Formation superficial deposits underlying the Principal Application Site to the east of the River are classified as a Secondary (A) Aquifer with permeable layers. These are defined by the Environment Agency as permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers.</p>

Detail	Comment
	<p>The peat and clay / silt superficial deposits underlying the Principal Application Site to the west of the River Yare are classified as unproductive.</p> <p>The underlying bedrock is classified as a Principal Aquifer. These are defined by the Environment Agency as layers of rock or drift deposits that have high intergranular and/or fracture permeability - meaning they usually provide a high level of water storage. They may support water supply and/or river base flow on a strategic scale.</p> <p>The nearest active groundwater abstraction is approximately 71m to the north west of the Principal Application Site and is for laundry use.</p>

## 2.2 Site History

2.2.1 The following site history summary has been taken from the Interpretative Environmental Desk Study Report (Appendix 16.B of this Environmental Statement) which includes a more detailed site history.

2.2.2 For simplicity, for the purposes of this report, the Principal Application Site has been split into two areas – east of the River Yare and west of the River Yare.

### Eastern Area

2.2.3 The earliest map provided by GroundSure dated 1883 indicates the eastern area of the Principal Application Site to be densely developed predominantly with commercial / industrial properties including a gasworks, boat building yard and an icehouse. Some residential properties were present but generally the area is dominated by industry. This eastern area of the Principal Application Site has generally remained a commercial / industrial area up to the present day. Various industries have been present including fish canning, oilskin production, chemical factory and unspecified depots, warehouses and factories.

---

## Western Area

- 2.2.4** The earliest map provided by GroundSure dated 1883 indicates the western area of the Principal Application Site to be less developed than the eastern area. The majority of the development was present adjacent to the River Yare and comprised a mix of residential properties and commercial / industrial sites such as an iron works, rope walk, gas works and malhouses. Beyond, towards the western boundary of the study area.
- 2.2.5** By 1906, a railway line running north south was constructed towards the western boundary and by 1926 / 1927, formal gardens and allotments are present towards the centre of the Principal Application Site. A shoe factory is marked adjacent to Queen Anne's Road in 1949 and by 1966 is relabelled as a printing works.
- 2.2.6** By 1978, the railway line had been dismantled and commercial / industrial units had started to be developed in the far west of the Principal Application Site and beyond. By 1988, the former rail route had started to be redeveloped as a dual carriageway and by 2002 the current major highway routes had been established.

## 2.3 Surrounding Land Uses

---

- 2.3.1** Surrounding land uses as detailed in the Interpretative Environmental Desk Study Report (Appendix 16B of this Environmental Statement) are as follows:
- North - Predominantly commercial / industrial with some residential properties on the west side of the river and predominantly residential properties with a few commercial properties on the east side of the river.
  - East - Predominantly residential properties with occasional commercial properties and a community centre.
  - South - Commercial / industrial properties on the east side of the river and residential properties, commercial properties and a recreation ground on the west side of the river.
  - West - Commercial / industrial properties.

## 2.4 Potential Sources of Contamination

### On-Site Contamination Sources

2.4.1 The following potential historical on-site sources of contamination have been identified with anticipated contaminants derived in accordance with site-specific interpretation of Department of Environment Industry Profiles:

*Table 2.2: Areas of Potential Contamination (APC)*

APC No.	APC Type	Anticipated Contaminants in Soil & / or Groundwater
<b>APC1</b>	Former railway lines, sidings and depots	Metals and metalloids, cyanides, ammonia, nitrates, sulphates and sulphides involved in a range of chemical processes formerly taking place on site. It is likely these contaminants are present within the soil although some compounds are soluble and therefore may also be present within the groundwater and soil leachate samples.  Petroleum hydrocarbons (TPH), PCBs, benzene, toluene, ethylbenzene, xylene (BTEX), polyaromatic hydrocarbons (PAH), Volatile Organic Compounds (VOC) and semi-VOC (SVOC), phenolic compounds, resins arising from fuel spillages and former onsite chemical processes. It is likely these compounds if present will be found within groundwater and leachate samples. Some of the volatile compounds such as solvents may be present as mobile gases.  Made ground associated with the development of the Principal Application Site for its former industrial uses resulting in potential ground gas contaminants (methane and carbon dioxide). Ground gases are considered likely in the former landfill areas.  Made ground also has the potential to contain asbestos.  The presence of buried former structures and foundations may also be a source of contaminants.
<b>APC2</b>	Former gasworks	
<b>APC3</b>	Former boat building yards, quayside and travelling crane	
<b>APC4</b>	Former iron works	
<b>APC5</b>	Former icehouse	
<b>APC6</b>	Former allotments	
<b>APC7</b>	Former rope walk	
<b>APC8</b>	Former depots	
<b>APC9</b>	Potentially contaminated silts	
<b>APC10</b>	Former oilskin works	
<b>APC11</b>	Former fish canning factories	
<b>APC12</b>	Former tanks on unlabelled sites	
<b>APC13</b>	Various former factories: chemical, shoe, printing and publishing works,	
<b>APC14</b>	Concrete works	

---

## Off-Site Contamination Sources

2.4.2 Within the surrounding area, the following potential sources of contamination are identified in the GroundSure report (Annex B of the Interpretative Environmental Desk Study Report) and has the potential to migrate onto the Principal Application Site:

- Former and current shipbuilding and dock works surrounding the River Yare
- Former saw mills, timber yard, boat building, icehouse and malthouse immediately adjacent to the river
- Former military barracks
- Former rope walk
- Former oilskin works
- Former barrel and box making factories
- Former electricity works
- Former oil pipeline construction depot
- Commercial / industrial buildings including tanks
- Contaminated silts within the River Yare
- Hospital

## 2.5 2006 Ground Investigation

---

2.5.1 The Applicant undertook an intrusive ground investigation partly within the Principal Application Site in 2006 and prepared a Factual Report dated October 2007. A copy of the 2007 report is presented in Annex B.3.

2.5.2 Where data from the 2006 ground investigation has been used in the assessments in Sections 5 to 8 of this interpretative report it is referenced where necessary to distinguish it from data from the 2017/2018 ground investigation.

---

2.5.3 The fieldwork was undertaken between the 7 August and 19 September 2006 and comprised the following:

- Nineteen cable percussion boreholes were carried out to a maximum depth of 40m.
- Eight window sample holes were carried out to a maximum depth of 5m.
- Three trial pits were carried out to a maximum depth of 3.5m.

2.5.4 In addition, samples were taken for both geotechnical and environmental testing. Standard Penetration Tests were also carried out within the boreholes and piezometers and combined water / gas monitoring installations were installed in seventeen cable percussion holes.

2.5.5 These locations were within the Principal Application Site - BH101, BH102, BH103, BH105, BH106, BH108, BH109, TP101, TP104, WS107 and WS108.

2.5.6 The following locations are immediately adjacent to the Principal Application Site and are therefore also considered - BH104, BH107 and BH110.

2.5.7 The following are sufficiently far from the Principal Application Site that they are unlikely to provide anything other than useful background information and are generally not considered further in this summary - BH111, BH111A, BH111B, BH112, BH113, BH114, BH115, BH116, BH117, WS103, WS104, WS105, WS106, WS110, WS111 and TP109.

### **Ground Conditions Encountered**

2.5.8 The following ground conditions were noted from the Engineers logs presented in the October 2007 Factual Report.

#### Made Ground

2.5.9 Asphalt and concrete (often reinforced with steel) were recorded at the surface at a number of locations up to 0.35m thick. Made ground was recorded at all locations from 0.3m thick (BH109) to 3m thick (WS108) and was heterogenous across the Principal Application Site but generally comprised a sand matrix with cobbles and man-made inclusions of concrete, brick, ash, metal and plastic.

#### Tidal River or Creek Deposits

2.5.10 Tidal River and Creek deposits were recorded underlying made ground in the eastern area up to 3.9m thick (BH105) as clay, silt or sand. It was not recorded in the western area.

---

### Breydon Formation

- 2.5.11 Peat, silt clay or sand of the Breydon Formation underlies made ground in the eastern area in the absence of the Tidal or River Creek Deposits and was not recorded in the western area. The Breydon peat was recorded as a soft dark grey amorphous peat up to 1.1m thick (BH101). The silts, clay and sand strata were recorded up to 5m thick (BH110) and always overlying the North Denes Formation.

### North Denes Formation

- 2.5.12 The North Denes Formation was recorded across most of the site as a sand with varying proportions of gravel. Thickness ranges from 3.95m on BH106 to 14m in BH107. Densities varied from loose to very dense.

### Corton Formation

- 2.5.13 The 2007 Factual Report discusses Corton Sand (recorded in the western area only) separately from the Corton Formation but does not include an explanation to clarify this.
- 2.5.14 The Corton Formation was only encountered in the western area where it was recorded as fine and medium sand between 0.3m thick (TP109) to 6.7m thick (BH110) and was underlain by the Crag Formation. Densities varied between medium dense and dense.
- 2.5.15 The Corton Sand was also only recorded in the western area between 6.9m thick (BH102) and 9.2m thick (BH104) and was underlain by the Crag Formation. Densities varied from medium dense up to very dense.

### Kesgrave Sand and Gravel

- 2.5.16 The 2007 Factual Report recorded the Kesgrave Sand and Gravel between the North Denes Formation and the Crag Formation. It was recorded as a loose, fine, medium and coarse sand and as a silty sandy clay.

### Crag Formation

- 2.5.17 Crag Formation was recorded in all cable percussion boreholes within the Principal Application Site but the trial pits and window samples did not progress to sufficient depth to encounter the formation.
- 2.5.18 The formation was generally encountered as a fine and medium sand with densities ranging from medium dense to very dense. Laminae, lenses and layers of silty clay and silt were recorded in this strata.

### Visual and Olfactory Evidence of Contamination

**2.5.19** Man-made detritus was recorded in made ground and comprised concrete, brick, metal, plastic.

**2.5.20** In addition, the following evidence of contamination was also recorded.

- TP101 – 1.5m to 1.7m. Base of made ground / top of Breydon Formation. Hydrocarbon and chemical odour – possible spent oxide.
- TP104 – 0.1m to 2.0m. Made ground. Sheets of asbestos
- BH104 – 0.7m to 1.9m. Made ground. Slight oil odour.
- BH110 – 0.1m to 0.2m. Made ground. Chemical odour.
- BH110 – 1.7m to 2.3m. Breydon Formation. Very heavily stained and spent oxide odour.

### Monitoring Wells

**2.5.21** Gas and groundwater monitoring wells are recorded in a number of boreholes and are summarised in the table below. Exact details of each installation are shown on the Engineer’s logs in Annex B.3.

*Table 2.3: Summary of Monitoring Wells*

Borehole ID	BH Depth (m bgl)	Installation Type	Standpipe Depth (m bgl)	Standpipe Response Zone (mbgl)	Target Strata
<b>BH101</b>	20.45	50mm	2.80	1.00-2.80	Made ground / Breydon
		19mm	9.00	6.00-9.00	Corton Sand
<b>BH102</b>	35.00	50mm	3.10	0.50-3.00	Made ground / Breydon
		50mm	28.00	22.00-28.00	Crag
<b>BH103</b>	35.00	50mm	1.50	1.00-1.50	Made ground / Tidal and River Creek Deposits
		19mm	35.00	32.00-35.00	Crag
<b>BH104</b>	30.45	50mm	5.00	0.50-5.00	Made ground / Breydon

Borehole ID	BH Depth (m bgl)	Installation Type	Standpipe Depth (m bgl)	Standpipe Response Zone (mbgl)	Target Strata
<b>BH105</b>	40.00	50mm	30.00	27.00-30.00	Crag
		50mm	3.00	1.00-3.00	Made Ground / Tidal and River Creek Deposits
		19mm	29.00	26.00-29.00	Crag
<b>BH106</b>	30.45	19mm	37.00	34.00-37.00	Crag
		50mm	3.50	0.50-3.50	Made ground / Tidal and River Creek Deposits / North Denes
<b>BH107</b>	30.00	19mm	12.00	9.00-12.00	Kesgrave
		50mm	2.50	0.50-2.50	Made ground / North Denes
<b>BH108</b>	20.00	19mm	10.0	10.00-9.00	North Denes
		50mm	2.20	1.50-2.20	Breydon Peat
<b>BH109</b>	40.00	19mm	20.00	19.00-20.00	Crag
		50mm	1.60	1.00-1.60	Tidal and River Creek Deposits
<b>BH110</b>	31.00	19mm	39.00	36.00-39.00	Crag
		50mm	3.00	0.50-3.00	Made ground / Breydon
		50mm	31.00	28.00-31.00	Crag

### Gas Monitoring

2.5.22 Gas monitoring was undertaken on five occasions from dual and triple installations within BH101 to BH110. The maximum concentration of carbon dioxide recorded was 6.4% (BH107) and the maximum methane

---

concentration recorded was 0.1%. Maximum flow rate was 0.2 litres per hour (BH101).

- 2.5.23** Significantly depleted oxygen was recorded in BH101, BH102, BH104, BH105, BH108, BH109 and BH110.

### **Groundwater Monitoring**

- 2.5.24** Groundwater monitoring was undertaken on five occasions (26th September 2007, 5th October 2007, 12th October 2007, 19th October 2007 and 22nd October 2007). The results are presented in the Factual Report in Annex B.3.

- 2.5.25** Water levels monitored appear to be generally consistent across all wells indicating a degree of hydraulic continuity between the shallow strata and the deeper Crag Formation.

### **Contamination Testing**

- 2.5.26** For the exploratory holes within or immediately adjacent to the Principal Application Site, chemical testing was undertaken on 40 samples from 13 exploratory hole locations for the following determinands, although not all samples were tested for all determinands:

- total sulphate;
- boron;
- arsenic;
- barium;
- beryllium;
- cadmium;
- chromium;
- copper;
- lead;
- mercury;
- nickel;
- selenium;

- 
- vanadium;
  - zinc;
  - ammonium as NH<sub>4</sub>;
  - nitrate;
  - sulphide;
  - total cyanide;
  - free cyanide;
  - complex cyanide;
  - asbestos;
  - speciated petroleum hydrocarbons including MTBE; and
  - speciated polyaromatic hydrocarbons.

**2.5.27** Water samples were taken on one occasion from six exploratory holes within or immediately adjacent to the Principal Application Site and tested for the following determinands, although not all samples were tested for all determinands:

- arsenic;
- barium;
- beryllium;
- boron;
- cadmium;
- chromium;
- copper;
- lead;
- nickel;
- selenium;
- vanadium;
- zinc;
- mercury;
- nitrate;

- 
- sulphate;
  - sulphide;
  - total cyanide;
  - free cyanide;
  - complex cyanide;
  - sulphur;
  - pH;
  - extractable petroleum hydrocarbons (EPH); and
  - speciated polyaromatic hydrocarbons.

---

---

## 3 2017 Ground Investigation

---

### 3.1 Preliminary Conceptual Site Model

---

3.1.1 The preliminary conceptual site model (CSM) from the Interpretative Environmental Desk Study Report identified a number of potential contaminant sources which are summarised in Section 2.4. The preliminary CSM also identified a number of plausible contaminant linkages (PCLs) that, without necessary protection and/or remediation, could put the following identified receptors at risk of significant exposure:

- Site users - Future site users, visitors and maintenance workers,
- Adjacent site users - Residents and users of nearby properties,
- Controlled waters - Principal and Secondary (A) aquifers and surface watercourses,
- On site infrastructure - Buildings, foundations and buried services,
- Marine Ecology - Vertebrates and invertebrates within the River Yare.

### 3.2 Rationale and Scope

---

3.2.1 The rationale for the site investigation scope was to provide geotechnical and geo-environmental information for design and to inform the DCO application. The scope was developed to also provide information to refine the preliminary Conceptual Site Model outlined in the Interpretative Environmental Desk Study Report presented as Appendix 16B to the Environmental Statement.

3.2.2 The main ground investigation works were land based but ten boreholes were also drilled in the River Yare itself and for distinction are referred to as marine investigation works.

3.2.3 Further details on the scope of works are presented in Annex A and Annex B.1.

#### Land Based Ground Investigation

3.2.4 The land based ground investigation was undertaken by the Applicants appointed Contractor, Norfolk Partnership Laboratory (NPL) between 18th September 2017 and 27th March 2018 and comprised the following:

- 25 Cable percussion boreholes;
- 16 Window Samples;
- Installation of gas and groundwater monitoring wells in 14 selected boreholes;
- Soil sampling from the boreholes and window samples for the purpose of chemical testing;
- Gas and groundwater monitoring and groundwater sampling and chemical testing following completion of the intrusive works; and
- It had been proposed to undertake machine excavated trial pits but these were changed to window samples due to access restrictions.

**3.2.5** In addition to the above, static cone penetration tests (CPT), dynamic cone penetrometer tests (DCP) and standard penetration tests (SPT) were also undertaken for the purposes of geotechnical assessment and will be reported separately by the WSP Ltd Geotechnical team.

**3.2.6** The as-built exploratory hole locations are presented on Drawing GYTRC-WSP-HGT-DR-GE-0001(AB) within the WSP Factual Report presented in Annex B.1. Exploratory hole locations are also presented on Drawing GYTRC-WSP-EGN-XX-DR-EN-0047 Figure 16.2 Exploratory Hole Locations (Regulation 5(2)(a)).

**3.2.7** Table 3.1 presents the scope of geo-environmental intrusive works undertaken.

*Table 3.1: Summary of Ground Investigation Intrusive Works*

Exploratory Hole Type	Depth	Purpose
<b>25 Cable Percussion Boreholes</b>	5m – 50.45m	General site conditions and also targeting deeper ground conditions.
<b>16 Window Samples plus.</b>	1.1m – 6.0m	General site conditions where deep ground condition information is not required. Three additional window samples targeting previously identified hydrocarbon odour.

---

**3.2.8** The scope of the field works and chemical testing suites are discussed in further detail in Annex A. Factual information provided by NPL comprising chemical test results and Engineer's logs is presented in the WSP Factual Report presented in Annex B.1.

**3.2.9** The findings of the ground investigation are discussed in Sections 4 to 7 and inform the refined CSM which is presented in Section 8.

### **Marine Based Sampling**

**3.2.10** The marine based sampling was carried out by NPL between 11th June 2018 and 14th July 2018. This work was primarily to inform the bridge abutment design but was also used to facilitate sampling of the river bed sediments to ascertain the contamination status in order to inform potential disposal routes for any excavated sediments. The marine sampling comprised the following:

- Six cable percussion boreholes to a nominal 25m depth (three on each side of the river) located close to the quayside
- Four cable percussion boreholes to a nominal 40m depth (two on each side of the river) located away from the quayside at the outer edge of the proposed abutments.

**3.2.11** Two locations were terminated at shallow depth and moved. MB01 was terminated due possible Unexploded Ordnance and MB04 was terminated due to a concrete obstruction.

**3.2.12** The as-built exploratory hole locations are presented on Drawing GYTRC-WSP-HGT-DR-GE-0006, within the WSP Factual Report presented in Annex C.

**3.2.13** In addition to the above, standard penetration tests (SPT) and pressure meter testing were also undertaken for the purposes of geotechnical assessment and will be reported separately by the WSP Ltd Geotechnical team.

**3.2.14** The scope of the marine based sampling works and chemical testing suites are discussed in further detail in Annex A. Factual information provided by NPL comprising chemical test results and Engineer's logs is presented in the WSP Factual Report presented in Annex C.

**3.2.15** The findings of the ground investigation are discussed in Sections 4 to 7 and inform the refined CSM which is presented in Section 8.

## 4 Ground Conditions Assessment

### 4.1 Ground Conditions Encountered On-Site

4.1.1 The findings summarised below generally confirm the anticipated strata identified in the Interpretative Environmental Desk Study Report (presented as Appendix 16B to the Environmental Statement). The findings are also similar to the findings from the 2006 ground investigation detailed in Section 2.5 above.

#### Made Ground Eastern Area

4.1.2 Made ground was recorded at almost all exploratory hole locations (absent from BH15) and varied in thickness from 0.55m to 4.8m. The thickness of made ground varied across the Principal Application Site with the thicker made ground generally recorded close to the quay wall.

4.1.3 The made ground was generally granular and heterogeneous in nature and included detritus comprising brick, wood, concrete, porcelain, asphalt, ceramics and metal. However, BH12A and BH13A both recorded brick / concrete within natural strata at depth (5.9m and 3.5m respectively) indicating this material may be reworked rather than being in-situ natural strata.

#### Made Ground Western Area

4.1.4 Made ground was recorded at almost all exploratory hole locations (absent from WS8) and varied in thickness from 0.4m to at least 4.2m, although the base of the made ground was not encountered in WS2 at 2m depth and therefore may be deeper.

4.1.5 The thickness of made ground varied across the western area and although thick made ground was recorded close to the quay wall, the thickest made ground was not recorded in this area.

4.1.6 The made ground was generally granular and heterogeneous in nature and included detritus comprising; concrete, asphalt, tile, brick, ceramic, pottery, wood, ash, leather, metal, glass, plastic, mortar and slag. BH5A at 2.0m recorded brick gravel within the Breydon Formation indicating this layer is likely to be made ground rather than in-situ natural strata.

4.1.7 WS4 at 2.3m and WS5 at 1.85m recorded a geogrid structure.

---

## Concrete and Underground Structures

- 4.1.8 Solid concrete was recorded at most locations in the eastern area and was recorded up to 0.65m thick. However, only a few locations in the western area recorded concrete up to 0.5m thick.
- 4.1.9 Bitumen up to 0.2m thick was recorded at a few locations in the western area but was absent from the eastern area.
- 4.1.10 No pipes or underground structures were recorded on the Engineer's logs.

## Natural Strata

### Tidal River or Creek Deposits

- 4.1.11 Tidal River or Creek deposits were generally indistinguishable from the underlying Breydon Formation. The Tidal River or Creek Deposits encountered that can be differentiated are located in the eastern area overlying the sand deposits of the North Denes formation. Here, they generally comprised a dark grey to black, silty, variably organic Clay, and a sandy, clayey Silt interbedded with light brown to black, fine to coarse Sand with occasional flint gravel and pockets of organic material.
- 4.1.12 The deposit was generally encountered underlying Made Ground, to the maximum depth of 5.6m in BH14. The thickness of this deposit varied from 0.5m in BH13 to 3.80m in borehole BH14.

### North Denes Formation

- 4.1.13 The North Denes Formation was only encountered in the eastern area where it was found underlying made ground. The Formation was typically described as a very loose to dense yellowish-brown fine to coarse sand with some rare gravels and some rare thin silt and clay bands.
- 4.1.14 The Formation was recorded at a maximum depth of 5.6m below ground level (bgl) (-3.64m above Ordnance Datum (aOD)) in BH14 and was not recorded in the four boreholes undertaken along the edge of the eastern quay wall (BH12, BH12A, BH13, BH13A), where Tidal River or Creek Deposits and the Breydon Formation were encountered within the depth range that the sands of the North Denes Formation were found towards the east.

### Breydon Formation

- 4.1.15 The Breydon Formation was encountered in most boreholes in both the western and eastern areas of the Principal Application Site. In the west the Formation was encountered as either granular, cohesive or peat material.

---

The Breydon Peat was encountered predominantly towards the west, but was also found in thinner layers close to the river. The cohesive and granular materials were encountered as interbedded layers of varying thicknesses across the Principal Application Site.

- 4.1.16 The Breydon Formation can be recognised as separate interbedded sub-strata and these are described below.

#### Breydon Peat

- 4.1.17 The Breydon Peat was encountered solely in the western area as soft, dark brown and black, variably fibrous, sometimes clayey amorphous Peat. Occasional wood and reed fragments were observed.
- 4.1.18 The Peat is found to a maximum depth of 11.9m bgl (-10.34m aOD) in BH2, with thickness ranging between 0.25m to 3.66m.
- 4.1.19 Towards the west the Peat was encountered in thicker layers often underlying made ground and overlaying the granular and cohesive Breydon Formation strata.

#### Breydon Clay and Silt

- 4.1.20 The clay component of the Breydon Formation was generally encountered as very soft to soft, dark grey to brown and variably silty, sandy and organic Clay, containing occasional shell fragments, gravel, pockets of peat and rootlets. The silt component contains occasional traces of gravel, organic debris, rootlets and shell fragments. The thickness of the cohesive bands varies from 0.1m to 1.0m in the eastern area and from 0.1m to a maximum of 5.1m in the western area.
- 4.1.21 The silts and clays were encountered between 0.3m and 4.0m bgl (1.19m aOD and -2.44m aOD) in the western area, and between 2.60m and 4.50m bgl (-0.32m aOD and -2.13m aOD) in the eastern area.

#### Breydon Sand and Gravel

- 4.1.22 The granular component comprises predominantly loose to very loose, with some locally dense areas, grey and brown grey silty clayey fine to medium Sand, with some angular to rounded gravels of flint and occasional quartz.
- 4.1.23 The thickness of the sand and gravel varies from 0.15m to 2.0m in the eastern area, with the top being encountered between 4m bgl and 4.95m bgl (-1.72m aOD to -2.58m aOD), and to a maximum depth of 6.50m bgl (-4.22m aOD).

---

4.1.24 The granular material in the western area was encountered in layers ranging between 0.10m and 4.00m thick, the top of which is found at depths of 0.85m bgl to 11.40m bgl (1.19m aOD to -9.70m aOD). The base of the strata is found up to a maximum depth of 13.00m bgl (-11.30m aOD).

#### Breydon Formation (Stratum A)

4.1.25 A stratum within the Breydon Formation was encountered as quartz and quartzite gravels within a granular matrix. This material was encountered across both the eastern and western areas and was typically described as a loose to medium dense, grey, slightly silty sand and gravel, where the gravels are fine to medium, angular to rounded flint and quartz with some rare limestone gravels and shells.

4.1.26 It was encountered across both the western and eastern areas at thicknesses ranging between 1.6m to 9.4m. The thickness decreases towards the west away from the river but remains relatively consistent in the eastern area. The top of the strata in the western area was encountered at depths of between 3.00m bgl to 6.00m bgl (-0.49m aOD to -4.23m aOD) and in the eastern area at depths of between 3.20m bgl to 11.70m bgl (-0.82m aOD to -8.50m aOD).

4.1.27 To differentiate it from the other strata within the Breydon Formation, the WSP Geotechnical assessment has labelled this material as Breydon Formation (Stratum A).

#### **Happisburgh Glacigenic Formation**

4.1.28 The Happisburgh Glacigenic Formation was encountered below the Breydon Formation Stratum A in the east. In the western area, it is partly replaced by the granular and cohesive layers of the Breydon Formation.

4.1.29 The Happisburgh Glaciogenic Formation was typically described as a loose to medium dense, light brown to orange-brown, fine to coarse though predominantly medium, variably silty sand with rare fine gravels. The sand contains variable amounts of angular to rounded, fine to coarse flint gravel. Some cohesive deposits were encountered within the strata as firm to stiff orange-brown laminated sandy silt and clay, with olive grey clay banding.

4.1.30 The formation was encountered in the western area at depths ranging between 5.00m bgl to 13.00m bgl (-3.97m aOD to -12.44m aOD) and ranged in thickness between 4.30m to 14.70m. On the eastern area, the formation was encountered deeper than in the west at depths ranging from 10.00m bgl to 18.00m bgl (-7.63m aOD to -16.00m aOD), ranging in thickness between 3.00m and 12.00m.

### Crag Group

- 4.1.31** The Crag Group was encountered across the entire Principal Application Site underlying the Happisburgh Glacigenic Formation as dense to very dense, grey to dark grey, fine to medium grained silty sand with frequent white shell fragments, with some fine gravel and occasional soft to firm silty clay layers.
- 4.1.32** This stratum was encountered at depths ranging between 15.85m bgl and 22.80m bgl (-14.64m aOD to -20.30m aOD) and with thicknesses ranging from 22.30m to 25.65m. Generally, the top of the strata indicated a relatively uniform horizon in both the west and east of the Principal Application Site.

### London Clay

- 4.1.33** London Clay was encountered at depth underlying the Crag Formation as a stiff to very stiff, brown grey, sometimes laminated silty clay. Some rare flint gravels and gypsum crystals were encountered.
- 4.1.34** The London Clay was encountered at depths ranging between 44.00m bgl to 46.50m bgl (-41.63m aOD to -44.00m aOD) and the base was not confirmed in any boreholes.

### Visual and Olfactory Evidence of Contamination

- 4.1.35** Other than the man-made detritus recorded within the made ground, visual and olfactory evidence of contamination was recorded by NPL at the following locations. Further detail is provided on the Engineer's logs presented in Annex B.1.

*Table 4.1: Summary of Visual and Olfactory Evidence of Contamination*

Exploratory Hole Reference	Comment	Strata Type	Impacted Strata Depth (m bgl)
<b>WS21</b>	Hydrocarbon odour	Alluvium (Engineer's Log states Alluvium but is likely to be either Tidal River or Creek Deposits or Breydon Formation)	1.4m – 2.0m
<b>WS21</b>	Hydrocarbon odour		2.5m – 2.95m
<b>BH14</b>	Diesel odour		2.6m
<b>BH14</b>	Slight diesel odour	North Denes Formation	7.6m – 8.0m

Exploratory Hole Reference	Comment	Strata Type	Impacted Strata Depth (m bgl)
<b>BH6</b>	Slight hydrocarbon odour	Made ground	0.4m – 1.2m
<b>BH4BU</b>	Hydrogen sulphide odour	Breydon Formation	2.65m – 2.85m

## 4.2 Marine Sediment

**4.2.1** The Engineer's logs for the marine boreholes presented in Annex C indicate that the shallow sediments within the River Yare comprise gravel, sand, silt and clay and are classified as Tidal River or Creek Deposits. These vary in thickness from 0.8m up to 5.3m. Underlying these sediments are the Happisburg Glacigenic Formation and the Crag Formation, both predominantly comprising sand but layers of silt and clay are also present. London Clay was encountered at depth beneath the Crag Formation at a few locations.

---

---

## 5 Hydrological and Hydrogeological Conditions

### 5.1 Local Hydrology

---

#### Surface Water Features

- 5.1.1 The River Yare splits the Principal Application Site in two and is recorded as a Primary River. Other than the sea, no other surface water features are present within 500m of the Principal Application Site.
- 5.1.2 Assessment of surface water is presented in more detail in Chapter 11: Road Drainage and the Water Environment within the Environmental Statement (document reference 6.1).

#### Surface Water Abstractions & Discharges

- 5.1.3 No surface water or potable water abstractions are present within 2km of the Principal Application Site.

### 5.2 Hydrogeology

---

#### Geology and Aquifer Status

- 5.2.1 Various superficial deposits were recorded during the ground investigation. Assessment of hydrogeology is presented in more detail in Chapter 11: Road Drainage and the Water Environment within the Environmental Statement (document reference 6.1).
- 5.2.2 The Happisburgh Formation, Breydon Formation and North Denes Formation are classified as Secondary (A) Aquifers which are defined by the Environment Agency as permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers.
- 5.2.3 The Crag Group bedrock (comprising sand with occasional gravel and clay layers) is designated by the Environment Agency as a Principal Aquifer. However, according to the British Geological Survey the Crag Group in the area of Great Yarmouth is recorded as a Secondary (A) Aquifer. For the purposes of this report and Environmental Statement, the worst case scenario is assumed and the Crag Group is considered a Principal Aquifer.
- 5.2.4 The deeper London Clay is classified as classified as unproductive. These are defined by the Environment Agency as rock layers or drift deposits with low permeability that have negligible significance for water supply or river base flow.

### Groundwater Abstractions

**5.2.5** The nearest active groundwater abstraction point is approximately 71m to the north west of the Principal Application Site for laundry use.

### Groundwater Encountered During Investigation

**5.2.6** Groundwater was recorded at a number of locations during the 2017/2018 ground investigation. The details are summarised in the table below. Groundwater strikes during the 2006 ground investigation are presented in the factual report in Annex B.3.

*Table 5.1: Summary of Groundwater Strikes during the 2017/2018 Ground Investigation*

Exploratory Hole Location	Groundwater Level at Strike (mOD)	Strata Type
<b>BH1</b>	-1.1	Sand (Made Ground)
<b>BH1</b>	-9.7	Sand (Breydon Formation)
<b>BH2</b>	-1.54	Sand (Made Ground)
<b>BH4</b>	-1.23	Sand and Gravel (Made Ground)
<b>BH4</b>	-3.73	Peat (Breydon Formation)
<b>BH4A</b>	-1.95	Peat (Breydon Formation)
<b>BH4D</b>	-0.72	Sand (Made Ground)
<b>BH5A</b>	-2.69	Sand (Made Ground)
<b>BH5A</b>	-0.19	Clay (Breydon Formation)
<b>BH6</b>	-1.17	Sand (Breydon Formation)
<b>BH7</b>	-2.67	Sand (Breydon Formation)
<b>BH8</b>	1.09	Sand (Made Ground)
<b>BH9</b>	0.53	Clay (Breydon Formation)
<b>BH10</b>	-1.55	Sand (Breydon Formation)
<b>BH10A</b>	1.15	Sand (either Tidal or River Creek Deposits or Breydon Formation)
<b>BH11</b>	0.06	Gravel (Made Ground)
<b>BH11A</b>	1.20	Sand (Made Ground)
<b>BH12</b>	-0.92	Silt (Alluvium either Tidal or River Creek Deposits or Breydon Formation)

Exploratory Hole Location	Groundwater Level at Strike (mOD)	Strata Type
<b>BH13</b>	0.57	Clay (Made Ground)
<b>BH13A</b>	0.48	Gravel (Breydon Formation)
<b>BH14</b>	0.56	Gravel (Made Ground)
<b>BH15</b>	-0.08	Sand (North Denes Formation)
<b>BH16</b>	0.00	Clay (Alluvium either Tidal or River Creek Deposits or Breydon Formation)
<b>BH17</b>	-0.45	Silt (Alluvium either Tidal or River Creek Deposits or Breydon Formation)
<b>BH18</b>	-0.70	Sand (Alluvium either Tidal or River Creek Deposits or Breydon Formation)
<b>BH4ASU</b>	0.13	Sand and Gravel (Marine Beach Deposits)
<b>BH4ASU</b>	-2.87	Sand (Breydon Formation)
<b>TP1</b>	-4.28	Silt (Breydon Formation)
<b>TP1B</b>	-0.18	Clay (Breydon Formation)
<b>WS1</b>	-0.45	Sand (Marine Beach Deposits)
<b>WS2</b>	-1.15	Sand and Gravel (Made Ground)
<b>WS3</b>	-0.62	Silt (Breydon Formation)
<b>WS4</b>	-0.41	Sand and Gravel (Breydon Formation)
<b>WS6</b>	-1.86	Clay and Silt (Breydon Formation)
<b>WS7</b>	-1.30	Sand (Breydon Formation)
<b>WS9</b>	-0.23	Sand (Made Ground)
<b>WS20</b>	-2.51	Sand (Alluvium either Tidal or River Creek Deposits or Breydon Formation)
<b>WS21</b>	0.96	Sand (Alluvium either Tidal or River Creek Deposits or Breydon Formation)
<b>WS22</b>	-1.00	Sand (Alluvium either Tidal or River Creek Deposits or Breydon Formation)

### Monitored Groundwater Levels

5.2.7 Monitoring of groundwater levels in relation to Ordnance Datum was undertaken on 8 occasion's to-date following the completion of the

2017/2018 intrusive ground investigation works. The details are provided in Annex B.1 and are summarised in the tables below.

- 5.2.8** The tables below do not include the data for BH4A, BH10 or BH12B. The response zones in these wells cross the made ground / natural ground boundary and therefore the exact source of the groundwater cannot be confirmed.

*Table 5.2: Summary of Groundwater Level Monitoring in the Eastern Study Area*

Stratum	Monitoring Well	Minimum (mOD)	Maximum (mOD)	Strata
<b>Made Ground</b>	No standalone monitoring wells within the made ground.			
<b>Natural Ground</b>	BH11	-0.3	0.19	Breydon, North Denes and Crag Formations.
	BH13	0.31	0.66	Breydon and Crag Formations.
	BH15	-0.18	0.66	North Denes Formation.
	WS20	0.23	0.29	Alluvium
	WS21	0.67	0.86	Alluvium
	WS22	1.05	1.14	Alluvium

*Table 5.3: Summary of Groundwater Level Monitoring in the Western Study Area*

Stratum	Monitoring Well	Minimum (mOD)	Maximum (mOD)	Strata
<b>Made Ground</b>	BH4D Shallow	-1.12	-0.12	Made ground
<b>Natural Ground</b>	BH4	-0.33	0.62	Breydon and Crag Formations
	BH4D Deep	-1.13	-0.01	Crag Formation
	BH6	-1.17	-0.21	Crag Formation

- 5.2.9** It should be noted that a monitoring well was also installed in BH7 but an oversight by the Contractor resulted in no monitoring at BH7 until the final visit on 20th December 2018. This does not effect the validity of the assessment undertaken and reported in this Environmental Statement.

- 5.2.10** The water levels recorded during the 2006 ground investigation are broadly similar to those in Tables 5.2 and 5.3 above.

---

---

### Hydraulic Gradient

- 5.2.11 The monitoring data obtained to date appears to indicate the hydraulic gradient is towards the River Yare from both the western area and the eastern area as would be expected. However, it should be noted that the groundwater monitoring data may be subject to tidal fluctuations which could affect the recorded levels.

### Hydraulic Continuity

- 5.2.12 The superficial deposits are likely to be in hydraulic continuity with the Crag Group due to the absence of any continuous low permeability strata separating these aquifers.
- 5.2.13 Similar groundwater quality characteristics across the Principal Application Site and the proximity to the River Yare also indicate the mixing of groundwater within the superficial deposits and the Crag Group is likely to be occurring.
- 5.2.14 The regional Chalk Group aquifer is considered to be protected by the overlying London Clay Formation, which is considered to significantly reduce the potential risks of any groundwater pollution present migrating to the Chalk within the study area. The superficial deposits are considered to be in hydraulic continuity with the Crag Group because no low permeable geologies segregate these aquifers. The mixing of groundwater and similar groundwater quality characteristics, dominated by the proximity to the River Yare, is therefore likely between the two hydrogeological units.

---

---

## 6 Qualitative Risk Assessment

### 6.1 Introduction

---

- 6.1.1 In the United Kingdom, the presence of contamination within soil or groundwater at a site is generally only of concern if an actual or potentially unacceptable risk to a sensitive receptor exists.
- 6.1.2 The risk assessment process begins with screening chemical concentrations in soil or groundwater against conservative screening values, a process called Generic Qualitative Risk Assessment (GQRA). GQRA's are performed to assess the potential risks to human health and controlled waters and to identify the presence of contaminants of concern (CoC), which may require further, more detailed assessment.
- 6.1.3 Annex B.1 and Annex B.3 presents the chemical test data and Annex E presents the screening spreadsheets.

### 6.2 Human Health Risk Assessment

---

- 6.2.1 Following the tiered approach which is described in Model Procedures for the Management of Land Contamination (Ref 16C.5) published by DEFRA and the Environment Agency, this section provides a GQRA of those contaminant linkages that were determined to be plausible in the refined CSM.
- 6.2.2 DEFRA and the Environment Agency have published a limited number of Soil Guideline Values (SGVs) for a series of generic land use scenarios which follow the Contaminated Land Exposure Assessment (CLEA) methodology. Where SGV's are not available, WSP has derived a set of Generic Assessment Criteria (GAC) for the CLEA generic land use scenarios using the CLEA Workbook v1.071 Excel modelling tool. The CLEA workbook does not currently have the capacity to derive criteria to assess risks from the inhalation of vapours derived from contaminants dissolved in groundwater. Therefore, a set of groundwater GAC's has also been derived using the Johnson & Ettinger (1991, Ref 16C.11) (J&E) approach.
- 6.2.3 The chemical test results have been assessed against screening values for both commercial / industrial and public open space land use scenarios. Further details in the methodologies adopted by WSP Ltd are provided in Annex D. These land use scenarios are also defined in the Environment Agency document 'Updated Technical Background to the CLEA Model' Report SC050021/SR3, January 2009 (Ref 16C.12).

- 
- 6.2.4 These two scenarios are most appropriate for the proposed highway and landscaping end uses, although both are considered to be reasonably conservative as it is unlikely anyone will be on-site for the duration that either scenario assumes. In the case of public open space this is up to 2 hours per day, up to 170 days per year for a 1-6 year old child. In the case of commercial / industrial, this is 0.7 hours per day up to 230 days per year.
- 6.2.5 The soil chemical data has been compared against end use GAC's for a conservative 1% soil organic matter (SOM) content. The average SOM concentration is 2.07% and therefore the nearest conservative concentration is 1%. Samples that exceed the screen are identified as CoC and are carried forward for further discussion.
- 6.2.6 For an initial assessment, the data has been split into made ground and natural ground averaging areas and then split again into eastern area and western area.
- 6.2.7 For some CoC, direct contact will be the dominant pathway for exposure. Due to the unknown nature of soil excavation and reuse at this stage of the design, it is possible that materials from any depth could be excavated and placed at or near the surface in the final design. In order to advise the development options, human exposure to all unsaturated soils, irrespective of depth, was assumed possible for the purpose of this assessment. This will maximise the information available to the design team on the suitability of all unsaturated material and can support with their materials management options.
- 6.2.8 Potential risks to human health from soil gases are assessed in Section 6.4.

### **Assessment of Results – Public Open Space Land Use Scenario**

- 6.2.9 Evidence of hydrocarbons (diesel) was identified at three locations during the ground investigation as detailed in Table 4.1 above. Two of these three locations were targeted for chemical testing and none of the results exceed the hydrocarbon GAC's. It should be noted that the diesel odour in BH14 was not scheduled for chemical testing by NPL but the area was targeted subsequently at the request of WSP with the three additional window samples WS20, WS21 and WS22. None of the additional samples tested recorded results in excess of the hydrocarbon GAC's.

#### Natural Ground (Eastern Area)

- 6.2.10 The following CoC have been identified from the screening of natural ground in the eastern area:

- Alkaline pH at two locations – BH13A and WS20 – 9.78 and 10.31 respectively compared to a screening value of 9.5.

#### Natural Ground (Western Area)

6.2.11 The following CoC have been identified from the screening of natural ground in the western area:

- Acid pH at one location – TP01 – 5.4 compared to a screening value of 5.5.

#### Made Ground (Eastern Area)

6.2.12 The following CoC have been identified from the screening of made ground in the eastern area:

- Alkaline pH at five locations – BH12A (9.62), BH17 (12.49), BH16 (11.41), BH14 (10.15) and WS21 (11.01) exceeded the GAC of 9.5.

#### Made Ground (Western Area)

6.2.13 The following COC have been identified from the screening of made ground in the western area:

- Asbestos was recorded by the chemical testing laboratory in four samples:
  - BH6 at 0.5m as chrysotile loose fibres;
  - BH6 at 1.0m as chrysotile loose fibres;
  - CPT3 at 0.5m as chrysotile loose fibres; and
  - CPT3 at 1.0m as chrysotile loose fibres.
- Lead at one location – BH5A at 0.5m depth (878mg/kg) compared to a GAC of 808mg/kg;
- Alkaline pH at two locations – BH11A (9.84) and BH10A (11.62) values exceeded the GAC of 9.5; and
- Benzo(a)pyrene at two locations – BH7 at 0.8m depth (510mg/kg) and BH4 at 2.0m depth (13.9mg/kg) compared to a GAC of 11mg/kg.

#### 2006 Ground Investigation Data

6.2.14 The 2006 ground investigation data was also screened against the public open space screening values and only one exceedance was recorded:

- BH110 total cyanide 36mg/kg compared to a screening value of 15mg/kg. This location also recorded evidence of spent oxide on the Engineers log

---

and this cyanide exceedance is likely to be further evidence of spent oxide waste.

### **Assessment of Results - Commercial / Industrial Land Use Scenario**

- 6.2.15 Evidence of hydrocarbons (diesel) was identified at three locations during the 2017 ground investigation as detailed in Table 4.1 above. Two of these three locations were targeted for chemical testing and none of the results exceed the hydrocarbon GAC's. It should be noted that the diesel odour in BH14 was not scheduled for chemical testing by NPL but the area was targeted subsequently at the request of WSP with the three additional window samples WS20, WS21 and WS22. None of the additional samples tested recorded results in excess of the hydrocarbon GAC's.

#### Natural Ground (Eastern Area)

- 6.2.16 The following CoC have been identified from the screening of natural ground in the eastern area:
- Alkaline pH at two locations – BH13A and WS20 – 9.78 and 10.31 respectively compared to a screening value of 9.5.

#### Natural Ground (Western Area)

- 6.2.17 The following CoC have been identified from the screening of natural ground in the western area:
- Acid pH at one location – WS TP01 – 5.4 compared to a screening value of 5.5.

#### Made Ground (Eastern Area)

- 6.2.18 The following CoC have been identified from the screening of made ground in the eastern area:
- Alkaline pH at five locations – BH12A (9.62), BH17 (12.49), BH16 (11.41), BH14 (10.15) and WS21 (11.01) exceeded the GAC of 9.5.

#### Made Ground (Western Area)

- 6.2.19 The following CoC have been identified from the screening of made ground in the western area:

- Asbestos was recorded by the chemical testing laboratory in four samples:
  - BH6 at 0.5m as chrysotile loose fibres,
  - BH6 at 1.0m as chrysotile loose fibres,
  - CPT3 at 0.5m as chrysotile loose fibres,
  - CPT3 at 1.0m as chrysotile loose fibres,
- Alkaline pH at two locations – BH11A (9.84) and BH10A (11.62) values exceeded the GAC of 9.5.
- Benzo(a)pyrene at one location – BH7 (510mg/kg) compared to a GAC of 38mg/kg.

#### 2006 Ground Investigation Data

- 6.2.20 The 2006 ground investigation data was also screened against the commercial industrial screening values and no exceedances were recorded.

#### **Discussion**

- 6.2.21 Asbestos has been identified at five shallow locations and is therefore likely to be encountered during the earthworks. Most of the other exceedances are likely to be mitigated from a human health perspective through the presence of hard standing or landscaping inert cover. However, the benzo(a)pyrene exceedance of 510mg/kg in BH7 at 0.8m depth may need further assessment or removal if this material is likely to be disturbed during construction.
- 6.2.22 The area around BH110 from the 2006 ground investigation which recorded elevated cyanide is just outside the Principal Application Site. However, it is approximately 200m to the south of the western bridge abutment and similar made ground could be encountered during excavation of the bascule pit.
- 6.2.23 The MIND charity site will include an area of green space and allotments close to the A47 / William Adams Way junction. In the absence of any suitable topsoil / subsoil identified across the Principal Application Site during the ground investigations, it is considered that construction of the new green space and allotment area will require an appropriate thickness of inert sub-soil and topsoil to be imported to encourage plant growth.
- 6.2.24 Depending upon the final Principal Application Site levels, excavation and placement of material may be required. If, following excavation, made ground remains, a geotextile break layer is likely to be required to separate the made ground from imported subsoil and topsoil.

---

## 6.3 Controlled Waters Risk Assessment

---

6.3.1 The generic controlled waters risk assessment was conducted in accordance with the principles of the Environment Agency publication 'Remedial Targets Methodology: Hydrogeological Risk Assessment for Land Contamination' 2006 (Ref 16C.13) and the 'prevent and limit' approach of the Water Framework Directive (2000/60.EC). Generic controlled waters risk assessments compare directly measured concentrations with standard assessment criteria. In this case the following assessments were undertaken:

- Level 1 - evaluates the concentrations of chemicals within the pore water in the unsaturated zone of source area soil, in this case soil leachate analysis/using theoretical calculations.
- Level 2 - evaluates the concentrations of chemicals within the saturated zone immediately underlying a source area i.e. taking dilution and attenuation into account, in this case groundwater analysis.

6.3.2 Appropriate Water Quality Standards (WQS) are selected based on both a hierarchy of relevance to England and Wales and the receptor. In this case, the controlled water receptors identified in the CSM are:

- River Yare surface watercourse;
- The underlying Secondary (A) and Principal Aquifers within the superficial and bedrock strata;

6.3.3 The following hierarchies of WQS were therefore considered to be appropriate:

### Aquifers

- UK Drinking Water Quality Standards (DWS) from The Water Supply (Water Quality) Regulations 2000 (amended 2016) (UK DWS) (Ref 16C.14);
- World Health Organisation Drinking Water Guidelines 2017 (WHO DWG 2017) (Ref 16C.15);
- World Health Organisation Petroleum Products in Drinking Water (2008) (WHO 2008) (Ref 16C.16)

---

## Surface Waters

- Environmental Quality Standards (EQS) from The Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015 (WFD 2015) (Ref 16C.17)
- CL:AIRE Petroleum in Groundwater Guidance 2017 (CL:AIRE 2017) (Ref 16C.18),
- R&D Technical Report P2-115/TR4 2002 (Ref 16C.19).

**6.3.4** The following Sections detailing the determinands recording test results in excess of the WQS screening values should be read in conjunction with the screening tables presented in Appendix E.

**6.3.5** It should be noted that two versions of the groundwater screening tables are presented in Annex E. One presented the data per monitoring visit and the other presents the data per geological strata so that a comparison between the different strata can be made.

**6.3.6** NPL undertook water sampling visits to extract water from the monitoring wells for chemical testing on the following occasions. It should be noted that not all monitoring wells were sampled on each visit:

- 1st June 2018
- 21<sup>st</sup> June 2018
- 3<sup>rd</sup> July 2018
- 19<sup>th</sup> July 2018
- 2<sup>nd</sup> August 2018
- 17<sup>th</sup> August 2018
- 30<sup>th</sup> August 2018
- 4<sup>th</sup> October 2018
- 18<sup>th</sup> October 2018
- 1<sup>st</sup> November 2018
- 14<sup>th</sup> November 2018
- 29<sup>th</sup> November 2018
- 11<sup>th</sup> December 2018
- 20<sup>th</sup> December 2018

## Risks to Aquifer

### Soil Leachability Testing

6.3.7 Generic screening of 24 soil leachate test results from the 2017/2018 ground investigation identified exceedances of the WQS screening values for the following determinands:

*Table 6.1: Summary of Soil Leachate Exceedances (Risks to Aquifer)*

Determinand	Exceedance	Screening Value	Source of Screening Value*	Number of Exceedances	Soil Concentrations at Exceedances
<b>Alkaline pH</b>	11.18	10	UK DWS	1	10.31
<b>Acid pH</b>	6.22	6.5	UK DWS	1	8.38
<b>Ammoniacal Nitrogen</b>	5.08mg/l to 0.39mg/l	0.389mg/l	UK DWS	10	71.2mg/kg to 8.6mg/kg
<b>Total cyanide</b>	0.021mg/l to 0.006mg/l	0.005 mg/l	UK DWS	6	2mg/kg to <1mg/kg
<b>Arsenic</b>	23µg/l to 13µg/l	10µg/l	UK DWS	5	12mg/kg to 4mg/kg
<b>Lead</b>	145µg/l to 14µg/l	10µg/l	UK DWS	9	752mg/kg to 14mg/kg
<b>Benzo(a)pyrene</b>	0.13µg/l to 0.03µg/l	0.01µg/l	UK DWS	3	13.9mg/kg to 0.37mg/kg
<b>Sum of four PAH</b>	0.34µg/l to 0.23µg/l	0.1µg/l	UK DWS	2	34.67mg/kg to 1.34mg/kg

6.3.8 It should be noted that the limits of detection for benzo(a)pyrene, bis(2-ethylhexyl)phthalate and hexachlorobutadiene are in excess of the screening values.

### Groundwater Testing

6.3.9 Generic screening of groundwater test results from the fourteen monitoring visits (from the 2017/2018 ground investigation) identified WQS exceedances for the following determinands but not from every sample on every monitoring visit. Discussion of the exceedances is presented in the following sections.

*Table 6.2: Summary of Groundwater Exceedances (Risks to Aquifer)*

Determinand	Exceedance	Screening Value	Source of Screening Value*	Number of Exceedances
<b>Alkaline pH</b>	10.34 to 11.9	10	UK DWS	5
<b>Ammoniacal Nitrogen</b>	0.42mg/l to 12.9mg/l	0.389mg/l	UK DWS	102
<b>Sulphate</b>	282mg/l to 2,720mg/l	250mg/l	UK DWS	54
<b>Free Cyanide</b>	0.006mg/l to 0.033mg/l	0.005mg/l	UK DWS	15
<b>Total Cyanide</b>	0.016mg/l to 0.231mg/l	0.005mg/l	UK DWS	39
<b>Arsenic</b>	11µg/l to 75µg/l	10µg/l	UK DWS	48
<b>Boron</b>	1,010µg/l to 4,920µg/l	1,000µg/l	UK DWS	37
<b>Benzo(a)pyrene</b>	0.02µg/l to 1.87µg/l	0.01µg/l	UK DWS	16
<b>Sum of four PAH</b>	0.11µg/l to 5.46µg/l	0.1µg/l	UK DWS	9
<b>Aromatic C<sub>10</sub>-C<sub>12</sub></b>	97µg/l	90µg/l	WHO 2008	1
<b>Aromatic C<sub>12</sub>-C<sub>16</sub></b>	121µg/l to 163µg/l	90µg/l	WHO 2008	2
<b>Aromatic C<sub>16</sub>-C<sub>21</sub></b>	110µg/l	90µg/l	WHO 2008	1

6.3.10 It should be noted that the limits of detection for bis(2-ethylhexyl)phthalate, vinyl chloride, 1,2-dibromoethane, 1,2-dibromo-3-chloropropane, hexachlorobutadiene are in excess of the screening values.

6.3.11 Most of the exceedances are marginal (less than one order of magnitude) and are unlikely to pose an unacceptable risk to drinking water. However, there are a few exceedances that are one or more orders of magnitude higher than the screening values and these are highlighted below.

6.3.12 Ammoniacal nitrogen exceeds the WQS in most samples by one order of magnitude although occasional samples from BH13, WS20, WS21 and WS22 recorded concentrations two orders of magnitude higher.

- 6.3.13** Sulphate exceeds the WQS by one order of magnitude in a few samples; BH6, BH4D (deep), BH11, BH13 and BH4.
- 6.3.14** Arsenic exceedances are no more than one order of magnitude higher than the WQS and are generally recorded in BH6, BH4D (shallow), BH15, but also in BH4D (deep), BH13, BH11, WS20, WS21 and WS22 on occasions.
- 6.3.15** Exceedances of benzo(a)pyrene were recorded in BH4D, BH4, WS20, WS21, WS22 and are generally less than one order of magnitude higher than the screening value. However, a maximum concentration of 1.87µg/l was recorded in WS22 during visit eight on 4th October 2018.
- 6.3.16** Total PAH exceeded the WQS on only nine occasions and were generally less than one order of magnitude higher than the WQS. However, two samples recorded concentrations greater than one order of magnitude – WS22 – 5.46µg/l on 4th October and WS20 – 1.54µg/l on 29th November.
- 6.3.17** Petroleum hydrocarbons are generally below the screening values apart from WS21 and BH13 in the last two monitoring visits where aromatic C12-C16 hydrocarbons were recorded up to 163µg/l. Test results above the limit of detection were also recorded for aromatic C10-C35 hydrocarbons indicating the possible presence of diesel.

Groundwater Testing – 2006 Ground Investigation

- 6.3.18** Generic screening of groundwater test results from the single monitoring visit from the 2006 ground investigation identified WQS exceedances for the following determinands. Discussion of the exceedances is presented in Sections 6.3.35 to 6.3.43.

*Table 6.3: Summary of Groundwater Exceedances 2006 GI (Risks to Aquifer)*

Determinand	Exceedance	Screening Value	Source of Screening Value*	Number of Exceedances
<b>Arsenic</b>	20µg/l to 35µg/l	10µg/l	UK DWS	4
<b>Boron</b>	1.4mg/l to 3.0mg/l	1mg/l/l	UK DWS	3
<b>Nickel</b>	26µg/l to 47µg/l	20µg/l	UK DWS	3
<b>Selenium</b>	53µg/l to 130µg/l	10µg/l	UK DWS	4

Determinand	Exceedance	Screening Value	Source of Screening Value*	Number of Exceedances
<b>Sulphate</b>	330mg/l to 1600mg/l	250mg/l	UK DWS	5
<b>Total cyanide</b>	0.18mg/l to 3.5mg/l	0.005mg/l	UK DWS	2
<b>Free cyanide</b>	0.94mg/l	0.005mg/l	UK DWS	1
<b>Benzo(a)pyrene</b>	34ng/l	10ng/l	UK DWS	1

**6.3.19** Most exceedances are less than one order of magnitude greater than the screening value. However, selenium and sulphate both exceed by one order of magnitude. The cyanide and benzo(a)pyrene exceedances are recorded in BH110 and TP104 in the southern part of the western area and may be indicative of gasworks waste and / or ash fill.

### Risks to River Yare Surface Water

#### Soil Leachability Testing

**6.3.20** Generic screening of 24 soil leachate test results from the 2017/2018 ground investigation identified the following WQS exceedances:

*Table 6.4: Summary of Soil Leachability Exceedances (Risks to River Yare)*

Determinand	Exceedance	Screening Value	Source of Screening Value*	Number of Exceedances	Soil Concentrations at Exceedances
<b>Cyanide</b>	0.021mg/l to 0.006mg/l	0.001mg/l	WFD 2015	6	2mg/kg to <1mg/kg
<b>Copper</b>	38µg/l to 4µg/l	3.76µg/l	WFD 2015	14	157mg/kg to 3mg/kg
<b>Nickel</b>	11µg/l	8.6µg/l	WFD 2015	1	17mg/kg
<b>Mercury</b>	0.1µg/l	0.07µg/l	WFD 2015	1	<0.17mg/kg
<b>Lead</b>	145µg/l to 2µg/l	1.3µg/l	WFD 2015	19	752mg/kg to 7mg/kg

Determinand	Exceedance	Screening Value	Source of Screening Value*	Number of Exceedances	Soil Concentrations at Exceedances
<b>Zinc</b>	644µg/l to 7µg/l	6.8µg/l	WFD 2015	15	1,900mg/kg to 16mg/kg
<b>Anthracene</b>	0.13µg/l	0.1µg/l	WFD 2015	1	0.02mg/kg
<b>Benzo(a)pyrene</b>	0.13µg/l to 0.03µg/l	0.00017µg/l	WFD 2015	3	13.9mg/kg to 0.37mg/kg
<b>Fluoranthene</b>	0.2µg/l to 0.02µg/l	0.0063µg/l	WFD 2015	16	9.18mg/kg to <0.08mg/kg
<b>Naphthalene</b>	3.75µg/l	2µg/l	WFD 2015	1	0.18mg/kg
<b>Bis(2-ethylhexyl)phthalate</b>	4µg/l	1.3µg/l	WFD 2015	1	<500µg/kg
<b>Aromatic C<sub>12</sub>-C<sub>16</sub></b>	11µg/l	2µg/l	CL:AIRE 2017	1	15.8µg/kg

6.3.21 It should be noted that the limits of detection for cyanide, phenols, cadmium, hexavalent chromium, mercury, benzo(a)pyrene, fluoranthene, 1,2,4-trichlorobenzene, 2,4-dichlorophenol, bis(2-ethylhexyl)phthalate, butylbenzyl phthalate, phenol and aromatic C<sub>5</sub>-C<sub>7</sub>, C<sub>10</sub>-C<sub>12</sub>, C<sub>12</sub>-C<sub>16</sub>, C<sub>16</sub>-C<sub>21</sub> and C<sub>21</sub>-C<sub>35</sub> hydrocarbons are in excess of the screening values.

#### Groundwater Testing

6.3.22 Generic screening of groundwater test results from the 14 monitoring visits (from the 2017/2018 ground investigation) identified WQS exceedances for the following determinands but not from every sample on every monitoring visit.

Table 6.5: Summary of Groundwater Exceedances (Risks to River Yare)

Determinand	Exceedance	Screening Value	Source of Screening Value*	Number of Exceedances
<b>Free cyanide</b>	0.006µg/l to 0.033µg/l	0.001mg/l	WFD 2015	15

Determinand	Exceedance	Screening Value	Source of Screening Value*	Number of Exceedances
<b>Total cyanide</b>	0.016µg/l to 0.231µg/l	0.001mg/l	WFD 2015	39
<b>Arsenic</b>	53µg/l to 75µg/l	25µg/l	WFD 2015	12
<b>Copper</b>	4µg/l to 74µg/l	3.76µg/l	WFD 2015	50
<b>Mercury</b>	0.1µg/l to 0.2µg/l	0.07µg/l	WFD 2015	2
<b>Zinc</b>	7µg/l to 60µg/l	6.8µg/l	WFD 2015	29
<b>Anthracene</b>	0.24µg/l to 0.25µg/l	0.1µg/l	WFD 2015	2
<b>Benzo(a)pyrene</b>	0.01µg/l to 1.87µg/l	0.00017µg/l	WFD 2015	22
<b>Fluoranthene</b>	0.01µg/l to 2.33µg/l	0.0063µg/l	WFD 2015	77
<b>Phenol</b>	13µg/l	7.7µg/l	WFD 2015	1
<b>Trichloroethene</b>	14µg/l to 20µg/l	10µg/l	WFD 2015	5
<b>Aromatic C9-C10</b>	5µg/l to 97µg/l	2µg/l	CL:AIRE 2017	13
<b>Aromatic C10-C12</b>	6µg/l to 163µg/l	2µg/l	CL:AIRE 2017	13
<b>Aromatic C12-C16</b>	6µg/l to 110µg/l	0.1µg/l	CL:AIRE 2017	23
<b>Aromatic C21-C35</b>	16µg/l to 45µg/l	0.00017µg/l	CL:AIRE 2017	5

**6.3.23** Most of the exceedances are marginal (less than one order of magnitude) and are unlikely to pose an unacceptable risk to surface waters. However, there are a few possible patterns that may indicate an impact has previously occurred.

**6.3.24** Trichloroethene and 1,2-dichloroethene are recorded above the limit of detection in BH4 (shallow and deep wells) in most of the monitoring visits. Trichloroethene is recorded above the screening value of 10µg/l in BH4D

---

(deep) during each of the first five monitoring visits. The concentrations recorded range from 14µg/l to 20µg/l. 1,2-dichloroethene concentrations only vary from 1µg/l to 12µg/l (compared to a WQS of 50µg/l). This would suggest an impact has occurred in the past but in the absence of significantly elevated concentrations of any other VOC's a significant risk is not considered to exist. This location is on the western side of the river.

- 6.3.25** Hydrocarbons were not recorded above the limit of detection during the first six visits. However, aromatic hydrocarbons were recorded above the limit of detection in wells on the eastern side of the river from visit seven (30th August 2018), particularly BH13, WS20, WS21 and WS22. Until the final two monitoring visits, the concentrations did not exceed 53µg/l. However, the last two monitoring visits recorded an increase in the number of locations recording concentrations above the limit of detection, particularly for aromatic C16 to C21 (up to 97µg/l). WS21 recorded aromatic hydrocarbons up to 163µg/l (C12 to C16).
- 6.3.26** Aliphatic hydrocarbons were generally less than the limit of detection except for a few occasions when BH4D, BH10, WS21 and WS22 recorded speciations above the limit of detection up to 80µg/l.
- 6.3.27** Hydrocarbon odours were recorded in BH14 and WS21 on the eastern side of the river during the drilling works. Elevated hydrocarbon concentrations within the groundwater have also been recorded in a similar area but only during the final two sampling visits. The elevated concentrations are for the aromatic C9 to C35 fractions and have a maximum concentration of 163µg/l and exceed the WQS for these fractions. An impact appears to have occurred but it is unclear why the last two sampling visits recorded exceedances and the previous visit generally did not.
- 6.3.28** Elevated arsenic was recorded in BH15 only up to a maximum concentration of 75µg/l and elevated cyanide was commonly recorded in BH15 and BH4D up to 0.227µg/l.
- 6.3.29** Fluoranthene was recorded in most samples during most visits and the results are generally in the range of 0.01µg/l to 0.05µg/l. However, occasional results for WS20, WS21, WS22, BH12B and BH4D (shallow) are recorded an order of magnitude higher, up to 0.48µg/l. WS22 also recorded a maximum concentration of 2.33µg/l. This same sample from WS22 (4th October 2018) also recorded elevated benzo(a)pyrene (1.87µg/l), the highest recorded during the monitoring as well as the only phenol exceedance and one of two anthracene exceedances (the other being WS20).

### Groundwater Testing – 2006 Ground Investigation

**6.3.30** Generic screening of groundwater test results from the single monitoring visit from the 2006 ground investigation identified WQS exceedances for the following determinands but not from every sample on every monitoring visit.

*Table 6.6: Summary of Groundwater Exceedances 2006 GI (Risks to River Yare)*

Determinand	Exceedance	Screening Value	Source of Screening Value*	Number of Exceedances
<b>Arsenic</b>	33µg/l to 35µg/l	25µg/l	WFD 2015	3
<b>Cadmium</b>	µg/l to µg/l	0.2µg/l	WFD 2015	1
<b>Nickel</b>	µg/l to µg/l	8.6µg/l	WFD 2015	4
<b>Zinc</b>	µg/l to µg/l	µg/l	WFD 2015	4
<b>Total cyanide</b>	µg/l to µg/l	µg/l	WFD 2015	2
<b>Free cyanide</b>	µg/l to µg/l	µg/l	WFD 2015	1
<b>Naphthalene</b>	67µg/l	2µg/l	WFD 2015	1
<b>Anthracene</b>	1.3µg/l	0.1µg/l	WFD 2015	1
<b>Fluoranthene</b>	0.019µg/l to 3.6µg/l	0.0063µg/l	WFD 2015	2
<b>Benzo(a)pyrene</b>	0.034µg/l	0.00017µg/l	WFD 2015	1

**6.3.31** Some exceedances are less than one order of magnitude greater than the screening value. However, zinc, total cyanide, free cyanide, naphthalene, anthracene, fluoranthene and benzo(a)pyrene exceedances are recorded at concentrations one or two orders of magnitude higher than the screening values. BH110 in particular records the most exceedances and may be indicative of gasworks waste and / or ash fill.

### **Discussion**

**6.3.32** The ground investigation recorded some olfactory evidence of hydrocarbons in WS21, BH14 and BH6 from the 2017 ground investigation and in TP101, BH104 and BH110 from the 2006 ground investigation.

**6.3.33** Sampling of groundwater from monitoring well installations (adopting best practice of purging) identified some exceedances of the conservative generic groundwater screening values for metals, inorganics and hydrocarbons. Most of these exceedances are less than one order of magnitude greater

---

than the screening values and are therefore not considered to be indicative of significant contamination.

- 6.3.34** However, there is some evidence of organic contamination (polyaromatic hydrocarbons, volatile organic compounds and petroleum hydrocarbons) and to a lesser extent metals and non-metals in the groundwater across the Principal Application Site indicating the groundwater has been impacted previously and has the potential to impact the surface water of the River Yare.
- 6.3.35** The soil leachate WQS exceedances are generally less than one order of magnitude above the screening values and indicate that there is a theoretical potential for an impact to occur. However, the Principal Application Site will be generally hard standing, thus limiting the degree of rainfall percolation through the made ground and hence the concentrations recorded suggest the made ground would not pose a significant risk to Controlled Waters.
- 6.3.36** In view of the above it is considered that the absence of test results that consistently exceed the screening values at each monitoring visit indicates that there is unlikely to be an unacceptable risk to the identified receptors and hence specific remediation to target existing groundwater exceedances is not considered necessary.
- 6.3.37** The groundwater monitoring test data has also been assessed on a strata by strata basis. This has not identified any significant difference in the exceedances between the different strata or from one side of the river to the other. This would suggest there is hydraulic continuity between the different strata.

### **Assessment of Saline Intrusion**

- 6.3.38** The two most recent sets of groundwater testing included results for electrical conductivity in order to make an assessment of saline intrusion. The results indicate that there is some influence from seawater across the Principal Application Site in both shallow and deep groundwater monitoring wells.

## **6.4 Ground Gas Assessment**

---

### **Results**

- 6.4.1** To date, nine rounds of ground gas monitoring have been undertaken by NPL on the following dates:

- 17<sup>th</sup> August 2018 – excludes BH7 and window sample locations WS20-WS22;
- 30<sup>th</sup> August 2018 - excludes BH7 and window sample locations WS20-WS22;
- 4<sup>th</sup> October 2018 – excludes BH7;
- 18<sup>th</sup> October 2018 - excludes BH7;
- 1<sup>st</sup> November 2018 - excludes BH7;
- 14<sup>th</sup> November 2018 - excludes BH7;
- 29<sup>th</sup> November 2018 - excludes BH7;
- 11<sup>th</sup> December 2018 - excludes BH7; and
- 20<sup>th</sup> December 2018 – only BH7 was monitored on this occasion.

**6.4.2** It is likely that a control building will be constructed adjacent to the eastern abutment and therefore this gas assessment will inform the design of that building.

**6.4.3** Atmospheric pressure varied as set out in Table 6.7 during the monitoring period.

*Table 6.7: Summary of Atmospheric Pressure Recorded during Gas Monitoring Visits*

Date	Atmospheric Pressure	Trend
<b>17/8/18</b>	1010	Steady
<b>30/8/18</b>	1020	Steady
<b>4/10/18</b>	1022	Steady
<b>18/10/18</b>	1024	Steady
<b>1/11/18</b>	1001	Steady
<b>14/11/18</b>	1022-1021	Falling
<b>29/11/18</b>	1002	Steady
<b>11/12/18</b>	1026	Steady
<b>20/12/18</b>	1003	Steady

**6.4.4** The results of the 2018 gas monitoring are presented in Annex B.2. The table below presents Gas Screening Values (GSV) and the subsequent Characteristic Situation which have been calculated in accordance with CIRIA Guidance C665 (Ref 16C.10) for each gas monitoring well.

*Table 6.8: Summary of Ground Gas Monitoring Results*

Exploratory Hole	Max Flow Rate (l/hr)	Max Methane (% v/v)	Max Carbon Dioxide (% v/v)	Methane GSV	Carbon Dioxide GSV	Characteristic Situation
<b>BH4</b>	0.1	0	4.8	0	0.000048	1
<b>BH4A</b>	0	0	5.1	0	0	1
<b>BH4D Shallow</b>	1.1	0	10.6	0	0.1166	2
<b>BH4D Deep</b>	1.0	0	10.1	0	0.101	2
<b>BH6</b>	0.1	0	0.9	0	0.0009	1
<b>BH7</b>	0	0	4.1	0	0	1
<b>BH10</b>	0.1	0	1.5	0	0.0015	1
<b>BH11</b>	1.1	1.1	6.1	0.0121	0.0671	1
<b>BH12B</b>	0.1	0	3.6	0	0.0036	1
<b>BH13</b>	0.1	0.8	0.3	0.0008	0.0003	1
<b>BH15</b>	0	0	0.5	0	0	1
<b>WS20</b>	0	0	0.1	0	0	1
<b>WS21</b>	0	0	0.1	0	0	1
<b>WS22</b>	0	0	0.2	0	0	1

- 6.4.5** The above GSV's range between zero and 0.1166 and indicate most monitoring wells are classified as Characteristic Situation 1, with two locations (BH4D deep and BH4D shallow) being Characteristic Situation 2. However, BH4A, BH11 and possibly also BH4, BH7 and BH13 exhibit gas concentrations that could classify these as Characteristic Situation 2 should gas flow increase at these locations.
- 6.4.6** No gas protection measures above and beyond standard construction are required for the areas classified as Characteristic Situation 1. However, areas classified as Characteristic Situation 2 may require gas protection measures.
- 6.4.7** The results of the gas monitoring from the 2006 ground investigation (presented in Annex B.3) do not change this assessment of the Characteristic Situation.
- 6.4.8** The control room and plant room are located at an elevated position on the side of the bridge abutments. They will not have any direct contact with the ground and therefore are considered to not require gas protection measures.

---

## 6.5 Piling Risk Assessment

---

6.5.1 A Piling Works Risk Assessment has been prepared in accordance with the following Environmental Agency guidance and will be presented as Appendix 16D to the Environmental Statement (document reference 6.3);

- Piling in layered ground: risks to groundwater and archaeology. Environment Agency Science Report SC020074/SR (Ref 16C.20);
- Piling into contaminated sites. Environment Agency National Groundwater and Contaminated Land Centres (Ref 16C.21); and
- Piling and penetrative ground improvement methods on land affected by contamination: guidance on pollution prevention. Environment Agency (Ref 16C.22).

## 7 Waste Assessment

### 7.1 Hazardous Properties Assessment

- 7.1.1 A waste classification hazardous properties assessment has been carried out in accordance with the WM3 Technical Guidance (Ref 16C.23), to determine if the site soils contain any hazardous properties.
- 7.1.2 The soil chemical test results from the 2017/2018 ground investigation have been assessed and identified hazardous properties in six samples;
- BH6 at 0.5m bgl,
  - BH7 at 0.8m bgl,
  - WS3 at 0.3m bgl,
  - BH4D at 3.9m bgl,
  - BH10A at 2.9m bgl,
  - BH17 at 0.5m bgl,
- 7.1.3 All of the above are in made ground and exhibit hazardous properties due to elevated either zinc, petroleum hydrocarbons, pH or speciated polyaromatic hydrocarbons or a combination of these.
- 7.1.4 A further 42 samples were highlighted as potentially hazardous due to the petroleum hydrocarbons.
- 7.1.5 Four samples recorded asbestos as loose fibres of chrysotile. Two of these samples underwent quantification testing, recording 0.016% (BH6 at 0.5m bgl) and <0.001% (BH6 at 1.0m bgl). BH6 at 0.5m may therefore also be classified as hazardous waste based on the asbestos content.
- 7.1.6 It may not be possible for material classified as hazardous to be reused in the Order Limits, Waste Catalogue (EWC) as '17 05 03' soil and stones containing dangerous substances.
- 7.1.7 Material classified as not containing hazardous properties is likely to be classified under the EWC as '17 05 04' soil and stones other than those mentioned in '17 05 03'.
- 7.1.8 Further testing will need to be carried out to confirm the waste classification of the material classified as potentially hazardous. No significant effects will occur as the material will have been earmarked for removal from site. The further testing is required to identify the appropriate disposal route.

---

## Waste Acceptance Criteria Testing

- 7.1.9** Waste acceptance criteria (WAC) analysis has been carried out on a number of samples in order to assess the acceptability to landfill should offsite disposal be required. Two samples (WS9 at 1.4m and BH4D at 3.9m) recording hazardous or potentially hazardous properties and subjected to WAC testing failed the hazardous waste criteria for loss on ignition (LOI) and total organic carbon (TOC).
- 7.1.10** Seven samples subjected to WAC testing recorded no hazardous properties. Six of these pass the inert waste criteria, but one sample (BH4A at 2.1m) fails the inert waste criteria for sulphate and total dissolved solids (TDS) and may require disposal as non-hazardous waste if the material is surplus to the scheme.
- 7.1.11** In addition, five samples were subjected to WAC testing but without a hazardous properties assessment. Of these, one (BH8 at 1.0m) fails the hazardous waste criteria for total organic carbon and one (WS20 at 3.1m) fails the inert waste criteria for chloride.
- 7.1.12** The construction Contractor will need to make their own assessment of the waste classifications.

---

---

## 8 Refined Conceptual Site Model

### 8.1 Introduction

---

- 8.1.1** This section provides a refinement of the preliminary CSM from the Interpretative Environmental Desk Study Report (presented as Appendix 16B within the Environmental Statement). From the information identified during the ground investigation and the risk assessments detailed in Section 6 above, plausible source-pathway-receptor contaminant linkages have been refined in line with industry good practice (principally CLR11 (Ref 16C.5)).
- 8.1.2** The refined CSM provides an updated understanding of the Principal Application Site based on the findings of the site investigation and analytical results and draws on the ground, hydrogeological and contamination models which are presented in Sections 4, 5 and 6. It has been used to inform the quantitative risk assessments undertaken in Section 6 in the context of a future land use comprising a new highway layout, bridge and associated landscaping and hard standing.

### 8.2 Plausible Contaminant Linkages

---

- 8.2.1** Table 8.1 provides a revised evaluation of the potential contaminant linkages that were considered to be plausible for the future use of the Principal Application Site. It uses the current site investigation findings to refine the Phase 1 assessment.

Table 8.1: Summary of Plausible Contaminant Linkages

Potential Contaminants	Potential Pathways	Potential Receptors	Comments
<b>Free asbestos fibres in made ground soil</b>	Inhalation of asbestos fibres.	Future site users Future maintenance workers	Extensive hard standing will restrict exposure following construction but exposure during construction and during maintenance works cannot be discounted. The presence of asbestos elsewhere within the made ground cannot be discounted therefore if made ground materials are placed in landscaping areas, a capping layer will also need to be considered to minimise the risk to site users and adjacent site users from inhalation of fibres.
<b>Contaminants in soil</b>	Dermal contact, ingestions and inhalation of contaminated made ground, soil particles and fugitive dust.	Future site users Future maintenance workers	Detected potential contaminants limited to benzo-a-pyrene (2 locations), pH (ten locations) and lead (one location).

Potential Contaminants	Potential Pathways	Potential Receptors	Comments
			Extensive hard standing will restrict exposure at most locations except where landscaping is proposed.
<p><b>Leachable contaminants and contaminants in groundwater</b></p>	<p>Vertical leaching from impacted soil and lateral migration of impacted groundwater derived from on-site sources.</p>	<p>Superficial Secondary (A) aquifers and bedrock Principal Aquifer. River Yare surface water</p>	<p>Groundwater appears to have been impacted slightly by inorganic determinands and at a few locations (principally WS22) by hydrocarbons.</p> <p>There is a theoretical risk to surface waters from leachable contaminants in soil including limited hydrocarbon exceedances.</p> <p>Extensive hard standing will limit rainfall percolation and leachate potential and the identified exceedances of the WQS criteria are generally not significantly elevated.</p> <p>Whilst a potential contaminant linkage has been identified, an unacceptable risk to</p>

---

---

Potential Contaminants	Potential Pathways	Potential Receptors	Comments
			controlled waters is considered unlikely. However, the hydrocarbons identified in WS22 will need to be assessed once all the groundwater monitoring visits are complete.

---

---

## 9 Conclusions

### 9.1 Ground Conditions

---

- 9.1.1 The ground investigation encountered made ground across most locations. The encountered underlying Superficial geology comprised clay and silt of the Tidal River or Creek Deposits, sand of the North Denes Formation, granular, cohesive or peat material of the Breydon Formation, sand of the Happisburg Formation. Bedrock geology was encountered at depth and comprised sand of the Crag Group and below that, clay of the London Clay.
- 9.1.2 Made ground was recorded at almost all exploratory locations, varied in proven thickness from 0.4m to 4.8m and was generally granular and heterogeneous in nature.
- 9.1.3 Solid concrete was encountered at most locations in the eastern area and was recorded up to 0.65m thick. However, only a few locations in the western area encountered concrete up to 0.5m thick.
- 9.1.4 Other than the man-made detritus recorded within the made ground, olfactory evidence of contamination was recorded at only a few locations as hydrocarbon odour or sulphurous odour. No hydrocarbon sheen or free phase product was recorded on the Engineer's logs.
- 9.1.5 The ground investigation confirmed the presence of shallow groundwater which is likely to be in hydraulic continuity with the River Yare.

### 9.2 Environmental / Contamination Assessment

---

- 9.2.1 The following contamination issues have been identified:
- Asbestos was recorded by the chemical testing laboratory at four locations as loose fibres of chrysotile. The potential for more asbestos containing materials to be present within made ground materials cannot be discounted and the construction Contractor should take necessary precautions to protect their staff, site users and adjacent site users as set out in the Outline Code of Construction Practice (Outline CoCP) (document reference 6.16).
  - Natural ground has recorded exceedances of the human health GAC values for pH.
  - Made ground has recorded exceedances of the human health GAC values for pH benzo(a)pyrene and lead.

- There have been several exceedances (for a number of determinants) of the conservative generic WQS screening values in the groundwater and soil leachate samples tested. The groundwater test results indicate that some impact to controlled waters has already occurred but it is considered unlikely that the proposed scheme will have an adverse impact on controlled waters. The soil leachability results indicate the soils have the theoretical potential to generate leachate but the impact is unlikely to be significant.
- Gas monitoring data indicates ground gas has been recorded at concentrations that may require specific gas protection measures up to Characteristic Situation 2, depending upon the location and design of any control buildings or structures. The control room and plant room are at an elevated location on the side of the bridge abutments and therefore do not have any direct contact with the ground. Gas protection measures are therefore not considered to be necessary for these two spaces.

### 9.3 Outline Remedial Measures

---

- 9.3.1** Potential risks to future site users from asbestos within made ground have been identified and the possibility of made ground at the Principal Application Site containing further asbestos cannot be ruled out. If the known asbestos locations are to be exposed / disturbed during construction or will be exposed at the surface in final landscaping areas, further sampling and assessment at these locations will need to be undertaken by the construction Contractor and if necessary, consideration should be given to excavating and removing this material from the Principal Application Site. The same will apply if further presence of asbestos is observed during the construction works. Measures are set out in the interim Outline CoCP (document reference 6.16) and will form part of the full CoCP.
- 9.3.2** Other potential human health risks were identified. These are mitigated to acceptable levels where construction of the road will break the pathway. However, in areas where landscaping or the MIND site allotments are proposed, it is considered that placement of an inert subsoil and topsoil capping underlain by a geotextile (to delineate the made ground / capping interface and to minimise mixing of the soils) may be necessary (in particular in the proposed allotment area). Discussion with the Regulators at detailed design stage will be required to agree the scope of any capping. Measures are set out in the interim Outline CoCP (document reference 6.16) and will form part of the full CoCP.
- 9.3.3** Groundwater extracted from excavations during construction is likely to require treatment prior to discharge and the exact details of this will need to be confirmed by the Contractor depending upon their chosen disposal route.

---

---

Measures are set out in the Outline CoCP (document reference 6.16) and will form part of the full CoCP.

## **9.4 Construction Considerations**

---

- 9.4.1** Protection of construction workers, site users and adjacent site users from airborne dust generated from made ground during construction will be required and measures are set out in the Outline CoCP (document reference 6.16) and will form part of the full CoCP.
- 9.4.2** The construction Contractor will need to keep a 'watching brief' for unforeseen contamination including hydrocarbons and asbestos. Hydrocarbon odours were identified during the ground investigation, but chemical testing did not record any elevated concentrations at those locations.

## **9.5 Operation Considerations**

---

- 9.5.1** Long term risks associated with contamination are dealt with in the outline remedial measures sub-section above. No additional remedial measures are therefore necessary during operation of the Scheme.

## Annex A: 2017/2018 Scope of Works

### Land Based Field Works

#### General Works

The land based ground investigation was undertaken between 18<sup>th</sup> September 2017 and 27<sup>th</sup> March 2018 by NPL who acted as Principal Contractor and were contracted to The Applicant. Envirolab Ltd were sub-contracted by NPL to undertake the chemical testing.

The ground investigation was undertaken in general accordance with techniques outlined in BS5930:2015 and BS1377:2016, as appropriate, at the positions shown on Drawing GYTRC-WSP-HGT-DR-GE-0001(AB). The exploratory hole logs are presented in Annex B.1.

The investigation was monitored part time by a Geotechnical Engineer from WSP Ltd.

#### Gas and Groundwater Monitoring Well Installation

Gas and groundwater monitoring wells were installed in selected boreholes summarised below and were constructed from 50mm perforated plastic pipe with a pea gravel surround and fitted with air tight gas valves. As a minimum requirement, each monitoring well comprised plain pipe from ground level to 1m with a bentonite pellet surround. Exact details of each installation are shown on the Engineer's logs in Annex B.1.

*Table A.1: Summary of Monitoring Wells*

Borehole ID	BH Depth (m bgl)	Installation Type	Standpipe Depth (m bgl)	Standpipe Response Zone (mbgl)	Target Strata
BH4	30.0	50mm Standpipe	9.5	6.5 – 9.5	Breydon and Crag Formations
BH4A	5.0	50mm Standpipe	1.8	0.5 – 1.7	Made ground and Alluvium
BH4D	30.0	50mm Standpipe	3.5	1.0 – 3.5	Made Ground
		50mm Standpipe	11.0	8.0 – 11.0	Crag Formation
BH6	30.0	50mm standpipe	15.0	9.0 – 15.0	Crag Formation
BH7	6.0	50mm Standpipe	6.0	0.3 – 1.15	Made ground and Breydon Formation

Borehole ID	BH Depth (m bgl)	Installation Type	Standpipe Depth (m bgl)	Standpipe Response Zone (mbgl)	Target Strata
<b>BH10</b>	50.0	50mm Standpipe	3.5	0.5 – 3.5	Made ground and alluvium
<b>BH11</b>	50.0	50mm Standpipe	20.5	4.5 – 20.5	Breydon, North Denes and Crag Formations
<b>BH12B</b>	50.0	50mm Standpipe	10.0	4.0 – 10.0	Made ground, alluvium and Breydon Formation
<b>BH13</b>	50.0	50mm Standpipe	14.5	3.5 – 14.5	Breydon Formation and Crag Formation
<b>BH15</b>	30.0	50mm Standpipe	7.0	1.0 – 7.0	North Denes Formation
<b>WS20</b>	5.0	50mm Standpipe	3.0	1.0 – 3.0	Alluvium (probably Tidal River or Creek Deposits)
<b>WS21</b>	5.0	50mm Standpipe	3.0	1.0 – 3.0	Alluvium (probably Tidal River or Creek Deposits)
<b>WS22</b>	6.0	50mm Standpipe	3.0	1.0 – 3.0	Alluvium (probably Tidal or River Creek Deposits)

It should be noted that an oversight by the Contractor resulted in only one gas and groundwater monitoring visit being undertaken for BH7.

#### Groundwater and Gas Monitoring

Boreholes were monitored by NPL for ground gas concentrations on a number of occasions on completion of the GI. Concentrations of methane (CH<sub>4</sub>), carbon dioxide (CO<sub>2</sub>), oxygen (O<sub>2</sub>) and trace gases (including carbon monoxide, hydrogen sulphide) were recorded together with gas flow rates. Atmospheric pressures during the monitoring were also noted to enable a

---

quantitative gas risk assessment to be carried out if necessary in accordance with current best practice.

The results of the gas and groundwater monitoring are presented in Annex B.1.

### Groundwater Sampling

NPL have undertaken groundwater sampling on a number of occasions to-date after completion of the site works. Prior to each round of groundwater sampling, three well volumes were purged.

Groundwater samples were retained by NPL in containers provided by Envirolab Ltd and transported to the testing laboratory in accordance with Envirolab Ltd sample handling protocols.

### **Marine Sampling Works**

#### General Works

The marine sampling works were undertaken between 11<sup>th</sup> June 2018 and 14<sup>th</sup> July 2018 by NPL who were contracted to The Applicant. The chemical testing suite was developed by WSP Ltd and undertaken by Envirolab who were sub-contracted by NPL.

Samples were stored in appropriate bottles and transported in cooler boxes to the testing laboratory under a chain of custody protocol within 24 hours of being taken.

The WSP Factual Report including sampling locations and test results is presented in Annex C.

### **Testing**

#### Chemical Testing – Soils & Leachate

Selected soil samples were scheduled for chemical analysis by WSP Ltd which was undertaken by Envirolab Ltd under contract to NPL. However, some locations (BH14, BH15, BH16, BH17 and WS20, WS21 and WS22) were scheduled by NPL for the same testing suite as those locations scheduled by WSP Ltd. The results of the contamination testing are presented in Annex B.1. The testing was scheduled as set out in Table A2 below.

<b>TPHCWG</b>	Speciated TPH (aliphatic and aromatic split and banded) including Benzene, Toluene, Ethyl Benzene and Xylene					
<b>SVOC</b>	Semi Volatile Organic Compounds					
<b>PAH</b>	Speciated Polycyclic Aromatic Hydrocarbons					

Chemical Testing - Water

Water Samples were extracted from the monitoring wells on the Principal Application Site on a number of occasions by NPL and submitted for chemical analysis at Envirolab Ltd. The results of the contamination testing are presented in Annex B.1. The testing was carried out as set out in Table A4 below.

*Table A.4: Summary of Chemical Testing for Water (Groundwater and Surface Water)*

Water Body	Laboratory Analysis (no.)						
	Metals	General Suite	TPHCWG	VOC	SVOC	PAH	Enhanced General Suite
<b>Groundwater</b>	112	88	112	88	88	112	24
<b>Key</b>							
<b>Metals</b>	Arsenic, cadmium, chromium (hexavalent and total), lead, mercury, copper, nickel, selenium and zinc),						
<b>General Suite</b>	pH, Sulphate water soluble, Ammonia as N, Cyanide (total and free) and phenol						
<b>TPHCWG</b>	Speciated TPH (aliphatic and aromatic split and banded) including Benzene, Toluene, Ethyl Benzene and Xylene						
<b>VOC</b>	Volatile Organic Compounds						
<b>SVOC</b>	Semi Volatile Organic Compounds						
<b>PAH</b>	Speciated Polyaromatic Hydrocarbons (PAH)						
<b>Enhanced general suite (final two monitoring visits only)</b>	Electrical conductivity, BOD, Alkalinity, Hardness, Total Suspended Solids, Ammonium / Ammoniacal nitrogen as NH <sub>4</sub> , Chloride, Bromine, Fluoride, Nitrite, Nitrate, Nitrate as N, Total Oxidised Nitrogen, Total Nitrogen, Nitrogen (kjeldahl), Phosphate (orthophosphate) as P, Total Phosphorus, Sulphate, DOC, Total Oil & Grease, Calcium, Iron, Manganese, Magnesium, Potassium, Sodium, Ethylene glycol (Monoethylene glycol)						

#### Chemical Testing – River Bed Soil Samples

River bed soil samples were taken by NPL from the 10 marine boreholes within the River Yare and were submitted for chemical analysis at Envirolab Ltd. The results of the contamination testing are presented in Annex C.

The soil testing was scheduled as set out in Table A5 below.

*Table A.5: Summary of Chemical Testing for River Yare Soils*

Strata	Soil Sample Laboratory Analysis (no.)											% Samples in Upper 1m
	Metals	General	TPHCWG	VOC	SVOC	PAH	PCB EC7	PCB WHO 12	WAC	Asbestos	SOM

# 1 INTRODUCTION

---

On the instructions and under the supervision of WSP (the Engineer), acting on behalf of Norfolk County Council (the Employer), a site investigation was undertaken by Norfolk Partnership Laboratory (Main Contractor) on land partly by James and Milton and partly by Ground Technology (sub-contractors) at the River Yare crossing in Great Yarmouth.

The Great Yarmouth Third Crossing Project comprises a bridge with a central bascule lifting section located centrally over River Yare, and the associated highway embankments, junctions and infrastructure. The proposed bridge alignment would provide an east-west connection between the Strategic Road Network (A47) and the South Denes Business Park, Enterprise Zone, Great Yarmouth Energy Park and the Outer Harbour, all of which are located on the South Denes peninsula.

This factual report is being produced by WSP on behalf of Norfolk Partnership Laboratory for Norfolk County Council.

The objective of the investigation was to determine the ground, groundwater and ground contamination conditions at the site and to provide information that would assist the geotechnical and geoenvironmental design of the proposed works. The scope of the investigation was determined by the Engineer.

The site work at Great Yarmouth Third River Crossing was carried out between the 18<sup>th</sup> September 2017 and 27<sup>th</sup> March 2018 and comprised:

- Twenty five cable percussion boreholes (four locations terminated early)
- Sixteen dynamic window sampling boreholes
- Five cone penetration tests
- In-situ and laboratory testing

The site plan Drawing Reference GYTRC-WSP-HGT-DR-GE-0001 is included in Appendix A.

## 2 THE SITE AND GEOLOGY

---

The irregular shaped site is located on both sides of River Yare, immediately south of Great Yarmouth town centre. The site is approximately bounded to the north by Boundary Road and Newcastle Road, to the east by Exmouth Road and Admiralty Road, to the south by Swanston's Road and William Adams Way, and to the west by Harfrey's Road. The site area is centred on National Grid reference 652320, 306005. The location of the site is shown on the appended site location plan, WSP drawing No. GYTRC-WSP-HGT-DR-GE-0001 included in Appendix A.

Made Ground material is expected to be present and varied in nature and thickness associated to existing infrastructural developments at the site.

The British Geology Survey Map Sheet 162 (British Geological Survey, 1991) for Great Yarmouth indicates that the site is underlain by a variety of superficial deposits:

- South West – peat of the Breydon Formation
- North – clay and silt of the Breydon Formation
- Eastern part beyond the River Yare – sand and gravel of the North Denes Formation
- Within the River Yare – Clay and silt tidal river or creek deposits

Solid geology underlying the site is shown on the BGS website to comprise sand and gravel of the Crag Group, underlain by London Clay.

Groundsure (Groundsure, 2017) records a number of historical ground workings on site, all associated with the quay/ wharf immediately adjacent to the River Yare.

Extract from geological map included in Appendix B

## 3 METHOD OF INVESTIGATION

### 3.1 GENERAL

A Cable Avoidance Tool (CAT) survey was undertaken at the exploratory hole locations. Prior to sinking of the boreholes, dynamic sampler holes and cone penetrometer tests, inspection pits were dug by hand at each location in order to identify the presence of any services.

Details of in-situ sampling and testing carried out, together with the descriptions of the strata encountered, are given on the various exploratory hole records. The investigation was generally carried out in accordance with BS 5930:1999 (British Standard, 1999), BS EN ISO 14688-1:2002 (British Standard, 2002) and BS EN ISO 14689-1:2003 (British Standard, 2003) as appropriate.

Exploratory hole details including depths, surveyed coordinates and installation information are given in Appendix C.

All geotechnical samples were transported to the laboratories and offices of Norfolk Partnership Laboratory (NPL) for examination and testing as scheduled by the NPL and the Engineer. Chemical samples were couriered to the Envirolab laboratory in Cheshire for testing scheduled by the Engineer.

### 3.2 UNEXPLODED ORDNANCE RISK MITIGATION SURVEY

A detailed unexploded ordnance assessment, commissioned by WSP, was undertaken by Dynasafe BACTEC with the report titled 'Explosive Ordnance Desktop Threat Assessment' dated 17th September 2017, Ref. 7307TA. The detailed assessment considers the site to include zones of low, medium and high risk of unexploded ordnance remaining within the site (Dynasafe, 2017).

At each proposed borehole, dynamic sampler and cone penetrometer (CPT) locations, a magnetometer survey was undertaken by MACC, the UXO protection sub-contractor, in order to identify the possible presence of unexploded ordnance (UXO). The testing was carried out by using a magnetic anomaly locator magnetometer or by inspection, in accordance with the guidance provided in CIRIA C681 (CIRIA, 2009). The results of the risk mitigation survey carried out for the ground investigation are given in Appendix D. The MAGNEX 120 LW operates by detecting ferromagnetic objects which are buried underground or underwater. A further important field of use of the Magnex 120 LW lies in the probing of bore holes where magnetic anomalies have been proven at relatively great depths or in detections fields with a lot of surface bound interference.

A total of three borehole locations were terminated before reaching their scheduled depth due to high Magnetometer readings. At these locations scanned depths were increased but readings remained high. The MACC UXO specialist on site advised that the exploratory holes should be terminated immediately following continuous high readings. A summary of the locations terminated due to high magnetometer readings are provided in the Table 1.

**Table 1 - UXO Borehole Termination Summary**

Location	Date	Termination Depth (m BGL)	Note
BH4A	04/12/2017	5.0	Location cancelled
BH5	01/12/2017	5.0	Location moved to BH5A
BH7	30/11/2017	6.0	Location cancelled

### **3.3 CONTAMINATED SITE PROCEDURES**

The site was designated to be in the Institution of Civil Engineers Site Investigation Steering Group Yellow category and appropriate protection measures were undertaken (Site Investigation Steering Group, 1993).

Hand held sampling tools were cleaned after each sample to prevent cross contamination between samples. Samples for chemical contamination testing were taken as appropriate for the intended analyses, as shown on the exploratory hole records.

Each borehole was cased, which was progressively reduced in diameter with depth. Environmental seals of bentonite pellets, adequately hydrated were installed with every change in casing diameter, in order to minimise downward mobilisation of any contaminants within shallow soils or Made Ground.

## 4 FACTUAL INFORMATION

### 4.1 CABLE PERCUSSION BORING

Twenty five boreholes using three diameter casings 300mm, 250mm and 200mm were sunk to depths below ground level (bgl) between 5.0m and 50.0m using light cable tool percussion boring techniques. The borehole records are included in Appendix C.

The cable percussive boreholes are summarised in the table below:

**Table 2 - Borehole Summary**

Borehole ID	Date Completed	Depth (mbgl)	Location	Easting	Northing	Ground Level

Disturbed samples were taken at each change in soil type and at regular vertical intervals during boring in order to identify and give a record of the strata encountered. Environmental disturbed samples were also taken at varying depths within the boreholes which reduced in frequency at deeper depths.

In cohesive soils nominal 100mm diameter general purpose thin-wall driven open tube (UT100) samples were taken and subsequently sealed to preserve their natural moisture contents.

Standard penetration tests (SPT) using a split spoon (S) or a solid 60° cone (C) were carried out in the Made Ground, granular deposits and alternating with UT100 sampling in the cohesive materials. The results of in-situ tests are shown on the borehole records at the relevant depths included in Appendix C.

During the course of boring attention was given to recording any evidence of water inflow in order that the groundwater level beneath the site could be established. Water levels at breaks in boring were recorded where appropriate. Water samples were taken where sufficient water was encountered to allow sampling. Where water was added to facilitate penetration of the soil strata, or to maintain a positive hydrostatic head in the granular strata, this is noted on the borehole records.

Where blowing sand were encountered during drilling, preventative measures were undertaken to reduce the negative effects of the blowing. This was achieved by altering the drilling method to reduce the build up of negative pressures, as well as adding Drilling fluid, i.e. water or a ‘Dandopol’ polymer/water mix to aid drilling.

A total of four locations, including BH4A, BH5, BH7 and BH12A, were terminated before the scheduled depth due to obstructions encountered or detected during drilling. Details of the termination for each borehole are included on the log that are presented in Appendix C.

## 4.2 MARINE CABLE PERCUSSION BORING

No marine cable percussive boreholes are included in this factual report. The Factual report for the 2018 off-shore ground investigation shall be issued separately.

## 4.3 DYNAMIC WINDOW SAMPLING BOREHOLES

Sixteen dynamic sampling boreholes were sunk using the soil sampling (window) system to depths of between 1.10m and 6.00m below ground level (bgl). Penetration of the sampler was obtained by driving up to 128mm diameter windowless tubes, with PVC sleeves, by percussion using a vibrating hammer. Disturbed samples were subsampled from the tubes onsite. The Window Sample records are included in Appendix C.

A total of two trial pit locations from the original scope were undertaken as window samples due to restricted space at each location. An additional two window samples (BH4ASU, BH4BU) were undertaken along William Adams Way at locations that were not accessible by either trial pitting or the cable percussive borehole rig.

The dynamic window sampling boreholes are summarised in the table below:

**Table 3 - Window Sample Summary**

Window Sample ID	Date Completed	Depth (mbgl)	Location	Easting	Northing	Ground Level
WS1	05/12/2017	5.00	West Bank – William Adams Way – Crest of embankment	652125	305895	1.55
WS2	06/12/2017	2.00	West Bank – William Adams Way – Mid slope of embankment	652124	305897	0.85

BH4BU	13/11/2017	5.00	West Bank – William Adams Way – Eastbound verge	652322	305820	1.83

#### 4.4 TRIAL PITTING

No Trial pits were undertaken as part of this ground investigation. Scheduled trial pitting was replaced by window sampling due to space constraints encountered on site, as detailed in Section 4.3.

#### 4.5 INSTRUMENTATION AND MONITORING

Fifteen installations were completed at No.14 locations within the scheme. 50mm diameter HDPE groundwater and gas monitoring standpipes and vibrating wire piezometers were installed within selected boreholes as summarised in the table below:

**Table 4 - Installations Summary**

Borehole ID	BH Depth (m bgl)	Installation Type	Standpipe Depth (m bgl)	Standpipe Response Zone (mbgl)
BH4	30.0	50mm Standpipe	9.5	6.5 – 9.5
BH4A	5.0	50mm Standpipe	1.8	0.5 – 1.7
BH4D	30.0	50mm Standpipe	3.5	1.0 – 3.5
		50mm Standpipe	11.0	8.0 – 11.0
BH5A	30.0	Vibrating Wire	6.5	5.5 – 6.0
BH6	30.0	50mm Standpipe	15.0	9.0 – 15.0
BH7	6.0	50mm Standpipe	1.15	0.3 – 1.15
BH10	50.0	50mm Standpipe	3.5	0.5 – 3.5
BH11	50.0	50mm Standpipe	20.5	4.5 – 20.5
BH12B	50.0	50mm Standpipe	10.0	4.0 – 10.0
BH13	50.0	50mm Standpipe	14.5	3.5 - 14.5
BH15	30.0	50mm Standpipe	7.0	1.0 – 7.0
WS20	5.0	50mm Standpipe	3.0	1.0 – 3.0
WS21	5.0	50mm Standpipe	3.0	1.0 – 3.0
WS22	6.0	50mm Standpipe	3.0	1.0 – 3.0

Groundwater entries were recorded in most boreholes with the exception of boreholes BH5, BH11A, BH12 and BH13. Groundwater entries were recorded in the range 0.90m (BH8) to 11.40m bgl (BH1). The recorded groundwater depths are summarised in the table below.

**Table 5 - Groundwater Records Summary**

<b>Borehole ID</b>	<b>Depth of seepage noted (m bgl)</b>	<b>Depth of water after 20 minutes (m bgl)</b>	<b>Change in water depth (+/- m bgl)</b>	<b>Notes</b>
BH1	2.80	2.80	0.00	Seepage

#### 4.5.1 GROUNDWATER MONITORING

Standpipes were installed as described above in Section 4.5. Details of these installations, and water depth upon completion of the installation are given within Table 5.

At the time of issue of this report a total of fourteen groundwater monitoring and sampling visits had been completed. If further groundwater monitoring is required it will be issued as an addendum to this report.

A summary of the monitoring completed between 01<sup>st</sup> June 2018 and the 20<sup>th</sup> December 2018 are presented in Appendix I. Details of the Piezometer, Methane, Carbon Dioxide Oxygen, flow and atmospheric pressure are presented in the Appendix.

All geoenvironmental testing undertaken from sampling completed during the groundwater monitoring visits are included in Section 6.2 of this report.

## **4.6 SITE SURVEY**

A final topographic survey of the completed exploratory hole location was undertaken on 28<sup>th</sup> March 2018 by surveyors appointed by the Norfolk Partnership Laboratory.

## 5 FIELD TESTING

### 5.1 CONE PENETRATION TEST

A total of 5 No. Static Cone Penetration Tests (CPT) were made using hydraulic penetrometer equipment at locations set out by the Clients Representative on site. Details of the test results and interpretations are presented in Appendix E. The fieldwork was carried out on the 19<sup>th</sup> and 20<sup>th</sup> March 2018.

The cone penetration tests are summarised in the table below:

**Table 6 - Cone Penetration Summary**

Test ID	Date Completed	Depth (mbgl)	Location	Coordinates	Ground Level
CPT 01	20/03/2018	30.0	West Bank – Suffolk Road	652228-305895	1.06
CPT 02	19/03/2018	30.0	West Bank – Suffolk Road	652244-305934	0.73
CPT 03	19/03/2018	32.4	West Bank – Access Road off Suffolk Road	652308-305951	1.17
CPT 04	19/03/2018	36.0	East Bank – Fish Warf	652572-306018	1.49
CPT 05	20/03/2018	30.0	East Bank – Fish Warf	652646-305985	1.83

The static cone penetration tests were made using twenty one tonne capacity hydraulic penetrometer equipment mounted on a truck, ballasted to provide the reaction weight. A 7.5 tonne capacity electric cone was used for each of the tests and during each test, measurements of local side friction were made in addition to cone end resistance. At all test locations measurements of porewater pressure were also made using an electric piezo-cone fitted with a filter and pressure sensor so that the pore water pressure (PWP) could be measured on the shoulder of the cone tip.

All tests were terminated at a depth instructed on site or on the basis of refusal when the maximum safe thrust capacity of the equipment was reached. The method of operation of the piezo-cone is outlined on the piezo-cone operation sheet in Appendix E, together with the Piezo-cone Penetrometer datasheet showing the layout of this type of cone.

The test results have been interpreted to provide the estimated soil types which have also been compared to borehole information from the site. The method of interpretation of the soil type is outlined on the data sheets given in Appendix E.

The results of all tests carried out are presented in the Appendix E and show the records of cone end resistance, local side friction and friction ratio. The results of the piezo-cone penetration tests are presented as separate plots for each test. The plots contains the basic data obtained during the test, i.e. cone resistance, cone sleeve friction and porewater pressure, as well as parameters derived from the basic data, i.e. net cone resistance, excess porewater pressure ratio and friction ratio.

5 pore pressure dissipation tests were carried out at CPT locations using the piezo-cone penetrometer. The test measured the dissipation of excess pore water pressures generated during cone testing. In order to achieve

this, the piezo-cone is advanced to the required test depth, temporarily stopped and the decrease in pore water pressure monitored with time. The results are presented in graphical form in Appendix E.

The cone penetration dissipation test locations are summarised in the table below:

**Table 7 - Dissipation Test Summary**

Test ID	Date Completed	Depth (mbgl)	Location	Coordinates	Ground Level
CPT 01	20/03/2018	3.46	West Bank – Suffolk Road	652228-305895	1.06
CPT 01	20/03/2018	4.00	West Bank – Suffolk Road	652228-305895	1.06
CPT 02	19/03/2018	2.40	West Bank – Suffolk Road	652244-305934	0.73
CPT 03	19/03/2018	4.60	West Bank – Access Road off Suffolk Road	652308-305951	1.17
CPT 04	19/03/2018	30.99	East Bank – Fish Warf	652572-306018	1.49

## 5.2 DYNAMIC CONE PENETROMETER TESTING

A total of seven Dynamic Cone Penetrometer (DCP) tests were undertaken during the fieldwork. Two tests were carried out in conjunction with shallow window sampling completed along the proposed realignment of the William Adams Way to the south at BH4A and BH4B. Three tests were undertaken along the existing embankment to the west of William Adams Way leading to the A12 round about and a single test (WS7DP) was completed to a depth of 15m close to the location of the cancelled BH3. A final DCP test was completed at the location of TP1.

The Dynamic Cone Penetrometer tests are summarised in the table below:

**Table 8 - Dynamic Cone Penetrometer Testing Summary**

Test ID	Date Completed	Depth (mbgl)	Location	Coordinates	Ground Level
BH4AS	14/12/2017	15.0	West Bank – William Adams Way	652284 - 305846	2.13
BH4B	14/12/2017	15.0	West Bank – William Adams Way	652312 - 305826	1.83
WS2DP	07/12/2017	5.00	West Bank – William Adams Way	652124 - 305896	0.85
WS5DP	05/12/2017	6.00	West Bank – William Adams Way	652156 - 305894	1.09
WS7DP	06/12/2017	15.00	West Bank – William Adams Way	652204 - 305884	0.85
WS8DP	07/12/2017	5.00	West Bank – William Adams Way	652203 - 305887	0.87

Test ID	Date Completed	Depth (mbgl)	Location	Coordinates	Ground Level
TP1	07/12/2017	15.0	To be confirmed - West Bank – Suffolk Road	652248 - 305907	0.72

The DCP's carried out as part of this investigation have been undertaken in accordance with TRL Project Report PR/INT/227/04

The results of the DCP tests are included in this report as Appendix F.

### 5.3 STANDARD PENETRATION TESTING

Standard Penetration Tests (SPT's) were carried out using the split spoon (S) or cone (C) attachment within the boreholes. The tests were carried out in accordance with BS EN ISO 22476-3:2005+A1:2011 (British Standard, 2006). The results are included on the appended borehole logs presented in Appendix C. The calibration / efficiency certificates for the relevant drilling rigs are summarised in the table below:

**Table 9 - SPT Efficiency Ratings**

SPT I.D	SPT Rod Type	Calibration Date	SPT Energy Ratio	Boreholes
DT-MGS174	1 ½ Whitworth SPT	06/04/2017	66.76	BH1, BH4, BH5A, BH8, BH9, BH10A, BH11A, BH13A
DT-GT03	1 ½ Whitworth SPT	27/04/2017	73.34	BH2, BH4A, BH4D, BH5, BH6, BH7, BH15
DT-AR1707	1 ½ Whitworth SPT	27/04/2017	70.37	BH10, BH11, BH12A, BH12B,
DT-DT0537	1 ½ Whitworth SPT	13/04/2017	70.68	WS1, WS2, WS3, WS4, WS5, WS6, WS7, WS8, WS9, TP1
J&M – JM03	1 ½ Whitworth SPT	12/11/2016	71.99	BH14, BH18,
J&M – JM04	1 ½ Whitworth SPT	12/11/2016	71.58	BH16, BH17

## 6 LABORATORY TESTING

### 6.1 GEOTECHNICAL LABORATORY TESTING

The laboratory testing schedules for geotechnical tests were prepared by WSP in coordination with Norfolk Partnership Laboratory.

The information included in this report is taken from the results of tests undertaken by the Norfolk Partnership Laboratory at County Hall, Martineau Land Norwich (UKAS accredited testing laboratory No. 0920), Harrison Group Environmental Ltd (UKAS accredited testing laboratory No. 4031) and Terra Tek, UKAS accredited testing laboratory No. 0126. The results of the laboratory tests in this report do not include some of the data required by the documented test procedure. However, all such data has been recorded by the aforementioned laboratories and will be issued on the client's instructions.

The following accredited test procedures were carried out:

- Natural Moisture Content
- Plasticity Index
- Liquid Limit
- Plastic limit
- Particle Size Density (PSD)
- Sedimentation
- Determination of CBR
- Maximum dry density/moisture content relationship
- Triaxial Testing (Quick Undrained Single Stage)
- Consolidation (one dimensional)

Testing was also scheduled and undertaken at the Norfolk Partnership Laboratory for sulphate suite in accordance with BRE Special Digest 1 (BRE, 2005), as listed below:

- Sulphate (total water soluble)
- Sulphur (Total)
- pH

A summary of the scheduled testing is shown in the table below:

**Table 10 - Geotechnical Laboratory Testing Summary**

Test	Number	Standard
Natural Moisture Content	17	BS 1377 : Part 2 :1990 - Section 3
Liquid Limit/ Plasticity Index	129	BS1377-2:1990 CI 4.3 BS1377-2:1990 CI 5

Test	Number	Standard
Particle Size Density	619	BS 1377 : Part 2 :1990 Section 9.1 & 9.4
Determination of CBR	4	BS 1377 : PART 4 : 1990
Determination of Dry Density/ Moisture Content Relationship	1	BS 1377 : Part 4 : 1990 : Section 3
Determination of Undrained Shear Strength - Definitive	65	BS1377 : Part 7 : 1990, Clause 8, Single Specimen
Determination of One Dimensional Consolidation	13	BS1377:Part 5:1990, clause 3

The geotechnical laboratory tests were carried out in the period between the September 2017 to October 2018.

The geotechnical laboratory testing has been carried out in accordance with BS 1377: 1990 (British Standard, 1990) using calibrated equipment specified within the British Standard.

The geotechnical laboratory test results are included in this report as Appendix G. All geotechnical testing will be submitted in AGS format with the electronic version of the report.

## 6.2 CHEMICAL LABORATORY TESTING

Soil samples selected by the Clients Representative were tested against a geo-environmental testing suite as chosen by WSP. The MCERTS accredited testing was undertaken by EnviroLab (UKAS Laboratory No. 1247).

The following accredited chemical testing test procedures were carried out on soil, water and for leachates:

**Table 11 – Chemical Laboratory Testing Summary**

Determinands	Soil	Soil Leachate	Water
Metals (Arsenic, Boron, Cadmium, Chromium (total and hexavalent), Copper, Lead, Mercury, Nickel, Selenium and Zinc)	✓	✓	✓
pH	✓	✓	✓
TPH CWG (GC-MS aliphatic/aromatic split) inc BTEX and MTBC	✓	✓	✓
VOCs by GCMS (including vinyl chloride)	✓		✓

Determinands	Soil	Soil Leachate	Water
SVOCs by GCMS excluding PAHs	✓	✓	✓
speciated PAH (USEPA 16)	✓	✓	✓
Ammonia as N	✓	✓	✓
Phenol	✓	✓	✓
Soil Organic Matter	Selected samples		
Cyanide - total	✓	✓	✓
Cyanide - free	✓	✓	✓
PCB's EC7 Congeners	Selected samples		
PCB's WHO 12 Congeners	Selected samples		
Sulphate - total	✓		
Sulphate - water soluble, 2:1 extract	✓	✓	✓
Asbestos (screen only)	Selected samples		
Total WAC Suite	Selected samples		
Leachate prep		✓	

In addition to the laboratory testing outlined above selected samples was tested against the Waste Acceptance Criteria (WAC) suite of contaminants for classification for potential offsite disposal. The WAC testing was undertaken between December 2017 to October 2018 by EnviroLab.

Details of the standards used and the test results are presented in the Laboratory Test Results included in Appendix H. All chemical testing will be submitted in AGS format with the electronic version of the report.

# SPT Calibration Report

## Hammer Energy Measurement Report

Type of Hammer: SPT HAMMER  
Client: GROUND TECHNOLOGY SERVICES  
Test No: EQU1782

Test Depth (m): 8.20  
Mass of the hammer:  $m = 63.5\text{kg}$   
Falling height:  $h = 0.76\text{m}$   
 $E_{\text{theor}} = m \times g \times h = 473\text{J}$

## Characteristics of the instrumented rod

Diameter:  $d_r = 0.052\text{ m}$   
Length of instrumented rod: 0.558 m  
Area:  $A = 11.61\text{ cm}^2$   
Modulus:  $E_o = 206843\text{ MPa}$

TESTED 06 April 2017  
VALID UNTIL 06 April 2018  
MORRIS  
ITS R1707

Observations:  
1.

## Executive Summary

**The Site:** The study area, centred on the approximate OS National Grid Reference: TG 52451 05820, is located in Great Yarmouth, approximately 10m north of Southtown Common Recreation Ground. The site is bound to the north by residential properties fronting Waveney Road, to the east by the Petersons Distribution Centre, to the south by residential properties fronting Alpha Road and to the west by the A12 Dual Carriageway

The study area is complex / varied, comprising industrial / commercial properties in the east and residential areas mixed with commercial units in the west, with the River Yare passing north to south through the site. The study area encompasses a number of highways; the A1243, Cromwell Road, Cromwell Crescent, Southtown Road, Queen Anne's Road, William Adams Way, Suffolk Road, Beccles Road and the A12. In the west, there is a variety of soft open ground including allotment gardens, residential gardens, areas of dense vegetation, mature woodland and the periphery of Southtown Common Recreation Ground.

**Proposed Works:** The proposed Site Investigation which shall include both onshore and offshore boreholes to a maximum depth of 50m bgl, CPT boreholes to a maximum depth of 30m bgl, trial pits to 3m bgl, observation trenches to 6m bgl and window samples to 6m bgl.

**Risk Assessment Methodology:** In accordance with CIRIA guidelines this assessment has carried out research, analysed the evidence and considered the risks that the site has been contaminated with unexploded ordnance; that such items remained on site; that they could be encountered during any intrusive works and the consequences that could result. Appropriate risk mitigation measures have been proposed.

**Explosive Ordnance Risk Assessment:** Taking into consideration the findings of this study, Dynasafe BACTEC considers the risk across the route to be heterogeneous and can therefore be divided into **Low**, **Medium** and **High** Risk Zones.

### **German UXO:**

- The site was located within central Great Yarmouth within an area of very high bombing density during WWII, with up to 8 x HE bombs likely to have landed on or adjacent to the site boundary. At least 12 further HE bombs are recorded within a 300m radius of the site. In addition, the site is likely to have been affected by 1kg incendiary bombing.
- The eastern extent of the site, comprising busy commercial / industrial areas would have been accessed on a daily basis thereby decreasing the risk of any UXB strike evidence going unnoticed. In addition, these areas may have been subject to post-raid checks for UXB entry holes.
- The western half of the site was occupied by large areas of ambiguous open ground and allotment gardens which are unlikely to have been accessed as regularly or frequently. Access to the allotments would have varied depending on the season and therefore, a UXB could conceivably have fallen here unobserved.
- Moreover, there are multiple areas of clearance and a ruin apparent on site, suggesting that these areas sustained serious bomb damage. As a result, the affected buildings will have been abandoned for a time, increasing the likelihood of subsequent UXO falling on site unnoticed. Therefore, it can be assumed that, for a time, significant quantities of rubble occupied this area and debris may have been strewn across the site, increasing the likelihood of a UXB remaining on site. However, had a UXB landed within the allotments, open ground soft, rubble, or area of open air storage on site it could have gone undetected. Note, that the entry hole of an SC50 (the most commonly deployed German HE bomb) could be as little as 20cm in diameter and therefore, easily obscured in dense vegetation.
- A UXB landing in the river during a night time raid will have been immediately obscured from view, beneath the waterline. Consequently, it is unlikely to have been observed, reported and mapped.
- A UXB entry hole within the river bank mud on site (revealed at low tide) is unlikely to have persisted; the next high tide filling in the hole with water and sediment. Even if evidence of a UXB was observed here and reported, it is highly unlikely to have been recovered by the local bomb disposal unit due to its insignificant location and the impracticalities of deep buried UXB removal in this environment.

### **British/Allied UXO:**

- Due to its coastal location in south-eastern England, Great Yarmouth was considered vulnerable to German invasion and consequently, was well defended by Army and HG units, with River Yare and beaches fortified with static defences, minefields and gun positions.
- A group of WWII anti-invasion defences, including four pillboxes, a road block and a Spigot Mortar emplacement were present within the northern section of the site on the junction of Queen Anne's Road and

Southtown Road. The central element of the site was a substantial road block, designed to check the progress of tanks rather than act as a check point. Further defences were located within the site boundary, located at the westernmost end of Cromwell Road a Spigot Mortar position and associated Type 24 Pillbox were located.

- Although these defence installations were located on site, it is considered highly likely that the risk of shallow buried UXO has been mitigated on site due to post war development.
- Note, that four HAA batteries were situated within a 5km radius of the site during WWII. For the same reasons as given above, it is quite possible that an unexploded AA shell or rocket could have landed in the river on site and remained there.

**The Risk that Unexploded Ordnance Remains on site: Land** - Within the footprint of post-war ground works, the risk of small, shallow buried UXO (LSA, SAA, AA shells and German 1kg incendiaries) remaining will have been partly mitigated since any such items could have been encountered and removed during soil stripping / levelling, foundations etc.

Only within the volume of any post-war basement level bulk excavations and at the precise locations of any post-war pile foundations / boreholes, will the risk from deeper buried German HE UXBs have been completely mitigated. Therefore, it is conceivable that such a weapon could reside within virgin / untouched geology, beneath and amongst any such post-WWII ground works, down to the maximum bomb penetration depth. The risk from UXO contamination within the eastern extent of the site and pre-war buildings has been assessed as minimal and therefore the risk from UXO remaining is minimal.

**River** - It has been assessed that a HE UXB falling in the river will likely have achieved full burial within the overburden sediment and may also have penetrated the Crag Group bedrock. Consequently, such a UXB will have remained in situ up to the present day, largely unaffected by environmental conditions. Also, any large partially buried UXBs on site are less likely to be affected by environmental conditions as a result of their significant mass.

Tidal riverbed environments are mobile in nature and therefore as a result of water currents, any small items of UXO (British AA shells and German 1kg IBs) residing on or near the riverbed surface could experience migration. This is evidenced by the large quantity of munitions that are washed up on beaches around the UK, every year. The wider River Yare environment will have been subject to the same UXO contamination conditions as the site during WWII and therefore although riverbed UXO could have migrated out of the site since WWII, equally, additional UXO could have migrated into the site.

**Bomb Penetration Assessment:** It has been assessed that a 500kg bomb would have had an approximate maximum bomb penetration depth of between **8-10m** below WWII ground level. Penetration depth could potentially have been greater if the UXB was larger (though only 4% of German bombs used in WWII over Britain were of that size). Note that UXBs may be found at any depth between just below the WWII ground level and the maximum penetration depth.

**Recommended Risk Mitigation Measures:** Dynasafe BACTEC believes the following risk mitigation measures should be deployed to support the proposed works at the Southtown, Great Yarmouth site:

- Site Specific Explosive Ordnance Safety and Awareness Briefings to all personnel conducting intrusive works.
- The Provision of Unexploded Ordnance Site Safety Instructions.
- Explosive Ordnance Disposal (EOD) Engineer presence on site to support shallow intrusive works.
- Handheld Intrusive Magnetometer Survey of all borehole locations down to the maximum bomb penetration depth.
- Non-Intrusive Magnetometer and Side Scan UXO Survey.
- Intrusive Magnetometer Survey - Down-hole Vallon Probing ahead of Marine Boreholes.

**Further Recommended Measures should the Scope of Works Change:**

- Intrusive Magnetometer Survey of all pile / boreholes locations down to the maximum bomb penetration depth.
- Pre-Piling Intrusive Magnetometer Survey: TFG Clearance ahead of Piling.
- Intrusive Magnetometer Survey: Down-hole Vallon Probing ahead of Piling.

# Explosive Ordnance Threat Assessment

In Respect of

## Southtown, Great Yarmouth

### 1 Introduction

#### 1.1 Background

WSP UK Limited has commissioned Dynasafe BACTEC Limited to conduct an Explosive Ordnance Threat Assessment for the Southtown, Great Yarmouth site.

Unexploded Ordnance (UXO) presents a significant threat to construction projects in parts of the UK as a result of enemy actions during the two 20<sup>th</sup> Century World Wars and historic British and Allied military activity.

It is estimated that over 20% of the UK landmass has been used for military training at some point and between 2006 and 2009, over 15,000 items of mainly British / Allied ordnance (excluding small arms ammunition) were found on UK construction sites.

In addition, one of the legacies of the two World Wars is buried unexploded air-dropped bombs or anti-aircraft projectiles resulting from the failure of a proportion of such weapons to function as designed. It is commonly accepted that the failure rate of these munitions was approximately 10% and, depending on their shape, weight, velocity and ground conditions many penetrated the ground and came to rest at depth.

Intensive efforts were made during and after the war to locate and render safe all UXO but, unsurprisingly, not all were found and dealt with. This is evidenced by the regular, on-going discoveries of UXO during construction-related intrusive ground works.

As a result of a generally increased risk awareness amongst professionals involved in ground engineering works and proactive health and safety measures, the threat to life and limb from UXO has been minimised. However even the simple discovery of a suspected device during on-going works can cause considerable disruption to production and cause unwanted delays and expense.

Such risks can be more fully addressed by a better understanding of the site-specific threat and the implementation of appropriate risk mitigation measures.

### 2 Construction Industry Duties and Responsibilities

#### 2.1 The UK Regulatory Environment

There is no specific legislation covering the management and control of the UXO risk in the UK construction industry but issues regarding health and safety are addressed under a number of regulatory instruments, as outlined below.

In practice, the regulations impose a responsibility on the construction industry to ensure that they discharge their obligations to protect those engaged in ground-intrusive operations (such as archaeology, site investigation, drilling, piling or excavations) from any reasonably foreseeable UXO risk.

## 2.2 The Health and Safety at Work Act, 1974

The Act places a duty of care on an employer to put in place safe systems of work to address, as far as is reasonably practicable, all risks (to employees and the general public) that are reasonably foreseeable.

## 2.3 Construction (Design and Management) Regulations 2015

CDM 2015 ensures that health and safety within the construction industry is continually improved:

- Works are sensibly planned and managed.
- Competent staff are engaged in the works.
- Risks are identified and managed.
- All parties cooperate and coordinate activities.
- Communication flows to those who require it.
- Workers are consulted and engaged about risks and how they are being managed.

In line with CDM 2015 legislation, Dynasafe BACTEC Limited are able to assist parties in their discharge of CDM duties as follows:

- Assist Principal Designers with pre-construction information and risk assessments
- Assist the Designer with the Designer's Risk Assessment.
- Issue UXO risks as have been identified, and manage risks accordingly.
- Assist the Principal Contractor with the construction phase information, in particular risk assessments and mitigation strategies.
- Plan, manage and monitor survey and clearance works under Dynasafe BACTEC Limited's control.

## 2.4 Other Legislation

Other relevant legislation includes the "Management of Health and Safety at Work Regulations 1999" and "The Corporate Manslaughter and Corporate Homicide Act 2007".

# 3 The Role of the Authorities and Commercial Contractors

## 3.1 The Authorities

The Police have the responsibilities for co-ordinating the emergency services in the case of an ordnance-related incident on a construction site. They will make an initial assessment (i.e. is there a risk that the find is ordnance or not?) and if they judge necessary impose a safety cordon and/or evacuation and call the military authorities (JSEODOC - Joint Services Explosive Ordnance Disposal Operations Centre) to arrange for investigation and/or disposal. In the absence of an EOD specialist on site many Police Officers will use the precautionary principle, impose cordon(s)/evacuation and await advice from the JSEODOC.

The priority given to the request by JSEODOC will depend on their judgement of the nature of the threat (ordnance, location, people and assets at risk) and the availability of resources. They will respond immediately or as resources are freed up. Depending on the on-site risk

assessment the item of ordnance may be removed or demolished (by controlled explosion) in situ. In the latter case additional cordons and/or evacuations may be necessary.

Note that the military authorities will only carry out further investigations or clearances in very high profile or high-risk situations. If there are regular ordnance finds on a site, the JSEODOC may not treat each occurrence as an emergency and will encourage the construction company to put in place alternative procedures (i.e. the appointment of a commercial contractor) to manage the situation and relieve pressure from the JSEOD disposal teams.

### **3.2 Commercial Contractors**

In addition to pre-construction site surveys and follow-on clearance work, a commercial contractor is able to provide a reactive service on construction sites. The presence of a qualified EOD Engineer with ordnance recognition skills will avoid unnecessary call-outs to the authorities and the Contractor will be able to arrange for the removal and disposal of low risk ordnance. If high risk ordnance is discovered actions will be co-ordinated with the authorities with the objective of causing the minimum possible disruption to site operations whilst putting immediate, safe and appropriate measures in place.

## **4 This Report**

### **4.1 Aims and Objectives**

The aim of this report is to examine the possibility of encountering any explosive ordnance during any intrusive works at the Southtown, Great Yarmouth site. Risk mitigation measures will be recommended, if deemed necessary, to eliminate or reduce the threat from explosive ordnance during the envisaged works. The report follows the CIRIA Guidelines.

The following issues will be addressed in the report:

- The risk that the site was contaminated with unexploded ordnance.
- The risk that UXO remains on site.
- The risk that ordnance may be encountered during any intrusive works.
- The risk that ordnance may be initiated.
- The consequences of initiating or encountering ordnance.

Risk mitigation measures, appropriate to the assessed level of risk and site conditions, will be recommended if required.

### **4.2 Approach**

In preparing this Explosive Ordnance Threat Assessment Report, Dynasafe BACTEC has considered general and, as far as possible, site specific factors including:

- Evidence of German bombing and delivery of UXBs.
- Site history, occupancy and conditions during WWII.
- The legacy of Allied military activity.
- Details of any known EOD clearance activity.
- The extent of any post war redevelopment.
- Scope of the current proposed works.

### 4.3 Sources of Information

Dynasafe BACTEC has carried out detailed historical research for this Explosive Ordnance Threat Assessment including accessing military records and archived material held in the public domain and in the MoD.

Material from the following sources has been consulted:

- The National Archives.
- Norfolk Record Office.
- Norfolk County Council.
- Landmark Maps.
- Peel Ports Great Yarmouth.
- Council for British Archaeology.
- Available material from 33 Engineer Regiment (EOD) Archive.
- Relevant information supplied by WSP UK Limited.
- Dynasafe BACTEC's extensive archives built up over many years of research and hands-on Explosive Ordnance Disposal activities in the UK.
- Open sources such as published books, local historical records and the internet.

### 4.4 General Considerations

This report is based upon research of historical evidence. Whilst every effort has been made to locate all relevant material Dynasafe BACTEC cannot be held responsible for any changes to the assessed level of risk or risk mitigation measures based on documentation or other information that may come to light at a later date.

The accuracy and comprehensiveness of wartime records is frequently difficult or impossible to verify. As a result, conclusions as to the exact location, quantity and nature of the ordnance threat can never be definitive but must be based on the accumulation and careful analysis of all accessible evidence. Dynasafe BACTEC cannot be held responsible for inaccuracies or gaps in the available historical information.

### 4.5 Bombing Records

During WWII, considerable efforts were expended in recording enemy air raids. Air Raid Precautions (ARP) wardens were responsible for making records of bomb strikes either through direct observation or by post-raid surveys. However, their immediate priority was to deal with casualties and limit damage, so it is to be expected that records are often incomplete and sometimes contradictory. Record keeping in the early days of bombing was not comprehensive and details of bombing in the early part of the war were sometimes destroyed in subsequent attacks. Some reports may cover a single attack, others a period of months or the entire war.

Records of raids that took place on sparsely or uninhabited areas were often based upon third party or hearsay information and are not always reliable; records of attacks on military or strategic targets were often maintained separately from the general records and have not always survived.

## 5 The Site

### 5.1 Site Location

The study area is located in Great Yarmouth, approximately 10m north of Southtown Common Recreation Ground. The site is bound to the north by residential properties fronting Waveney Road, to the east by the Petersons Distribution Centre, to the south by residential properties fronting Alpha Road and to the west by the A12 Dual Carriageway.

The site, centred on the approximate OS National Grid Reference: TG 52451 05820.

Site Location Maps are presented in **Annex A**.

### 5.2 Site Description

The study area is complex / varied, comprising industrial / commercial properties in the east and residential areas mixed with commercial units in the west, with the River Yare passing north to south through the site.

The study area encompasses a number of highways; the A1243, Cromwell Road, Cromwell Crescent, Southtown Road, Queen Anne's Road, William Adams Way, Suffolk Road, Beccles Road and the A12.

In the west, there is a variety of soft open ground including allotment gardens, residential gardens, areas of dense vegetation, mature woodland and the periphery of Southtown Common Recreation Ground.

A Recent Aerial Photograph of the site is presented in **Annex B**.

## 6 Scope of the Proposed Works

The proposed Site Investigation which shall include both onshore and offshore boreholes to a maximum depth of 50m bgl, CPT boreholes to a maximum depth of 30m bgl, trial pits to 3m bgl, observation trenches to 6m bgl and window samples to 6m bgl.

A Site Plan showing the proposed future development of the site is presented in **Annex C**.

## 7 Ground Conditions

Published British Geological Survey (BGS) scale mapping indicates that the western extent of the site is underlain by superficial Breydon Formation (Peat), whilst the River Yare and the eastern extent of the site is underlain with Tidal River or Creek Deposits (Clay and Silt). Whereas the entirety of the site is underlain by Crag Group bedrock.

Data supplied by the WSP UK Limited, for a borehole sunk on land in 2007, records the following shallow geology on site:

- 1m of Made Ground.
- 3m of Sand (Tidal and River Creek Deposits).
- >10m of Sand (dense brown fine medium and coarse Sand – North Denes Formation).

A (marine) log (dated 2007) for a borehole sunk on site records the following shallow geology:

- 1.39m of Sand (shelly Sand with occasional silt/clay).

- >8.21m of Sand (Sand with layers of gravel).

## 8 Site History

Latest available pre-WWII and earliest available post-WWII OS maps were obtained from Landmark Maps. These are presented in **Annex D** and described below:

### 8.1 Pre-WWII

The 1927 (1:2,500 scale) map shows the site split into two halves by the River Yare. The eastern half is occupied by multiple industrial buildings, areas of open ground, unlabelled roadways and part of *Fish Wharf*. A rail siding supplying the Wharf is present in three locations within the eastern half of the site.

The western half of the site is predominantly occupied by residential properties, open ground and *Allotment Gardens*. The western half of the site is crossed by *Southtown Road*, *Queen Anne's Road*, *Cromwell Road* and smaller unlabelled roadways. The southern section of the site occupied the peripheries of *Southtown Common Recreation Ground*.

Note, that a 1927 (1: 2,500 scale) map was reviewed (not annexed) which shows the westernmost section of the site to be occupied by open ground.

### 8.2 Post-WWII

The 1949 (1:2,500 scale) map shows the eastern half of the site to have undergone two small areas of clearance, whilst the south-easternmost section of the site encroaches upon an area of redevelopment. No further major changes have occurred on this part of the site.

The western half of the site has sustained five areas of clearance across the site, whilst a single *Ruin* is located to the centre of the site. Note, the westernmost section of the site remains open ground.

Within the immediate surrounding area, a number of examples of clearance, redevelopment and ruins are noted. Such observations are often indicative of serious bomb damage on early post-WWII OS maps.

## 9 The Threat from German Aerial Bombing and Artillery Shelling

### 9.1 Conflict History of Great Yarmouth

#### 9.1.1 First World War

##### 9.1.1.1 Air Raids

A WWI bomb census map, shows that the town was subject to aerial bombardment. Note however that the map does not allow an accurate assessment of the bomb strike locations in relation to the study area due to the small scale and lack of detail.

Great Yarmouth suffered the first aerial bombardment in the UK, inflicted by Zeppelin L3 on 19<sup>th</sup> January 1915. Humberside is thought to have been the intended target, however, due to navigational difficulties, Great Yarmouth was attacked.

The Zeppelin reportedly dropped 10 bombs across the town; one of which landed outside the First and Last Tavern in Southgate Road by Fish Wharf. No casualties were sustained, the damage was confined to broken windows and a hole in the road. A second bomb landed adjacent to a riverside restaurant at Fish Wharf causing extensive damage, inflicted one

casualty from shattering glass. Therefore, as Fish Wharf occupies the eastern extent of the site it is likely that these bombs landed on site. However, no UXBs were noted.

#### **9.1.1.2 Naval Bombardment**

On the 25<sup>th</sup> April 1916 Lowestoft was attacked by the German Navy. Four large German battle cruisers (SMS Lützow, Derfflinger, Moltke and Von der Tann) supported by U-Boats bombarded the town with 6", 11" and 12" projectiles from a distance of approximately 6.5km. The attack commenced at 04:10 and lasted for 10 minutes.

The secondary target for this raid was to be Great Yarmouth however, the Royal Navy were made aware of the Germans actions and the British fleet engaged the German ships. This, coupled with heavy fog meant that only a few shells were fired at Great Yarmouth before the German warships pulled back.

#### **9.1.1.3 Deductions**

Although this study recognises the threat posed by WWI bombs and shells, it cannot be quantified to the same degree as the WWII threat due to the lack of complete and accurate incident records.

WWI bombs were generally smaller than those used in WWII and were dropped from a lower altitude, resulting in limited UXB penetration depths. Aerial bombing was often such a novelty at the time that it attracted public interest and even spectators to watch the raids in progress.

As only a few shells landed in Great Yarmouth it is unlikely that any failed to explode. Therefore, the risk of a German WWI unexploded bomb or shell landing on site unobserved, and subsequently going unreported, is considered minimal and therefore the risk from German WWI UXO is considered low and will not be further addressed in this report.

### **9.1.2 Second World War**

The Luftwaffe reportedly carried out more bombing raids on Great Yarmouth than any other coastal town, due in part to the presence of an important port with a large fishing fleet and associated industries.

Moreover, due to the town's position on the east coast, where it was difficult to detect an incoming attack en route to the Midlands, it would have been vulnerable to 'tip and run' incidents, whereby an enemy aircraft under heavy AA fire or fighter interception would prematurely jettison its bomb load in order to evade the defences or indiscriminately deposit unused ordnance whilst returning to bases in northern Europe.

Consequently, the town was frequently attacked by German bombers. In a total of 237 properties were destroyed, 1,598 were severely damaged and subsequently demolished, 1,816 were seriously damaged but repairable and 19,818 were slightly damaged.

The available records of bombing incidents for Great Yarmouth are presented in the following sections.

## **9.2 Second World War Bombing Records**

### **9.2.1 Bombing Statistics**

The following table summarises the quantity of German bombs (excluding 1kg incendiaries and anti-personnel bombs) falling on the Municipal Borough of Great Yarmouth (within which the site was historically located) between 1940 and 1945: (source: National Archives)

<b>Record of German Ordnance Dropped on the Municipal Borough of Great Yarmouth</b>	
Area Acreage	3,598
High Explosive Bombs (all types)	910
Parachute Mines	9
Oil Bombs	1
Phosphorus Bombs	8
Fire Pot	10
V1 Flying Bomb	0
V2 Long Range Rocket	0
Total	938
<b>Items Per 1,000 Acres</b>	<b>260.7</b>

Evidence from a secondary source shows the statistics regarding the quantity of UXO dropped on Great Yarmouth<sup>1</sup>:

<b>Record of German UXO Dropped on the Municipal Borough of Great Yarmouth</b>	
High Explosive (all types)	221 (12)
Parachute Mines	7 (2)
Phosphorus Bombs	7 (1)
Fire Pot	10
Oil Bomb	1
V1 Flying Bomb	0
Unclassified HE Bombs	653 (60)

*N.B. Number denoted in brackets are Unexploded Bombs*

Detailed records of the quantity and locations of the 1kg incendiary and anti-personnel bombs were not routinely maintained by the authorities as they were frequently too numerous to record. However, an estimated 1,590 of these IBs were recorded in the Municipal Borough of Great Yarmouth.

Although the incendiaries are not particularly significant in the threat they pose, they nevertheless are items of ordnance that were designed to cause damage and inflict injury and should not be overlooked in assessing the general risk to personnel and equipment. The anti-personnel bombs were used in much smaller quantities and are rarely found today but are potentially more dangerous. This table does not include UXO found during or after WWII.

<sup>1</sup> Bowyer, M. *Air Raid the Emergency air offensive against East Anglia 1939-1945* (1986)

### 9.2.2 Great Yarmouth Bomb Plot Map

This Great Yarmouth Bomb Plot Map (presented in **Annex E**) only records 28 raids between 11/10/1941 and 31/05/1944, taken from the National Archives. It records the closest HE bomb strike to be approximately 115m south-west of the site. Note, this map only depicts a small quantity of the ordnance dropped on the town as Luftwaffe activity was greater between the summers of 1940 and 1941.

### 9.2.3 Great Yarmouth Bomb Census Map

A bomb census map for the wider area included within a publication (*J. P. Foynes 1994*) was reviewed. A section of this small-scale map (presented in **Annex F**) depicts the locations of bombs and mines dropped on Great Yarmouth throughout the duration of WWII.

It records approximately 8 x HE bomb strikes on or within the site boundary and multiple 1kg IBs to have fallen on site.

However, this map has very few geographical indicators and is of poor quality, therefore should not be considered an accurate representation of the distribution of bomb strikes in and around Great Yarmouth. Note, however it is possible to apply some accuracy when plotting the site due to the gas works location immediately to the east of the site.

### 9.2.4 WWII-era RAF Aerial Photography

Historical RAF aerial photography of the site was supplied by Norfolk County Council. A post-WWII image is presented in **Annex F**.

This photography, was taken in 1946, and shows the site in its entirety, much as it appears in the OS Mapping. Although of small scale and low resolution it shows the western half of the site to be occupied by large areas of unused open ground, allotment gardens, hard-surfaced roadways and residential properties.

The eastern half of the site is occupied by a number of industrial buildings and hard-surfaced roadways, which appear to have survived the war intact. Note, that there are two smaller areas set back from the quayside which appear to be occupied by open soft ground which may have been used for the storage of materials during the war. An area of clearance is apparent within the western section of the site as is consistent to post-war OS Mapping, and is likely a result of bomb damage.

Note, no HE bomb craters are visible within the open soft ground, however, such features on worked ground (allotments) are likely to have been infilled during the war. Therefore, a UXB entry hole could have gone unnoticed on site.

### 9.2.5 Abandoned Bombs

A post-air raid survey of buildings, facilities and installations would have included a search for evidence of bomb entry holes. If evidence were encountered, Bomb Disposal Officer teams would normally have been requested to attempt to locate, render safe and dispose of the bomb. Occasionally evidence of UXBs was discovered but due to a relatively benign position, access problems or a shortage of resources the UXB could not be exposed and rendered safe. Such an incident may have been recorded and noted as an Abandoned Bomb.

Given the inaccuracy of WWII records and the fact that these bombs were 'abandoned', their locations cannot be considered definitive, nor the lists exhaustive. The MoD states that 'action to make the devices safe would be taken only if it was thought they were unstable'. It should be noted that other than the 'officially' abandoned bombs, there will inevitably be UXBs that

were never recorded. Dynasafe BACTEC holds no records of officially registered abandoned bombs at or near the site.

### 9.3 Likelihood of Post-raid UXO Detection

Utilising the available historical bombing records as reviewed in *Section 9.2*, it is possible to make an assessment of the likelihood that evidence of UXO would have been noted on a site during the war and the incident dealt with or recorded at the time. Factors such as bombing density, frequency of access, ground cover, damage and failure rate have been taken into consideration.

#### 9.3.1 Density of WWII Bombing

Bombing density is an important consideration for assessing the possibility that UXO remains in an area. A very high density can for example result in increased levels of damage sustained to structures, greater likelihood of errors in record keeping and a higher risk that UXBs fell over the area.

The site was located within an area of very high bombing density during WWII, with up to 8 x HE bombs likely to have landed on or adjacent to the site boundary. At least 12 further HE bombs are recorded within a 300m radius of the site. In addition, the site is likely to have been affected by 1kg incendiary bombing.

#### 9.3.2 Damage

If structures on a site have been subject to significant bomb or fire damage, rubble and debris are likely to have been present; similarly, a HE bomb strike on open ground is likely to have resulted in a degree of soil disturbance. Under such conditions there is a greater risk of the entry holes of UXBs dropped during subsequent raids being obscured and going unnoticed.

A review of the historical resources suggests that many of the buildings on site survived the war largely intact. Note however, the available aerial photograph does not allow for an accurate assessment of bomb damage to all buildings.

Note, there are multiple areas of clearance apparent within the western section of the site, and a single ruin, suggesting that these areas sustained serious bomb damage. As a result, the affected buildings will have been abandoned for a time, increasing the likelihood of subsequent UXO falling on site unnoticed. Therefore, it can be assumed that, for a time, significant quantities of rubble occupied this area and debris may have been strewn across the site.

#### 9.3.3 Frequency of Access

UXO at sites where human access was infrequent would have a higher chance of being overlooked than at those sites which were subject to greater occupancy. The importance of a site or facility to the war effort is also an important consideration as such sites are likely to have been both frequently accessed and are also likely to have been subject to post-raid checks for evidence of UXO.

The eastern extent of the site was occupied by Fish Wharf, comprising quayside areas and associated buildings / structures during the war. Note, however there is an area of open ground that may have possibly been occupied by dense vegetation/bare earth or used for open air storage during the war. Therefore, decreasing the likelihood of regular / frequent access.

These busy commercial / industrial areas would have been accessed on a daily basis thereby decreasing the risk of any UXB strike evidence going unnoticed. In addition, these areas may have been subject to post-raid checks for UXB entry holes.

The western half of the site was occupied by large areas of ambiguous open ground and allotment gardens. These areas are unlikely to have been accessed as regularly or frequently as the developed portion of the site. Access to the allotments would have varied depending on the season and therefore a UXB could conceivably have fallen here unobserved. This is especially pertinent since many of the German air raids over Great Yarmouth took place at night. Furthermore, the undeveloped parts of the site would not have been subject to specific post-raid searches for UXO.

#### 9.3.4 Ground Cover

The degree and type of groundcover present during WWII would have a significant effect on the visual evidence at ground level which may have indicated the presence of buried UXO.

Evidence of German UXO will have been obvious within the developed, undamaged parts of the study area, as a UXB strike to buildings and hard-standing will still have caused significant damage or an obvious, persistent entry hole, even without detonating. Following any such incident, the UXB would have been reported and subsequently exhumed / removed.

However, had a UXB landed within the allotments, open ground soft, rubble, or area of open air storage on site it could have gone undetected. Note, that the entry hole of an SC50 (the most commonly deployed German HE bomb) could be as little as 20cm in diameter and therefore, easily obscured in dense vegetation.

A UXB entry hole within the river bank mud on site (revealed at low tide) is unlikely to have persisted; the next high tide filling in the hole with water and sediment. Even if evidence of a UXB was observed, it is unlikely to have been reported due to its insignificant position.

A UXB striking the water on site will have been immediately obscured from view and therefore, is unlikely to have been observed, reported and mapped.

Also noteworthy is that during WWII German 1kg incendiary bombs were observed to penetrate to a significant depth when dropped into soft ground. The photograph presented in **Annex H** shows how such a sub-munition (known to have been deployed locally), could have remained undetected in the post-war period.

#### 9.3.5 Bomb Failure Rate

There is no evidence to suggest that the bomb failure rate in the vicinity of the site would have been different from the “approximately 10%” figure normally used.

### 9.4 Generic Types of WWII German Air-delivered Ordnance

The nature and characteristics of the ordnance used by the Luftwaffe allows an informed assessment of the hazards posed by any unexploded items that may remain today. Detailed illustrations of German air delivered ordnance are presented at **Annex I**.

- **HE Bombs:** In terms of weight of ordnance dropped, HE bombs were the most frequent weapon deployed. Most bombs were 50kg, 250kg or 500kg (overall weight, about half of which was the high explosive) though large bombs of up to 2,000kg were also used. HE bombs had the weight, velocity and shape to easily penetrate the ground intact if they failed to explode. Post-raid surveys would not always have spotted the entry hole or other indications that a bomb penetrated the ground and failed to explode and contemporary ARP documents describe the danger of assuming that damage, actually caused by a large UXB, was due to an exploded 50kg bomb. Unexploded HE bombs therefore present the greatest risk to present-day intrusive works.

- Blast Bombs/Parachute Mines: Blast bombs generally had a slow rate of descent and were extremely unlikely to have penetrated the ground. Non-retarded mines would have shattered on most ground types, if they had failed to explode. There have been extreme cases when these items have been found unexploded, but this was where the ground was either very soft or where standing water had reduced the impact. BACTEC does not consider there to be a significant threat from this type of munition on land.
- Large incendiary bombs: This type of bomb ranged in size from 36kg to 255kg and had a number of inflammable fill materials (including oil and white phosphorus), and a small explosive charge. They were designed to explode and burn close to the surface but their shape and weight meant that they did have penetration capability. If they penetrated the ground complete combustion did not always occur and in such cases, they remain a risk to intrusive works.
- 1kg Incendiary Bombs (IB): These bombs, which were jettisoned from air-dropped containers, were unlikely to penetrate the ground and in urban areas would usually have been located in post-raid surveys. However, if bombs did not initiate and fell in water or dense vegetation, or became mixed with rubble in bomb damaged areas they could have been overlooked. Some variants had explosive heads and these present a risk of detonation during intrusive works.
- Anti-personnel (AP) Bomblets: AP bombs had little ground penetration ability and should have been located by the post-raid survey unless they fell into water, dense vegetation or bomb rubble.
- Specialist Bombs (smoke, flare, etc): These types do not contain high explosive and therefore a detonation consequence is unlikely. They were not designed to penetrate the ground.

## 9.5 German Air-delivered Ordnance Failure Rate

Based on empirical evidence, it is generally accepted that 10% of the German HE bombs dropped during WWII failed to explode as designed. This estimate is probably based on the statistics of wartime recovered UXBs and therefore will not have taken account of the unknown numbers of UXBs that were not recorded at the time, and is probably an underestimate.

The reasons for failures include:

- Fuze or gain malfunction due to manufacturing fault, sabotage (by forced labour) or faulty installation.
- Clockwork mechanism failure in delayed action bombs.
- Failure of the bomber aircraft to arm the bombs (charge the electrical condensers which supplied the energy to initiate the detonation sequence) due to human error or equipment defect.
- Jettison of the bomb before it was armed or from a very low altitude. Most likely if the bomber was under attack or crashing.

War Office Statistics document that a daily average of 84 bombs which failed to function were dropped on civilian targets in Great Britain between 21<sup>st</sup> September 1940 and 5<sup>th</sup> July 1941. 1 in 12 of these (probably mostly fitted with time delay fuzes) exploded sometime after they fell - the remainder were unintentional failures.

There is no evidence to suggest that the bomb failure rate in the vicinity of the study area would have been different from the “approximately 10%” figure normally used.

From 1940 to 1945 bomb disposal teams dealt with a total of 50,000 explosive items of 50kg and over (i.e. German bombs), 7,000 AAA shells and 300,000 beach mines. These operations resulted in the deaths of 394 officers and men.

Media articles relating to recent German UXB finds on land and underwater are presented in **Annex J**.

## 9.6 Initiation of Unexploded Bombs

Unexploded bombs do not spontaneously explode. All high explosive requires significant energy to create the conditions for detonation to occur. In the case of unexploded German bombs discovered within the construction site environment, there are a number of potential initiation mechanisms:

- Direct impact onto the main body of the bomb: Unless the fuze or fuze pocket is struck, there needs to be a significant impact (e.g. from piling or large and violent mechanical excavation) to initiate a buried iron bomb. Such violent action can cause the bomb to detonate.
- Re-starting the clock timer in the fuze: Only a small proportion of German WWII bombs employed clockwork fuzes. It is probable that significant corrosion has taken place within the fuze mechanism over the last 60 years that would prevent clockwork mechanisms from functioning, nevertheless it was reported that the fuze in a UXB dealt with by 33 EOD Regiment in Surrey in 2002 did re-commence.
- Induction of a static charge, causing a current in an electric fuze: The majority of German WWII bombs employed electric fuzes. It is probable that significant corrosion has taken place within the fuze mechanism over the last 60 years such that the fuze circuit could not be activated.
- Friction impact initiating the (shock-sensitive) fuze explosive: This is the most likely scenario resulting in the bomb detonating.

**Annex K** details UXB incidents where intrusive works have caused UXBs to detonate, resulting in death or injury and damage to plant.

## 10 Unexploded Bomb Penetration

### 10.1 General Considerations

The actual penetration depth of aerial delivered bombs into the ground will have been determined by the mass and shape of the bomb, the velocity and angle of the bomb on impact (dependent on the height of release) and the nature of the ground and ground cover; the softer the ground, the greater the potential penetration. Peat, alluvium and soft clays are easier to penetrate than gravel and sand. Bombs are brought to rest or are commonly deflected by bedrock or large boulders.

### 10.2 The “j” Curve Effect

An air-dropped bomb falling from normal bombing altitude (say 5,000m) into homogeneous ground will continue its line of flight but turn in an upwards curve towards the surface as it comes to rest. This offset from vertical is generally thought to be about one third of the penetration depth, but can be up to 15m depending on ground conditions or the bomb’s angle of impact.

### 10.3 Second World War UXB Land Penetration Studies

During WWII, the Ministry of Home Security undertook a major study on actual bomb penetration depths, carrying out statistical analysis on the measured depths of 1,328 bombs as reported by Bomb Disposal, mostly in the London area. They then came to conclusions as to the likely average and maximum depths of penetration of different sized bombs in different geological strata.

The median penetration of 430 x 50kg German bombs in London Clay was 4.6m and the maximum penetration observed for the SC50 bomb was 9m.

They concluded that the largest common German bomb, 500kg, had a likely penetration depth of 6m in sand or gravel but 8.7m in clay. The maximum observed depth for a 500kg bomb was 10.2m and for a 1,000kg bomb 12.7m. Theoretical calculations suggested that significantly greater penetration depths were probable.

### 10.4 Maximum Bomb Penetration Depth - Land

To assess the maximum bomb penetration depth at the eastern and western (land) extents of the site, the following parameters have been used:

- WWII Geology - 1m of Made Ground, >13m of Sand.
- Impact Angle and Velocity - 80-90° from horizontal and 267 metres per second.
- Bomb Mass and Configuration - The 500kg SC (General Purpose) HE bomb, without retarder units or armour piercing nose. This was the largest of the common bombs used against Britain.

Taking into account the above-mentioned factors it has been assessed that a 500kg bomb would have had an approximate maximum bomb penetration depth of **8-10m** below WWII land level. Penetration depth could potentially have been greater if the UXB was larger (though only 4% of German bombs used in WWII over Britain were of that size). Note that UXBs may be found at any depth between just below the WWII ground level and the maximum penetration depth.

### 10.5 UXB Penetration through Water

UXB penetration of riverbed (through water) provides a more challenging scenario to model. The key considerations are:

- Bombs hit the water at the terminal velocity of air: 267 metres per second.
- Ignoring surface tension there will be an immediate loss of inertia due to rapid energy losses; sound, wave, splash, bubble formation and cavitation.
- The drag force rapidly decelerates the bomb. If there is sufficient water depth then acceleration will become 0m/s<sup>2</sup> and terminal velocity through water will be achieved: 11m/s.
- Once the terminal velocity in water is reached the bomb impacts the riverbed as a free-fall penetrator, not necessarily in a nose down orientation.

Analysis of the air-water-soil regime is complex. The current model assumes that 5m of water is required in order to achieve the terminal velocity in water of a 500kg UXB. Impacts at this speed will cause a penetration of 2.3m assuming a riverbed bearing capacity of 75kPa (*Department of The US Army, TM 5-855-1*). However, the bearing capacity of the riverbed sediment within the site boundary is not known.

In order to assess the bomb penetration depth within the river environment, the extreme water depth scenario must be considered; that is, the deepest point of the river at low tide. A current Admiralty Chart for the site was reviewed. This confirms the deepest Chart Datum water depth within the site boundary to be 4.3m.

As the depth is <5m, it can be assumed that a 500kg German UXB landing at any location within the river, at any time of day will strike the river bed with a force sufficient to impact the river bed in a vertical / nose down orientation. As opposed to the “tumbling” nature of items falling through the water column once the terminal velocity has been achieved.

However, the nature of the river sediment within the site boundary is not known both in terms of its precise composition and thickness. This, coupled with the lack of an accurate mathematical model for bomb behaviour through the water column, makes calculation of a maximum penetration depth value within the river environment impossible.

However, the significant decelerating effect caused by the water column on site indicates that even a large German UXB would not be able to penetrate a substantial distance into the Crag Group bedrock underlying the overburden sediment.

## **11 The Threat from British / Allied Military Ordnance**

### **11.1 General**

The following historical and modern facilities / activities / incidents have been considered:

- Army, Navy and RAF Bases / Installations
- Military Training Areas / Weapons Ranges
- Ordnance / Explosives Factories and Storage Depots
- Sites requisitioned for military use
- Military Fortifications and Coastal Defences
- Locations of Army Explosive Ordnance Clearance Tasks
- WWII Anti-Aircraft Batteries
- WWII Pipe Mined Locations and Beach Minefields

The most likely source of British / Allied ordnance is anti-aircraft fire/Home Guard activity, as discussed below.

### **11.2 Potential Sources of Explosive Ordnance**

#### **11.2.1 Anti-Aircraft Artillery**

At the start of the war two types of AAA guns were deployed: Heavy Anti-Aircraft Artillery (HAA), using large calibre weapons such as the 3.7” QF (Quick Firing) gun and Light Anti-Aircraft Artillery (LAA) using smaller calibre weapons such as 40mm Bofors gun.

During the early war period, there was a severe shortage of AAA available and older WWI 3” and modified naval 4.5” guns were deployed alongside those available 3.7” weapons. The maximum ceiling height of fire at that time was around 11,000m (for the 3.7” gun and less for other weapons). As the war progressed improved variants of the 3.7” gun was introduced and, from 1942, large 5.25-inch weapons began to be brought into service. These had significantly improved ceiling heights of fire reaching over 18,000m.

The LAA batteries were intended to engage fast low flying aircraft and were typically deployed around airfields or strategic installations. These batteries were mobile and could be moved to new positions with relative ease when required. The most numerous of these was the 40mm Bofors gun which could fire up to 120 x 40mm HE shells per minute to over 1,800m.

The HAA projectiles were high explosive shells, usually fitted with a time delay or barometric pressure fuze to make them explode at a pre-determined height. Before the war all the clockwork fuses used by the Royal Artillery had come from Switzerland. When that source of supply was cut off, Britain had been forced to make its own. After four years of war, the country still lacked the engineering skills to produce a reliable fuse.

This resulted in a considerable number of AA projectiles either exploding prematurely, killing the gunners or failing to explode at all; falling to the ground as UXBs. In January 1944 more people in London were killed by HAA shells than by German bombs. Details of the most commonly deployed WWII AAA projectiles are shown below:

Gun type	Calibre	Shell Dimensions	Shell Weight	HE Fill Weight
3.7 Inch	94mm	94mm x 438mm	12.7kg	1.1kg
4.5 Inch	114mm	114mm x 578mm	24.7kg	1.7kg
40mm	40mm	40mm x 311mm	0.84kg	70g

Although the larger unexploded projectiles could enter the ground they did not have great penetration ability and are therefore likely to be found close to WWII ground level. These shells are frequently mistakenly identified as small German air-delivered bombs, but are differentiated by the copper driving band found in front of the base. With a high explosive fill and fragmentation hazard these items of UXO present a significant risk if encountered. The smaller 40mm projectiles are similar in appearance and effect to small arms ammunition and, although still dangerous, present a lower risk.

Four static HAA batteries were operational within 5km of the site during WWII. With four guns per battery, firing up to ten rounds a minute, HAA batteries could expend numerous shells during even short air raids and therefore as the town was frequently attacked by the Luftwaffe, the risk of unexploded HAA shell contamination within study area is elevated.

Numerous unexploded AA shells were recovered during and following WWII, and are still occasionally encountered on sites today. Illustrations of Anti-Aircraft projectiles and rockets are presented in **Annex L**. Any unexploded AA shell landing in the river would have remained there for a time could have become subsequently buried in sediment.

## 11.2.2 Home Guard Activity

The Home Guard (HG) was a defence organisation of the British Army, operational between 1940 and 1944. It comprised 1.5 million local volunteers, otherwise ineligible for military service, and acted as a secondary defence force, in case of enemy invasion which was expected during 1940 and 1941. The HG guarded the coastal areas of Britain and other important facilities such as RAF airfields, weapons factories, explosives stores, radar sites, etc.

Due to its coastal location in south-eastern England, Great Yarmouth was considered vulnerable to German invasion and consequently was well defended by Army and HG units, with River Yare and beaches fortified with static defences, minefields and gun positions.

A group of WWII anti-invasion defences, including four pillboxes, a road block and a Spigot Mortar emplacement were present within the northern section of the site on the junction of

Queen Anne's Road and Southtown Road. The central element of the site was a substantial road block, designed to check the progress of tanks rather than act as a check point.

To the south, the road block was flanked by two pillboxes, a Type 22 on the easternmost extent of site boundary, and a Type 24 or variant pillbox on the north side of Queen Anne's Road. The defences were removed and the road resurfaced in August 1945.

Located at the westernmost end of Cromwell Road a Spigot Mortar position and associated Type 24 Pillbox were located. It can be assumed that the installation was sited to guard trackways and bridges across the drains that lay to the north of Queen Anne's Road.

Today, items of WWII ordnance related to the HG are occasionally encountered by members of the public and the construction industry. Experience has shown that the 'housekeeping' of WWII soldiers was often poor with items of faulty, surplus or expended ammunition often burnt, buried, misplaced or otherwise discarded on civilian land (see *Section 12.2*).

Furthermore, HG personnel are known to have purposefully buried caches of ammunition and weapons in tactical positions, to be exhumed and used in case of invasion. This is substantiated by several recent HG UXO finds (see *Annex M*).

Details of the most commonly encountered WWII-era British ammunition (Land Service Ammunition and Small Arms Ammunition) are presented in *Annex N* and *Annex O* respectively.

## 12 Ordnance Clearance and Post-WWII Ground Works

### 12.1 General

The extent to which any ordnance clearance activities have taken place on site or extensive ground works have occurred is relevant since on the one hand they may indicate previous ordnance contamination but also may have reduced the risk that ordnance remains undiscovered.

### 12.2 EOD Bomb Disposal and Clearance Tasks

Dynasafe BACTEC holds a number of official records of explosive ordnance disposal operations during and following WWII, obtained from the Explosive Ordnance Disposal (EOD) Archive Information Office at 33 Engineer Regiment (EOD), British Army. However, no records could be found to indicate that any Army EOD tasks have taken place on site.

No evidence of Royal Navy EOD divers carrying out any UXO disposal tasks in the River Yare (in close proximity to the site) was found.

Note, however that two gardeners discovered a live grenade at Dicken Court (approximately 330m north-east of the site) during garden maintenance operations. This would have likely been buried by the HG as part of a cache that of weapons in case of invasion, and often occurred within vulnerable coastal areas.

### 12.3 Post War Redevelopment

The eastern half of the site has undergone two phases of post war redevelopment, the first in the 1970's and the second during the 1980's when the site took its current form. Whilst the western half of the site appears to have remained largely untouched since the war, apart from the A12 roundabout and A147 installation during the 1980's and larger commercial properties to the north and east of the site.

Note, that minor dredging works are reported to have occurred on the River Yare in the post-war period. However, the extents of which are unknown at the time of writing this report.

## 13 The Overall Explosive Ordnance Threat Assessment

### 13.1 General Considerations

Taking into account the quality of the historical evidence, the assessment of the overall threat to any intrusive works from UXO must evaluate the following risks:

- That the site was contaminated with unexploded ordnance
- That UXO remains on site
- That such items could be encountered during any intrusive works
- That ordnance may be activated by the works operations
- The consequences of encountering or initiating ordnance

### 13.2 The Risk that the Site was Contaminated with Unexploded Ordnance

For the reasons discussed in *Sections 9 and 11* Dynasafe BACTEC believes that there is a risk that UXO contaminated the study area. This is based on the following:

#### **German UXO:**

- The site was located within central Great Yarmouth within an area of very high bombing density during WWII, with up to 8 x HE bombs likely to have landed on or adjacent to the site boundary. At least 12 further HE bombs are recorded within a 300m radius of the site. In addition, the site is likely to have been affected by 1kg incendiary bombing.
- The eastern extent of the site, comprising busy commercial / industrial areas would have been accessed on a daily basis thereby decreasing the risk of any UXB strike evidence going unnoticed. In addition, these areas may have been subject to post-raid checks for UXB entry holes.
- The western half of the site was occupied by large areas of ambiguous open ground and allotment gardens which are unlikely to have been accessed as regularly or frequently. Access to the allotments would have varied depending on the season and therefore, a UXB could conceivably have fallen here unobserved.
- Moreover, there are multiple areas of clearance and a ruin apparent on site, suggesting that these areas sustained serious bomb damage. As a result, the affected buildings will have been abandoned for a time, increasing the likelihood of subsequent UXO falling on site unnoticed. Therefore, it can be assumed that, for a time, significant quantities of rubble occupied this area and debris may have been strewn across the site, increasing the likelihood of a UXB remaining on site. However, had a UXB landed within the allotments, open ground soft, rubble, or area of open air storage on site it could have gone undetected. Note, that the entry hole of an SC50 (the most commonly deployed German HE bomb) could be as little as 20cm in diameter and therefore, easily obscured in dense vegetation.
- A UXB landing in the river during a night time raid will have been immediately obscured from view, beneath the waterline. Consequently, it is unlikely to have been observed, reported and mapped.
- A UXB entry hole within the river bank mud on site (revealed at low tide) is unlikely to have persisted; the next high tide filling in the hole with water and sediment. Even if evidence of

a UXB was observed here and reported, it is highly unlikely to have been recovered by the local bomb disposal unit due to its insignificant location and the impracticalities of deep buried UXB removal in this environment.

**British/Allied UXO:**

- Due to its coastal location in south-eastern England, Great Yarmouth was considered vulnerable to German invasion and consequently, was well defended by Army and HG units, with River Yare and beaches fortified with static defences, minefields and gun positions.
- A group of WWII anti-invasion defences, including four pillboxes, a road block and a Spigot Mortar emplacement were present within the northern section of the site on the junction of Queen Anne's Road and Southtown Road. The central element of the site was a substantial road block, designed to check the progress of tanks rather than act as a check point. Further defences were located within the site boundary, located at the westernmost end of Cromwell Road a Spigot Mortar position and associated Type 24 Pillbox were located.
- Although these defence installations were located on site, it is considered highly likely that the risk of shallow buried UXO has been mitigated on site due to post war development.
- Note, that four HAA batteries were situated within a 5km radius of the site during WWII. For the same reasons as given above, it is quite possible that an unexploded AA shell or rocket could have landed in the river on site and remained there.

### 13.3 The Risk that Unexploded Ordnance Remains on Site

**Land** - Within the footprint of post-war ground works, the risk of small, shallow buried UXO (LSA, SAA, AA shells and German 1kg incendiaries) remaining will have been partly mitigated since any such items could have been encountered and removed during soil stripping / levelling, foundations etc.

Only within the volume of any post-war basement level bulk excavations and at the precise locations of any post-war pile foundations / boreholes, will the risk from deeper buried German HE UXBs have been completely mitigated. Therefore, it is conceivable that such a weapon could reside within virgin / untouched geology, beneath and amongst any such post-WWII ground works, down to the maximum bomb penetration depth.

The risk from UXO contamination within the eastern extent of the site and pre-war buildings has been assessed as minimal and therefore the risk from UXO remaining is minimal.

**River** - It has been assessed that a HE UXB falling in the river will likely have achieved full burial within the overburden sediment and may also have penetrated the Crag Group bedrock. Consequently, such a UXB will have remained in situ up to the present day, largely unaffected by environmental conditions. Also, any large partially buried UXBs on site are less likely to be affected by environmental conditions as a result of their significant mass.

Tidal riverbed environments are mobile in nature and therefore as a result of water currents, any small items of UXO (British AA shells and German 1kg IBs) residing on or near the riverbed surface could experience migration. This is evidenced by the large quantity of munitions that are washed up on beaches around the UK, every year. The wider River Yare environment will have been subject to the same UXO contamination conditions as the site during WWII and therefore although riverbed UXO could have migrated out of the site since WWII, equally, additional UXO could have migrated into the site.

### 13.4 The Risk that Ordnance may be Encountered during the Works

**Land** - The most likely scenarios under which a UXO could be encountered during construction works is during piling, drilling operations or bulk excavations for basement levels. The overall risk will depend on the extent of the works, such as the numbers of boreholes/piles (if required) and the volume of the excavations.

Since an air-dropped bomb may come to rest at any depth between just below ground level and its approximate penetration depth there is also a chance that such an item could be encountered during shallow excavations (for services or site investigations) into the original WWII ground level.

If the proposed works are due to be undertaken within post war fill material / made ground, the risk of encountering WWII UXBs is low. However, if works are to be undertaken below WWII ground level this risk is significantly higher.

The risk of UXO remaining within the eastern extent of the site and pre-war buildings has been assessed as minimal, therefore the risk from UXO being encountered during the proposed works is minimal.

**River** – Minor dredging works on the River Yare have been identified to have taken place, however it is not known to what extent these would have occurred within the site boundary. Therefore, these activities could have partly mitigated the risk from UXO within the river environment, however it is conceivable that UXO could have subsequently been washed into the site boundary. Therefore, the risk of encountering UXO during the proposed works remains partially unmitigated. The proposed investigatory works will be to a depth beyond the maximum bomb penetration depth, therefore if UXO is situated at the location of the borehole, it will be encountered.

### 13.5 The Risk that Ordnance may be Initiated

The risk that UXO could be initiated if encountered will depend on its condition, how it is found and the energy with which it is struck. The most violent activity on most construction sites is percussive piling. As a result, items that are shallow buried present a slightly lower risk than those that are deep buried, since the force of impact is usually lower and they are more likely to be observed – when immediate mitigating actions can be taken.

### 13.6 The Consequences of Encountering or Initiating Ordnance

Clearly the consequences of an inadvertent detonation of UXO during construction operations would be catastrophic with a serious risk to life, damage to plant and a total site shutdown during follow-up investigations.

Since the risk of initiating ordnance is significantly reduced if appropriate mitigation measures are undertaken, the most important consequence of the discovery of ordnance will be economic. This would be particularly so in the case of high profile locations and could involve the evacuation of the public.

The unexpected discovery of ordnance may require the closing of the site for any time between a few hours and a week with a potentially significant cost in lost time. Note also that the suspected find of ordnance, if handled solely through the authorities, may also involve loss of production since the first action of the Police in most cases will be to isolate the locale whilst awaiting military assistance, even if this turns out to have been unnecessary.

### 13.7 Dynasafe BACTEC's Assessment

Taking into consideration the findings of this study, Dynasafe BACTEC considers the risk on the site to be heterogeneous and can therefore be divided into **Low**, **Medium** and **High** Risk Zones. These are described below and illustrated on a Risk Map, presented in **Annex P**.

#### Low Risk Zone:

- Buildings and hard standing that survived the war intact.

Type of Ordnance	Level of Risk			
	Negligible	Low	Medium	High
German WWII High Explosive Bombs		✓		
German WWII 1kg Incendiary Bombs		✓		
British Anti-Aircraft Shells		✓		
British Small Arms and Land Service Ammunition		✓		

#### Medium Risk Zone:

- Open soft ground that would not have been accessed regularly nor frequently.
- Areas of substantial bomb damage.
- Buffer Area to incorporate the "J-Curve" Buffer Zone.

Type of Ordnance	Level of Risk			
	Negligible	Low	Medium	High
German WWII High Explosive Bombs			✓	
German WWII 1kg Incendiary Bombs			✓	
British Anti-Aircraft Shells			✓	
British Small Arms and Land Service Ammunition			✓	

#### High Risk Zone:

- Occupied by the River Yare.

Type of Ordnance	Level of Risk			
	Negligible	Low	Medium	High
German WWII High Explosive Bombs				✓
German WWII 1kg Incendiary Bombs			✓	
British Anti-Aircraft Shells			✓	
British Small Arms and Land Service Ammunition		✓		

## 14 Proposed Risk Mitigation Strategy

### 14.1 General

Dynasafe BACTEC believes the following risk mitigation measures should be deployed to support the proposed works at the Southtown, Great Yarmouth site.

### 14.2 Scope Specific Risk Mitigation Measures

*All Risk Zones:*

- **Site Specific Explosive Ordnance Safety and Awareness Briefings to all personnel conducting intrusive works:** A specialised briefing is always advisable when there is a possibility of explosive ordnance contamination. It is an essential component of the Health & Safety Plan for the site and conforms to requirements of CDM Regulations 2015. All personnel working on the site should be instructed on the identification of UXB, actions to be taken to alert site management and to keep people and equipment away from the hazard. Posters and information of a general nature on the UXB threat should be held in the site office for reference and as a reminder.
- **The Provision of Unexploded Ordnance Site Safety Instructions:** These written instructions contain information detailing actions to be taken in the event that unexploded ordnance is discovered. They are to be retained on site and will both assist in making a preliminary assessment of a suspect object and provide guidance on the immediate steps to be taken in the event that ordnance is believed to have been found.

*Medium Risk Zones:*

- **Explosive Ordnance Disposal (EOD) Engineer presence on site to support shallow intrusive works:** When on site the role of the EOD Engineer would include; monitoring works using visual recognition and instrumentation and immediate response to reports of suspicious objects or suspected items of ordnance that have been recovered by the ground workers on site; providing Explosive Ordnance Safety and Awareness briefings to any staff that have not received them earlier and advise staff of the need to modify working practices to take account of the ordnance threat, and finally to aid Incident Management which would involve liaison with the local authorities and Police should ordnance be identified and present an explosive hazard.
- **Handheld Intrusive Magnetometer Survey of all borehole locations down to the maximum bomb penetration depth:** As part of the EOD Engineer presence on site, Dynasafe BACTEC can deploy intrusive magnetometry techniques to provide staged clearance ahead of all the borehole locations.

*High Risk Zone:*

- **Non-Intrusive Magnetometer and Side Scan UXO Survey:** A Magnetometer and high-resolution Side Scan Survey should be conducted over the proposed works area to identify any ferrous anomalies (potential UXO) on or near to the riverbed surface. This will provide clear areas for the placement of barge legs or anchors. It also allows for the identification of non-ferrous near surface obstructions which may hamper the proposed works.
- **Intrusive Magnetometer Survey - Down-hole Vallon Probing ahead of Marine Boreholes:** A down-hole Vallon magnetometer is lowered to the estuary bed first to scan a radius for ferrous anomalies. Provided the river bed is clear, boreholing is conducted to 1m. Nonferrous sleeving must be used with the Vallon lowered down the sleeve to clear the next metre ahead of the borehole. This sequence is repeated until bomb penetration depth is reached, then boreholing can continue unrestricted. Sleeving would be expected to extend from the JU Barge deck to river bed to ensure drill bit relocates the borehole each time it is withdrawn.

**14.3 Further Recommended Measures should the Scope of Works Change:**

- **Intrusive Magnetometer Survey of all pile / boreholes locations down to the maximum bomb penetration depth:** Dynasafe BACTEC can deploy a range of intrusive magnetometry techniques to clear ahead of all the pile locations. The appropriate technique is governed by a number of factors, but most importantly the site's ground conditions. The appropriate survey methodology would be confirmed once the enabling works have been completed. A site meeting would be required between BACTEC and the client to determine the methodology suitable for this site. Target investigation or avoidance will be recommended as appropriate.
- **Pre-Piling Intrusive Magnetometer Survey: TFG Clearance ahead of Piling:** A TFG magnetometer survey probe will scan 1m at a time for ferrous anomalies ahead of a rotary drill. This process is repeated down to the max bomb penetration depth. If a ferrous mass is located the TFG survey would have to relocate however, this would clear the way prior to the borehole survey. Having cleared the location, piling can then be conducted on that position unrestricted.
- **Intrusive Magnetometer Survey: Down-hole Vallon Probing ahead of Piling:** A down-hole Vallon magnetometer is lowered to the estuary bed first to scan a radius for ferrous anomalies. Provided the river bed is clear, piling is conducted to 1m. Nonferrous sleeving must be used with the Vallon lowered down the sleeve to clear the next metre ahead of the borehole. This sequence is repeated until bomb penetration depth is reached, then piling can continue unrestricted.

**Most Commonly Deployed German Bombs**

**SC 50**

**Bomb Weight:** 40-54kg (110-119lb)  
**Explosive Weight:** c25kg (55lb)  
**Fuze Type:** Impact fuze/electro-mechanical time delay fuze  
**Bomb Dimensions:** 1,090 x 280mm (42.9 x 11.0in)  
**Body Diameter:** 200mm (7.87in)  
**Use:** Against lightly damageable materials, hangars, railway rolling stock, ammunition depots, light bridges and buildings up to three stories.  
**Remarks:** The smallest and most common conventional German bomb. Nearly 70% of bombs dropped on the UK were 50kg.

50kg bomb, London Docklands

SC-50 JA (Guteklasse 1)

**SC 250**

**Bomb weight:** 245-256kg (540-564lb)  
**Explosive weight:** 125-130kg (276-287lb)  
**Fuze type:** Electrical impact/mechanical time delay fuze.  
**Bomb dimensions:** 1640 x 512mm (64.57 x 20.16in)  
**Body diameter:** 368mm (14.5in)  
**Use:** Against railway installations, embankments, flyovers, underpasses, large buildings and below-ground installations.

250kg bomb, Hawkinge

SC-250 JA (Güterboote 1)

**1kg Incendiary Bomb**

**Bomb weight:** 1.0 and 1.3kg (2.2 and 2.87lb)  
**Filling:** 680gm (1.3lb) Thermite  
**Fuze type:** Impact fuze  
**Bomb dimensions:** 350 x 50mm (13.8 x 1.97in)  
**Body diameter:** 50mm (1.97in)  
**Use:** As incendiary – dropped in clusters against towns and industrial complexes  
**Remarks:** Jettisoned from air-dropped containers. Magnesium alloy case. Sometimes fitted with high explosive charge

1. Scaffold pipe
2. Incendiary 1kg bomb
3. Incendiary bomb recently found on site in UK

Giant WWII bomb dug up by builders in London

A massive evacuation procedure is carried out in Bermondsey, south London, after the 1,000lb explosive measuring 5ft long was uncovered

Mother-of-two digs up unexploded WWII bomb in garden and casually flings it on the rubbish thinking it was an old exhaust pipe

- Carole Fisher-White, 56, unearthed a mortar shell in her back garden
• It was only when sons said it looked like a bomb that the penny dropped
• Royal Navy bomb disposal team called to defuse the device
• The 29mm Spigot Mortar was an infantry anti-tank weapon
• Also known as the Blacker Bombard it was used by the Home Guard

Unexploded Second World War grenade discovered by a curious dog

Police and Army bomb disposal experts were called to the address in Peckholt Avenue, Heald Green. A dog called Snoopy has sniffed out a suspected Second World War grenade in a backport garden. Police and Army bomb disposal experts were called to the address in Peckholt Avenue, Heald Green. The dog took the grenade to nearby parkland and destroyed it in a controlled explosion.

Unexploded bomb 'started to tick'

An unexploded World War II bomb started to tick and ooze liquid as experts tried to defuse it, police have said.

The large bomb was found in a river at Sugar House Lane, near Bromley-by-Bow Tube station in east London, on Monday.

Rush-hour travel was disrupted as overnight work to make the bomb safe continued into Thursday morning.

"It measures approximately the size and length of a man, and weighs around 1,000kg (2,200lb).

Road closed after German bomb found in Axminster garden

By Exeter Express and Echo | Posted June 22, 2014

A major road in Axminster has been closed after an air-dropped German bomb was found in a garden.

## WW2 bomb found in Portsmouth harbour

22 February 2017 | Hampshire &amp; Isle of Wight

[f](#) [t](#) [v](#) [e](#) [Share](#)

A World War Two bomb containing 290lb (131kg) of "high explosives" has been found in Portsmouth harbour.

The ordnance was discovered by a dredger in the water at about 03:00 GMT, the Royal Navy said.

Specialist divers at the scene said the bomb posed a "very serious threat". It was towed out to sea and detonated.

All ferries were stopped and trains between Portsmouth and Southsea station and Portsmouth Harbour were suspended, but have since started running again.

There were also extensive road closures in the area, affecting access to Gunwharf Quays.

The Royal Navy said the device, believed to be a German SC250 that weighs 500lb (227kg), was removed from the harbour before being "safely" blown up in the sea off the Isle of Wight.

Lt Mike St Pierre, the officer leading the bomb disposal team, had said: "Despite being old, these devices can pose a very serious threat."

By JOSEPH CURTIS FOR MAILONLINE

PUBLISHED: 17:00, 16 November 2016 | UPDATED: 19:49, 16 November 2016

## Portsmouth harbour is sealed off with hundreds of people evacuated and ferries halted after a 500lb unexploded WWII bomb was found on the sea bed

The Royal Navy today destroyed an unexploded 500lb German World War Two bomb which closed Portsmouth harbour for six hours when dredging workers discovered it on the sea bed.

Contractors completing works ready for the arrival of the Royal Navy's new 65,000 tonne state-of-the-art ship HMS Queen Elizabeth discovered the German UXB torpedo while dredging Portsmouth Harbour, Hampshire, this morning.

Bomb disposal experts rushed to the scene after it was brought to the surface while work was carried out west of Victory Jetty.

The bomb was towed from Portsmouth Harbour, Hants, out to open waters 1.5 miles east of the Isle of Wight.

## World War Two bomb removed from River Thames and exploded

© 20 January 2017 | London

Share

The device was identified as a German SD 50kg bomb

**An unexploded 50kg World War Two bomb found in the River Thames has been removed and exploded.**

The operation by the Royal Navy and Metropolitan Police forced Waterloo Bridge, Westminster Bridge and Victoria Embankment in central London to shut.

A Ministry of Defence spokesman said the WW2 device had been towed along the river to Tilbury, Essex, where it was safely detonated.

Police had been called to the river at 17:15 GMT on Thursday.

The device has been identified as a German SD 50kg bomb, a small armour-piercing ordnance dropped from an aircraft.

The Port of London Authority said the suspected bomb measured 2ft by 1ft (60cm x 30cm).

1994

RESCUE workers search for survivors after a Second World War bomb exploded at a building site in Berlin, killing three people and injuring at least eight others. A fire brigade spokesman said he feared the final death toll could be higher. One worker was still missing, believed to be trapped under a machine. "We've

### Blown up by history

found human remains 100 metres away but we can't tell if they belong to the dead already found," the spokesman said. The blast, set off by drilling work on Frankfurter Allee, one of east Berlin's busiest avenues, trapped

workers under building machinery and sent huge chunks of concrete tumbling through the air. A large office block was being built on the site of the explosion which sent shoppers scrambling for shelter and paralysed

dense afternoon traffic. One eyewitness said: "There was a bang, then silence, and then it started raining stones and dirt." Dozens of cars within a 250-metre radius were wrecked and the top two floors of a nearby apartment block caved in. Radio reports claimed that the total number of injured stood at 14.

2008

2006

### World War II bomb kills three in Germany

Three people have been killed and six injured trying to defuse a World War II bomb in central Germany.

Workers building a sports stadium had earlier unearthed the bomb in the town of Goettingen.

It was not immediately clear why the bomb, reportedly weighing 500kg (1,100lb), had detonated.

Unexploded WWII bombs dropped by Allied planes are frequently found in Germany, though it is unusual for them to explode unexpectedly.

2010

The bomb went off as the machine lifted up earth and debris

A World War Two bomb has exploded at a construction site near a west German town, killing a man and injuring eight others, police say.

The explosion occurred after a digger accidentally struck the device during excavation work in Euskirchen in the state of North Rhine-Westphalia.

The machine's operator died on the spot. Two of those hurt were critically wounded, the dpa news agency reports.

### 3.7 inch Anti-Aircraft Projectile

Weight: 12.7kg (28lb)  
 Dimensions: 94 x 360mm (3.7 x 14.7in)  
 Carriage: Mobile and Static Versions  
 Rate of Fire: 10-20 rounds per minute  
 Ceiling: 9-18,000m (29-59,000ft)  
 Muzzle Velocity: 792m/s (2,598ft/s)  
 Remarks: 4.5 inch projectiles were also commonly utilised

This AA shell was uncovered on a construction site in North London in February 2009.

Layout plan for a typical HAA battery site.

Hyde Park 1939 3.7 Inch QF gun on mobile mounting

3.7 inch AA Projectile Minus Fuze

### Rockets / Unrotating Projectiles

Weight: Overall: 24.5kg (54lb) Warhead: 1.94kg (4.28lb)  
 Dimensions: 1930mm x 82.6mm (76 x 3.25in)  
 Carriage: Mobile – transported on trailers  
 Ceiling: 6770m (22,200ft)  
 Maximum Velocity: 457mps (1,500 fps)

MK II HE Shell (3.5kg)

Rocket Battery in action

Home Guard soldiers load an anti-aircraft rocket at a 'Z' Battery

2" U.P. AA Rocket

### 40mm Bofors Gun Projectile

Weight: 0.86kg (1.96lb)  
 Dimensions: 40mm x 310mm (1.6in x 12.2in)  
 Rate of Fire: 120 rounds per minute  
 Ceiling: 23,000ft (7000m )  
 Muzzle Velocity: 2,890 ft/s (881m/s)  
 Remarks: Mobile batteries – normally few records of where these guns were located

Unexploded 40mm Bofors projectile

40mm Bofors gun and crew at Stanmore in Middlesex, 28 June 1940.

## Covert British troops 'could have buried' WWII devices

**World War II incendiary devices found on a building site in Gloucestershire could have been left by covert British troops, according to researchers.**

More than 20 phosphorus bombs were unearthed in Birdlip after a digger hit one, causing it to burst into flames.

A former worker at the site said he saw a Home Guard officer burying objects there 65 years ago.

The Coleshill Auxiliary Research Team said auxiliary officers often used Home Guard uniforms as cover.

The bombs were put into vats of water to make them safe

## Army bomb disposal team called to Blacksole Bridge in Herne Bay

Comments 13

by Aidan Barlow [abarlow@thekmgroupp.co.uk](mailto:abarlow@thekmgroupp.co.uk)

08 July 2015

It was like a scene from Dad's Army when Army bomb disposal experts found wartime explosives made by the Home Guard in makeshift bottles.

A team was called to the Blacksole Bridge in Herne Bay after the wartime bombs were found.

The team from the Royal Logistics Corps set up a 30 metre exclusion zone for pedestrians around the railway embankment after the suspected homemade phosphorous bombs were found.

## Treasure hunter stumbles on deadly Dad's Army bomb cache

By MAIL ONLINE REPORTER  
Last updated at 4:06 PM on 9th July 2010

Comments (0) Add to My Stories

A treasure hunter escaped serious injury when he unearthed a cache of bombs that were buried by the Home Guard during the darkest days of World War 2.

The weapons - primed to go off when they made contact with the air - were secreted on a beach by a Captain Mainwaring of the day.

Loaded with dangerous benzene and phosphorus, the Dad's Army-style team would have used them in battle against Nazi troops in the event of invasion.

'Are you sure that's wise?': The Home Guard's stash of bombs finally goes off, 70 years later

## VIDEO: Explosion after 80 grenades detonated in Eastbourne

16:31 Monday 13 April 2015

Marked 'AW Bomb 1940' the grenades were thought to have been phosphorus incendiary grenades created as improvised anti-tank weapons when Britain was facing invasion following the army's evacuation from Dunkirk in 1940.

He said, "I remember the grenades being buried. It was part of the Home Guard stash, it was put there in case we were invaded. It had to be in 1943. There were a lot of them [stashes], they were all over the place."

Source: Various news sources

**No. 36 'Mills' Grenade**

Weight: 0.7kg filled (1lb 6oz)  
 Type: Hand or discharger, fragmentation  
 Dimensions: 95 x 61mm (3.7 x 2.4in)  
 Filling: Alumatol, Amatol 2 or TNT  
 Remarks: 4 second hand-throwing fuse with approximate 30m range. First introduced May 1918.

Grenade, .303 inch rifle, No. 36M, Mark I.

**No. 69 Grenade**

Weight: 0.38kg filled (0.8lb)  
 Type: Percussion/Blast  
 Date Introduced: December 1940  
 Remarks: Black Bakelite body. Blast rather than fragmentation type. After unscrewing the safety cap, a tape is held when throwing the grenade releasing the safety bolt in the throwing motion. Detection is problematic due to its very low metal content.

**Typical Smoke Grenade**

Dimensions: Approx. 65 x 115mm (2.5 x 4.5in)  
 Type: Smoke  
 Date Introduced: Current MoD issue  
 Remarks: Smoke grenades are used as ground-to-ground or ground-to-air signalling devices, target or landing zone marking devices, and screening devices for unit movement.

Report Reference:  
7307TA

Client: WSP UK Limited  
 Project: Southtown, Great Yarmouth

### Typical 2 inch High Explosive Mortar

- Bomb Weight: 1.02kg (2.25lb)
- Type: High Explosive
- Dimensions: 51 x 290mm (2in x 11.4in)
- Filling: 200g RDX/TNT
- Maximum Range: 457m (500yds)
- Remarks: Fitted with an impact fuze which detonates the fuze booster charge (exploder) and, in turn, the high explosive charge. The main charge shatters the mortar bomb body, producing near optimum fragmentation and blast effect at the target.

### Typical 3 inch Smoke Mortar

- Type: Smoke
- Dimensions: c490 x 76mm (19.3in x 3in)
- Filling: Typically white phosphorous
- Maximum Range: 2515m (2,750yds)
- Remarks: On impact, the fuze functions and initiates the bursting charge. The bursting charge ruptures the mortar bomb body and disperses the white phosphorous filler. The white phosphorous produces smoke upon exposure to the air.

### Typical 2 inch Illuminating Mortar

- Type: Illum.
- Dimensions: 51 x 290mm
- Filling: Various
- Remarks: The expulsion charge ignites and ejects the candle assembly. A spring ejects the parachute from the tail cone. The parachute opens, slowing the descent of the burning candle which illuminates the target.

Report Reference: 7307TA	Client: WSP UK Limited
	Project: Southtown, Great Yarmouth

### Self Igniting Phosphorous (SIP) Grenades

**Filling:** White Phosphorous and Benzene  
**Remarks:** The grenade comprised a glass bottle with a total volume of approximately one pint. It was filled with White Phosphorus, benzene, a piece of rubber and water. Over time the rubber dissolved to create a sticky fluid which would self ignite when the bottle broke. Fired by hand or Northover Projector. Sometimes called the "A & W" (Albright & Wilson) grenade.

### No 74 Grenade (Sticky Bomb)

**Remarks:** Designed as an anti-tank grenade and used by the Home Guard. The grenade consisted of a glass ball on the end of a Bakelite (plastic) handle. Inside the glass ball was an explosive filling whilst on the outside was a very sticky adhesive covering. Until used, this adhesive covering was encased in a metal outer casing.

### Flame Fougasse Bomb

**Remarks:** A Flame Fougasse was a weapon in which the projectile was a flammable liquid, typically a mixture of petrol and oil. It was usually constructed from a 40-gallon drum dug into the roadside and camouflaged. Ammonal provided the propellant charge which, when triggered, caused the weapon to shoot a flame 3m (10ft) wide and 27m (30 yards) long. Initially a mixture of 40% petrol and 60% gas oil was used, this was later replaced by an adhesive gel of tar, lime and petrol known as 5B.

### 20mm Hispano HEI Ammunition

Type: Live canon round  
 Markings: Upper half of projectile painted 'buff' colour, lower half is red.  
 Cartridge Weight: 256 grams  
 Dimensions: Total cartridge / projectile length - 182mm  
 Fuzed: Contact fuze – No.253, No.254 or No.917  
 Filling: 108 grains of contact explosive + 68 grains of SR.379 incendiary composition.  
 Threat: Explosives within unspent cartridge as well as the projectile.  
 Deployment: Royal Navy, RAF and British Army Light Anti-Aircraft guns. Also RAF aircraft canons.  
 Remarks: Cartridges are belted or supplied lose in cartons.

COLOUR IDENTIFICATION		
BRITISH

PROJ. TRACER		Green
H.E. INCENDIARY	T.N.T.	Red
H.E. INCENDIARY TRACER	T.N.T.	Yellow

### .303" Ammunition

Type: Rifle / machine gun round  
 Markings: Regular round - none. Tracer round – red Primer  
 Bullet Weight: 150 - 180 grams  
 Dimensions: Total cartridge /projectile length - 78mm  
 Filling: Regular round – none. Tracer round - small incendiary fill  
 Threat: Explosive cordite within unspent cartridge  
 Deployment: Royal Navy, RAF and British Army Light Anti-Aircraft guns, machine guns and rifles. Standard British and Commonwealth military cartridge from 1889 until the 1950s.  
 Remarks: Cartridges are belted or supplied lose in cartons.

TYPES OF SMALL ARMS AMMUNITION  
 Fig. 1. Four types of ammunition used by modern infantry. 1 and 2 are ball cartridges, 3 is an armour-piercing bullet, and 4 a tracer bullet which burns and makes its flight visible.

**Attention:** Mr Bumstead

Dear Mr Bumstead,

We have pleasure in providing a digital copy of our report and data in AGS format for the above project.

We hope that you are satisfied with the performance of our staff, equipment and reporting on this project. If you should have any queries about any aspect of the works carried out, please do not hesitate to contact us. We look forward to being of service to you in the future.

Yours faithfully,

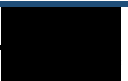

**In Situ Site Investigation Limited**

Darren Ward

Director

## 1.0 INTRODUCTION

In Situ Site Investigation Limited (In Situ) was engaged in a geotechnical site investigation at Great Yarmouth 3rd River Crossing at the request of Norfolk Partnership Laboratory (the client). The site investigation consisted of completing 5 *Static Piezocone Penetration Tests (CPTU)* to provide information on the soil conditions and derived geotechnical parameters at:

Fish Wharf

Off South Denes Road

Gt Yarmouth

NR30 3LP

All test locations were provided by the client, as shown on the site map, in *Appendix A.1*. The tests were stopped when they reached the target depth as per the client's technical specifications or for other technical reasons, as detailed in *Appendix A.2* and on each CPTU log.

The fieldwork was carried out from 19/03/2018 to 20/03/2018 as per the client's request.

The work on site and the final factual reporting have been undertaken in accordance with the international technical standard *BS EN ISO 22475-1:2012*.

## 2.0 FIELDWORK

### 2.1 CONE PENETRATION TESTS

The fieldwork activity is summarised in Table 2.1.

Table 2.1 Fieldwork Summary	
CPT Operator/s	Darren Hughes and Andrew Evans
Date Started	19/03/2018
Date Finished	20/03/2018
In Situ S.I. Project Manager	Darren Ward
Main Contractor's Site Manager	Martyn Bumstead

#### 2.1.1 Rig Information

Details of CPTU rig used in this project are shown in Table 2.2. Full data sheet for the rig is presented in *Appendix A.3*.

Table 2.2 Rig Summary	
Rig Name	Rig Description
CPT 010	21 Tonne Wheeled CPT Rig

#### 2.1.2 CPTU Cone

Details of electric CPTU cone (Type TE2) used in this project conforming to the requirements of Application Class 2 of *ISO 22476-1:2012*, are shown in Table 2.3.

Table 2.3 Cone Summary		
Number	Cross-section area	Filter position
P15CFPT <sub>XY</sub> 70080	15cm <sup>2</sup>	u <sub>2</sub>

A full datasheet of the cone used is shown in *Appendix A.4*.

The cone's measured parameters are shown in Table 2.4.

**Table 2.4 Completed Fieldwork Summary**

5 CPTU to a maximum depth of 36.00m. Each test measured Cone Resistance,  $q_c$ , Sleeve Friction,  $f_s$ , Porewater Pressure in the shoulder position,  $u_2$ , Inclination in X and Y axes.

*Provision of factual report with estimated soil type, derived geotechnical parameters and AGS data.*

### 2.1.3 CPTU Cone Calibration

The cone resistance and sleeve friction are recorded by calibrated load cells in the cone. The CPTU load cells and pressure transducers are regularly calibrated in line with ISO 22476-1:2012 standard by the cone manufacturer. The cone calibration certificate for the cone used at this site are presented in *Appendix A.5*.

### 2.1.4 CPTU Cone Saturation

The pore water pressure is recorded using a calibrated pressure transducer located in the piezocone. To ensure pore water pressure measurements are not affected by the presence of air in the measuring transducer, a de-airing procedure is carried out prior to each test. The cone and filter are saturated using a glycerine fluid with a viscosity of 10,000CST.

### 2.1.5 Test Procedure

The tests are carried out in accordance with the *International Standard for Electrical Cone and Piezocone Penetration Test (ISO 22476-1:2012)*.

The final depths of the tests were determined by either completion to the specified test depth or when the maximal safe capacity of the equipment was reached. A schedule of the tests performed is shown in *Appendix A.2*, which has been compiled from the operators' daily progress reports.

The data is transmitted from the digital CPTU through an umbilical cable that runs through the push rods to the data acquisition system. Results are displayed instantaneously on the computer logging screen. The results are recorded on the computer hard disc.

The rate of penetration is kept constant at 2cm/s  $\pm 10\%$  except when penetrating very dense or hard strata. Before each test is carried out zero values are taken of the cone to check if it is within calibration. At the end of each test, zero values are taken again to see if there has been any drift during the test. These values are inspected during the post processing stage. This is a quality check on the data and the testing procedure. Individual test zero values are shown on their corresponding test results in *Appendix B* and *C*.

### 2.1.6 In Situ Pore Pressure ( $u_0$ )

The in situ or hydrostatic pore pressure is required for the calculation of several derived parameters included in this report. These values are presented on the pore pressure plot, *Form 01*, which is included in *Appendix B*. For this report, the values were estimated by our client.

## 2.2 DISSIPATION TESTS

As per the client's request, 5 dissipation tests were performed at the required depth. A summary table of the dissipation tests is presented in *Appendix D*.

The dissipation test is carried out by pausing the penetration at a point when there is excess porewater pressure. This excess pore pressure generated around the cone will then start to dissipate, and the decay of pore pressure with time is recorded. The rate of dissipation depends upon the coefficient of consolidation, which in turn depends on the compressibility and permeability of the soil and on the diameter of the probe. It is common to record the time to reach 50% dissipation,  $t_{50}$ . If the equilibrium pore pressure is required, the dissipation test is continued until no further dissipation is observed. This can occur rapidly in sands, but may take many hours in plastic clays.

The data recorded from the dissipation tests on site is used to calculate the consolidation characteristics, as shown in *Appendix D*.

## 2.3 POSITIONING

Positioning and surveying of all investigated locations was the responsibility of the client. The site map and position of the tests are presented in *Appendix A.1*. All tests coordinates are included in the summary sheet in *Appendix A.2*.

## 3.0 CONE PENETRATION MEASURED PARAMETERS

All measured parameters of tests carried with the CPTU cone are shown in *Appendix B* and all the information about data processing and results are given in sections 3.1, 3.2 and 3.3.

### 3.1 DATA PROCESSING

The measured parameters, cone end resistance,  $q_c$ , sleeve friction,  $f_s$ , porewater pressure measurements with filter in shoulder position,  $u_2$  and inclination for  $x$  and  $y$  axis,  $I_x$ ,  $I_y$ , were recorded for every 10 mm of penetration keeping a constant speed of 20 mm/s  $\pm$  5 mm/s, which may slightly change when the cone is penetrating hard strata.

The measured data from the site works is processed and presented using specialised CPT software. The interpretations on the CPTU results were carried out following the recommendations of *Lunne et al. (1997)*, *Robertson (2015)* and *BS EN ISO 22475-1:2012*. Measured parameters, mentioned in *Sections 3.2* and *3.3*, were used to derive all the geotechnical parameters, which are presented in *Chapter 4.0*. The soil behaviour type method used on this report is *Robertson et al (1986)*, shown in *Figure 3.2*.

#### 3.1.1 Zero Measurements

Before and after each CPTU test, zero measurements are recorded for each channel of the cone. The zero measurements are presented on the logs in *Appendix B* and *C*. This is a routine quality check carried out on site.

### 3.2 MEASURED PARAMETERS

#### 3.2.1 Cone Resistance ( $q_c$ )

Cone resistance,  $q_c$ , is measured as the total force acting on the cone, divided by the projected area of the cone. The results are presented in MPa, on *Log 01*, in *Appendix B*, scale 0-20 MPa with a minor scale printing on the same graph at 0-4 MPa.

#### 3.2.2 Sleeve Friction ( $f_s$ )

Sleeve friction,  $f_s$ , is measured as the total frictional force acting on the friction sleeve divided by its surface area. The results are presented in kPa, on *Log 01*, in *Appendix B*, using a scale of 0-500 kPa.

### 3.2.3 Porewater pressure ( $u_2$ )

The pore pressure,  $u_2$ , is measured during the test. If the material is free draining and saturation is maintained it will normally measure hydrostatic pore pressure. In materials that are not free draining, it will record the total pore pressure (hydrostatic plus any excess pore pressures generated) created by the cone penetration through this material.

The filter element can be mounted in one of three positions. For all tests carried out in this project the filter was mounted in the  $u_2$  position (see *Figure 3.1*).

**Figure 3.1:** Diagram showing pore pressure filter locations (after Lunne et al., 1997)

### 3.2.4 Inclination ( $I_x, I_y$ )

The CPT rig was set up to obtain a thrust direction as near as possible to vertical. The CPTU cones have inclinometers incorporated to measure the non-verticality of the test. For test depths less than 15 m, significant non-verticality is unusual, provided the initial thrust direction is vertical.

## 3.3 ESTIMATED SOIL BEHAVIOUR TYPE

### 3.3.1 Friction Ratio ( $R_f$ )

The friction ratio,  $R_f$  is the ratio between the sleeve friction and the cone resistance (Lunne et al., 1997).

$$\text{Friction Ratio } (R_f) = \left( \frac{\text{Sleeve Friction } (f_s)}{\text{Cone Resistance } (q_c)} \right) \times 100$$

### 3.3.2 Estimated Soil Behaviour Type (SBT)

The estimation of soil behaviour type, *SBT*, using measurements of cone resistance and sleeve friction is based upon the variations of the friction ratio and cone resistance. The

friction ratio varies depending upon whether the soil is cohesive or granular. The cone resistance varies depending on the strength and densities of the soil.

The interpretation used in this report is *Robertson et al. (1986)*, which is shown in Figure 3.2. The results are presented on *Log 01*, in *Appendix B*.

Figure 3.2: Robertson et al., 1986 soil behaviour type chart.

### 3.3.3 Pore Pressure Ratio ( $B_q$ )

Pore pressure ratio,  $B_q$  is the ratio between the measured pore pressure generated during penetration and the corrected cone resistance minus the total overburden stress.

Pore pressure ratio as defined by *Senneset and Janbu (1985)* is defined as:

$$B_q = \frac{u_2 - u_0}{q_t - \sigma_{vo}}$$

where

- $u_2$  is pore pressure measured between the cone and the friction sleeve
- $u_0$  is equilibrium pore pressure
- $\sigma_{vo}$  is total overburden stress
- $q_t$  is cone resistance corrected for unequal end area effects

### 3.4 APPLIED CORRECTIONS

#### 3.4.1 Corrected Cone Resistance ( $q_t$ )

For each penetration test, the measured cone resistance,  $q_c$ , can be corrected for the “unequal area effect” due to the influence of the ambient pore water pressure acting on the cone.

The correction has been applied using the following equation by Lunne et al., 1997:

$$q_t = q_c + [u_2 \cdot (1 - \alpha)]$$

where

$\alpha$  is the cone area ratio

The cone used on this project has a cone area ratio of 0.79. This value is geometrically measured.

#### 3.4.2 Depth Correction

All tests in the report have been corrected for depth difference caused by inclination. This has been calculated using the method described in ISO 22476-1:2012.

To calculate the corrected depth the following formula is used:

$$z = \int_0^l C_{inc} \cdot dl$$

where

$z$  is penetration depth, in  $m$

$l$  is penetration length, in  $m$

$C_{inc}$  is correction factor for the effect of the inclination of the CPTU relative to the vertical axis.

The equation for calculating the correction factor for the influence of the inclination for a bi-axial inclinometer is:

$$C_{inc} = \frac{1}{\sqrt{(1 + \tan^2 \beta_1 + \tan^2 \beta_2)}}$$

where

$\beta_1$  is the angle between the vertical axis and the projection of the axis of the CPTU on a vertical plane, in degrees

$\beta_2$  is the angle between the vertical axis and the projection of the axis of the CPTU on a vertical plane that is perpendicular to the plane of angle  $\beta_1$ , in degrees

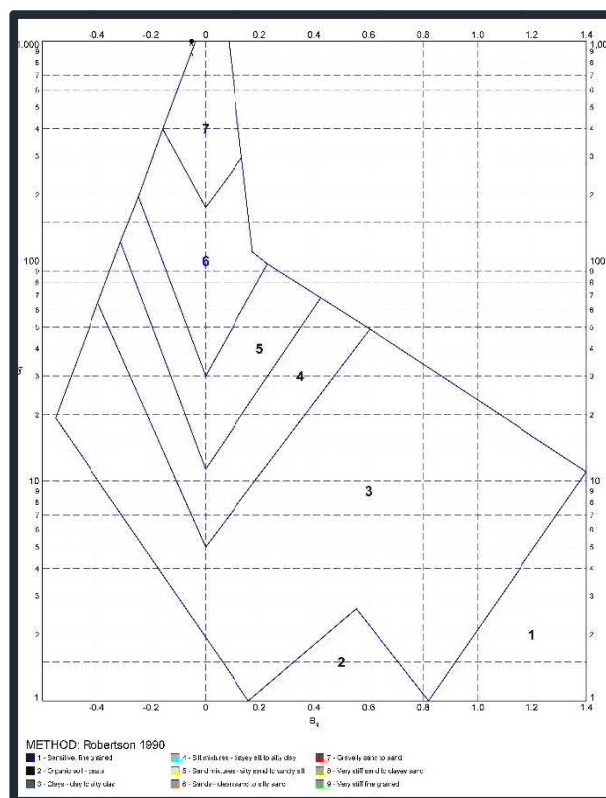

## 4.0 GEOTECHNICAL DERIVED PARAMETERS

A number of empirical correlations can be used to derive geotechnical parameters from CPTU data. This report includes only the parameters which are described in this chapter. The results of all correlations used to obtain the geotechnical derived parameters are presented on *Log 02* and *Log 03* in *Appendix C*.

**Please note that each empirical correlation is derived for a certain type of soil, and may not be appropriate for all the soil types encountered on this project.**

### 4.1 SOIL BEHAVIOUR TYPE INDEX ( $I_c$ )

The soil behaviour type index,  $I_c$ , was derived by *Jefferies and Davies (1991)*, and was created to simplify the application of CPTU SBT chart shown in *Chapter 3, Figure 3.2*. This approach has been modified for use with the *Robertson (1990)* normalised CPT soil classification chart, *Figure 4.1*. The normalised cone parameters  $Q_t$  and  $F_r$  (for definitions see *Appendix A6 Symbol List*) can be combined into one Soil Behaviour Type Index,  $I_c$ , (Lunne et al., 1997).

**Figure 4.1: Robertson 1990 soil behaviour type chart.**

The soil behaviour type index,  $I_c$ , can then be defined using *Robertson (2010)* formula, given below:

$$I_c = ((3.47 - \log Q_t)^2 + (\log F_r + 1.22)^2)^{0.5}$$

where

$Q_t$  is the normalized cone resistance which represents the simple normalization with a stress exponent ( $n$ ) of 1.0, which applies well to clay-like soils

$F_R$  is the normalized friction ratio, in %

The boundaries of soil behaviour type are then given in terms of the index,  $I_c$ , presented in *Table 4.1* below.

The soils behaviour type index does not apply to zones 1, 8 and 9. The profiles of  $I_c$  provide a simple guide to the continuous variation of soil behaviour type in a given soil profile based on CPTU results, with a reliability greater than 80% compared with soil samples (*Robertson, 2015*).

Zone	Soil Behaviour Type	$I_c$
1	Sensitive fine grained	N/A
2	Organic Soils – clay	>3.6
3	Clays – silty clay to clay	2.95 – 3.6
4	Silt mixtures – clayey silt to silty clay	2.60 – 2.95
5	Sand mixtures – silty sand to sandy silt	2.05 – 2.6
6	Sands – clean sand to silty sand	1.31 – 2.05
7	Gravelly sand to dense sand	<1.31
8	Very stiff sand to clayey sand*	N/A
9	Very stiff fine grained *	N/A

\* Heavily overconsolidated or cemented

**Table 4.1:** Normalized CPTU Soil Behaviour Type ( $SBT_n$ ) Index values,  $I_c$ . (*Robertson, 2010*)

## 4.2 N VALUE OF STANDARD PENETRATION TEST (SPT) ( $N_{60}$ )

The derived  $N$  value of SPT,  $N_{60}$ , is strongly and directly related to the cone resistance,  $q_c$ .

In this report the  $N_{60}$  value is derived using the following correlations, developed by *Robertson and Wride (1998)* and *Jefferson and Davies (1998)*

- 1) *Robertson & Wride (1998)*

$$N_{60} = \frac{q_c}{8.5 \cdot p_a \left(1 - \frac{I_c}{4.6}\right)}$$

- 2) *Jefferson and Davies (1993)*

$$N_{60} = \frac{q_c}{0.85 \cdot \left(1 - \frac{I_c}{4.75}\right)}$$

where

- $q_c$  is the cone resistance
- $p_a$  is the atmospheric pressure equal to  $100 \text{ kPa}$
- $I_c$  is the soil behaviour type index calculated as given in *section 4.1*

It is suggested that this method provides a better estimation of the  $N$  value than the actual SPT test, due to its poor repeatability. But in fine grained soil with high sensitivity these methods of estimating  $N_{60}$  may overestimate it (*Jefferies and Davies, 1991*).

## 4.3 RELATIVE DENSITY ( $D_r$ )

Relative density,  $D_r$ , is an intermediate parameter for coarse grained soils, widely used to describe sand deposits. All the research on deriving the relative density from CPTU tests results are carried out for **clean predominantly quartz sands**. The studies have shown that CPTU resistance in granular soils is controlled by sand relative density, in situ effective stresses and compressibility. The more compressible sands tend to give lower penetration resistance for a given relative density than less compressible sands.

In this report relative density is calculated using the methods suggested by *Baldi et al., (1986)*, *Jamiolkowski et al., (2001)* and *Kulhawy and Mayne (1990)* as shown in the equations below:

- 1) *Baldi et al., (1986)*

$$D_r = \frac{1}{C_2} \cdot \ln \left( \frac{q_c \cdot Wehr}{C_1 \cdot (\sigma'_{v0})^{0.55}} \right) \cdot 100$$

where

$C_1$  is a consolidation coefficient which is 157 for normally consolidated soils and 181 for over consolidated soils

$C_2$  is a consolidation coefficient which is 2.41 for normally consolidated soils and 2.46 for over consolidated soils

Wehr is a correction coefficient for calcareous soils

2) Jamilkowski et al., (2001)

$$D_r = 100 \cdot \left[ 0.268 \cdot \ln \left( \frac{q_t / \sigma_{atm}}{\sqrt{\sigma'_{v0} / \sigma_{atm}}} \right) + C_1 \right]$$

where

$C_1$  is a compressibility coefficient which is -0.675 for average compressible soils,  $\leq 1.0$  for high compressible soils and carbonate or calcareous sands and  $\geq -2.0$  for low compressible soils

$q_t$  is corrected cone resistance

$\sigma_{atm}$  is the atmospheric pressure

3) Kulhawy and Mayne, (1990)

$$D_r = \left[ \frac{q_{c1}}{305 \cdot C_1 \cdot OCR^{0.18} \cdot (1.2 + 0.05 \cdot \log(t/100))} \right]^{0.5} \cdot 100$$

where

$q_{c1}$  is the cone resistance corrected for initial vertical effective stress and atmospheric pressure, calculated by the following formula

$$q_{c1} = \frac{q_c}{\sqrt{\sigma'_{v0} \cdot \sigma_{atm}}}$$

where

$q_c$  is the cone resistance in *kPa*

$\sigma'_{v0}$  is the initial vertical effective stress in *kPa*

$C_1$  is a compressibility coefficient which is -0.91 for low compressible sands, 1.0 for medium compressible sands and 1.09 for high compressible sands

$t$  is time in years

#### 4.4 FRICTION ANGLE ( $\phi'$ )

Friction angle,  $\phi'$ , is used to express the shear strength of uncemented, coarse grained soils. In this report friction angle is derived by the correlations of *Mayne and Campanella (2005)*, *Robertson and Campanella (1983)* and *Kulhawy and Mayne (1990)*.

- 1) Mayne and Campanella, (2005)

$$\phi' = 29.5^0 \cdot B_q^{0.121} \cdot [0.256 + 0.336 \cdot B_q + \log Q_t]$$

where

$B_q$  is the pore pressure ratio, calculated as in Session 3.3

$Q_t$  is the normalized cone resistance

- 2) Roberston and Campanella, (1983)

$$\phi' = \tan^{-1} \left( 0.1 + 0.38 \cdot \log \left( \frac{q_t}{\sigma'_{v0}} \right) \right)$$

where

$q_c$  is the cone resistance in *kPa*

$\sigma'_{v0}$  is the initial vertical effective stress in *kPa*

- 3) Kulhawy and Mayne, (1990)

$$\phi' = 17.6^0 + 11.0^0 \cdot \log(q_{t1})$$

where

$q_{t1}$  is the corrected cone resistance corrected for initial vertical effective stress and atmospheric pressure, calculated by the following formula

$$q_{t1} = \frac{q_t}{\sqrt{\sigma'_{v0} \cdot \sigma_{atm}}}$$

The method suggested by *Mayne and Campanella (2005)* will not provide reliable results for heavily overconsolidated soils, fissured geomaterials and highly cemented or structures clays. This approach gives reliable results when pore pressure is positive and varies  $0.1 < B_q < 1.0$ . The correlation suggested by *Robertson and Campanella (1983)* estimates the peak friction angle for uncemented, unaged, moderately compressible, predominately quartz sands. For sands of higher compressibility the method will tend to predict low friction angles. The method suggested by *Kulhawy and Mayne (1990)* is an alternate relationship for clean, rounded, uncemented, quartz sands.

#### 4.5 FINES CONTENT ( $FC$ )

The fines content,  $FC$ , in this report is estimated using two different methods, one from *Robertson and Wride (1998)* and the other, *Suzuki et al (1998)* as presented below:

- 1) Robertson and Wride (1998)

$$I_c < 1.26: FC = 0$$

$$1.26 \leq I_c \leq 3.5: FC(\%) = 1.75I_c^{3.25} - 3.7$$

$$3.5 < I_c: FC = 100\%$$

- 2) Suzuki et al (1998)

$$FC(\%) = 2.8I_c^{2.6}$$

where

$I_c$  is the soil behaviour type index, calculated as in section 4.1

#### 4.6 UNDRAINED SHEAR STRENGTH ( $s_u$ )

Estimation of undrained shear strength,  $s_u$ , from CPTU tests using corrected cone resistance is carried out using the following correlation from *Lunne et al. (1981)*:

$$S_u = \frac{(q_t - \sigma_{v0})}{N_{kt}}$$

where

$N_{kt}$  is the empirical cone factor, which varies from 10 (6 for very soft sensitive fine grained soils) to 20. In this report 3 values are considered: 15, 17.5 and 20.  $N_{kt}$  tends to increase with increasing plasticity and decrease with increasing soil sensitivity. It decreases as  $B_q$  increases. (*Lunne et al., 1997*)

$\sigma_{v0}$  = total overburden stress.

This report only presents the undrained shear strength data on soils with soil behaviour type index,  $I_c$  values greater than 2.60.

The value of undrained shear strength,  $s_u$  to be used in analysis depends on the design problem. In general, the simple shear direction of lading often represents the average undrained strength. For larger, moderate to high risk projects, where high quality field and laboratory data may be available, site specific correlations should be developed based on appropriate and reliable values of  $s_u$ .

## 4.7 SENSITIVITY ( $S_t$ )

The sensitivity,  $S_t$  of clays is defined as the ratio of undisturbed peak undrained shear strength to totally remoulded undrained shear strength.

In this report  $S_t$  is calculated using two correlations developed by *Schmertmann (1978)* and *Mayne (2007)*.

- 1) Schmertmann (1978)

$$S_t = \frac{s_u}{s_{u(rem)}} = \frac{q_t - \sigma_v}{N_{kt}} \left( \frac{1}{f_s} \right)$$

where

$s_{u(rem)}$  is the remoulded undrained shear strength. It can be assumed equal to the sleeve resistance,  $f_s$ .

- 2) Mayne (2007)

$$S_t = \frac{0.073 \cdot (q_t - \sigma_{v0})}{f_s}$$

For relatively sensitive clays,  $S_t > 10$ , the value of  $f_s$  can be very low and not very accurate, hence the estimate of sensitivity should be used as a guide only.

## 4.8 SOIL UNIT WEIGHT ( $\gamma$ )

Soil unit weight,  $\gamma$  in this report is calculated by using one method for sands, considered under dry conditions and two methods for clays, considered under saturated conditions. These relationships are developed by *Mayne (2007)* and the equations are presented below:

- 1) Mayne (2007)

Dry unit weight for sands:

$$\gamma_{dry} = 1.89 \cdot \log(q_{t1}) + 11.82$$

Saturated unit weight for clays method 1

$$\gamma_{sat} = 8.32 \cdot \log(V_s) - 1.61 \cdot \log(z)$$

Saturated unit for clays method 2

$$\gamma_{sat} = 2.60 \cdot \log(f_s) + 15 \cdot G_s - 26.5$$

where

$q_{t1}$  is the corrected cone resistance corrected for initial vertical effective stress and atmospheric pressure, calculated by the following formula:

$$q_{t1} = \frac{q_t}{\sqrt{\sigma'_{v0} \cdot \sigma_{atm}}}$$

$z$  is the depth

$V_s$  is the shear wave velocity, calculated as  $V_s = 118.8 \cdot \log(f_s) + 18.5$

$G_s$  is the specific gravity of solids, typically between 2.40 and 2.90

#### 4.9 STATE PARAMETER ( $\psi$ )

The state parameter,  $\psi$  is defined as the difference between the current void ratio,  $e$  and the void ratio at critical state  $e_{cs}$ , at the same mean effective stress for granular soils.

The problem of evaluating the state parameter from CPTU response is complex and depends on several soil parameters, including shear stiffness, shear strength, compressibility and plastic hardening. (*Jefferis and Been, 2006*)

In this report, the state parameter is calculated based on five methods as follows:

- 1) Been et al. (1987)

$$\psi = -\frac{\ln\left(\frac{Q_p}{k}\right)}{m}$$

and

$$Q_p = \left(\frac{3Q_t}{1 + 2K_0}\right)$$

where

$Q_t$  is the normalized cone resistance

$K_0$  is the coefficient of lateral earth pressure

- 2) Shuttle and Jefferies (1998)

$$\psi = -\frac{\ln\left(\frac{Q_p}{k}\right)}{m}$$

where

$$k = \left( (3.79 + 1.12 \ln(I_r)) (1 + 1.06(M - 1.25)) (1 - 0.30(N - 0.2)) (H/1000)^{0.326} (-1.55(\lambda - 0.01)) \right)^{1.45}$$

$$m = 1.45 (1.04 + 0.46 \ln(I_r)) (1 - 0.4(M - 1.25)) (1 - 0.30(N - 0.2)) (H/100)^{0.15} (1 - 2.21(\lambda - 0.01))$$

where

$Q_t$  is the normalised cone resistance

$I_r$  is rigidity index

$K_0$	is the coefficient of lateral earth pressure
$M$	is critical state ratio
$N$	is dilation parameter
$H$	is plastic hardening modulus;
$\lambda$	is slope CSL line

### 3) Shuttle and Jefferies (1998)

The state parameter calculated according this third method is similar to state parameter calculated as presented in the second method, except for the rigidity index that is calculated as follows:

$$I_r = I_{r100} \left( \frac{P_a}{\sigma'_{v0}} \right)^{0.5}$$

where

$I_{r100}$	is rigidity index in reference pressure
$P_a$	is the reference pressure equal to 100 kPa
$\sigma'_{v0}$	is effective vertical overburden stress

### 4) Plewes (1992)

$$\psi = - \frac{\ln \left( \frac{Q_p / (1 - B_q)}{k'} \right)}{m'}$$

where

$$k' = M \left( 3 + \frac{0.85}{\lambda} \right)$$

$$m' = 11.9 - 13.3\lambda$$

$$\lambda = \frac{F_r}{10}$$

where

$Q_t$	is the normalized cone resistance
$B_q$	is pore pressure ratio
$K_0$	is the coefficient of lateral earth pressure
$F_R$	is normalized friction ratio
$M$	is critical state ration

### 5) Been and Jefferies (1992)

$$\psi = - \frac{\ln \left( \frac{Q_p / (1 - B_q)}{k'} \right)}{m'}$$

where

$$k' = M \left( 3 + \frac{0.85}{\lambda} \right)$$

$$m' = 11.9 - 13.3\lambda$$

$$\lambda = \frac{1}{34 - 10I_c}$$

For high-risk projects a detailed interpretation of CPTU results using laboratory results and numerical modelling can be appropriate (e.g. *Shuttle and Cunning, 2007*), although soil variability can complicate the interpretation procedure. For low risk projects and in the initial screening for high-risk projects there is a need for a simple estimate of soil state.

*Plewes et al (1991)* provided a means to estimate soil state using the normalized soil behaviour type, *SBT<sub>n</sub>* chart suggested by *Jefferies and Davies (1991)*. *Jefferies and Been (2006)* suggested that soils with a state parameters less than -0.05 are dilative at large strains.

#### 4.10 IN SITU STRESS RATIO ( $K_0$ )

There are various estimations to determine in situ stress ratio,  $K_0$ , from CPTU in fine grained soils. In this report the methods suggested by *Mayne (2007)* and *Kulhawy and Mayne (1990)* are used, as given below:

- 1) Mayne (2007)

$$K_0 = (1 - \sin\phi')OCR^{\sin\phi'}$$

$$\text{Max } K_0 = K_p = \frac{(1 + \sin\phi')}{(1 - \sin\phi')}$$

$$K_0 = 0.192\left(\frac{q_t}{\sigma_{atm}}\right)^{0.22}\left(\frac{\sigma_{atm}}{\sigma_{v0}}\right)^{0.22}OCR^{0.27}$$

where

OCR is the overconsolidation ration, calculated as presented in session 4.12

- 2) Kulhawy and Mayne (1990)

$$K_0 = 0.1\left(\frac{q_t - \sigma_{v0}}{\sigma_{v0}'}\right)$$

These approaches are generally limited to mechanically overconsolidated, fine grained soils. As considerable scatter exists in the database used for these correlations, in moderate to high risk projects further tests should be performed and these correlations must be considered only as a guide.

#### 4.11 OVERCONSOLIDATION RATIO (OCR)

Overconsolidation ratio, *OCR* is defined as the ratio of the maximum past effective consolidation stress and the present effective overburden stress:

$$OCR = \frac{\sigma'_p}{\sigma'_{v0}}$$

This definition is appropriate for mechanically overconsolidated soils, where the only change has been the removal of overburden stress. For cemented and aged soils the *OCR* may represent the ratio of the yield stress and the present effective overburden stress.

In this report  $\sigma'_p$  is calculated based on six methods as presented below:

- 1) Mayne (1995)

$$\sigma'_p = 0.33(q_t - \sigma_{v0})$$

- 2) Chen & Mayne (1996)

$$\sigma'_p = 0.53\Delta u$$

- 3) Mayne (2005)

$$\sigma'_p = 0.6(q_t - u_2)$$

- 4) Robertson (2009)

$$\sigma'_p = 0.25(Q_t^{1.25} - \sigma'_{v0})$$

- 5) Mayne (2005)

$$\sigma'_p = \left[ \frac{0.192 \left( \frac{q_t}{\sigma_{atm}} \right)^{0.125}}{(1 - \sin\phi') \left( \frac{\sigma'_{v0}}{\sigma_{atm}} \right)^{0.31}} \right]^{\left( \frac{1}{\sin\phi' - 0.27} \right)} \sigma'_{v0}$$

- 6) Mayne (2007)

$$\sigma'_p = 0.101 \sigma_{atm}^{0.102} (G_0)^{0.478} \sigma'_{v0}{}^{0.420}$$

For larger, moderate to high risk projects, where additional high quality field and laboratory data may be available, site specific correlations should be developed based in consistent and relevant values of *OCR*.

#### 4.12 SMALL STRAIN YOUNG MODULUS ( $E_0$ )

Deriving small strain undrained Young's modulus,  $E_0$ , from CPTU is difficult. There is insufficient data available to make a direct correlation, and it is recommended that  $c_u$  should be derived, then  $E_U$  estimated, as a rough order of value from one of the available correlations between  $E_U$  and  $c_u$  (*Meigh, 1987*).

In this report the small strain Young's modulus is derived as follows:

- 1) Defined from elastic theory:

$$E_0 = 2(1 + \nu)G_0$$

where

$\nu$  is the Poisson ratio, equal to 0.2

$G_0$  is the small strain shear modulus calculated by the formula given below:

$$G_0 = 1634 \left( \frac{q_c}{\sqrt{\sigma'_{v0}}} \right)^{-0.75} q_c$$

2) Calculated based on the degree of loading,  $q_c$ , effective stress and reduction factor

$$E_0 = \alpha q_c$$

where

$\alpha$  is calculated from degree of loading,  $q_c$ , effective stress and reduction factor, given in *Figure 4.2*

**Figure 4.2:** Estimation of equivalent Young's modulus for sand based on degree of loading (Robertson, 1990)

### 4.13 CONSTRAINED MODULUS (M)

Constrained Modulus,  $M$ , can be estimated by CPTU using the following empirical relationship:

$$M = \alpha_M (q_t - \sigma_{v0})$$

where

$\alpha_M$  varies with soil plasticity and natural water content for a wide range of fine grained soils and organic soils. *Meigh (1987)* suggested that  $\alpha_M$  lies in the range of 2 to 8, whereas *Mayne (2001)* suggested the value of 5.

*Robertson (2001)* suggested that  $\alpha_M$  varies with  $Q_t$ , such that:

When  $I_c > 2.2$  (fine grained soils) use:  $\alpha_M = Q_t$  when  $Q_t < 14$   
 $\alpha_M = 14$  when  $Q_t > 14$

When  $I_c < 2.2$  (coarse grained soils) use:  $\alpha_M = 0.0188[10^{(0.55I_c+1.68)}]$

In this report the Constrained Modulus,  $M$ , is calculated after *Kulhawy and Mayne (1990)* using the equation below:

$$M = 8.25(q_t - \sigma_{v0})$$

Also an alternative method is included in the results, developed by *Burns and Mayne (2002)* using the following relationship:

$$M = 0.02G_0$$

#### 4.13.1 Equivalent Oedometer Coefficient of Compressibility ( $m_v$ )

Equivalent oedometer coefficient of compressibility,  $m_v$  can be calculated directly by the Constrained Modulus,  $M$ , as follows:

$$m_v = \frac{1}{M}$$

## 4.14 SMALL STRAIN SHEAR MODULUS ( $G_0$ )

Elastic theory states that the small strain shear modulus,  $G_0$ , can be determined from the following equation:

$$G_0 = \rho v_s^2$$

where

$\rho$  is the mass density of the soil  
 $v_s$  is the shear wave velocity

In this report the small strain shear modulus,  $G_0$ , will be presented calculated by the three methods shown below, developed by *Rix & Stoke (1992)*, *BE* and *UB Rix & Stoke (1992)*, respectively.

$$G_0 = 1634 \left( \frac{q_c}{\sqrt{\sigma'_{v0}}} \right)^{-0.75} q_c$$

$$G_0 = \frac{\gamma_{bulk}}{g} v_s^2$$

where

- $q_c$  is the net cone tip resistance in kPa
- $\sigma'_{v0}$  is the effective initial vertical stress in kPa
- $\gamma_{bulk}$  is the bulk density of the soil
- $v_s$  is the shear wave velocity

This correlation of  $G_0$  is applicable to all soil types.

#### 4.14.1 Mass Density of Soil ( $\rho$ )

Mass density of soil,  $\rho$ , is defined as:

$$\rho = \frac{\gamma}{g}$$

where

- $\gamma$  is the elastic stiffness of the soils at shear strain less than  $10^{-4}\%$ ,  $\gamma < 10^{-4}\%$ .

#### 4.15 HIDRAULIC CONDUCTIVITY (k)

An approximate estimate of soil hydraulic conductivity of coefficient of permeability,  $k$ , can be made from an estimate of soil behaviour type using the CPTU *SBT chart*, and presented in the table below:

SBT Zone	SBT	Range of k (m/s)	SBT <sub>n</sub> I <sub>c</sub>
1	Sensitive fine grained	$3 \times 10^{-10}$ to $3 \times 10^{-8}$	NA
2	Organic soils-clay	$1 \times 10^{-10}$ to $1 \times 10^{-8}$	$I_c > 3.60$
3	Clay	$1 \times 10^{-10}$ to $1 \times 10^{-9}$	$2.95 < I_c < 3.60$
4	Silt Mixture	$3 \times 10^{-9}$ to $1 \times 10^{-7}$	$2.60 < I_c < 2.95$
5	Sand Mixture	$1 \times 10^{-7}$ to $1 \times 10^{-5}$	$2.05 < I_c < 2.60$
6	Sand	$1 \times 10^{-5}$ to $1 \times 10^{-3}$	$1.31 < I_c < 2.05$
7	Dense sand to gravelly sand	$1 \times 10^{-3}$ to 1	$I_c < 1.31$
8	*Very dense/ stiff soil	$1 \times 10^{-8}$ to $1 \times 10^{-3}$	NA
9	*Very stiff fine grained soil	$1 \times 10^{-9}$ to $1 \times 10^{-7}$	NA

\*Overconsolidated and/ or cemented

**Table 4.2:** Estimated soil permeability (k) based on the CPTU SBT chart by Roberston (2009)

The average relationship between soil permeability,  $k$  and  $SBT_n I_c$ , shown in *Table 4.1*, can be represented by the following relationships:

$$\begin{aligned} \text{When } 1.0 < I_c \leq 3.27 & \quad k = 10^{(0.952-3.04I_c)} \\ \text{When } 3.27 < I_c \leq 4.0 & \quad k = 10^{(-4.52-1.37I_c)} \end{aligned}$$

In this report, the hydraulic conductivity is given using 2 methods, *Robertson et al. (1986)* and *Robertson et al. (1990)*, considering both minimum and maximum values for each method.

The hydraulic conductivity (permeability),  $k$ , values, minimum and maximum, defined after soil behaviour type *Robertson et al. (1986)* are presented in *Table 4.3*, below:

SBT Zone	Soil Behaviour Type (SBT)	Range of hydraulic conductivity, $k$ (m/s)
1	Sensitive fine grained	$3 \times 10^{-9}$ to $3 \times 10^{-8}$
2	Organic soils	$1 \times 10^{-8}$ to $1 \times 10^{-6}$
3	Clay	$1 \times 10^{-10}$ to $1 \times 10^{-9}$
4	Silty CLAY to CLAY	$3 \times 10^{-9}$ to $1 \times 10^{-8}$
5	Clayey SILT to silty CLAY	$1 \times 10^{-8}$ to $1 \times 10^{-7}$
6	Sandy SILT to clayey SILT	$1 \times 10^{-7}$ to $1 \times 10^{-6}$
7	Silty SAND to sandy SILT	$1 \times 10^{-5}$ to $1 \times 10^{-6}$
8	SAND to silty SAND	$1 \times 10^{-5}$ to $1 \times 10^{-4}$
9	SAND	$1 \times 10^{-4}$ to $1 \times 10^{-3}$
10	Gravelly SAND to SAND	$1 \times 10^{-3}$ to 1
11	Very stiff fine grained	$1 \times 10^{-8}$ to $1 \times 10^{-6}$
12	SAND to clayey SAND	$3 \times 10^{-7}$ to $3 \times 10^{-4}$

**Table 4.3:** Estimated soil permeability ( $k$ ) based on SBT chart by *Robertson et al. (1986)*

The hydraulic conductivity (permeability),  $k$ , minimum and maximum values, defined after soil behaviour type by *Robertson et al. (1990)* are presented in *Table 4.4*, here below:

SBT Zone	Soil Behaviour Type (SBT)	Range of hydraulic conductivity, $k$ (m/s)
1	Sensitive fine grained	$3 \times 10^{-9}$ to $3 \times 10^{-8}$
2	Organic soils	$1 \times 10^{-8}$ to $1 \times 10^{-6}$
3	Clay	$1 \times 10^{-10}$ to $1 \times 10^{-9}$
4	Silt Mixture	$3 \times 10^{-9}$ to $1 \times 10^{-7}$
5	Sand Mixture	$1 \times 10^{-7}$ to $1 \times 10^{-5}$
6	Sand	$1 \times 10^{-5}$ to $1 \times 10^{-3}$
7	Gravelly sands to dense sands	$1 \times 10^{-3}$ to 1

8	Very stiff sand to clayey sand	$1 \times 10^{-8}$ to $1 \times 10^{-6}$
9	Very stiff fine grained	$1 \times 10^{-8}$ to $1 \times 10^{-6}$

**Table 4.4:** Estimated soil permeability ( $k$ ) based on SBT chart by Robertson et al. (1990).

#### 4.16 CONSOLIDATION CHARACTERISTICS

All the results of consolidation characteristics calculated using the formulas below are presented in *Appendix D*.

##### 4.16.1 Rigidity Index ( $I_R$ )

The rigidity index,  $I_R$ , for fine materials is defined using the following formula, developed by *Mayne (2001)*:

$$I_R = \exp \left[ \left( \frac{1.5}{M} + 2.925 \right) \left( \frac{q_t - \sigma_{v0}}{q_t - u_2} \right) \right] - 2.925$$

where

$M$  is the Cam Clay constant, slope of the critical state line defined as:

$$M = \frac{6 \sin \phi'}{3 - \sin \phi'}$$

where

$\phi'$  is the internal friction angle.

The second method used to define the rigidity index,  $I_R$ , for fine material is based on plasticity index and overconsolidation ratio,  $OCR$ , and calculated after the relationship developed by *Keaveny and Mitchel (1986)* as follows:

$$I_R = \frac{\exp(0.0435(137 - PI))}{[1 + \ln\{1 + 0.385(OCR - 1)^{3.2}\}]^{0.8}}$$

where

$PI$  is the plasticity index of the soil, equal to 20.

$OCR$  is the overconsolidation ratio of the soil

##### 4.16.2 Coefficients of consolidation ( $c_h, c_v$ )

The coefficient of consolidation is interlinked with the hydraulic conductivity through the formula below:

$$c = \frac{kM}{\gamma_w}$$

where

$M$  is the 1-D constrained modulus relevant to the problem (i.e. unloading, reloading, virgin loading, etc)

$\gamma_w$  is the unit weight of water  
 $k$  is the hydraulic conductivity

In geotechnical practice it is very difficult to measure  $c$  and  $k$ , because due to soil anisotropy  $c$  and  $k$  have different values in the horizontal,  $c_h$  and  $k_h$  and vertical  $c_v$  and  $k_v$  direction. The relevant design values depend on drainage and loading direction.

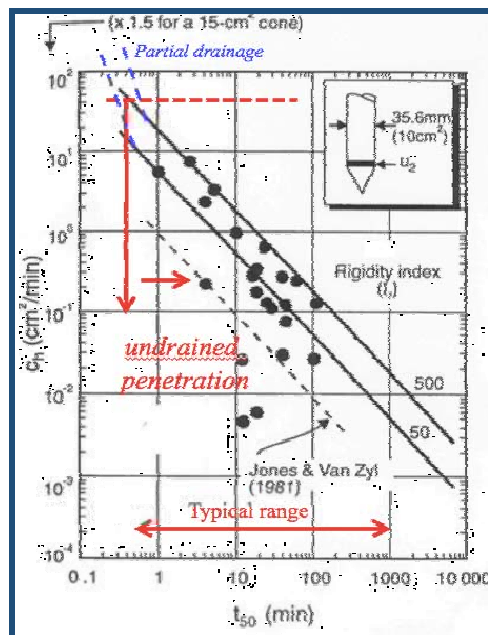

The coefficient of consolidation can be estimated by measuring the dissipation or rate of decay of pore pressure with time after a stop in CPTU penetration. The coefficient of consolidation should be interpreted at 50% dissipation, using the following formula:

$$c = \left(\frac{T_{50}}{t_{50}}\right)r_0^2$$

where

$T_{50}$  is theoretical time factor  
 $t_{50}$  is measured time for 50% dissipation  
 $r_0$  is penetrometer radius

In soils of very low permeability the time for dissipation can be decreased by using smaller diameter probes. A theoretical solution for this cases is given by *Teh and Houlsby (1991)* and it is compared with data from around the world by *Robertson et al. (1992)*, as shown in *Figure 4.3*.

**Figure 4.3:** Average laboratory  $c_h$  values and CPTU results

(after *Robertson et al. 1992*, *Teh and Houlsby theory* shown as solid lines for  $I_R = 50$  and  $I_R = 500$ ).

$c_h$  estimation is controlled by soil stress history, sensitivity, anisotropy, rigidity index (relative stiffness), fabric and history. In overconsolidated soils, the pore pressure behind the cone

tip can be low or negative, results in dissipation data that can initially rise before decreasing to the equilibrium values. Care is required to ensure the dissipation test to end at the right moment of time, not stopped prematurely after the initial rise.

An approximate estimate of the coefficient of consolidation in the vertical direction can be obtained using the ratios of permeability in the horizontal and vertical direction given in the section on hydraulic conductivity, since:

$$c_v = c_h \left( \frac{k_v}{k_h} \right)$$

For relative short dissipations, the dissipation results can be plotted on a square-root time scale. The gradient of the initial straight line in m, where:

$$c_h = \left( \frac{m}{M_T} \right)^2 r^2 I_r^{0.5}$$

where

$M_T$  is 1.15 for  $u_2$  position and 10 cm<sup>2</sup> cone ( $r=1.78$  cm).

#### 4.17.3 Coefficients of permeability (hydraulic conductivity, $k_h$ , $k_v$ )

The horizontal coefficient of permeability can be estimated from the following expression:

$$k_h = \frac{\gamma_w}{2.3\sigma'_{v0}} RR c_h$$

where

RR is the compression ratio in the overconsolidated range. It represents the strain per log cycle of effective stress during recompression and can be determined from laboratory consolidation tests ( $0.5 \times 10^{-2} < RR < 2 \times 10^{-2}$  was recommended by Baligh and Levadoux).

Robertson et al. (1992a) presented a summary of available data from dissipation tests and laboratory determined  $k_h$  values.

Nature of clay	$k_h/k_v$
No macrofabric, or only slightly developed macrofabric, essentially homogeneous deposits	1 to 1.5
From fairly well to well developed macrofabric, e.g. sedimentary clays with discontinuous lenses and layers of more permeable material	2 to 4
Varved clays and other deposits containing embedded and more or less continuous permeable layers	3 to 15

**Table 4.4:** Range of field values of  $k_h/k_v$  for soft clays (from Jamiolkowski et al., 1985).

Estimation of soil permeability from CPTU and dissipation data is subject to much uncertainty and should be used as a guide only.

## 5.0 CPTU RESULTS APPLICATIONS

### 5.1 SOIL PROFILING AND APPLICATIONS IN GEOTECHNICAL DESIGN

#### 5.1.1 Soil Behaviour Type

The major applications of CPTU are on *soil behaviour type and soil profiling*. Typically, the cone resistance,  $q_c$  is high in sands and low in clays, and the friction ratio,  $R_f = f_s/q_t$  is low in sands and high in clays. The CPTU cannot be expected to provide accurate predictions of soil type based on *physical characteristics*, e.g. *grain size distribution*, but provides a guide to the *mechanical characteristics*, including: *strength, stiffness, and compressibility* of the soils, or the *soil behaviour type, SBT*.

The most commonly used CPTU soil behaviour type chart, suggested by *Robertson et al. (1986)* uses the basic CPTU measured parameters of cone resistance,  $q_c$  and friction ratio,  $R_f$ . The chart is global in nature and can provide reasonable predictions of soil behaviour type for CPTU testing. The expected overlap in some zones is modified in the interpretations of this report somewhat based on previous experience or local knowledge of the site.

Since both the penetration resistance and sleeve resistance increase with depth due to the increase in effective overburden stress, the CPTU data requires normalization for overburden stress for very shallow and/or very deep tests. A popular CPTU soil behaviour chart based on normalized CPTU data is firstly proposed by *Robertson (1990)*. The chart identifies general trends in ground response, such as: *increasing soil density, OCR, age and cementation* for granular soils, and *increasing stress history, OCR and soil sensitivity* for cohesive soils.

A more general normalized CPTU *SBT* chart, using large strain *soil behaviour* descriptions, proposed by *Robertson (2012)* is shown in *Figure 5.1*.

**Figure 5.1:** Normalized CPTU Soil Behaviour Type ( $SBT_n$ ) chart,  $Q_{tn}-F_R$  using general large strain soil behaviour description (Robertson, 2012).

\*

- CD is coarse grained dilative soil-predominately drained CPTU
- CC is coarse grained contractive soil-predominately drained CPTU
- FD is fine grained dilative soil-predominately undrained CPTU
- FC is fine grained contractive soil-predominately undrained CPTU

### 5.1.2 Soil Profiling

CPTU is an excellent test for soil profiling. The continuous monitoring of pore pressure during the cone penetration improves the soil stratigraphy descriptions. The pore pressure develops in response to the soil type being penetrated in the area where the pore pressure element is located. Soft, firm or stiff clays and contractive silts can show very high pore pressure. Very stiff overconsolidated clays and dilative silts can give very low or negative pore pressures same as very dense silty sands.

The thin layers of sand, or silt in a thick layer of clay, or thin layers of clay or silt in a thick layer of sand are easily distinguished during a CPTU test, which will give a response time sufficiently fast to observe pore pressure changes even in the very thin layers of soils (< 5mm), depending on the response of soil to the advancing of cone.

The sandy soils tend to produce high cone resistance and low friction ratio, whereas soft clayey soils tend to produce low cone resistance and high friction ratio. Organic soils such as peat tend to have very low cone resistance and very high friction ratio. Soils with high horizontal stresses (*high OCR*) tend to have higher cone resistance and friction ratio.

CPTU is an excellent tool to classify the soils based on their behaviour type, and not based on grain size distribution. (Douglas and Olser, 1981)

The measurements of sleeve friction,  $f_s$  are often less reliable than the measurements of cone resistance,  $q_c$  (Lunne *et al.*, 1986), but to overpass these problems pore pressure parameter ratio,  $B_q$ , and the classification charts based on it, which are also presented in *Appendix A.9*, are used when necessary.

For more reliability in soil profiling, the soil interpretations in this report are carried out based on three parameters measured on site, cone resistance, sleeve friction and pore pressure and three derived geotechnical parameters soil behaviour type index for all soils, undrained shear strength for cohesive soils and relative density for granular soils.

Generally, soils that fall in zones 8, 9 and 10 of *Robertson et al (1986)* chart (6 and 7 of *Robertson (1990)* chart) represent approximately drained penetration, whereas, soils in zones 1, 2, 3, 4, 5 and 6 of *Robertson et al (1986)* chart (1, 2, 3 and 4 of *Robertson (1990)* chart) represent approximately undrained penetration. Soils in zones 7, 11 and 12 of *Robertson et al (1986)* (5, 8 and 9 of *Robertson (1990)* chart) may represent partially drained penetration. The classification is often influenced by changes in *stress history, in situ stresses, sensitivity, stiffness, mineralogy*, etc. An advantage of pore pressure measurements during cone penetration is the ability to evaluate drainage conditions more directly. (Lunne *et al.*, 1997)

The information about the rate and manner of excess pore pressures during the dissipations significantly helps the accurate classification in the corresponding depths of dissipation tests. In very stiff, overconsolidated clayey soils, the pore pressure behind the cone is very low and sometimes negative of the equilibrium pore pressure,  $u_0$ , whereas the pore pressure on the face of the cone is very large due to the large increase in normal stresses created by the cone penetration. When penetration is stopped in overconsolidated clays, pore pressure recorded behind the cone may initially increase before decreasing to the equilibrium pore pressure. The rise is caused by local equalization of the high pore pressure gradient around the cone.

Cone penetration in fine grained soils, such as clays and silts, is generally undrained. Cone penetration tests under undrained conditions generate high pore pressure and this reading is extremely useful, because it affects both cone resistance and sleeve friction measurements. These parameters should be corrected using the measured pore pressure.

CPTU in coarse grained soils, such as sandy or gravelly soils is generally drained. In these conditions there is no excess pore pressure generated as a result of cone penetration. Relative density has been used as the main parameter for description of sandy deposits.

### 5.1.3 Applications in geotechnical design

CPTU measured parameters are used to derive geotechnical parameters, which are the input in several geotechnical analyses. An alternate approach is to directly apply CPTU results to the geotechnical calculations.

As a guide, *Table 5.1* shows a summary of the applicability of CPTU results for direct design applications. The ratings shown in the table have been assigned based on current experience and represent a qualitative evaluation of the confidence level assessed to each design problem and general soil type. Details of ground conditions and project requirements can influence these ratings.

Type of soil	Pile Design	Bearing Capacity	Settlement	Compaction Control	Liquefaction
Sand	A-B	A-B	B-C	A-B	A-B
Clay	A-B	A-B	B-C	C-D	A-B
Intermediate Soils	A-B	B-C	B-C	B-C	A-B

**Table 5.1:** Perceived applicability of CPTU for various direct design problems.

- A is high
- B is high to moderate
- C is moderate
- D is moderate to low

<b>Remarks</b>	
Data "As Received" = "As Left" unless otherwise noted. Calibration data for this item was derived from one or more of the following sources: the Nederlands Meetinstituut (NMI) or other national laboratory, a natural physical constant, or a ratio technique. The data is on file at the NMI. This calibration is compliant with Gouda Geo-Equipment's internal quality system, internal calibration procedure and meets the requirements of standard ISO22476. The Calibration Interval will vary from customer use and different conditions. All calibrations are verified at a moment in time; and confirmed within controlled temperature and humidity specified standards. Gouda Geo-Equipment is not responsible for future calibrations. Improper use of the apparatus (e.g. dropping) may cause loss of calibration.

## APPENDIX A3 – Project Summary Sheet

### *CPT Tests Summary Sheet*

<b>HOLE ID</b>	<b>Final Depth (m)</b>	<b>Date of Test</b>	<b>Cone Used</b>	<b>Test Remarks</b>
CPT 01	30.00	20/03/2018	P15-CFPT <sub>xy</sub> 70080	Test completed at target depth.
CPT 02	30.00	19/03/2018	P15-CFPT <sub>xy</sub> 70080	Test completed at target depth.
CPT 03	32.44	19/03/2018	P15-CFPT <sub>xy</sub> 70080	Test refused on total pressure.
CPT 04	36.00	19/03/2018	P15-CFPT <sub>xy</sub> 70080	Test stopped due to buckling rods.
CPT 05	30.01	20/03/2018	P15-CFPT <sub>xy</sub> 70080	Test completed at target depth.

*Dissipation Tests Summary Sheet*

<b>HOLE ID</b>	<b>Dissipation No.</b>	<b>Depth of Dissipation (m)</b>	<b>Cone Used</b>	<b>Filter Position</b>	<b>Remarks</b>
CPT 01	1	3.46	P15-CFPT <sub>xy</sub> 70080	U2	Test OK
CPT 01	2	4.00	P15-CFPT <sub>xy</sub> 70080	U2	Test OK
CPT 02	1	2.40	P15-CFPT <sub>xy</sub> 70080	U2	Test OK
CPT 03	1	4.60	P15-CFPT <sub>xy</sub> 70080	U2	Test OK
CPT 04	1	30.99	P15-CFPT <sub>xy</sub> 70080	U2	Test OK

## APPENDIX A4 – CPT Rig Datasheet

### RIGS

#### 21 TONNE WHEELED RIG (CPT010)

This rig is ideal for geotechnical testing on hardstanding sites such as car parks, motorways and docks. Fitted with reflective yellow and red chevrons, these high visibility rear markings meet the 'Chapter 8' requirements for vehicles working on highways. In addition, there are beacons fitted to the front and strobes to the back corners to ensure further safety and visibility for night work on the motorways. This efficient truck is capable of pushing to a depth of 30 to 40 metres depending on the ground conditions of the site. Furthermore, the interior is large enough to house our MiHpt equipment for environmental testing.

#### CPT RIG DETAILS

<b>DRIVE SYSTEM</b>	6 X 2 WHEELED DRIVE
<b>TOTAL WEIGHT</b>	21 TONNES
<b>GROUND BEARING PRESSURE</b>	75KPA
<b>CPT RAM THRUST CAPACITY</b>	20 TONNES
<b>MAXIMUM PENETRATION</b>	30-40M DEPENDING ON THE GROUND CONDITIONS.
<b>PERFORMANCE RATES</b>	100-150M CF TESTING A DAY, DEPENDING ON ACCESS TO POSITIONS.
<b>TYPICAL SITES FOR THIS RIG</b>	HARDSTANDING SITES E.G. ROADS INCLUDING MOTORWAYS, CAR PARKS, DOCKS. DRY NON HARDSTANDING SITES.

#### CPT RIG DIMENSIONS

## APPENDIX A5 – Symbol List

### English

a	is area ratio of the cone ( $= A_n/A_c$ )
A	is area
$A_c$	is projected area of the cone
$A_n$	is cross sectional area of load cell or shaft
$A_s$	is area of friction sleeve
$A_{sb}$	is bottom end area of friction sleeve
$A_{st}$	is top end area of friction sleeve
$B_q$	is pore pressure parameter ( $= (u_2 - u_0)/(q_t - \sigma_{v0})$ )
$c_h$	is horizontal coefficient of consolidation
$c_v$	is vertical coefficient of consolidation
D	is diameter
$D_r$	is relative density ( $= \frac{e_{max}-e}{e_{max}-e_{min}} \times 100\%$ )
e	is void ratio
$e_{max}$	is maximum void ratio
$e_{min}$	is minimum void ratio
E	is Young's modulus
$f_s$	is unit sleeve friction resistance
$f_t$	is sleeve friction corrected for pore pressure effects
$F_s$	is total force acting on friction sleeve
$F_R$	is normalized friction ratio ( $= f_s/(q_t - \sigma_{v0})$ )
FoS	is factor of safety
FC	is fines content
g	is acceleration due to gravity
$G_0$	is initial or maximum shear modulus, shear stiffness
$I_c$	is soil behavior type index
$I_r$	is rigidity index ( $= G/s_u$ )
$I_p$	is plasticity index
k	is coefficient of permeability
$k_h$	is coefficient of permeability in horizontal direction
$k_v$	is coefficient of permeability in vertical direction
$K_0$	is coefficient of earth pressure at rest ( $= \sigma'_{h0}/\sigma'_{v0}$ )
L	is length
$m_v$	is coefficient of volume change
M	is constrained deformation modulus
M7.5	is earthquake magnitude of 7.5 Richter scale
N	is number of blows of SPT
$N_{60}$	is SPT energy ratio
$N_k$	is cone factor
$N_{ke}$	is cone factor
$N_{kt}$	is cone factor
$N_{\Delta u}$	is cone factor
$p_a$	is reference stress ( $= 100 \text{ kPa}$ )
$q_c$	measured cone resistance
$q_e$	effective cone resistance ( $= q_t - u_2$ )
$q_n$	is net cone resistance ( $= q_t - \sigma_{v0}$ )

$q_t$	is corrected cone resistance ( $= q_c - (1 - a)u_2$ )
$Q_c$	is total force acting on the cone
$Q_t$	is normalized cone resistance ( $= q_t - \sigma_{v0} / \sigma'_{v0}$ )
$R_f$	is friction ratio ( $= (f_t / q_t) \times 100\%$ or alternatively $= (f_t / q_t) \times 100\%$ )
$s_u$	is undrained shear strength
$s_{ur}$	is remoulded undrained shear strength
$S_t$	is sensitivity
$t$	is time
$t_{50}$	is time for 50% dissipation of excess pore water pressure
$T_{50}$	is time factor at $U = 50\%$
$u$	is pore water pressure
$u_0$	is in situ pore pressure
$u_1$	is pore pressure measured on the cone
$u_2$	is pore pressure measured behind the cone
$u_3$	is pore pressure measured behind sleeve friction
$\Delta u$	is excess pore water pressure
$U$	is normalized excess pore pressure
$V_s$	is shear wave velocity
$z$	is depth

### Greek

$\alpha$	is constant
$\alpha$	is cone roughness
$\beta$	is constant
$\beta_1$	is the angle between the vertical axis and the projection of the axis of the CPTU on a vertical plane, in degrees
$\beta_2$	is the angle between the vertical axis and the projection of the axis of the CPTU on a vertical plane that is perpendicular to the plane of angle $\beta_1$ , in degrees
$\gamma$	is unit weight of soil
$\gamma_w$	unit weight of water
$\Delta$	is change
$\Delta u$	is excess pore pressure ( $= u - u_0$ )
$\mu$	is Poisson's ratio
$\rho$	is density
$\psi$	is state parameter
$\sigma, \sigma'$	is normal stress (total, effective)
$\sigma_h, \sigma'_h$	is horizontal stress (total, effective)
$\sigma_v, \sigma'_v$	is horizontal stress (total, effective)
$\sigma_{v0}, \sigma'_{v0}$	is overburden stress (total, effective)
$T_{av}$	average cyclic shear stress
$T_{cy}$	cyclic shear stress
$\varphi'$	effective friction angle

## APPENDIX A6 – Abbreviations

ASTM	is American Society for Testing and Materials
CPTU	Cone Penetration Test with Pore Pressure Measurement (Piezocone Test)
CRR	Cyclic Resistance Ratio
CSR	Cyclic Stress Ratio
GWT	Ground Water Table
NC	Normally Consolidated
OC	Overconsolidated
OCR	Overconsolidation Ratio
PL	Limit Pressure
SDMT	Seismic Dilatometer Marchetti
SPT	Standard Penetration Test
TC	Technical Committee

## APPENDIX A7 – Glossary

### CPT

Cone Penetration Test.

### Cone

The part of the cone penetrometer on which the end bearing is developed.

### Cone Penetrometer

The assembly containing the *cone*, *friction sleeve*, any other sensors and measuring systems, as well as the connections to the *push-rods*.

### Cone resistance, $q_c$

The total force acting on the cone,  $Q_c$ , divided by the projected area of the cone,  $A_c$ .  
 $q_c = Q_c / A_c$

### Corrected cone resistance, $q_t$

The *cone resistance*,  $q_c$  corrected for pore water pressure effects.

### Corrected sleeve friction, $f_t$

The *sleeve friction* corrected for pore water pressure effects on the ends of the *friction sleeve*.

### Data acquisition system

The system used to measure and record the measurements made by the *cone penetrometer*.

### Dissipation Test

A test when the decay of the pore water pressure is monitored during a pause in penetration.

### Filter element

The porous element inserted into the cone penetrometer to allow transmission of the pore water pressure to the pore pressure sensor, while maintaining the correct profile of the *cone penetrometer*.

### Friction ratio, $R_f$

The ratio, expressed as a percentage of the *sleeve friction*,  $f_s$ , to the *cone resistance*,  $q_c$ , both measured at the same depth.

### Friction reducer

A local enlargement on the push-rod surface, placed at a distance above the cone penetrometer, and provided to reduce the friction on the *push-rods*.

### Friction sleeve

The section of the *cone penetrometer* upon which the *sleeve friction* is measured.

### Normalized cone resistance, $Q_c$ or $Q_t$

The *cone resistance* expressed in a non dimensional form and taking account of stress changes *in situ*,  $Q_c = (q_c - \sigma_{v0}) / \sigma'_{v0}$ , or when the *corrected cone resistance* is used  $Q_t =$

$(q_t - \sigma_{v0}) / \sigma'_{v0}$ . Where  $\sigma_{v0}$  and  $\sigma'_{v0}$  are the total and effective vertical stress respectively.

### Net cone resistance, $q_n$

The *corrected cone resistance* minus the vertical total stress.  $q_n = q_t - \sigma_{v0}$

**Normalized friction ratio,  $F_r$** 

The *sleeve friction* normalized by the *net cone resistance*.

**Piezocone**

A *cone penetrometer* containing a pore pressure sensor.

**Pore pressure,  $u$** 

The pore pressure generated during penetration and measured by a pore pressure sensor,  $u_1$  when measured on the cone,  $u_2$  when measured just behind the cone and  $u_3$  when measured just behind the friction sleeve.

**Pore pressure ratio,  $B_q$** 

The *net pore pressure* normalized with respect to the *net cone resistance*.

**Push-rods**

The thick-walled tubes or rods used for advancing the cone penetrometer.

**Rig machine**

The equipment which pushes the cone penetrometer and rods into the ground.

**Sleeve friction,  $f_s$** 

The total frictional force acting on the *friction sleeve*,  $F_s$ , divided by its *surface area*,  $A_s$ .

$$f_s = F_s / A_s$$

## APPENDIX A8 – Soils Description Tables

### GRANULAR SOILS (Sands and Gravels)

Description	Relative Density $D_r$ (%)	SPT N value, $N_{SPT}$
Very Loose	0 – 15	0 - 4
Loose	15 – 35	4 - 10
Medium Dense	35 – 65	10 - 30
Dense	65 – 85	30 - 50
Very Dense	>85	>50

### COHESIVE SOILS (Clays and Silts)

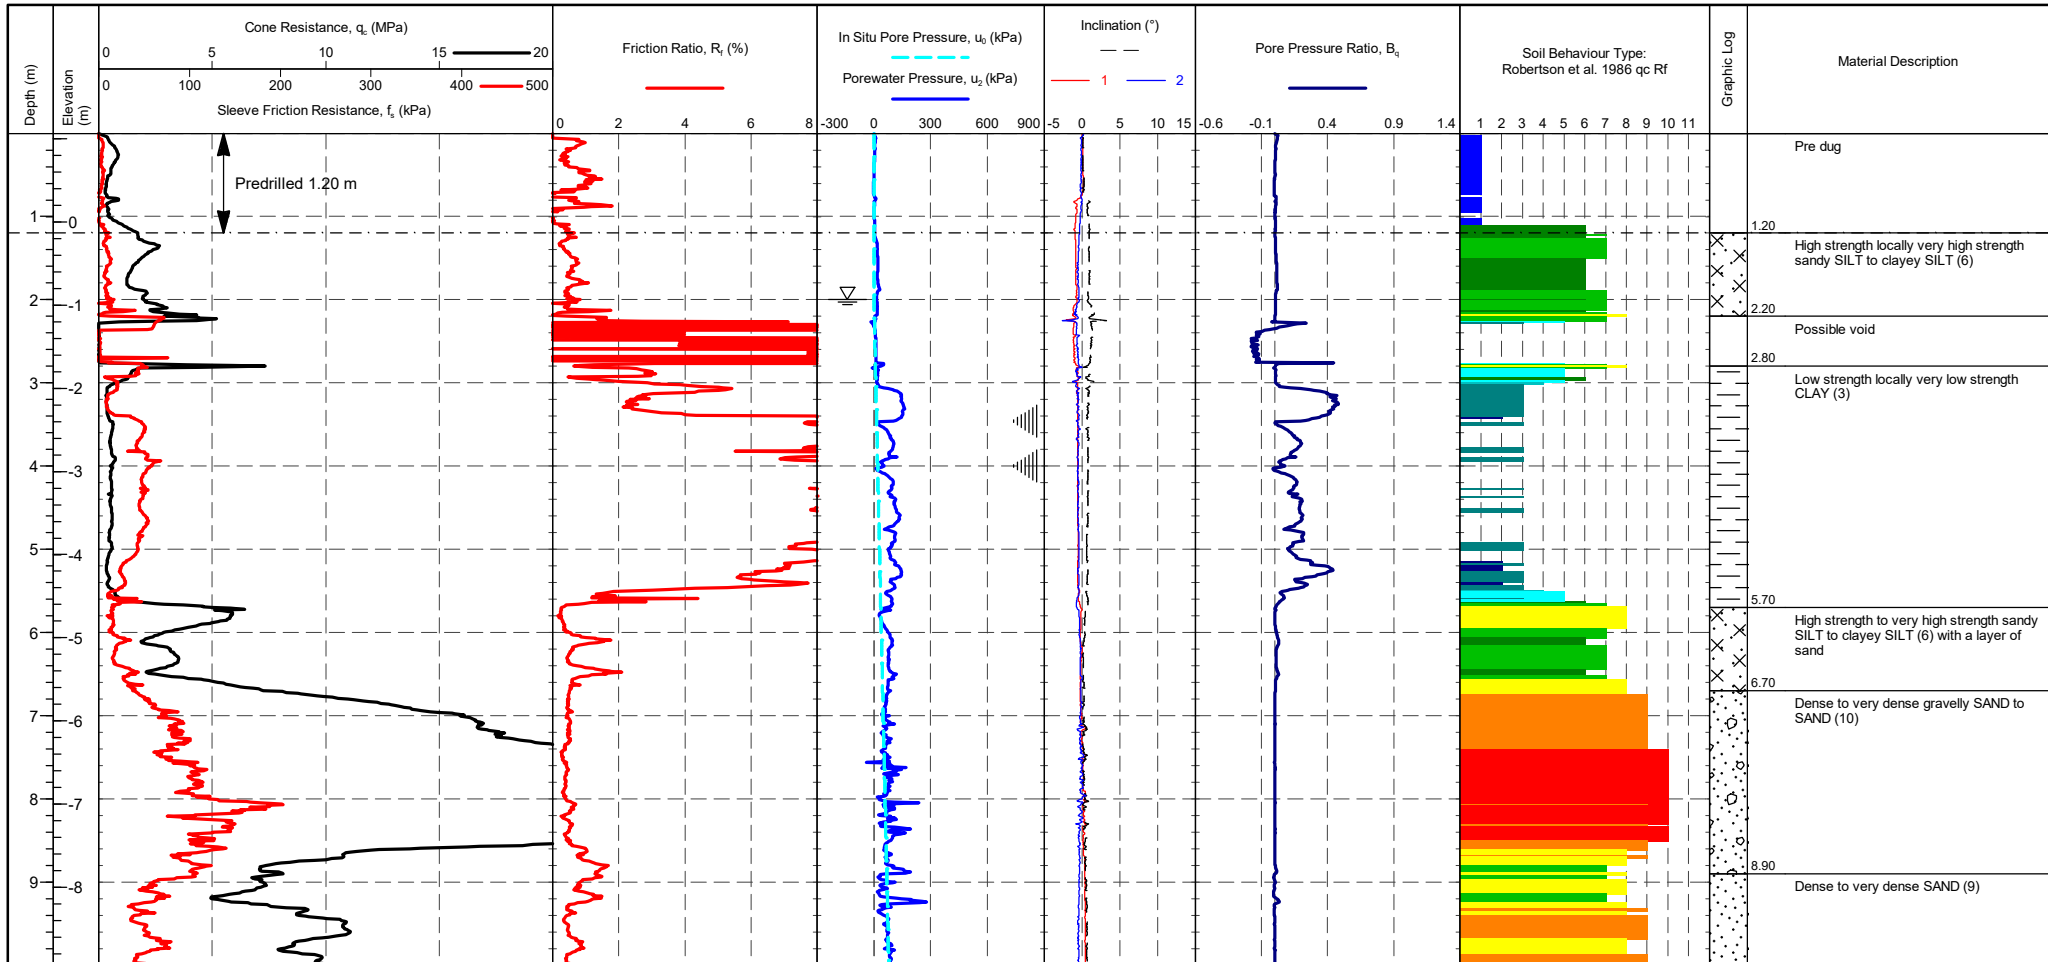

Term based on measurement	Undrained Shear Strength Classification, $s_u$ (kPa)
Extremely low	<10
Very low	10 - 20
Low	20 - 40
Medium	40 - 75
High	75 - 150
Very high	150 - 300
Extremely high	>300

BS 1377 : Part 2 : 1990, clause 4.3 and 5

Project Name:	<b>Gt Yarmouth 3rd River Crossing</b>	Project Number:	<b>PZ1522D1</b>
Client Name:	<b>Community &amp; Environmental Services</b>	Sample Location:	BH1
Sample Description:	Grey slightly gravelly sandy CLAY. Gravel is of flint and occasional shell fragments.	Sample Depth (m)	27.45
		Sample Reference	D71

Preparation: Material was washed and oven dried at below 50°C

Results: As Received Moisture Content: (BS1377 : Part 2 : Clause 3 : 1990) 27 %  
 Percentage Passing 425µm sieve: 97 %  
 Liquid Limit: 39 %  
 Plastic Limit: 17 %  
 Plasticity Index: 22

Liquidity Index: 0.45  
 Modified Plasticity Index: (NHBC Standards Chapter 4.2) 21

Remarks	Approved	Date	Sheet No.:
	MW	25/01/2018	1 of 1

### LIQUID LIMIT, PLASTIC LIMIT, PLASTICITY INDEX, & LIQUIDITY INDEX

BS 1377 : Part 2 : 1990, clause 4.3 and 5

Project Name:	<b>Gt Yarmouth 3rd River Crossing</b>	Project Number:	<b>PZ1522D1</b>
Client Name:	<b>Community &amp; Environmental Services</b>	Sample Location:	BH1
Sample Description:	Grey slightly clayey silty SAND	Sample Depth (m)	30.00
		Sample Reference	D76

Preparation: Material was washed and oven dried at below 50°C

Results: As Received Moisture Content: (BS1377 : Part 2 : Clause 3 : 1990) 22 %  
 Percentage Passing 425µm sieve: 94 %  
 Liquid Limit: 20 %  
 Plastic Limit: Non-plastic %  
 Plasticity Index: Non-plastic

Liquidity Index: Non-plastic  
 Modified Plasticity Index: (NHBC Standards Chapter 4.2) Non-plastic

Remarks	Approved	Date	Sheet No.:
	MW	25/01/2018	1 of 1

### LIQUID LIMIT, PLASTIC LIMIT, PLASTICITY INDEX, & LIQUIDITY INDEX

BS 1377 : Part 2 : 1990, clause 4.3 and 5

Project Name:	<b>Gt Yarmouth 3rd River Crossing</b>	Project Number:	<b>PZ1522D1</b>
Client Name:	<b>Community &amp; Environmental Services</b>	Sample Location:	BH2
Sample Description:	Grey brown slightly gravelly slightly sandy silty CLAY. Gravel is of flint, quartzite and occasional shell fragments	Sample Depth (m)	4.40
		Sample Reference	B15

Preparation: Material was washed and oven dried at below 50°C

Results: As Received Moisture Content: (BS1377 : Part 2 : Clause 3 : 1990) 55 %  
 Percentage Passing 425µm sieve: 89 %  
 Liquid Limit: 56 %  
 Plastic Limit: 26 %  
 Plasticity Index: 30

Liquidity Index: 0.97  
 Modified Plasticity Index: (NHBC Standards Chapter 4.2) 27

Remarks	Approved	Date	Sheet No.:
	MW	25/01/2018	1 of 1

### LIQUID LIMIT, PLASTIC LIMIT, PLASTICITY INDEX, & LIQUIDITY INDEX

BS 1377 : Part 2 : 1990, clause 4.3 and 5

Project Name:	<b>Gt Yarmouth 3rd River Crossing</b>	Project Number:	<b>PZ1522D1</b>
Client Name:	<b>Community &amp; Environmental Services</b>	Sample Location:	BH2
Sample Description:	Grey slightly sandy silty CLAY	Sample Depth (m)	6.50
		Sample Reference	B21

Preparation: Material was washed and oven dried at below 50°C

Results: As Received Moisture Content: (BS1377 : Part 2 : Clause 3 : 1990) 83 %  
 Percentage Passing 425µm sieve: 91 %  
 Liquid Limit: 67 %  
 Plastic Limit: 35 %  
 Plasticity Index: 32

Liquidity Index: 1.50  
 Modified Plasticity Index: (NHBC Standards Chapter 4.2) 29

Remarks	Approved	Date	Sheet No.:
	MW	25/01/2018	1 of 1

### LIQUID LIMIT, PLASTIC LIMIT, PLASTICITY INDEX, & LIQUIDITY INDEX

BS 1377 : Part 2 : 1990, clause 4.3 and 5

Project Name:	<b>Gt Yarmouth 3rd River Crossing</b>	Project Number:	<b>PZ1522D1</b>
Client Name:	<b>Community &amp; Environmental Services</b>	Sample Location:	BH2
Sample Description:	Grey brown clayey SAND	Sample Depth (m)	27.00
		Sample Reference	B66

Preparation: Material was washed and oven dried at below 50°C

Results: As Received Moisture Content: (BS1377 : Part 2 : Clause 3 : 1990) 24 %  
 Percentage Passing 425µm sieve: 91 %  
 Liquid Limit: 20 %  
 Plastic Limit: 15 %  
 Plasticity Index: 5

Liquidity Index: 1.80  
 Modified Plasticity Index: (NHBC Standards Chapter 4.2) 5

Remarks	Approved	Date	Sheet No.:
	MW	25/01/2018	1 of 1

### LIQUID LIMIT, PLASTIC LIMIT, PLASTICITY INDEX, & LIQUIDITY INDEX

BS 1377 : Part 2 : 1990, clause 4.3 and 5

Project Name:	<b>Gt Yarmouth 3rd River Crossing</b>	Project Number:	<b>PZ1522D1</b>
Client Name:	<b>Community &amp; Environmental Services</b>	Sample Location:	BH2
Sample Description:	Grey slightly silty sandy CLAY.	Sample Depth (m)	27.90
		Sample Reference	D67

Preparation: Material was natural

Results: As Received Moisture Content: (BS1377 : Part 2 : Clause 3 : 1990) 24 %  
 Percentage Passing 425µm sieve: 100 %  
 Liquid Limit: 30 %  
 Plastic Limit: 15 %  
 Plasticity Index: 15

Liquidity Index: 0.60  
 Modified Plasticity Index: (NHBC Standards Chapter 4.2) 15

Remarks	Approved	Date	Sheet No.:
	MW	25/01/2018	1 of 1

### LIQUID LIMIT, PLASTIC LIMIT, PLASTICITY INDEX, & LIQUIDITY INDEX

BS 1377 : Part 2 : 1990, clause 4.3 and 5

Project Name:	<b>Gt Yarmouth 3rd River Crossing</b>	Project Number:	<b>PZ1522D1</b>

Project Name:	<b>Gt Yarmouth 3rd River Crossing</b>	Project Number:	<b>PZ1522D1</b>
Client Name:	<b>Community &amp; Environmental Services</b>	Sample Location:	BH15
Sample Description:	Grey slightly sandy silty CLAY	Sample Depth (m)	27.60
		Sample Reference	D70

Preparation: Material was natural

Results: As Received Moisture Content: (BS1377 : Part 2 : Clause 3 : 1990) 28 %  
 Percentage Passing 425µm sieve: 100 %  
 Liquid Limit: 33 %  
 Plastic Limit: 14 %  
 Plasticity Index: 19

Liquidity Index: 0.74  
 Modified Plasticity Index: (NHBC Standards Chapter 4.2) 19

Remarks	Approved	Date	Sheet No.:
	MW	30/01/2018	1 of 1

## LIQUID LIMIT, PLASTIC LIMIT, PLASTICITY INDEX, & LIQUIDITY INDEX

BS 1377 : Part 2 : 1990, clause 4.3 and 5

Project Name:	<b>Gt Yarmouth 3rd River Crossing</b>	Project Number:	<b>PZ1522D1</b>
Client Name:	<b>Community &amp; Environmental Services</b>	Sample Location:	BH15
Sample Description:	Grey mottled dark grey slightly sandy very silty CLAY	Sample Depth (m)	30.00
		Sample Reference	D74

Preparation: Material was natural

Results: As Received Moisture Content: (BS1377 : Part 2 : Clause 3 : 1990) 28 %  
 Percentage Passing 425µm sieve: 99 %  
 Liquid Limit: 39 %  
 Plastic Limit: 18 %  
 Plasticity Index: 21

Liquidity Index: 0.48  
 Modified Plasticity Index: (NHBC Standards Chapter 4.2) 21

Remarks	Approved	Date	Sheet No.:
	MW	30/01/2018	1 of 1

### Particle Size Distribution to BS 1377 : Part 2 : 1990 Sedimentation Method Section 9.4

**Scheme:** Gt Yarmouth 3rd River Crossing

**Location:** BH14 D9 3.8m

Particle Size Distribution

Sieving & Sed.		Sample Proportions		Description
Particle Size mm	% Passing		%	
6.3	*See note	Coarse SAND	1	Dark greyish brown, clayey, silty, fine and medium SAND, weathering to brown.
2.0	98	Medium SAND	67	
0.6	97	Fine SAND	19	
0.212	30	Coarse SILT	4	
0.063	11	Medium SILT	2	
0.02	7	Fine SILT	1	
0.006	5	CLAY	4	
0.002	4	Moisture content	22	

Test carried out on a disturbed sample prepared in accordance with BS1377 Part 1 clause 7.4.5, "in its natural state".  
 Moisture content in accordance with BS1377 Part 2 clause 3.2, Oven-drying method. No pre-treatment was carried out.  
 Location and orientation are not applicable.

\* This test determines the particle size distribution from the coarse sand size to the clay size.

Test Code = 612

**Particle Size Distribution**

Sieving & Sed.		Sample Proportions		Description
Particle Size mm	% Passing		%	
6.3	*See note	Coarse SAND	0	Soft, greeny grey, very clayey, sandy, fine, medium and coarse SILT.
2.0	100	Medium SAND	7	
0.6	100	Fine SAND	16	
0.212	93	Coarse SILT	37	
0.063	76	Medium SILT	14	
0.02	39	Fine SILT	6	
0.006	25	CLAY	19	
0.002	19	Moisture content	34	

Test carried out on a disturbed sample prepared in accordance with BS1377 Part 1 clause 7.4.5, "in its natural state".  
 Moisture content in accordance with BS1377 Part 2 clause 3.2, Oven-drying method. No pre-treatment was carried out.  
 Location and orientation are not applicable.

\* This test determines the particle size distribution from the coarse sand size to the clay size.

Test Code = 612

## Particle Size Distribution to BS 1377 : Part 2 : 1990 Sedimentation Method Section 9.4

Scheme: Gt Yarmouth 3rd River Crossing

Location: BH18 B17 9.6-10.0m

Particle Size Distribution

Sieving & Sed.		Sample Proportions		Description
Particle Size mm	% Passing		%	
6.3	*See note	Coarse SAND	0	Dark grey, clayey, very silty fine and medium SAND, weathering to brown.
2.0	100	Medium SAND	19	
0.6	100	Fine SAND	29	
0.212	80	Coarse SILT	20	
0.063	51	Medium SILT	9	
0.02	31	Fine SILT	5	
0.006	21	CLAY	16	
0.002	16	Moisture content	38	

Test carried out on a disturbed sample prepared in accordance with BS1377 Part 1 clause 7.4.5, "in its natural state".  
 Moisture content in accordance with BS1377 Part 2 clause 3.2, Oven-drying method. No pre-treatment was carried out.  
 Location and orientation are not applicable.

\* This test determines the particle size distribution from the coarse sand size to the clay size.

Test Code = 612
