0.063	85	Medium SILT	18	
0.02	66	Fine SILT	13	
0.006	48	CLAY	35	
0.002	35	Moisture content	26	

Test carried out on a disturbed sample prepared in accordance with BS1377 Part 1 clause 7.4.5, "in its natural state". Moisture content in accordance with BS1377 Part 2 clause 3.2, Oven-drying method. No pre-treatment was carried out. Location and orientation are not applicable.

\* This test determines the particle size distribution from the coarse sand size to the clay size.

Test Code = 612

## DETERMINATION OF ONE DIMENSIONAL CONSOLIDATION PROPERTIES

BS1377:Part 5:1990, clause 3

Project Name:	<b>Gt Yarmouth 3rd River Crossing</b>	Project Number:	<b>PZ1522D1</b>
Client Name:	<b>Community &amp; Environmental Services</b>	Sample Location:	BH1
Sample Description:	Grey brown and grey CLAY	Sample Depth (m):	4.00
		Sample Reference:	P17

Sample condition: Undisturbed  
 Depth of specimen: 4.10 m

Swelling Pressure: 0.4 kPa  
 Note: Initial seating load of 0.4 kPa sufficient to prevent swelling

**Initial Conditions:**

Moisture Content: 68 %  
 Voids Ratio: 1.813  
 Diameter: 74.69 mm  
 Height: 20.04 mm  
 Bulk Density: 1.62 Mg/m<sup>3</sup>  
 Dry Density: 0.96 Mg/m<sup>3</sup>

**Final Conditions**

Moisture Content: 47 %  
 Voids Ratio: 1.158  
 Initial Degree of Saturation: 100 %  
 Particle Density (Assumed): 2.70 Mg/m<sup>3</sup>  
 Laboratory Temperature: 16.9 °C

Pressure Range kPa	Time Fitting Method	Mv (m <sup>2</sup> /MN)	Voids Ratio	Cv M <sup>2</sup> /year
0 - 6	t90	3.0	1.762	0.91
6 - 12	t90	2.1	1.728	0.41
12 - 25	t90	1.9	1.661	0.40
25 - 50	t90	1.2	1.578	0.38
50 - 100	t90	1.1	1.434	0.28
100 - 200	t90	0.81	1.238	0.32
200 - 400	t90	0.4	1.056	0.32
400 - 50	t90	0.14	1.158	

Log of Pressure (kPa)

**Remarks**

Swelling pressure determined in accordance with BS 1377 Part 5 Clause 4.1a  
 Determination of swelling pressure not covered by UKAS accreditation.

		Sample Reference	UT11

Test Number	1				
Length	200.7	mm			
Diameter	102.8	mm			
Bulk Density	1.64	Mg/m <sup>3</sup>			
Moisture Content	73.8	%			
Dry Density	0.95	Mg/m <sup>3</sup>			
Rate of Strain	1.0	%/min			
Cell Pressure	50	kPa			
At failure	15.0	%			
Axial Strain	36	kPa			
Deviator Stress, (σ <sub>1</sub> - σ <sub>3</sub> ) <sub>f</sub>	18	kPa	½(σ <sub>1</sub> - σ <sub>3</sub> ) <sub>f</sub>		
Undrained Shear Strength, c <sub>u</sub>					
Mode of Failure	Plastic				

### Deviator Stress v Axial Strain

### Mohr Circles

Deviator stress corrected for area change and membrane effects

Mohr circles and their interpretation is not covered by BS1377. This is provided for information only.

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## Final Test Report

Envirolab Job Number: 17/08296  
Issue Number: 1  
Date: 14-Dec-17

Client: Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk, NR1 2SG

Project Manager: Sharon Woods; Simon Holden  
Project Name: Gt Yarmouth 3rd River Crossing  
Project Ref: PZ1522D1  
Order No: 573823

Date Samples Received: 30-Nov-17  
Date Instructions Received: 6-Dec-17  
Date Analysis Completed: 14-Dec-17

### Notes - Soil analysis

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones >10mm are removed or excluded from the sample prior to analysis and reported results corrected to a whole sample basis.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis.

### Notes - General

This report shall not be reproduced, except in full, without written approval from Envirolab.

Subscript "A" indicates analysis performed on the sample as received. "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve, unless asbestos is found to be present in which case all analysis is performed on the sample as received.

All analysis is performed on the dried and crushed sample for samples with Matrix Code 7 and this supercedes any "A" subscripts.

All analysis is performed on the sample as received for soil samples from outside the European Union and this supercedes any "D" subscripts

Superscript "M" indicates method accredited to MCERTS.

For complex, multi-compound analysis, quality control results do not always fall within chart limits for every compound and we have criteria for reporting in these situations.

If results are in italic font they are associated with such quality control failures and may be unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid

**Predominant Matrix Codes:** 1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited

**Secondary Matrix Codes:** A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal, E = contains roots/twigs.

IS indicates Insufficient sample for analysis, NDP indicates No Determination Possible and NAD indicates No Asbestos Detected.

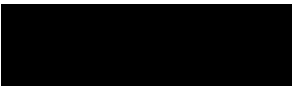

Superscript # indicates method accredited to ISO 17025.

Analytical results reflect the quality of the sample at the time of analysis only. Opinions and interpretations expressed are outside the scope of our accreditation.

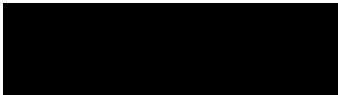

Please contact us if you need any further information.

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## Final Test Report

Envirolab Job Number: 17/08632  
Issue Number: 1 Date: 8-Jan-18

Client: Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk, NR1 2SG

Project Manager: Scott Viner/Sharon Woods; Simon Holden  
Project Name: Gt Yarmouth 3rd River Crossing  
Project Ref: PZ1522D1  
Order No: 575575

Date Samples Received: 14-Dec-17  
Date Instructions Received: 20-Dec-17  
Date Analysis Completed: 5-Jan-18

### Notes - Soil analysis

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones >10mm are removed or excluded from the sample prior to analysis and reported results corrected to a whole sample basis.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis.

### Notes - General

This report shall not be reproduced, except in full, without written approval from Envirolab.

Subscript "A" indicates analysis performed on the sample as received. "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve, unless asbestos is found to be present in which case all analysis is performed on the sample as received.

All analysis is performed on the dried and crushed sample for samples with Matrix Code 7 and this supercedes any "A" subscripts.

All analysis is performed on the sample as received for soil samples from outside the European Union and this supercedes any "D" subscripts

Superscript "M" indicates method accredited to MCERTS.

For complex, multi-compound analysis, quality control results do not always fall within chart limits for every compound and we have criteria for reporting in these situations.

If results are in italic font they are associated with such quality control failures and may be unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid

**Predominant Matrix Codes:** 1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited

**Secondary Matrix Codes:** A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal, E = contains roots/twigs.

IS indicates Insufficient sample for analysis, NDP indicates No Determination Possible and NAD indicates No Asbestos Detected.

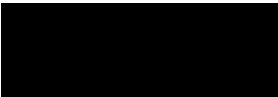

Superscript # indicates method accredited to ISO 17025.

Analytical results reflect the quality of the sample at the time of analysis only. Opinions and interpretations expressed are outside the scope of our accreditation.

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT

**Envirolab Job Number:** 17/08066  
**Issue Number:** 1  
**Date:** 11 December, 2017

**Client:** Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk  
NR1 2SG

**Project Manager:** Sharon Woods; Simon Holden  
**Project Name:** Gt Yarmouth 3rd River Crossing  
**Project Ref:** PZ1522D1  
**Order No:** 572985  
**Date Samples Received:** 27/11/17  
**Date Instructions Received:** 28/11/17  
**Date Analysis Completed:** 08/12/17

**Prepared by:**

Holly Neary-King  
Administrative Assistant

**Approved by:**

Richard Wong  
Client Manager

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## Final Test Report

Envirolab Job Number: 17/08066  
Issue Number: 1  
Date: 11-Dec-17

Client: Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk, NR1 2SG

Project Manager: Sharon Woods; Simon Holden  
Project Name: Gt Yarmouth 3rd River Crossing  
Project Ref: PZ1522D1  
Order No: 572985

Date Samples Received: 27-Nov-17  
Date Instructions Received: 28-Nov-17  
Date Analysis Completed: 8-Dec-17

### Notes - Soil analysis

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones >10mm are removed or excluded from the sample prior to analysis and reported results corrected to a whole sample basis.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis.

### Notes - General

This report shall not be reproduced, except in full, without written approval from Envirolab.

Subscript "A" indicates analysis performed on the sample as received. "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve, unless asbestos is found to be present in which case all analysis is performed on the sample as received.

All analysis is performed on the dried and crushed sample for samples with Matrix Code 7 and this supercedes any "A" subscripts.

All analysis is performed on the sample as received for soil samples from outside the European Union and this supercedes any "D" subscripts

Superscript "M" indicates method accredited to MCERTS.

For complex, multi-compound analysis, quality control results do not always fall within chart limits for every compound and we have criteria for reporting in these situations.

If results are in italic font they are associated with such quality control failures and may be unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid

**Predominant Matrix Codes:** 1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited

**Secondary Matrix Codes:** A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal, E = contains roots/twigs.

IS indicates Insufficient sample for analysis, NDP indicates No Determination Possible and NAD indicates No Asbestos Detected.

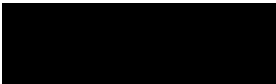

Superscript # indicates method accredited to ISO 17025.

Analytical results reflect the quality of the sample at the time of analysis only. Opinions and interpretations expressed are outside the scope of our accreditation.

Please contact us if you need any further information.

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT

## Final Test Report

Envirolab Job Number: 18/00646  
Issue Number: 1  
Date: 5-Feb-18

Client: Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk, NR1 2SG

Project Manager: Sharon Woods; Simon Holden  
Project Name: Gt Yarmouth 3rd River Crossing  
Project Ref: PZ1522D1  
Order No: 579331

Date Samples Received: 25-Jan-18  
Date Instructions Received: 29-Jan-18  
Date Analysis Completed: 5-Feb-18

### Notes - Soil analysis

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones >10mm are removed or excluded from the sample prior to analysis and reported results corrected to a whole sample basis.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis.

### Notes - General

This report shall not be reproduced, except in full, without written approval from Envirolab.

Subscript "A" indicates analysis performed on the sample as received. "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve, unless asbestos is found to be present in which case all analysis is performed on the sample as received.

All analysis is performed on the dried and crushed sample for samples with Matrix Code 7 and this supercedes any "A" subscripts.

All analysis is performed on the sample as received for soil samples from outside the European Union and this supercedes any "D" subscripts

Superscript "M" indicates method accredited to MCERTS.

For complex, multi-compound analysis, quality control results do not always fall within chart limits for every compound and we have criteria for reporting in these situations.

If results are in italic font they are associated with such quality control failures and may be unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid

**Predominant Matrix Codes:** 1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited

**Secondary Matrix Codes:** A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal, E = contains roots/twigs.

IS indicates Insufficient sample for analysis, NDP indicates No Determination Possible and NAD indicates No Asbestos Detected.

Superscript # indicates method accredited to ISO 17025.

Analytical results reflect the quality of the sample at the time of analysis only. Opinions and interpretations expressed are outside the scope of our accreditation.

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT

**Envirolab Job Number:** 18/00839  
**Issue Number:** 1  
**Date:** 14 February, 2018

**Client:** Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk  
NR1 2SG

**Project Manager:** Sharon Woods; Simon Holden  
**Project Name:** Gt Yarmouth 3rd River Crossing  
**Project Ref:** PZ1522D1  
**Order No:** 580346  
**Date Samples Received:** 05/02/18  
**Date Instructions Received:** 06/02/18  
**Date Analysis Completed:** 14/02/18

**Prepared by:**

Holly Neary-King  
Administrative Assistant

**Approved by:**

Georgia King  
Admin & Client Services Supervisor

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## Final Test Report

Envirolab Job Number: 18/02053  
Issue Number: 1 Date: 4-Apr-18

Client: Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk, NR1 2SG

Project Manager: Scott Viner/Sharon Woods; Simon Holden  
Project Name: Gt. Yarmouth 3rd River Crossing  
Project Ref: PZ1522D1  
Order No: 584856

Date Samples Received: 23-Feb-18  
Date Instructions Received: 21-Mar-18  
Date Analysis Completed: 4-Apr-18

### Notes - Soil analysis

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones >10mm are removed or excluded from the sample prior to analysis and reported results corrected to a whole sample basis.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis.

### Notes - General

This report shall not be reproduced, except in full, without written approval from Envirolab.

Subscript "A" indicates analysis performed on the sample as received. "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve, unless asbestos is found to be present in which case all analysis is performed on the sample as received.

All analysis is performed on the dried and crushed sample for samples with Matrix Code 7 and this supercedes any "A" subscripts.

All analysis is performed on the sample as received for soil samples from outside the European Union and this supercedes any "D" subscripts

Superscript "M" indicates method accredited to MCERTS.

For complex, multi-compound analysis, quality control results do not always fall within chart limits for every compound and we have criteria for reporting in these situations.

If results are in italic font they are associated with such quality control failures and may be unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid

**Predominant Matrix Codes:** 1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited

**Secondary Matrix Codes:** A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal, E = contains roots/twigs.

IS indicates Insufficient sample for analysis, NDP indicates No Determination Possible and NAD indicates No Asbestos Detected.

Superscript # indicates method accredited to ISO 17025.

Analytical results reflect the quality of the sample at the time of analysis only. Opinions and interpretations expressed are outside the scope of our accreditation.

Please contact us if you need any further information.

NR1 2SG

**Project Manager:** Sharon Woods; Simon Holden  
**Project Name:** Gt Yarmouth 3rd River Crossing  
**Project Ref:** PZ1522D1  
**Order No:** 584843  
**Date Samples Received:** 19/02/18  
**Date Instructions Received:** 16/03/18  
**Date Analysis Completed:** 26/03/18

**Prepared by:**

Holly Neary-King  
Administrative Assistant

**Approved by:**

Richard Wong  
Client Manager

Envirolab Job Number: 18/01967

Client Project Name: Gt Yarmouth 3rd River Crossing

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## Final Test Report

Envirolab Job Number: 18/01967  
Issue Number: 1 Date: 26-Mar-18

Client: Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk, NR1 2SG

Project Manager: Sharon Woods; Simon Holden  
Project Name: Gt Yarmouth 3rd River Crossing  
Project Ref: PZ1522D1  
Order No: 584843

Date Samples Received: 19-Feb-18  
Date Instructions Received: 16-Mar-18  
Date Analysis Completed: 26-Mar-18

### Notes - Soil analysis

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones >10mm are removed or excluded from the sample prior to analysis and reported results corrected to a whole sample basis.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis.

### Notes - General

This report shall not be reproduced, except in full, without written approval from Envirolab.

Subscript "A" indicates analysis performed on the sample as received. "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve, unless asbestos is found to be present in which case all analysis is performed on the sample as received.

All analysis is performed on the dried and crushed sample for samples with Matrix Code 7 and this supercedes any "A" subscripts.

All analysis is performed on the sample as received for soil samples from outside the European Union and this supercedes any "D" subscripts

Superscript "M" indicates method accredited to MCERTS.

For complex, multi-compound analysis, quality control results do not always fall within chart limits for every compound and we have criteria for reporting in these situations.

If results are in italic font they are associated with such quality control failures and may be unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid

**Predominant Matrix Codes:** 1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited

**Secondary Matrix Codes:** A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal, E = contains roots/twigs.

IS indicates Insufficient sample for analysis, NDP indicates No Determination Possible and NAD indicates No Asbestos Detected.

Superscript # indicates method accredited to ISO 17025.

Analytical results reflect the quality of the sample at the time of analysis only. Opinions and interpretations expressed are outside the scope of our accreditation.

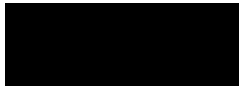

Please contact us if you need any further information.

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT

**Envirolab Job Number:** 18/02142  
**Issue Number:** 1 **Date:** 03 April, 2018

**Client:** Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk  
NR1 2SG

**Project Manager:** Sharon Woods; Simon Holden  
**Project Name:** Gt Yarmouth 3rd River Crossing  
**Project Ref:** PZ1522D1  
**Order No:** 585493  
**Date Samples Received:** 19/03/18  
**Date Instructions Received:** 22/03/18  
**Date Analysis Completed:** 03/04/18

**Prepared by:**

Holly Neary-King  
Administrative Assistant

**Approved by:**

Georgia King  
Admin & Client Services Supervisor

Envirolab Job Number: 18/02142

Client Project Name: Gt Yarmouth 3rd River Crossing

Client Project Ref: PZ1522D1

Lab Sample ID	18/02142/1	18/02142/2								Units	Method ref
Client Sample No	4	13									
Client Sample ID	BH12A	BH12A									
Depth to Top	1.40	4.40									
Depth To Bottom	1.50	4.50									
Date Sampled	15-Mar-18	15-Mar-18									
Sample Type	Soil - ES	Soil - ES									
Sample Matrix Code	1A	1A									
% Stones >10mm <sub>A</sub>	10.8	6.8								% w/w	A-T-044
pH <sub>D</sub>	8.43	9.62								pH	A-T-031s
Ammoniacal nitrogen <sub>D</sub>	<0.2	<0.2								mg/kg	A-T-033s

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## Final Test Report

Envirolab Job Number: 18/02142  
Issue Number: 1 Date: 3-Apr-18

Client: Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk, NR1 2SG

Project Manager: Sharon Woods; Simon Holden  
Project Name: Gt Yarmouth 3rd River Crossing  
Project Ref: PZ1522D1  
Order No: 585493

Date Samples Received: 19-Mar-18  
Date Instructions Received: 22-Mar-18  
Date Analysis Completed: 3-Apr-18

### Notes - Soil analysis

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones >10mm are removed or excluded from the sample prior to analysis and reported results corrected to a whole sample basis.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis.

### Notes - General

This report shall not be reproduced, except in full, without written approval from Envirolab.

Subscript "A" indicates analysis performed on the sample as received. "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve, unless asbestos is found to be present in which case all analysis is performed on the sample as received.

All analysis is performed on the dried and crushed sample for samples with Matrix Code 7 and this supercedes any "A" subscripts.

All analysis is performed on the sample as received for soil samples from outside the European Union and this supercedes any "D" subscripts

Superscript "M" indicates method accredited to MCERTS.

For complex, multi-compound analysis, quality control results do not always fall within chart limits for every compound and we have criteria for reporting in these situations.

If results are in italic font they are associated with such quality control failures and may be unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid

**Predominant Matrix Codes:** 1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited

**Secondary Matrix Codes:** A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal, E = contains roots/twigs.

IS indicates Insufficient sample for analysis, NDP indicates No Determination Possible and NAD indicates No Asbestos Detected.

Superscript # indicates method accredited to ISO 17025.

Analytical results reflect the quality of the sample at the time of analysis only. Opinions and interpretations expressed are outside the scope of our accreditation.

Please contact us if you need any further information.

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

## Final Test Report

Envirolab Job Number: 18/02218  
Issue Number: 1 Date: 6-Apr-18

Client: Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk, NR1 2SG

Project Manager: Sharon Woods; Simon Holden  
Project Name: Gt Yarmouth 3rd River Crossing  
Project Ref: PZ1522D1  
Order No: 586162

Date Samples Received: 19-Mar-18  
Date Instructions Received: 26-Mar-18  
Date Analysis Completed: 6-Apr-18

### Notes - Soil analysis

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones >10mm are removed or excluded from the sample prior to analysis and reported results corrected to a whole sample basis.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis.

### Notes - General

This report shall not be reproduced, except in full, without written approval from Envirolab.

Subscript "A" indicates analysis performed on the sample as received. "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve, unless asbestos is found to be present in which case all analysis is performed on the sample as received.

All analysis is performed on the dried and crushed sample for samples with Matrix Code 7 and this supercedes any "A" subscripts.

All analysis is performed on the sample as received for soil samples from outside the European Union and this supercedes any "D" subscripts

Superscript "M" indicates method accredited to MCERTS.

For complex, multi-compound analysis, quality control results do not always fall within chart limits for every compound and we have criteria for reporting in these situations.

If results are in italic font they are associated with such quality control failures and may be unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid

**Predominant Matrix Codes:** 1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited

**Secondary Matrix Codes:** A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal, E = contains roots/twigs.

IS indicates Insufficient sample for analysis, NDP indicates No Determination Possible and NAD indicates No Asbestos Detected.

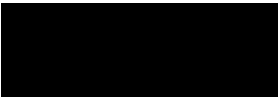

Superscript # indicates method accredited to ISO 17025.

Analytical results reflect the quality of the sample at the time of analysis only. Opinions and interpretations expressed are outside the scope of our accreditation.

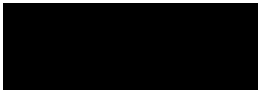

Please contact us if you need any further information.

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## Final Test Report

Envirolab Job Number: 18/02216  
Issue Number: 1 Date: 6-Apr-18

Client: Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk, NR1 2SG

Project Manager: Sharon Woods; Simon Holden  
Project Name: Gt Yarmouth 3rd River Crossing  
Project Ref: PZ1522D1  
Order No: 585985

Date Samples Received: 23-Mar-18  
Date Instructions Received: 26-Mar-18  
Date Analysis Completed: 6-Apr-18

### Notes - Soil analysis

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones >10mm are removed or excluded from the sample prior to analysis and reported results corrected to a whole sample basis.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis.

### Notes - General

This report shall not be reproduced, except in full, without written approval from Envirolab.

Subscript "A" indicates analysis performed on the sample as received. "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve, unless asbestos is found to be present in which case all analysis is performed on the sample as received.

All analysis is performed on the dried and crushed sample for samples with Matrix Code 7 and this supercedes any "A" subscripts.

All analysis is performed on the sample as received for soil samples from outside the European Union and this supercedes any "D" subscripts

Superscript "M" indicates method accredited to MCERTS.

For complex, multi-compound analysis, quality control results do not always fall within chart limits for every compound and we have criteria for reporting in these situations.

If results are in italic font they are associated with such quality control failures and may be unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid

**Predominant Matrix Codes:** 1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited

**Secondary Matrix Codes:** A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal, E = contains roots/twigs.

IS indicates Insufficient sample for analysis, NDP indicates No Determination Possible and NAD indicates No Asbestos Detected.

Superscript # indicates method accredited to ISO 17025.

Analytical results reflect the quality of the sample at the time of analysis only. Opinions and interpretations expressed are outside the scope of our accreditation.

Please contact us if you need any further information.

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT

**Envirolab Job Number:** 18/01112  
**Issue Number:** 1  
**Date:** 22 February, 2018

**Client:** Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk  
NR1 2SG

**Project Manager:** Sharon Woods; Simon Holden  
**Project Name:** Gt Yarmouth 3rd River Crossing  
**Project Ref:** PZ1522D1  
**Order No:** 581299  
**Date Samples Received:** 14/02/18  
**Date Instructions Received:** 14/02/18  
**Date Analysis Completed:** 22/02/18

**Prepared by:**

Gill Walker  
Laboratory Manager

**Approved by:**

Iain Haslock

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT

**Envirolab Job Number:** 18/01160  
**Issue Number:** 1 **Date:** 28 February, 2018

**Client:** Norfolk Partnership Laboratory

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## Final Test Report

Envirolab Job Number: 17/08502  
Issue Number: 1  
Date: 21-Dec-17

Client: Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk, NR1 2SG

Project Manager: Sharon Woods; Simon Holden  
Project Name: Gt Yarmouth 3rd River Crossing  
Project Ref: PZ1522D1  
Order No: 574728

Date Samples Received: 6-Dec-17  
Date Instructions Received: 14-Dec-17  
Date Analysis Completed: 21-Dec-17

### Notes - Soil analysis

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones >10mm are removed or excluded from the sample prior to analysis and reported results corrected to a whole sample basis.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis.

### Notes - General

This report shall not be reproduced, except in full, without written approval from Envirolab.

Subscript "A" indicates analysis performed on the sample as received. "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve, unless asbestos is found to be present in which case all analysis is performed on the sample as received.

All analysis is performed on the dried and crushed sample for samples with Matrix Code 7 and this supercedes any "A" subscripts.

All analysis is performed on the sample as received for soil samples from outside the European Union and this supercedes any "D" subscripts

Superscript "M" indicates method accredited to MCERTS.

For complex, multi-compound analysis, quality control results do not always fall within chart limits for every compound and we have criteria for reporting in these situations.

If results are in italic font they are associated with such quality control failures and may be unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid

**Predominant Matrix Codes:** 1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited

**Secondary Matrix Codes:** A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal, E = contains roots/twigs.

IS indicates Insufficient sample for analysis, NDP indicates No Determination Possible and NAD indicates No Asbestos Detected.

Superscript # indicates method accredited to ISO 17025.

Analytical results reflect the quality of the sample at the time of analysis only. Opinions and interpretations expressed are outside the scope of our accreditation.

Please contact us if you need any further information.

## Final Test Report

Envirolab Job Number: 18/01112  
Issue Number: 1 Date: 22-Feb-18

Client: Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk, NR1 2SG

Project Manager: Sharon Woods; Simon Holden  
Project Name: Gt Yarmouth 3rd River Crossing  
Project Ref: PZ1522D1  
Order No: 581299

Date Samples Received: 14-Feb-18  
Date Instructions Received: 14-Feb-18  
Date Analysis Completed: 22-Feb-18

### Notes - Soil analysis

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones >10mm are removed or excluded from the sample prior to analysis and reported results corrected to a whole sample basis.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis.

### Notes - General

This report shall not be reproduced, except in full, without written approval from Envirolab.

Subscript "A" indicates analysis performed on the sample as received. "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve, unless asbestos is found to be present in which case all analysis is performed on the sample as received.

All analysis is performed on the dried and crushed sample for samples with Matrix Code 7 and this supercedes any "A" subscripts.

All analysis is performed on the sample as received for soil samples from outside the European Union and this supercedes any "D" subscripts

Superscript "M" indicates method accredited to MCERTS.

For complex, multi-compound analysis, quality control results do not always fall within chart limits for every compound and we have criteria for reporting in these situations.

If results are in italic font they are associated with such quality control failures and may be unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid

**Predominant Matrix Codes:** 1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited

**Secondary Matrix Codes:** A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal, E = contains roots/twigs.

IS indicates Insufficient sample for analysis, NDP indicates No Determination Possible and NAD indicates No Asbestos Detected.

Superscript # indicates method accredited to ISO 17025.

Analytical results reflect the quality of the sample at the time of analysis only. Opinions and interpretations expressed are outside the scope of our accreditation.

Please contact us if you need any further information.

## Final Test Report

Envirolab Job Number: 18/01160  
Issue Number: 1 Date: 26-Feb-18

Client: Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk, NR1 2SG

Project Manager: Scott Viner/Sharon Woods; Simon Holden  
Project Name: Gt Yarmouth 3rd River Crossing  
Project Ref: PZ1522D1  
Order No: 581534

Date Samples Received: 15-Feb-18  
Date Instructions Received: 16-Feb-18  
Date Analysis Completed: 26-Feb-18

### Notes - Soil analysis

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones >10mm are removed or excluded from the sample prior to analysis and reported results corrected to a whole sample basis.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis.

### Notes - General

This report shall not be reproduced, except in full, without written approval from Envirolab.

Subscript "A" indicates analysis performed on the sample as received. "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve, unless asbestos is found to be present in which case all analysis is performed on the sample as received.

All analysis is performed on the dried and crushed sample for samples with Matrix Code 7 and this supercedes any "A" subscripts.

All analysis is performed on the sample as received for soil samples from outside the European Union and this supercedes any "D" subscripts

Superscript "M" indicates method accredited to MCERTS.

For complex, multi-compound analysis, quality control results do not always fall within chart limits for every compound and we have criteria for reporting in these situations.

If results are in italic font they are associated with such quality control failures and may be unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid

**Predominant Matrix Codes:** 1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited

**Secondary Matrix Codes:** A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal, E = contains roots/twigs.

IS indicates Insufficient sample for analysis, NDP indicates No Determination Possible and NAD indicates No Asbestos Detected.

Superscript # indicates method accredited to ISO 17025.

Analytical results reflect the quality of the sample at the time of analysis only. Opinions and interpretations expressed are outside the scope of our accreditation.

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT

**Envirolab Job Number:** 18/07384  
**Issue Number:** 1

**Date:** 25 September, 2018

**Client:** Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk  
NR1 2SG

**Project Manager:** Sharon Woods; Simon Holden  
**Project Name:** Gt Yarmouth 3rd River Crossing  
**Project Ref:** PZ1522D1  
**Order No:** 605028  
**Date Samples Received:** 13/09/18  
**Date Instructions Received:** 14/09/18  
**Date Analysis Completed:** 25/09/18

**Prepared by:**

Georgia King  
Admin & Client Services Supervisor

**Approved by:**

Danielle Brierley  
Client Manager

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure, these are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed.

Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT

**Envirolab Job Number:** 18/07536  
**Issue Number:** 1  
**Date:** 01 October, 2018

**Client:** Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk  
NR1 2SG

**Project Manager:** Sharon Woods; Simon Holden  
**Project Name:** Gt Yarmouth 3rd River Crossing  
**Project Ref:** PZ1522D1  
**Order No:** 605482  
**Date Samples Received:** 17/09/18  
**Date Instructions Received:** 19/09/18  
**Date Analysis Completed:** 01/10/18

**Prepared by:**

Gill Walker  
Director/Laboratory Manager

**Approved by:**

Richard Wong  
Client Manager

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure, these are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed.

Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## Final Test Report

Envirolab Job Number: 18/07384  
Issue Number: 1 Date: 25-Sep-18

Client: Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk, NR1 2SG

Project Manager: Sharon Woods; Simon Holden  
Project Name: Gt Yarmouth 3rd River Crossing  
Project Ref: PZ1522D1  
Order No: 605028

Date Samples Received: 13-Sep-18  
Date Instructions Received: 14-Sep-18  
Date Analysis Completed: 25-Sep-18

### Notes - Soil analysis

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones >10mm are removed or excluded from the sample prior to analysis and reported results corrected to a whole sample basis.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis.

### Notes - General

This report shall not be reproduced, except in full, without written approval from Envirolab.

Subscript "A" indicates analysis performed on the sample as received. "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve, unless asbestos is found to be present in which case all analysis is performed on the sample as received.

All analysis is performed on the dried and crushed sample for samples with Matrix Code 7 and this supercedes any "A" subscripts.

All analysis is performed on the sample as received for soil samples from outside the European Union and this supercedes any "D" subscripts

Superscript "M" indicates method accredited to MCERTS.

For complex, multi-compound analysis, quality control results do not always fall within chart limits for every compound and we have criteria for reporting in these situations.

If results are in italic font they are associated with such quality control failures and may be unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid

**Predominant Matrix Codes:** 1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited

**Secondary Matrix Codes:** A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal, E = contains roots/twigs.

IS indicates Insufficient sample for analysis, NDP indicates No Determination Possible and NAD indicates No Asbestos Detected.

Superscript # indicates method accredited to ISO 17025.

Analytical results reflect the quality of the sample at the time of analysis only. Opinions and interpretations expressed are outside the scope of our accreditation.

Please contact us if you need any further information.

## Final Test Report

Envirolab Job Number: 18/07536  
Issue Number: 1 Date: 1-Oct-18

Client: Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk, NR1 2SG

Project Manager: Sharon Woods; Simon Holden  
Project Name: Gt Yarmouth 3rd River Crossing  
Project Ref: PZ1522D1  
Order No: 605482

Date Samples Received: 17-Sep-18  
Date Instructions Received: 19-Sep-18  
Date Analysis Completed: 1-Oct-18

### Notes - Soil analysis

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones >10mm are removed or excluded from the sample prior to analysis and reported results corrected to a whole sample basis.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis.

### Notes - General

This report shall not be reproduced, except in full, without written approval from Envirolab.

Subscript "A" indicates analysis performed on the sample as received. "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve, unless asbestos is found to be present in which case all analysis is performed on the sample as received.

All analysis is performed on the dried and crushed sample for samples with Matrix Code 7 and this supercedes any "A" subscripts.

All analysis is performed on the sample as received for soil samples from outside the European Union and this supercedes any "D" subscripts

Superscript "M" indicates method accredited to MCERTS.

For complex, multi-compound analysis, quality control results do not always fall within chart limits for every compound and we have criteria for reporting in these situations.

If results are in italic font they are associated with such quality control failures and may be unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid

**Predominant Matrix Codes:** 1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited

**Secondary Matrix Codes:** A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal, E = contains roots/twigs.

IS indicates Insufficient sample for analysis, NDP indicates No Determination Possible and NAD indicates No Asbestos Detected.

Superscript # indicates method accredited to ISO 17025.

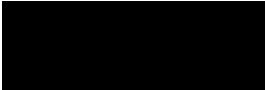

Analytical results reflect the quality of the sample at the time of analysis only. Opinions and interpretations expressed are outside the scope of our accreditation.

Please contact us if you need any further information.

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure, these are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed.

Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

# Appendix H.1

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure, these are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed.

Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT SUPPLEMENT TO TEST REPORT 18/05033/1

**Envirolab Job Number:** 18/05033

**Issue Number:** 2

**Date:** 20 December, 2018

**Client:** Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk  
NR1 2SG

**Project Manager:** Sharon Woods; Simon Holden  
**Project Name:** Gt Yarmouth 3rd River Crossing  
**Project Ref:** PZ1522D1  
**Order No:** 596974  
**Date Samples Received:** 25/06/18  
**Date Instructions Received:** 26/06/18  
**Date Analysis Completed:** 09/07/18

**Prepared by:**

Holly Neary-King  
Sales Executive

**Approved by:**

Georgia King  
Admin & Client Services Supervisor

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure, these are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed.

Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT SUPPLEMENT TO TEST REPORT 18/05361/1

**Envirolab Job Number:** 18/05361

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure, these are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed.

Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT SUPPLEMENT TO TEST REPORT 18/05864/1

**Envirolab Job Number:** 18/05864  
**Issue Number:** 2  
**Date:** 20 December, 2018

**Client:** Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk  
NR1 2SG

**Project Manager:** Sharon Woods; Simon Holden  
**Project Name:** Gt. Yarmouth 3rd River Crossing  
**Project Ref:** PZ1522D1  
**Order No:** 600180  
**Date Samples Received:** 23/07/18  
**Date Instructions Received:** 23/07/18  
**Date Analysis Completed:** 01/08/18

**Prepared by:**

Holly Neary-King  
Sales Executive

**Approved by:**

Georgia King  
Admin & Client Services Supervisor

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure, these are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed.

Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT SUPPLEMENT TO TEST REPORT 18/06265/1

**Envirolab Job Number:** 18/06265

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure, these are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed.

Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT SUPPLEMENT TO TEST REPORT 18/06637/1

**Envirolab Job Number:** 18/06637  
**Issue Number:** 2  
**Date:** 20 December, 2018

**Client:** Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk  
NR1 2SG

**Project Manager:** Sharon Woods; Simon Holden  
**Project Name:** Gt Yarmouth 3rd River Crossing  
**Project Ref:** PZ1522D1  
**Order No:** 602780  
**Date Samples Received:** 17/08/18  
**Date Instructions Received:** 20/08/18  
**Date Analysis Completed:** 29/08/18

**Prepared by:**

Holly Neary-King  
Sales Executive

**Approved by:**

Georgia King  
Admin & Client Services Supervisor

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure, these are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed.

Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT SUPPLEMENT TO TEST REPORT 18/07049/1

**Envirolab Job Number:** 18/07049  
**Issue Number:** 2

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure, these are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed.

Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT SUPPLEMENT TO TEST REPORT 18/08232/1

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure, these are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed.

Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT SUPPLEMENT TO TEST REPORT 18/08736/1

**Envirolab Job Number:** 18/08736

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure, these are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed.

Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT SUPPLEMENT TO TEST REPORT 18/09217/1

**Envirolab Job Number:** 18/09217

**Issue Number:** 2

**Date:** 20 December, 2018

**Client:** Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk  
NR1 2SG

**Project Manager:** Scott Viner/Sharon Woods; Simon Holden  
**Project Name:** Gt Yarmouth 3rd River Crossing  
**Project Ref:** PZ1522D1  
**Order No:** 610527  
**Date Samples Received:** 05/01/18  
**Date Instructions Received:** 05/11/18  
**Date Analysis Completed:** 13/11/18

**Prepared by:**

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure, these are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed.

Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT SUPPLEMENT TO TEST REPORT 18/09646/1

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure, these are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed.

Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT SUPPLEMENT TO TEST REPORT 18/10170/1

**Envirolab Job Number:** 18/10170  
**Issue Number:** 2  
**Date:** 20 December, 2018

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure, these are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed.

Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## 1.0. Introduction.

This ground investigation was carried out on land approximately 2 kilometres to the south of the centre Great Yarmouth. The site is approximately centred at OSGR 652620,305495. The area of investigation is approximately 1 kilometre in length north, south and extends to the east approximately 500 metres and approximately 350 metres to the west from the River Yare. The investigation was undertaken by Norfolk Partnership Laboratory on behalf of Norfolk County Council. Norfolk Partnership Laboratory provides a service within the Highways Operation Group of the Department of Planning and Transportation of Norfolk County Council.

It is proposed to construct a new River Yare crossing to ease the traffic congestion within Great Yarmouth town centre. At present the options being considered are;

- a) High level bridge crossings (deck level >8m above Spring Tide level)
- b) Low level bridge crossings
- c) Tunnel crossings

At this stage five different locations for a high or low level bridge and two locations for a tunnel are being considered. These combined give a total of twelve alternative crossing options.

This report covers a preliminary site investigation of the area. The principle purposes of this phase of the investigation were to:

- a) Carry out an early assessment of the actual ground conditions present and to determine their geotechnical properties.
- b) Carry out an early assessment of the actual ground conditions present with respect to contamination within the soil and water.
- c) Carry out an early assessment of the tidal influence on groundwater levels that are likely to affect construction.
- d) Carry out a UXO Desk Study and a preliminary UXO survey in the field during the site investigation works.

This report describes the expected geology of the region, the fieldwork carried out laboratory tests performed and the actual ground conditions encountered.

This site investigation data contained within this report is available in Association of Geotechnical Specialist (AGS) data format upon request.

Opinions and interpretations expressed herein are outside the scope of UKAS accreditation.

## 2.0 General Geology

The geology of the region may be summarised as follows :-

Recent	: Tidal River or Creek Deposits	
	: Blown Sand	
	: Breydon Formation	: Breydon Peat
		: Breydon Silts and Clays
	: North Denes Formation	
Pleistocene	: Corton Formation	: Corton Sand
	: Kesgrave Sand and Gravel	
	: Lowestoft Till	
	: Norwich Crag	
Eocene	: Walton Member	
	: Harwich Member	
	: Hales Clay	
Palaeocene	: Ormesby Clay	
Cretaceous	: Upper Chalk	

An extract from the geological map can be found in Appendix A.

The **Norwich Crag** was formed when, after a long period of standing above sea level, the area was submerged by a marine transgression caused by movements of the sea floor during a period of coastal instability in the region. The deposits are a variable series of yellowish or reddish brown sands, laminated clays and pebbly gravels. In places they are highly fossiliferous, shell fragments being especially prolific. The thickness of these deposits is variable between 5 and 60 metres.

**Lowestoft Till** is a heterogeneous mass of rock fragments, mainly chalk and flint, but with some material from further afield, suspended in a groundmass of grey sand, silt and clay which is usually derived from local sources. The glaciers which formed this material advanced from the west or north-west.

The **Corton Formation** is probably glacio-marine in origin and comprises of orange to buff, mostly fine grained sand with subordinate gravel, often gravely towards the base. A widespread sandy clay or till occurs at the base and is equivalent to the Cromer Till of North Norfolk. Thicknesses up to 10 metres may be present.

**North Denes Formation** comprises the deposits of a coastal barrier that extends in a tract up to about one kilometre wide between Caister-on-Sea and Gorleston-on-Sea, a distance of some eight kilometres. It consists of sand and subordinate gravel, and flanks the eastern limits of the Breydon Formation. Seawards, the formation extends to an arbitrary limit taken at the present coastline, where it is flanked by shoreface and beach sands.

The **Breydon Formation** is a series of older estuarine deposits of soft grey to dark grey silty clay and fine to medium grained sand. The materials are commonly laminated or bioturbated and include disseminated plant material and layers of peat. Bivalve shells occur locally. The upper 1-2 metres often forms a desiccated crust and is mottled and firm to stiff in nature. These materials may be up to 20 metres in thickness nearer the coast tapering to a thin veneer further inland.

Sands of a wind blown origin known as **Blown Sand** deposits which are locally up to 5 metres thick occurs at the surface in the coastal belt. This formation is common between Caister on Sea and Gorleston on Sea, and forms the foundation for much of the older part of the town of Great Yarmouth. The sand is typically buff in colour and fine in nature.

**Alluvium** is the material laid down in its channel and on the flood plain by modern day rivers. This material is generally silt, sand or clay. The presence of gravels represents times of flood. Where still conditions prevail then the growth of plant material may occur in or near the river channel, this facilitates the development of peat as this material dies and is buried.

According to the Regional Hydrogeology Map of Northern East Anglia, the Upper Chalk is the principle aquifer for the area.

#### 4.0 Geotechnical Laboratory Testing

A laboratory geotechnical testing schedule was drawn up to assist classification of the soils and to determine their physical and chemical properties. Norfolk Partnership Laboratory is a UKAS TESTING laboratory No. 0920.

- a) The determination of Natural Moisture Content by oven drying (BS1377:1990:Part 2: Clause 3).
- b) The determination of Liquid Limit using the four point cone penetrometer method (BS 1377: 1990: Part 2: Clause 4).
- c) The determination of the Plastic Limit (BS 1377: 1990: Part 2: Clause 5).
- d) The determination of Particle Size Distribution (BS1377:1990:Part 2: Clause 9.2).
- e) The determination of Particle Size Distribution by Sedimentation (BS1377:1990:Part 2: Clause 9.3).
- f) The determination of Plasticity Index (BS 1377: 1990: Part 2: Clause 5).
- g) The determination of the Californian Bearing Ratio value (B.S. 1377: Part 4: 1990: Clause 7).
- h) The determination of the Moisture Content / Density Relationship (B.S. 1377: Part 4: 1990: Clause 3).
- i) The determination of Particle Density by Gas Jar Method (BS1377:1990: Part 2 : Clause 8).
- j) The determination of organic matter content (BS1377: Part 3 :Section 3).

The laboratory does not hold accreditation for the following tests undertaken:

In addition the following tests were subcontracted to ALcontrol Geochem (UKAS TESTING laboratory No 1291)

- k) The determination of Total Sulphate, Water Soluble Sulphate and Total Potential Sulphur in accordance with TRL447.

Additional testing was subcontracted for the detection of potential soil and groundwater contamination. This is outlined in Section 7 of this report.

These results are included in Appendix D. The laboratory will retain remaining samples for 28 days from the date of issue of this report.

## 5.0 Ground Conditions

The exploratory holes substantially confirm the Geology outlined in Section 2.1 of this report and the soils are described below.

### 5.1 Surface Deposits and Made Ground

No Topsoil was recorded during this investigation.

Asphalt and intact concrete was recorded as the surface deposits in a number of holes. Thickness ranged between 0.10 metre up to 0.35 metres. Often the concrete was reinforced with steel. Flint cobbles were also noted in a small number of holes on the eastern side of the site.

Soft cover was noted in BH's 101, 107, 108, 111, 111A, 111B, 112, 113, TP's 101, 104, 109 and WS 111. Made Ground was recorded in all holes undertaken within the site. The thickness of Made Ground revealed ranged from 0.30 in BH 109 up to 3.00 metres in BH's 112, 115 and WS 108. The Made Ground deposits varied vastly across the site. Generally a fine and medium sand matrix was noted with numerous up to cobble size inclusions. These inclusions were noted as concrete, brick, flint, ash and metal. More detail can be found on the logs in Appendix C.

### 5.2 Tidal River or Creek Deposits

Tidal River and Creek deposits were revealed in BH's 103, 105, 106, 109, 114 and 117. This deposit was encountered at depths ranging from 0.30 metre in BH 109 up to 2.60 metres in BH 114. Colours included light brown, dark grey, black, greyish brown, brownish grey, brown, orangey brown and grey. This material comprised a sandy silt or a silty clayey sand. Organic lenses and material were also noted within this deposit. Thickness recorded ranged from 0.40 metres in BH 114 up to 3.90 metres in BH 105. The base of this deposit was proven in all holes where found at a maximum depth of 5.00 metres in BH 117.

SPT N values calculated within this material ranged from very loose through loose up to an occasional medium dense.

### 5.3 Blown Sand

Blown Sand was revealed in WS's 105, 106 and 111. This deposit was encountered at depths of 0.50 metre in WS's 105 and 111 and 0.60 metre in WS 106. This material comprised a light brown fine and medium sand. Occasional and a little fine and medium or fine medium and coarse rounded flint clasts were noted in some of this deposit. Thickness recorded ranged from 2.70 metres in WS 105 up to 3.40 metres in WS 106. The base of this deposit was proven in all holes where found at a maximum depth of 4.00 metres in WS 106.

#### 5.4 Breydon Formation : Breydon Peat

The Breydon Formation : Breydon Peat was encountered in BH's 101 and 108. This deposit was encountered at a depth of 1.50 metres in BH 108 and 1.70 metres in BH101. Colours were generally dark grey, black and greyish brown. This material generally comprised a soft dark grey amorphous peat. Soft organic silty clay with lenses of black fibrous peat was also noted. Thickness recorded ranged from 0.50 metre in BH 108 up to 1.10 metres in BH 101. The base of this deposit was proven in all holes where found at a maximum depth of 2.80 metres in BH 101.

#### 5.5 Breydon Formation : Breydon Silts and Clays

The Breydon Formation : Breydon Silts and Clays were encountered in BH's 101, 102, 104, 108, 110, 111, 111A, 113, TP's 101 and 104. This deposit was encountered at depths ranging from 1.10 metres in BH 102 up to 2.30 metres in BH 113. Colours included dark grey, black, greyish brown, brownish grey, brown, orangey brown and grey. This material was found to be a mixture of sands, sandy silty clay, peaty sands, clay and silt. Thickness recorded ranged from 0.10 metre in TP101 up to 5.00 metres in BH 110. The base of this deposit was not proven in TP's 101 and 104 at depths of 1.70 metres and 3.30 metres respectively. The deposit was proven in all other holes where identified at a maximum depth of 6.70 metres in BH 110.

#### 5.6 North Denes Formation

The North Denes Formation was identified in BH's 103, 105, 106, 107, 109, 114, 115, 116, 117, WS's 103, 104, 105, 106, 107, 108, 110 and 111. This deposit was encountered at depths ranging from 0.50 metre in WS's 103, 104 and 110 up to 5.00 metres in BH 117. Colours included light brown, greyish brown, brownish grey, brown, greyish brown and dark grey. This material was generally a sand with varying proportions of sub angular and rounded gravel. Clast content ranged from none through some and much up to equal proportions of fine, medium and coarse flint. Proven thickness recorded ranged from 3.95 metres in BH's 106 up to 14.00 metres in BH 107. The base of this deposit was not proven in BH 114 and all the window sample holes at a maximum depth of 5.00 metres. The deposit was proven in all other holes where identified at a maximum depth of 16.80 metres in BH 109.

N values calculated within this material ranged across the site with values increasing with depth. Densities recorded were loose, medium dense, dense and very dense.

#### 5.7 Corton Formation

The Corton Formation was identified in BH's 108, 110, 111, 111A, 112, 113 and TP109. This deposit was encountered at depths ranging from 0.30 metre in TP 109 up to 6.7 metres in BH 110. Colours included brown, orangey brown, yellowish brown and dark grey. This material was generally a fine and medium sand. Occasional clay and silt lenses were noted present within this deposit. Varying proportions of sub angular and rounded gravel were noted. Clast content ranged from none through a little up to some fine, medium and coarse flint and occasional

quartz. Thickness recorded ranged from 4.40 metres in BH 113 up to 8.00 metres in BH 112. The base of this deposit was not proven in TP 109 at a depth of 3.50 metres. The deposit was proven in all other holes where identified at a maximum depth of 12.00 metres in BH 112.

N values calculated within this material ranged across the site with values increasing with depth. Densities recorded were medium dense and dense.

#### 5.8 Corton Formation: Corton Sand

The Corton Formation : Corton Sand was identified in BH's 101, 102 and 104. This deposit was encountered at depths ranging from 2.80 metres in BH 101 up to 5.80 metres in BH 104. Colours included brown, orangey brown, yellowish brown, greyish brown and grey. This material was generally a fine and medium sand. Varying proportions of sub angular and rounded gravel Clast content ranged from none through a little up to some fine, medium and coarse flint. Thickness recorded ranged from 6.90 metres in BH 102 up to 9.20 metres in BH 104. The base of this deposit was proven in all holes where identified at a maximum depth of 15.00 metres in BH 104.

N values calculated ranged from medium dense through dense up to very dense.

#### 5.9 Kesgrave Sand and Gravel

The Kesgrave Sand and Gravel was identified in BH's 106 and 116. This deposit was encountered at depths ranging from 6.00 metres and 8.50 metres respectively. Colours included brown, orangey brown and reddish brown. This material was generally a fine, medium and coarse sand and gravel and varying proportions of sub rounded and rounded gravel. Clast content ranged from none through some up to much fine, medium and coarse flint and quartz. Thickness recorded ranged from 5.50 metres in BH 116 up to 10.00 metres in BH 106. The base of this deposit was proven in all holes where identified at a maximum depth of 16.00 metres in BH 106.

Although not identified in other holes, this material maybe present as it is difficult to distinguish from other granular deposits.

N values calculated ranged were generally medium dense to dense. It should be noted that occasional loose densities were recorded.

#### 5.10 Lowestoft Till

No Lowestoft Till deposits were positively identified during this investigation.

#### 5.11 Crag

Crag deposits were positively identified during this investigation in all cable percussion boreholes with the exception of BH's 111A and 111B. The Crag deposits were not discovered in any of the trialpits or any of the window sample hole.

This deposit was encountered at depths ranging from 7.00 metres in BH 111 up to 16.80 metres in BH 109. Colours included reddish brown, orangey brown and grey. This material was generally a fine and medium sand. Laminae, lenses and layers of silty clay and silt were also noted within this deposit. A little fine flint gravel and shell fragments were noted to be present within some areas of this deposit. A maximum thickness of 31.50 metres was recorded in BH 113. The base of this deposit was not proven in any of the holes where identified at a maximum depth of 40.00 metres in BH's 105, 109, 113 and 117.

N values calculated within this material indicate densities ranging from medium dense through dense up to very dense.

#### 5.12 Walton Member

No Walton Member deposits were positively identified during this investigation.

#### 5.13 Harwich Member

The Harwich Member was not encountered during this investigation.

#### 5.14 Hales Clay

No Hales Clay was recorded during this investigation.

#### 5.15 Ormesby Clay

The Ormesby Clay was not positively identified during this investigation.

#### 5.16 Upper Chalk

No Upper Chalk was revealed during this investigation.

Groundwater was subsequently monitored on five occasions. These results can be seen tabulated below.

Table 2. Piezometer readings

BH ID	Hole depth (m)	26/09/07	05/10/07	12/10/07	19/10/07	22/10/07
		Depth below ground level (m)				
101	3.20	1.60	1.69	1.44	1.60	1.57
101	9.00	1.51	1.73	1.55	1.57	1.60

117	40.00	1.94	1.96	1.75	1.90	1.87

More detail concerning the water level dips can be found in Appendix F.

## 7.0 Contamination Investigation

### 7.1 Contamination within the soil

The following tests were subcontracted ALcontrol Hawarden. ALcontrol Hawarden is a UKAS TESTING laboratory No. 1291.

The following samples were analysed.

Location Number	Depth (m)	Type	Testing undertaken
BH101	0.50	Soil	MM4, Speciated PAH
BH101	1.00	Soil	BRE SD1
BH101	8.00-8.45	Soil	BRE SD1
BH102	0.5	Soil	MM4, Speciated PAH
BH102	1.20-1.65	Soil	BRE SD1
BH102	3.0	Soil	MM4, Speciated PAH
BH102	10.00-10.45	Soil	BRE SD1
BH103	21.0	Soil	BRE SD1
BH103	0.5	Soil	MM4, Speciated TPH
BH103	5.0	Soil	BRE SD1
BH104	0.5	Soil	MM4
BH104	0.6	Soil	BRE SD1
BH104	25.5-25.95	Soil	BRE SD1
BH105	1.00	Soil	MM4, BRE SD1, Speciated PAH, Speciated TPH
BH 105	30.20	Soil	BRE SD1
BH 105	26.00	Soil	BRE SD1
BH 105	34.00	Soil	BRE SD1
BH106	0.2	Soil	MM4
BH 106	9.00	Soil	BRE SD1
BH 106	0.60	Soil	BRE SD1

Dibenzo(ah)anthracene	<8	3100	<8 ug/kg
Benzo(ghi)perylene	16	11000	<10 ug/kg
PAH 16 Total	69	230000	<25 ug/kg

## 7.2 Contamination within the Groundwater

Groundwater was sampled and analysed from nine locations across the site. These locations were agreed at the end of the drilling works. All the boreholes were purged before sampling with three times the insitu volume being removed before sampling took place. In addition one water sample was taken from TP104 and was also sent for analysis.

The testing was subcontracted to ALcontrol Hawarden. ALcontrol Hawarden is a UKAS TESTING laboratory No. 1291.

The sampling points and testing can be seen tabulated below;

BH ID	Depth of bore (m)	Location	Tests
104 Shallow	5.50	West of River Yare	MM4, TPH total, PAH total, Speciated PAH
105 Deep	40.00	East of River Yare	MM4, TPH total, PAH total, Speciated PAH
107 Shallow	2.95	East of River Yare	MM4, TPH total, PAH total, Speciated PAH
108 Deep	19.90	West of River Yare	MM4, TPH total, PAH total, Speciated PAH
110 Shallow	2.60	West of River Yare	MM4, TPH total, PAH total, Speciated PAH
112 Deep	19.70	West of River Yare	MM4, TPH total, PAH total, Speciated PAH
114 Shallow	2.80	East of River Yare	MM4, TPH total, PAH total, Speciated PAH
115 Deep	27.70	East of River Yare	MM4, TPH total, PAH total, Speciated PAH
117 Deep	40.00	East of River Yare	MM4, TPH total, PAH total, Speciated PAH
TP 104	n/a	West of River Yare	MM4, TPH total, PAH total, Speciated PAH

Tabulated below are the minimum and maximum values recorded

Parameter	Minimum	Maximum	Units + LOD
Arsenic Dissolved (ICP-MS)	2	35	<1 ug/l
Barium Dissolved (ICP-MS)	10	430	<1 ug/l
Beryllium Dissolved (ICP-MS)	<1	<1	<1 ug/l
Boron Dissolved (ICP-MS)	74	3000	<10 ug/l
Cadmium Dissolved (ICP-MS)	<0.4	0.6	<0.4 ug/l
Chromium Dissolved (ICP-MS)	3	16	<1 ug/l
Copper Dissolved (ICP-MS)	<1	2	<1 ug/l
Lead Dissolved (ICP-MS)	<1	1	<1 ug/l
Nickel Dissolved (ICP-MS)	2	47	<1 ug/l
Selenium Dissolved (ICP-MS)	<1	130	<1 ug/l
Vanadium Dissolved (ICP-MS)	<1	25	<1 ug/l
Zinc Dissolved (ICP-MS)	<3	160	<3 ug/l
Mercury Dissolved (CVAA)	<0.05	0	<0.05 ug/l
Nitrate as NO <sub>3</sub>	<0.3	56	<0.3 mg/l
Sulphate (soluble)	8	1600	<3 mg/l
Sulphide	<0.5	<0.5	<0.5 mg/l
Total Cyanide	<0.05	3.5	<0.05 mg/l
Free Cyanide	<0.05	0.94	<0.05 mg/l
Complex Cyanide	0.18	0.18	<0.05 mg/l
Free Sulphur	<0.05	0.13	<0.05 mg/l
pH Value	7.64	8.16	<1.00 pH Units
EPH (DRO) (C10-C40) Aqueous	<10	4300	<10 ug/l
Naphthalene Aqueous	<26	67000	<26 ng/l
Acenaphthylene Aqueous	<11	1300	<11 ng/l
Acenaphthene Aqueous	<15	1900	<15 ng/l
Fluorene Aqueous	<14	3200	<14 ng/l
Phenanthrene Aqueous	<22	13000	<22 ng/l
Anthracene Aqueous	<15	1300	<15 ng/l
Fluoranthene Aqueous	<17	3600	<17 ng/l
Pyrene Aqueous	<15	2100	<15 ng/l
Benz(a)anthracene Aqueous	<17	180	<17 ng/l
Chrysene Aqueous	<13	130	<13 ng/l
Benzo(b)fluoranthene Aqueous	<23	63	<23 ng/l
Benzo(k)fluoranthene Aqueous	<27	<27	<27 ng/l
Benzo(a)pyrene Aqueous	<9	34	<9 ng/l
Indeno(123cd)pyrene Aqueous	<14	<14	<14 ng/l
Dibenzo(ah)anthracene Aqueous	<16	<16	<16 ng/l
Benzo(ghi)perylene Aqueous	<16	<16	<16 ng/l
PAH 16 Total Aqueous	<27	93000	<27 ng/l

The results of all these tests can be found in Appendix E.

An AGS file containing all these results has been issued accompanying this report.

## 8.0 Gas investigation

Monitoring of naturally occurring ground gasses was undertaken on thirty five installations across the site. Five sets of gas results were obtained. The maximum and minimum values can be found below. The complete results can be found in Appendix G.

### Minimum Values

## 9.0 Other Information

### 9.1 BH110 Gas House Quay

No geotechnical testing was undertaken on material from BH 110. A number of samples recovered from this borehole were seen to contain material associated with historical gas works. Contamination testing was undertaken on a number of these samples. The results of these tests can be found in Appendix E.

### 9.2 Tidal influences

It should be noted that the tidal River Yare dissects the area of investigation. This should be taken into consideration when any analysing the water level data is undertaken.

### 9.3 UXO investigation

A UXO survey was undertaken on all excavations. It should be noted that some excavation locations were moved and some terminated due to the findings of the UXO engineer.

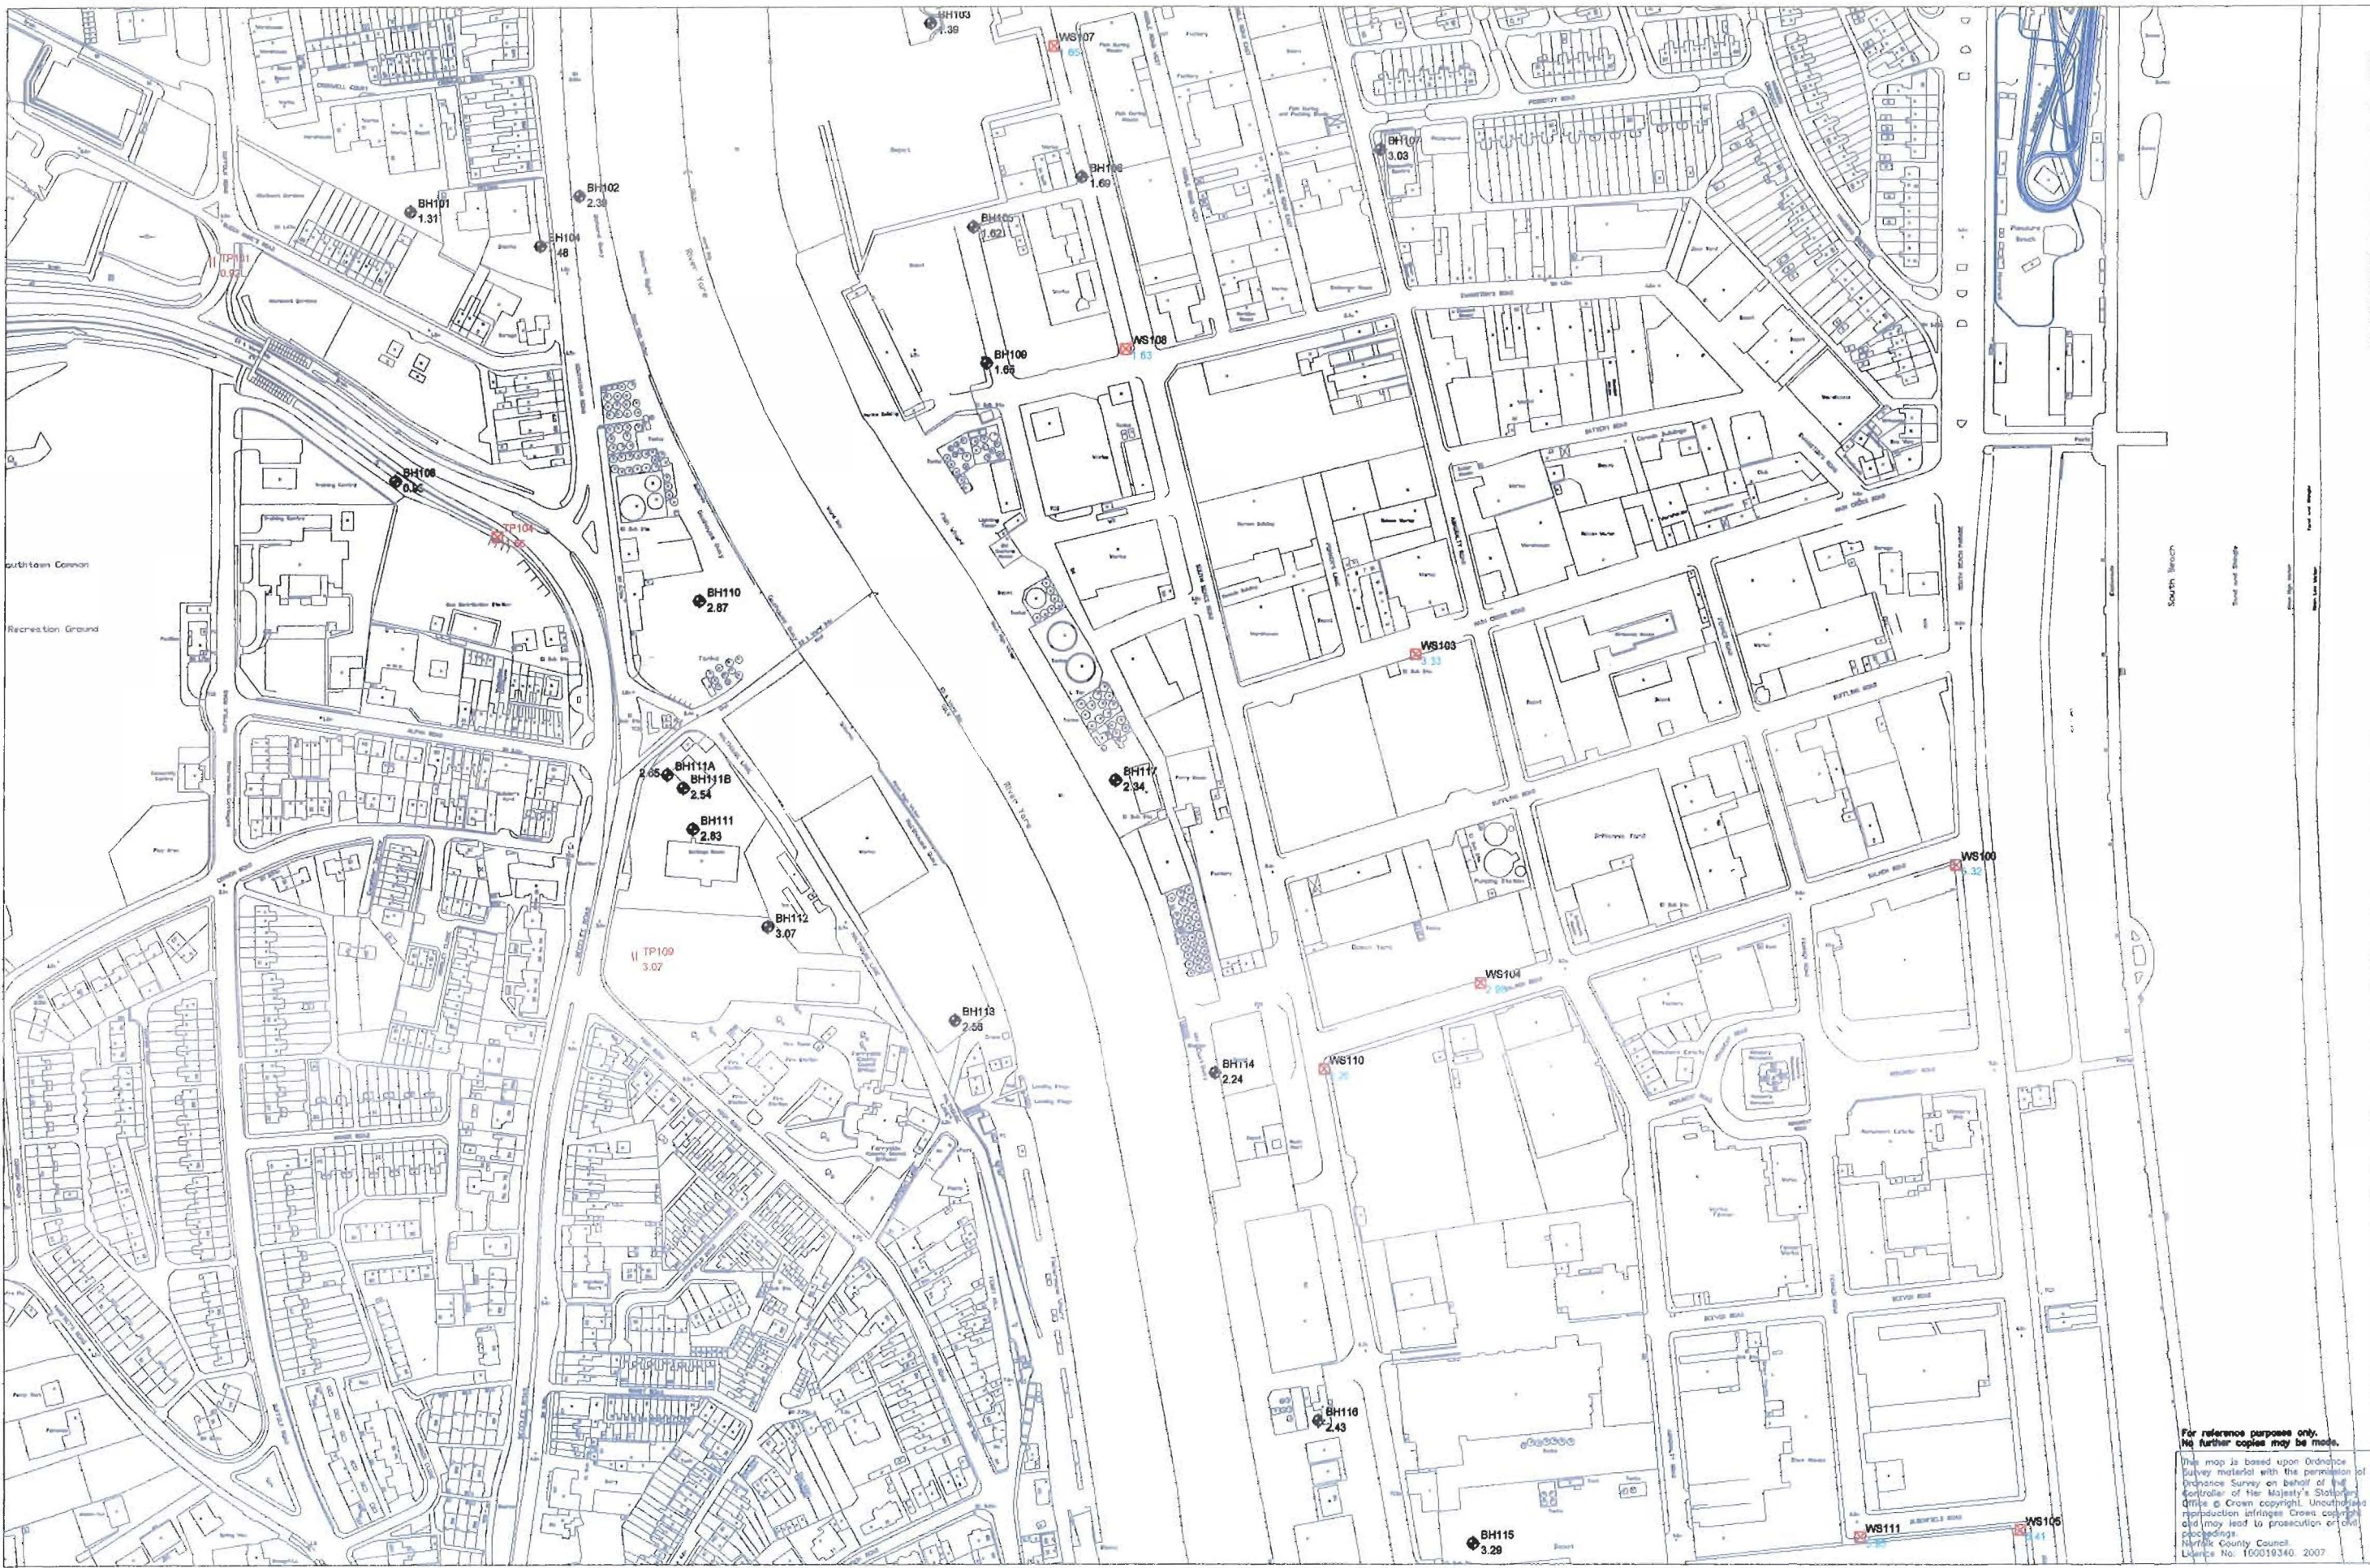

The UXO engineers reports can be found in Appendix I.

## DETERMINATION OF THE CALIFORNIA BEARING RATIO TO BS 1377 : PART 4 : 1990

<b>Scheme</b>	Great Yarmouth Third River Crossing		
<b>Location</b>	BH 115	<b>Depth</b>	6 m
<b>Date sampled</b>		<b>Date received</b>	21-Sep-07
<b>Sample type</b>	B	<b>Sample Mass</b>	

Sampled by Driller who is not a member of Norfolk Partnership Laboratory. If a Sample Certificate was provided it is available for inspection. The accuracy of information provided by third parties cannot be guaranteed.

<b>Material</b>	Bulk Disturbed
<b>Description</b>	Brown, light brown and grey slightly gravelly fine, medium and coarse SAND. Gravel is sub-angular to sub-rounded fine, medium and coarse flint

<b>Supplier</b>	<b>Source</b>	<b>Ex site</b>
Conveyance note No.

\* These descriptions are only intended to act as a cross check if sample identities are questioned, and to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions.

We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials-whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample.

Other coarse granular materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

## ALcontrol Geochem Analytical Services Table Of Results - Appendix

Job Number: 07/14582/02/01  
 Client: Norfolk County Council  
 Client Ref. No.: PTPZ0008

### Report Key :

Results expressed as (e.g.) 1.03E-07 is equivalent to 1.03x10<sup>-7</sup>

NDP	No Determination Possible	*	Subcontracted test
NFD	No Fibres Detected	»	Result previously reported (Incremental reports only)
#	ISO 17025 accredited	M	MCERTS Accredited
PFD	Possible Fibres Detected	EC	Equivalent Carbon (Aromatics C8-C35)

Note: Method detection limits are not always achievable due to various circumstances beyond our control.

### Summary of Method Codes contained within report :

Method No.	Reference	Description	ISO 17025 Accredited	MCERTS Accredited	Wet/Dry Sample <sup>1</sup>	Surrogate Corrected
TM001	In - house Method	Screening of Soils for Fibres			WET	
TM068	ASTM D-1552	Total sulphur determination by combustion method	✓		DRY	
TM074	Modified: US EPA Method 8100	Determination of Polynuclear Aromatic Hydrocarbons (PAH) by GC-MS. MCERTS Accreditation on Soils for Naphthalene except when Kerosene present.			NA	
TM074	Modified: US EPA Method 8100	Determination of Polynuclear Aromatic Hydrocarbons (PAH) by GC-MS. MCERTS Accreditation on Soils for Naphthalene except when Kerosene present.	✓		DRY	
TM074	Modified: US EPA Method 8100	Determination of Polynuclear Aromatic Hydrocarbons (PAH) by GC-MS. MCERTS Accreditation on Soils for Naphthalene except when Kerosene present.	✓	✓	DRY	
TM089	Modified: US EPA Methods 8020 & 602	Determination of Gasoline Range Hydrocarbons (GRO) and BTEX (MTBE) compounds by Headspace GC-FID (C4-C12)			WET	
TM089	Modified: US EPA Methods 8020 & 602	Determination of Gasoline Range Hydrocarbons (GRO) and BTEX (MTBE) compounds by Headspace GC-FID (C4-C12)	✓		WET	
TM089	Modified: US EPA Methods 8020 & 602	Determination of Gasoline Range Hydrocarbons (GRO) and BTEX (MTBE) compounds by Headspace GC-FID (C4-C12)	✓	✓	WET	
TM097	Modified: US EPA Method 325.1 & 325.2	Determination of Chloride using the Kone Analyser	✓		DRY	
TM098	Method 4500E, AWWA/APHA, 20th Ed., 1999	Determination of Sulphate using the Kone Analyser	✓		DRY	
TM099	BS 2690: Part 7:1968 / BS 6068: Part2.11:1984	Determination of Ammonium in Water Samples using the Kone Analyser	✓		WET	
TM101	Method 4500B & C, AWWA/APHA, 20th Ed., 1999	Determination of Sulphide in soil and water samples using the Kone Analyser			WET	
TM102	Method 4500H, AWWA/APHA, 20th Ed., 1999	Determination of Total Oxidised Nitrogen using the Kone Analyser	✓		DRY	
TM127	Method 3112B, AWWA/APHA, 20th Ed., 1999	The Determination of Trace Level Mercury in Aqueous Media and Soil Extracts by Atomic Absorption Spectroscopy	✓		NA	

<sup>1</sup> Applies to Solid samples only. **DRY** indicates samples have been dried at 35°C. **NA** = not applicable.

## ALcontrol Geochem Analytical Services Table Of Results - Appendix

**Job Number:** 07/14582/02/01  
**Client:** Norfolk County Council  
**Client Ref. No.:** PTPZ0008

### Report Key :

Results expressed as (e.g.) 1.03E-07 is equivalent to 1.03x10<sup>-7</sup>

NDP	No Determination Possible	*	Subcontracted test
NFD	No Fibres Detected	»	Result previously reported (Incremental reports only)
#	ISO 17025 accredited	M	MCERTS Accredited
PFD	Possible Fibres Detected	EC	Equivalent Carbon (Aromatics C8-C35)

Note: Method detection limits are not always achievable due to various circumstances beyond our control.

### Summary of Method Codes contained within report :

Method No.	Reference	Description	ISO 17025 Accredited	MCERTS Accredited	Wet/Dry Sample <sup>1</sup>	Surrogate Corrected
TM129	Method 3120B, AWWA/APHA, 20th Ed., 1999 / Modified: US EPA Method 3050B	Determination of Metal Cations by IRIS Emission Spectrometer			DRY	
TM129	Method 3120B, AWWA/APHA, 20th Ed., 1999 / Modified: US EPA Method 3050B	Determination of Metal Cations by IRIS Emission Spectrometer	✓		DRY	
TM129	Method 3120B, AWWA/APHA, 20th Ed., 1999 / Modified: US EPA Method 3050B	Determination of Metal Cations by IRIS Emission Spectrometer	✓	✓	DRY	
TM133	BS 1377: Part 3 1990	Determination of pH in Soil and Water using the GLpH pH Meter	✓		NA	
TM133	BS 1377: Part 3 1990	Determination of pH in Soil and Water using the GLpH pH Meter	✓	✓	WET	
TM136	Method 17.10, Second Site property, March 2003	Determination of Sulphur by HPLC	✓		NA	
TM149	BS 1377: Part 3 1990 ( Extraction)	Analysis of Total Sulphate using ICP-OES Spectrophotometer			DRY	
TM152	Method 3125B, AWWA/APHA, 20th Ed., 1999	Analysis of Aqueous Samples by ICP-MS	✓		NA	
TM153	Method 4500A,B,C, I, M AWWA/APHA, 20th Ed., 1999	Determination of Total Cyanide, Free (Easily Liberatable) Cyanide and Thiocyanate using the "Skalar SANS+ System" Segmented Flow Analyser	✓		WET	
TM154	In - house Method	Determination of Petroleum Hydrocarbons by EZ Flash GC-FID in the Carbon range C6- C40			WET	
TM154	In - house Method	Determination of Petroleum Hydrocarbons by EZ Flash GC-FID in the Carbon range C6- C40	✓		WET	
TM172		EPH in Waters	✓		NA	
TM173		Determination of Speciated Extractable Petroleum Hydrocarbons in Soils by GC-FID			DRY	
TM173		Determination of Speciated Extractable Petroleum Hydrocarbons in Soils by GC-FID	✓		DRY	

<sup>1</sup> Applies to Solid samples only. **DRY** indicates samples have been dried at 35°C. **NA** = not applicable.

# Appendix H

**DESK STUDY  
FOR  
UNEXPLODED ORDNANCE  
FOR  
3<sup>RD</sup> RIVER CROSSING  
GREAT YARMOUTH**

Prepared for: Norfolk Partnership Laboratory

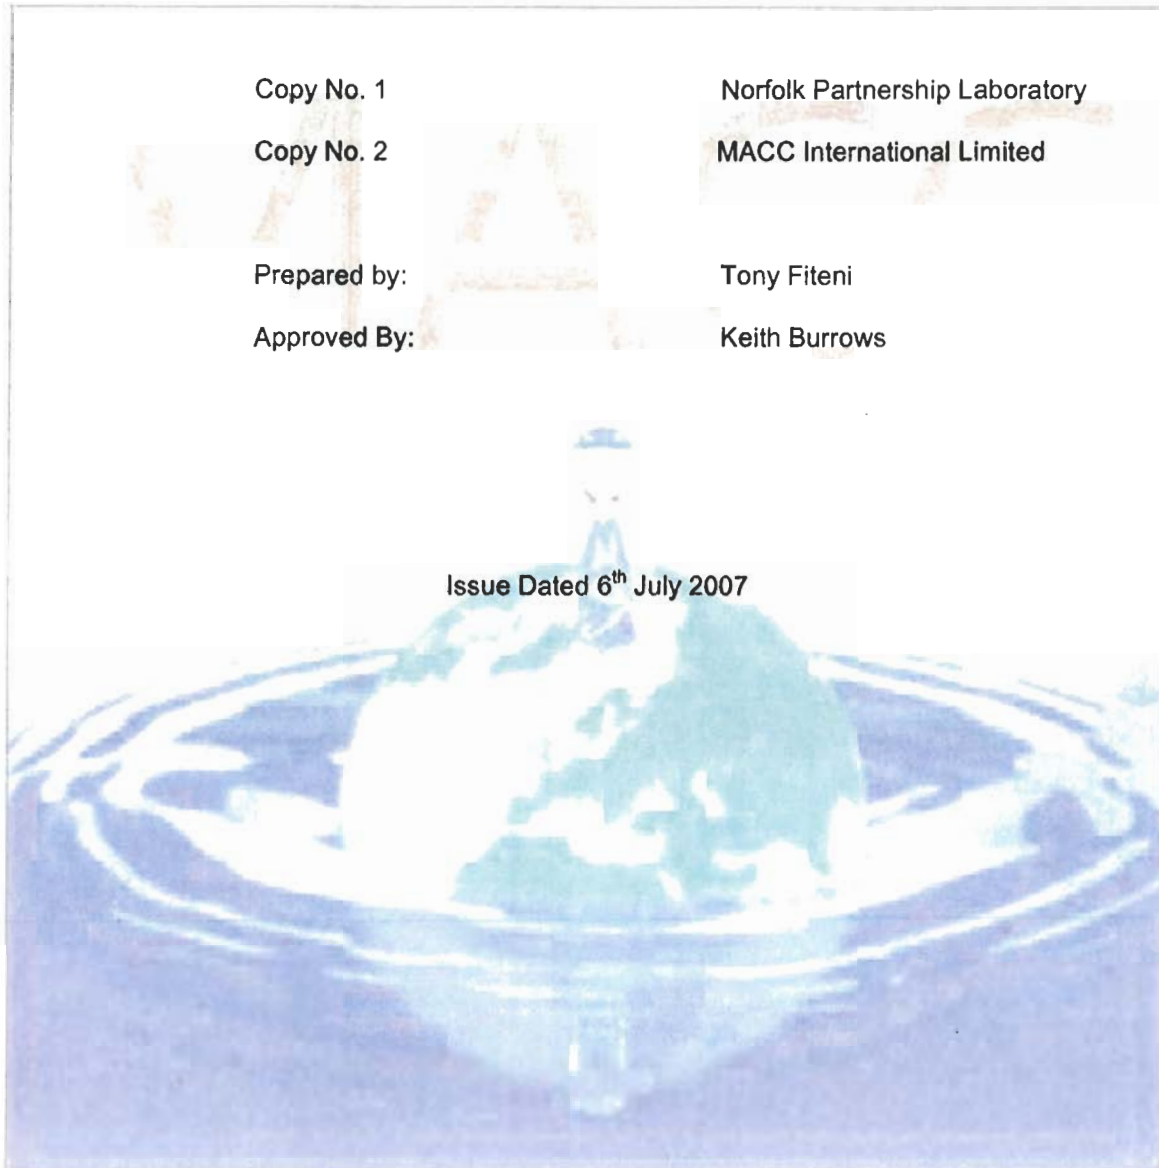

Project Number: 3154

Report Number: 3154/01

Dated: 6<sup>th</sup> July 2007

This document has been produced by MACC International Limited solely for the purpose of assessment and evaluation. It may not be used by any person for any purpose other than that specified without the express written permission of MACC International Limited. Any liability arising out of use by a third party of this document for purposes not wholly connected with the above shall be the responsibility of that party, who shall indemnify MACC International Limited against all claims, costs, damages and losses arising out of such use.

## TERMS AND DEFINITIONS

### Anti Aircraft Shells (AA)

Small HE shells ranging up to 40mm in diameter.

### Anti Personnel Bomb (APB)

Small sub-munitions dispensed from a main carrier may be aimable or non-aimable these are highly dangerous and are to be treated with extreme caution,

### Battlefield Area Clearance (BAC)

The systematic clearance of munitions from military property or old battle sites e.g. ranges, airfields etc.

### Borehole Search

The placing of boreholes in a set pattern, then using a magnetometer to take readings at specific depths along each borehole. When used with a geophysical survey system this will give a magnetic signature of the area. The depth of the borehole and the pattern will depend upon the type of UXB and the geology of the ground.

### Doodle Bug (See Pilotless Aircraft)

### Explosive Ordnance (EO)

All munitions containing explosives, nuclear fission or fusion materials and biological and chemical agents. This includes bombs and warheads; guided and ballistic missiles; artillery, mortar, rocket and small arms ammunition; all mines, torpedoes and depth charges; pyrotechnics; clusters and dispensers; cartridge and propellant actuated devices; electro-explosive devices; clandestine and improvised explosive devices; and all similar or related items or components explosive in nature.

### Explosive Ordnance Disposal (EOD)

The detection, identification, field evaluation, render safe, recovery and disposal of UXO.

### Fragmentation Hazard Zone

The area that could be reached by fragmentation following detonation for a given explosive item, explosive storage or mine/UXO contaminated area.

Note: Several factors should be considered when determining this zone; the amount of explosive, body construction, type of material, ground conditions etc. See also [secondary fragmentation].

### Geophysical Survey

The survey of an area using a Magnetometer and geophysical gathering device, after interpretation, this will produce a geophysical map and an object list for any metallic hotspots.

### High Explosive (HE)

High explosives burn/detonate at rates of up to 9,000 m/per second.

### Incendiary Bomb (IB)

Incendiary bombs ranged from 1kg in size to 500kg the larger sizes were sometimes called Oil Bombs. Fills range from thermite mixtures, phosphorus to kerosene.

### Intrusive Search

The use of a cone penetrometer or boreholes to take magnetometer test in a set pattern (see borehole search)

### Land Service Ammunition (LSA)

LSA is defined as "All items containing explosives or pyrotechnic compounds which are placed, thrown or projected so as to cause damage to men and equipment during land warfare.

### Long Range Rocket (LRR)

The long range rocket sometimes codenamed Big Ben is the V2 rocket designed to deliver an approximate payload of 1000 kg.

### Oil Bomb (OB)

A bomb containing a flammable liquid normally the KC 250 Flam or the C 500 flam.

### Pilot less Aircraft (PAC)

A flying bomb (Fly) or doodlebug is the V1 rocket or predecessors designed to deliver an explosive payload of approximately 500kg - 800kg.

### Parachute Flare (PF)

### Parachute Mine (PM)

Air dropped mine may have been used as a blast effect bomb maximum explosive content 1600lb always fitted with anti-handling and anti-stripping equipment.

### Phosphorus (PH) see WP

### Secondary Fragmentation

In an explosive event, fragmentation that was not originally part of the UXO.

### Unexploded Bomb (UXB)

Any air dropped bomb that has failed to operate.

---

**Unexploded Ordnance (UXO)**

Explosive ordnance that has been primed, fused, armed or otherwise prepared for use or used. It may have been fired, dropped, launched or projected yet remains unexploded either through malfunction or design or for any other cause.

**Unexploded Parachute Mine (UXPM)**

Any unexploded parachute mine.

**Vengeance Weapons (V)**

V1 see Pilot less Aircraft.  
V2 see Long Range Rocket.

**White Phosphorus (WP)**

Munitions filled with WP are designed for signaling, screening and incendiary purposes. They achieve their effect by dispersing WP, which burns, on contact with the air over a target area.

1        **INTRODUCTION**

1.1      **INSTRUCTION**

MACC International Limited, at the request of Norfolk Partnership Laboratory has conducted a Desk Study for Explosive Ordnance (EO)/Unexploded Ordnance (UXO) in the vicinity of the intended 3<sup>rd</sup> river crossing, Great Yarmouth.

This desk study is a collation and review of existing records and documentation.

1.2      **SCOPE OF WORK**

The purpose of this desk study is to assess the likelihood of buried EO/UXO within the vicinity of the intended 3<sup>rd</sup> river crossing, Great Yarmouth.

This report has been specifically prepared for Norfolk Partnership Laboratory, without the benefit of knowing the intentions of any third parties; therefore, it should not be used by such organizations without prior consultation with MACC International Limited.

1.3      **REPORTING CONDITIONS**

It must be emphasized that a desk study can only indicate the potential for EO/UXO to be present on the site. A Geophysical survey and intrusive investigation is fundamentally important to provide proof that the site is free of EO/UXO threat.

This report was written with the site conditions prevailing at the time of the study and no liability can be accepted by MACC International Limited for any change in the condition of the area.

The reader is reminded that the majority of military information from pre WWII has not been retained and the only available documentation is old maps, which rarely denote any specifics and sometimes are just a blank area.

This desk study relies on the information contained in the documents consulted and MACC International Limited will in no circumstances be held responsible for the accuracy of such information or data supplied (in some instances circa 1939/40 these documents were compiled in a wartime scenario).

The mapping system used throughout WWII is the War Office False Ordnance System (WOFO).

1.4      **SENSITIVE DOCUMENTATION**

Information may be classified, restricted or deemed to be confidential in nature to MACC International Limited, where such material has been gained a summary of the documentation has been approved.

## 2 SOURCES OF INFORMATION

Research of the sites history, with regard to military usage, bombing raids and bomb impacts has been undertaken to establish the following:

- Frequency and intensity of enemy bombing raids for the site and immediate vicinity up to 1000m radius.
- Bomb impacts and associated damage on the Site and in the immediate vicinity.
- The potential for UXO to remain on the Site and in the vicinity.
- Records of UXO removal activities for the Site and immediate vicinity.

Due to reasons of National Security defence related information, such as maps detailing wartime bombing campaigns, the location of unexploded bombs (UXB's) and military bases are generally not indicated on publicly available plans. It is for this reason that information regarding such sites is often difficult to locate and access.

The main sources of information consulted include:

- MACC International Limited defence related site records.
- MACC International Limited company records.
- Ministry of Defence records. The relevant records are attached.
- Specific research into the military history and development of the Site.
- Local Authority records.
- National Government Records Office.

## 3 LOCATION OF THE SITE

The site is located in Great Yarmouth and is centred on TG5256305773. The client provided the site location map, shown at Annex A, with an amended brief that the eastern boundary is to be extended to the adjoining North Sea coastline.

## 4 HISTORICAL INFORMATION

### 4.1 UK DEFENCE HISTORY

Records of air raids, bomb damage, casualties and the locations of UXO are rarely released into the public domain. Details relating to these records are often difficult to locate. Prior to WWII records of EO/UXO found are minimal and only the possible military usage of an area can be defined.

The records compiled during WWII were only as detailed and accurate as the availability of time, personnel and the ease of access to information would allow. Densely populated areas associated with the major cities tended to have a greater number of records than those produced for the more provincial or rural areas.

Prior to 1942, the mapping and information collation for bomb strikes/unexploded bombs was limited due to the ability of the persons recording the data. In April 1942 the Ministry of Home Security instigated a training programme for all personnel carrying out bomb census records, this standardised records and greatly improved the accuracy of the data.

Official records were often supplemented by press reports and local information. This source of information was sometimes discredited by being inadvertently inaccurate or purposely made inaccurate, in order to confuse enemy intelligence. Even the accuracy of classified official records is somewhat dubious. This stance has been borne out by the number of unrecorded UXO and part exploded ordnance discovered since 1945.

### 4.2 WORLD WAR I

The first attack on Great Yarmouth was on 3<sup>rd</sup> November 1914 when the town was shelled by the German Navy at 7am. No damage was done as the shells fell harmlessly on the beach. Two more bombardments followed later in the war, one on 25<sup>th</sup> April 1915 when some damage was sustained and a more serious attack on 14<sup>th</sup> January 1918 when 50 shells hit the town within 5 minutes, killing four people and injuring eight.

On 19<sup>th</sup> January 1915 at 8.30pm a Zeppelin airship of the German Navy passed slowly over the town and dropped ten bombs. The bombs fell in line from Albemarle Road to the South Denes, destroying buildings and causing fatalities.

### 4.3 WORLD WAR II

In 1939 the Royal Navy established a series of shore bases to protect the vital East Coast Convoy Route, a shipping lane from the Firth of Forth to the Thames. Through this channel convoys of merchant ships would carry essential supplies for the war effort. These convoys had to be protected and Great Yarmouth was one of the bases from which mine sweepers, motor torpedo boats, air sea rescue boats and salvage tugs operated throughout the war.

Also in 1939, precautions against possible invasion were put in place. The beaches were heavily mined, lined with barbed wire and tank traps constructed along the beaches to the north of the town. Three Gun batteries were also constructed to protect the harbour and beaches. In addition to these main batteries anti-aircraft guns were placed at strategic points around the town, including one on Stonecutters Quay and several along the sea front.

The first of over **ninety** air raids on Great Yarmouth was at 6.30am on 11<sup>th</sup> July 1940, a single German aircraft dropped bombs on the junction of Gordon Road and Wolseley Road, Southtown. The worst year of the war was 1941, during frequent air raids over 15,000 incendiary bombs and 800 high explosive bombs were dropped. The most severe of these raids began on 9<sup>th</sup> July when 68 HE bombs were dropped on the town.

*Admiralty Road, June 5th, 1941*

**An unexploded high explosive bomb recovered in Admiralty Road.  
This bomb was the only one dropped in a raid on 5<sup>th</sup> June 1941.**

*Fredrick Road, Gorleston, June 12th, 1941*

**A 4,000lb bomb which failed to explode in Fredrick Road, Gorleston.  
This was one of three bombs dropped on 12<sup>th</sup> June 1941.**

Extracts from publications and records for Great Yarmouth in 1941 include:

- Monday, March 31<sup>st</sup>

Another 26 aircraft (including two seeking alternative targets to Hull) attacked dock installations at Great Yarmouth with 29 tonnes of HE (14 SC 1000, 20 SC 500, 20 SD 500 and four LMB mines) and 7,956 incendiaries between 2017 and 2300 hours. Visual bombing was attempted, in the light of 40 LC 50 flares, and was seemingly successful. Crews reported explosions and fires in the target area, with one extraordinary large fire on the west bank of the River Yare. A ship was also seen to be on fire.

- Monday, April 21<sup>st</sup>

On the other side of the country 13 aircraft of Luftflotte 2 carried out an attack on Great Yarmouth, delivering 15 tonnes of HE (9 SC 1000, 5 SC 500 and 74 SD 50) and 6,336 incendiaries between 2135 and 2250 hours.

- 6<sup>th</sup>/7<sup>th</sup> July 1941 to 18<sup>th</sup> Feb 1942

Total HE bombs dropped - 159 of which 15 were UXBs.

During 1942, although there were fewer air raids, the destruction continued. On 25<sup>th</sup> June incendiary bombs destroyed the Parish Church, only the shell remaining at daybreak.

**St Nicholas Church**

**Aerial photograph of Great Yarmouth taken by the Luftwaffe 12<sup>th</sup> April 1942**

Low flying aircraft became a problem in 1943 and Barrage Balloons appeared over the town. During a raid on 11<sup>th</sup> May on the north end of town 49 people were killed and 41 injured.

By 1944 air raids were considerably reduced and evacuees returned to the town. Repairs to damaged property began and the council bought land at Gorleston for new housing (the Magdalen College Estate). The long task of clearing the beach of its mines did not commence until after hostilities in Europe had come to an end on 8<sup>th</sup> May 1945.

#### 4.4 AIR RAIDS

Classified records relating to local air raids have been examined. It should be noted that air records in no way constitute a full account of air raids that may have occurred during the war period.

Annex B details the cross referenced information by location, date, type and quantity of **ordnance dropped** during attacks within the area concerned. The resulting bomb plots are mapped in Annex C.

Annex D details additional bomb plots from a separate map. It has not been possible to verify these bomb plots by date, type and quantity, against written reports. They do however; replicate a number of known bomb plots detailed in Annex C.

At Annex E, the bomb plots from both maps have been transferred onto a current OS map for overall appreciation.

A record of overall quantity of **air dropped weapons** is listed as 938. What percentage of these were UXBs is unknown. It should be noted that this total does not include the large quantity of incendiary bombs dropped on Great Yarmouth, for which very few records were available.

#### 4.5 MACC INTERNATIONAL LIMITED RECORDS

MACC International Limited records indicate that a variety of bombs were delivered ranging from 50kg through to 500kg in addition to **PM's and incendiary bombs**. Details of the known range of ordnance used by the Germans can be seen at Annex F to this report.

#### 4.6 SITE DESCRIPTION

The site during the WW II was a mixture of civilian housing, military accommodation and installations, light industrial buildings, the Norfolk and Suffolk Joint Railway to the west, and the River Yare transecting the site north to south with its docks and wharfs situated along its length.

#### 4.7 SUMMARY OF BOMB DAMAGE

Bomb damage to the area is not fully apparent in the Aerial Photograph circa 1942 to 1954 shown in Annex G.

5 **UXO AND HAZARD INFORMATION**

5.1 **GENERAL**

Great Yarmouth suffered heavy bombing during the period of WW II, with bombs dropped on or within the vicinity of the site, of which at least 3 were UXBs. An unknown quantity of incendiary bombs were also dropped but cannot be accounted for.

Explosive Ordnance is inherently dangerous, further information on Explosive Ordnance and Safety is detailed in Annex F.

6 **ENVIRONMENTAL**

This site may have other environmental considerations. These have not been taken into consideration as they are outside the bailiwick of this report.

7 **CONCLUSIONS**

7.1 **GENERAL**

When drawing conclusions the reader is reminded that the WW II bomb census did not commence fully until November 1941. Great Yarmouth and the site at the time of WW II was primarily a naval shore base.

Where evidence of bombing runs exist the quantity, exact location and type of ordnance dropped cannot be verified so doubt remains as to what was actually delivered and failed to detonate.

7.2 **HISTORICAL USE**

The site was a naval shore base intermingled with light industry and civilian buildings with the River Yare transecting the site north to south. At the height of the war 220 officers and over 2,200 ratings were based at the port.

7.3 **BOMB CENSUS**

The bomb census indicates heavy bomb activity around and on the site. It is estimated that Great Yarmouth was subjected to over ninety air raids with an estimated 938 bombs being dropped. The total number of UXBs and incendiary bombs is unknown.

7.4 **FUTURE USE**

The proposed scheme is to either build a bridge or a submerged tube tunnel spanning the River Yare (the 3<sup>rd</sup> river crossing).

7.5 **OTHER NOTES OF INTEREST IN THE AREA**

- On the 10<sup>th</sup> February 1986 an unexploded 50 kg bomb was found in Blackwall Reach Road.
- There are several references to bombs, both exploded and unexploded, landing in the River Yare.

7.6 **RISK SUMMARY**

The risk factor to site personnel carrying out intrusive works:

- The potential for the discovery of UXBs on the proposed site of the 3<sup>rd</sup> River Crossing is HIGH.
- Records indicate that the total number of bombs dropped on Great Yarmouth was 938, not including incendiary bombs. An accepted failure rate for any type of EO, not to function as designed, is 10%.
- Despite having a Naval Bomb Disposal team based on Southgates Road during WW II, not all UXBs were accounted for; a 50 kg UXB was discovered in 1986.

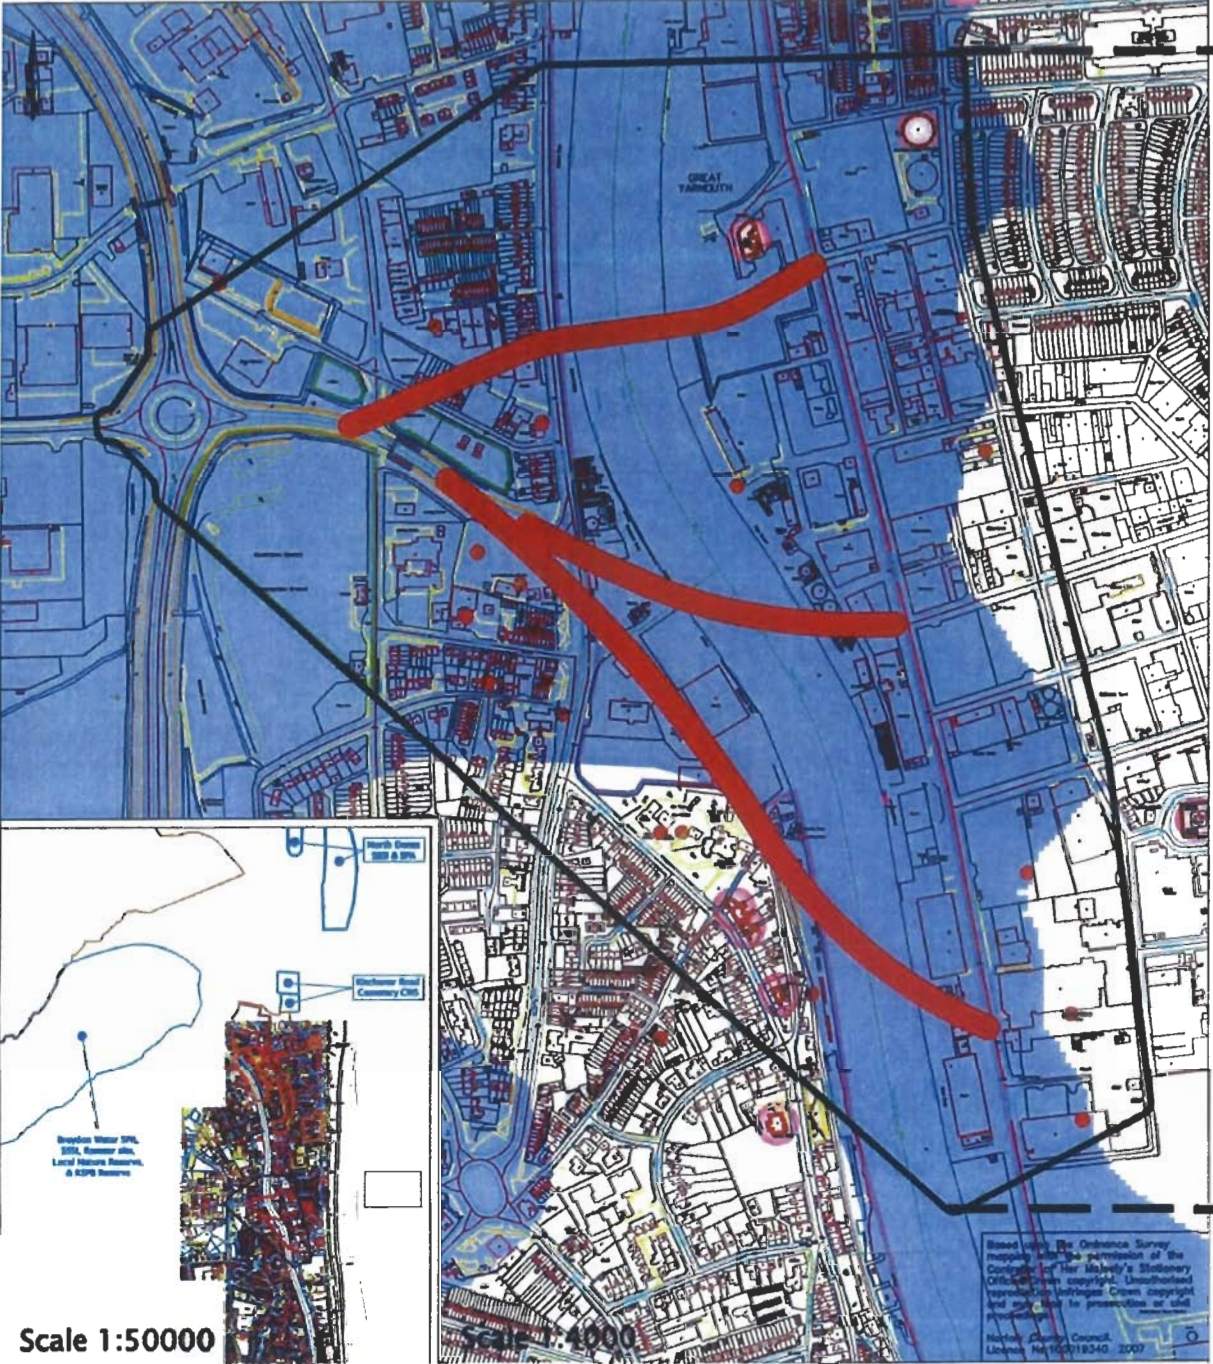

8 **RECOMMENDATIONS**

8.1 **GENERAL**

- Prior to excavation being carried out **ALL** ground workers are given an EO Safety and Awareness Briefing (Toolbox) as part of their Site Safety Induction.
- An EO Supervisor from a reputable EOD company supervises all excavation work below original ground level.
- The riverbed is surveyed, along the line of the proposed tunnel, for the presence of any remaining EO.

**BOUNDARY OF SITE LOCATION (Centred on TG5256305773)**

**RECORDED EVIDENCE OF BOMB ACTIVITY IN AND AROUND THE PROPOSED SITE**

Bomb No	Date	Type of Weapon	QTY	Location	Remarks
1	30/31 Oct 41	HE 250 kg	1	Admiralty Road - WG985242	Exploded bomb No 3 of 7

<b>Key:</b> Red indicates Exploded bomb (XB) Green indicates Unexploded bomb (UXB)	

**EXPLOSIVE ORDNANCE SAFETY AND INFORMATION**

**1 UNEXPLODED ORDNANCE**

Since the end of WWII, there have been a limited number of recorded incidents in the UK where bombs have detonated during engineering works, though a significant number of bombs have been discovered. Intrusive works (piling operations) on a site in Berlin in September 1994 resulted in a bomb being struck. This initiation and subsequent detonation resulted in 3 workmen being killed and considerable damage to property.

The threat to any proposed investigation or development on the site may arise from the effects of a partial or full detonation of a bomb or ordnance item. The major effects usually being shock, blast, heat and shrapnel damage. It should be noted that the detonation of a 50kg buried bomb could damage brick/concrete structures up to 16m away and unprotected personnel on the surface up to 70m away from the blast. Larger ordnance is obviously more destructive. Table 2 denotes recommended safe distance for UXO.

**Table 2 Safety Distances for Personnel**

UXO (Kg)	Safety Distances (m)			
	Surface UXO		Buried UXO	
	Protected	Unprotected	Protected	Unprotected
<b>2</b>	20	200	10	20
<b>10</b>	50	400	20	50
<b>50</b>	70	900	40	70
<b>250</b>	185	1100	120	185
<b>500</b>	200	1250	140	200
<b>1000</b>	275	1375	185	275
<b>3000</b>	450	1750	300	450
<b>5000</b>	575	1850	400	575

Explosives rarely become inert or lose effectiveness with age. Over time, fuzing mechanisms can become more sensitive and therefore more prone to detonation.

This applies equally to items that have been submersed in water or embedded in silt, clay, peat or similar materials.

Once initiated, the effects of the detonation of the explosive ordnance such as shells or bombs are usually extremely fast, often catastrophic and invariably traumatic to the personnel involved.

The degradation of a shell or bomb may also offer a source of explosive contamination into the underlying soils. Although this contamination may still present an explosion hazard, it is not generally recognised that explosives offer a significant toxicological risk at concentrations well below that at which a detonation risk exists.

## 2 SUMMARY OF PENETRATION DEPTHS

The maximum penetration depth at the site of bombs between 50kg and 1000kg has been calculated based on the site geology.

The above information assumes:

- A high level release with an impact velocity of 260m/s (>5,000 ft altitude).
- A strike angle of 10 - 15° to the vertical.
- That the bomb is stable in flight and on penetration.
- That no retarder units are fitted to the bomb.

A typical high altitude release bomb will enter the ground at between 10 and 15° (to the vertical) and will travel on this trajectory until momentum is nearly lost. The bomb will then turn abruptly to the horizontal before coming to rest. The distance between the centre of the entry hole and the centre of the bomb at rest is known as the "offset". A marked lateral movement from the original line of entry is not uncommon.

The average offset is approximately one third of the penetration depth, i.e. an offset of 2.0m may be expected for a 50kg bomb in clay soils. Hard standing on the site can result in an offset increasing by some four times. It should be noted that bombs striking buildings might be deflected to give a wider variation in the impact angle.

The expected average bomb depths in normal ground and crater sizes are:

**Table 1: Average Bomb Depths and Crater Size.**

Serial	UXB <sup>1</sup> Weight (Kg)	Average Depth <sup>2</sup> (m)	Average Crater Size <sup>3</sup> (m)	
			Buried	Surface
1	50	3.7	6.1 x 1.8	2.75 x 1.8
2	250	7.6	10 x 3	4.6 x 1.5
3	500	9.1	13.7 x 3.7	5.5 x 1.8
4	1000	10.7	17 x 4.9	7.9 x 2.4
5	1800	12.2	22 x 6	10 x 3

Notes:

1. UXB is for a General Purpose iron bomb.

2. Specialised UXB's will differ in depth, e.g. a Deep Penetration bomb is designed to penetrate to a greater depth than a General Purpose bomb.
3. Average craters dimensions relate to clay and should be multiplied by 0.6 for chalk, sand or gravel.
4. Bombs may have settled over the past 55 - 60 years and with the geology and water table on this site a high likelihood of movement can be expected.

### 3 TYPES OF ORDNANCE

#### 3.1 HE Bombs

There are three types of HE bomb classification:

- HE Bombs:- GP (General Purpose) Thin Steel Cased 50kg, 250kg, 500kg, 1000kg and 1800kg.
- Semi Armour Piercing (SAP) Thick Steel Cased 50kg, 250kg, 500kg, 1000kg and 1400kg.
- Large Light Alloy Cased Bombs 1800kg or 2500kg.

#### 3.2 Incendiary Bombs

Different types of incendiary can be classed as:

- 1kg Incendiary Bomb.
- Oil Bombs – Flam c 250 and Flam c 500.
- 4lb Cylindrical Anti-Personnel Bomb.
- Mines, 'C' and 'D' types with parachute and the 'G' type without.

### 4 German Aircraft used to Deliver Bombs over England and their Bomb Loads

The principle bombers, which operated over this country during the war was:

- 4.1 **Dornier 17.** This was a light bomber of the Blenheim type. A typical bomb load would consist of 2 x 250kg, 16 x 50kg or approximately 550 x 1kg incendiary bombs. A combination of all three types was sometimes used. The average total load carried by this aircraft during operations varied between 600kg and 1000kg.
- 4.2 **Heinkel 111 Bomber.** This aircraft could carry either 2 x 500kg, 8 x 250kg, 32 x 50kg or approximately 1100 x 1kg incendiary bombs. It could carry a combination of any of these four types. The typical average load for this aircraft was 1500kg.

**4.3 Junkers 88.** This aircraft could carry either 4 x 500kg, 4 x 250kg, 28 x 50kg or 1100 x 1kg incendiary bombs or any combination of these types. The typical average load for this aircraft was 1500kg.

The He 111 and the Ju88 were retro fitted with external bomb racks carrying 2 x 1000kg bombs, 2 x 'C', 'D' or 'G' type mines or 1 x 1,800kg bomb. Both aircraft could carry three of the large type Incendiary containers, which held either 700 or 360 1kg incendiary bombs.

Reports indicated that the He111 could carry 3 x 'G' type mines; however, this was considered exceptional.

Any of these aircraft could carry the Flam C 250 Oil bomb as an alternative to the relevant number of 250kg HE bombs also the Flam C 500 could be carried by the He 111 and the Ju 88 as an alternative to the 500kg bombs.

## **5 METHODS OF BOMB RELEASE**

All bombs in the loads referred to above could be released singly, in salvoes or in sticks.

It must be remembered that a stick of bombs would vary in length and or shape according to the altitude and speed variation of the aircraft. A straight stick at regular intervals could only be achieved by straight and level flying during the bombing run.

WWII GERMAN INCENDIARIES

1Kg and 1.3kg INCENDIARIES

These are air dropped incendiary bomblets. The bomb is unpainted magnesium; the tail is dark green. The B1EZA and the B1.3EZA may have a red A stenciled on the nose and probably will have a Z stamped on the body near the tail. The B1EZB and the B1.3EZB may have a red B stenciled on the nose and a Z stamped on the body near the tail. The body is a cylindrical alloy casting, threaded internally at the nose to receive the fuze holder and fuze. The after body is tapered to receive the sheet metal, three-finned drum-shrouded tail assembly. The 1.3-kg and 1-kg bombs are identical except that the nose of the former is made of steel, while that of the latter is of light alloy.

Dimensions:

Diameter: 50.8mm  
Length: 248mm

2Kg

This is a small incendiary bomb that has a High Explosive burster. The incendiary body is painted olive green, the tail dark green, and the H.E. container black, unpainted, or dark red. A Z is stamped on the body near the tail, and a red Z is stenciled on the nose. This bomb

consists of three main components: a tail unit, an incendiary body, and an H.E. attachment. The incendiary body is tapered at the after end to fit into the long tail cone and is reduced in diameter at the forward end to fit into the steel H.E. container. A steel plug is fitted into the after end of the incendiary body, while at the forward end are located an igniter pellet, a distance piece, a relay pellet and a black powder separating charge and housing. The H.E. container accommodates the penthrite charge and the fuze. The fuze is armed by a long arming rod which passes through the tail section and locks a spring-out safety pin. A metal wind cap, or drogue, is attached to the after end of the rod. The main body is steel. Dimensions: Diameter: 50.8mm Length: 527mm.

2.2Kg

These are small incendiary bombs dropped from bomb containers. The incendiary bomb proper is painted green over-all, the tail unit is painted dark green; the sleeve is unpainted and the H.E. container is painted bright red. The letter Z is stamped on the incendiary body near the tail. This bomb is similar to the 1-kg incendiary bomb, with modifications to the fuze container. These alterations are: external threading on the nose to receive a sleeve; an additional hole to receive a spring-out safety pin; the addition of a train of burning composition leading to the sleeve. The sleeve contains a length of safety fuse wound on a metal spool. The H.E. container is threaded to the base of the sleeve and contains a detonator to which the safety fuse leads.

These bombs are carried in several different sizes and types of containers.

Dimensions:

Diameter: 50.8mm  
Length: 527mm

PARACHUTE MINE

**Type 'C'** – 8ft 8in long weighing 1000kg with parachute.

**Type 'D'** – 5ft 8in long weighing 500kg with parachute.

**Type 'G'** – 6ft 6in long weighing 1000kg with bakelite tail unit.

The first intentional use of these mines against land targets commenced on the night of September 16, 1940, when numbers of both Type C and Type D mines were dropped in night raids. The mines, with their high charge ratio of 60 to 70 per cent explosive, created considerable blast damage in built-up areas.

Great Yarmouth Circa 1942 - 1954

# 1 INTRODUCTION

---

On the instructions and under the supervision of WSP (the Engineer), acting on behalf of Norfolk County Council (the Employer), a site investigation undertaken by Norfolk Partnership Laboratory (Main Contractor) and James and Milton Drilling Ltd (sub-contractor) at a single site crossing the River Yare in Great Yarmouth.

The Great Yarmouth Third Crossing Project comprises a bridge with a central bascule lifting section located centrally over River Yare, and the associated highway embankments, junctions and infrastructure. The proposed bridge alignment would provide an east-west connection between the Strategic Road Network (A47) and the South Denes Business Park, Enterprise Zone, Great Yarmouth Energy Park and the Outer Harbour, all of which are located on the South Denes peninsula

This factual report has been produced by WSP on behalf of Norfolk Partnership Laboratory for Norfolk County Council.

The objective of the investigation was to determine the ground, groundwater and ground contamination conditions at the site and to provide information that would assist the geotechnical and geoenvironmental design of the proposed works. The scope of the investigation was determined by WSP.

The site work at Great Yarmouth Third River Crossing was carried out between the 11<sup>th</sup> June 2018 and 04<sup>th</sup> July 2018 and comprised:

- Ten cable percussion boreholes
- Four in-situ pressuremeter tests
- In-situ and laboratory testing

The site plan Drawing Reference GYTRC-WSP-HGT-DR-GE-0006 is included in Appendix A.

## 2 THE SITE AND GEOLOGY

---

The site is located at an off-shore location over the River Yare, immediately south of Great Yarmouth town centre. The site is approximately bounded to the west by the port authority berths 31A to 31D and to the east by berths 14B to 13A. The site area covers approximately 0.01 km<sup>2</sup> of over water locations and is centred on National Grid reference 652320, 306005. The location of the site is shown on the appended site location plan, WSP drawing No. GYTRC-WSP-HGT-DR-GE-0006 included in Appendix A.

The British Geology Survey Map Sheet 162 (British Geological Survey, 1991) for Great Yarmouth indicates that the site is underlain by a variety of superficial deposits:

- Tidal river or creek deposits
- Breydon Formation
- Happisburgh Formation

Solid geology underlying the site is shown on the BGS website to comprise sand and gravel of the Crag Group, underlain by London Clay.

Groundsure (Groundsure, 2017) records no historical overwater workings on site. Only ground investigations associated with the quay/ wharf immediately adjacent to the River Yare have been undertaken adjacent to the site.

Extracts from geological map are included in Appendix B

### 3 METHOD OF INVESTIGATION

#### 3.1 GENERAL

Details of in-situ sampling and testing carried out, together with the descriptions of the strata encountered, are given on the exploratory hole (borehole) records. The investigation was carried out in accordance with BS 5930:1999 (British Standard, 1999), BS EN ISO 14688-1:2018 (British Standard, 2018) and BS EN ISO 14689-1:2003 (British Standard, 2018).

Exploratory hole details including depths, surveyed coordinates and in situ testing locations are given in Appendix C.

All geotechnical samples were transported to the laboratories and offices of Norfolk Partnership Laboratory (NPL) for examination and testing as scheduled by the NPL and WSP. Chemical samples were couriered to the Envirolab laboratory in Cheshire for testing as scheduled by WSP.

#### 3.2 UNEXPLODED ORDNANCE RISK MITIGATION SURVEY

At each borehole location, a magnetometer survey was undertaken in order to identify the possible presence of unexploded ordnance (UXO). The testing was carried out by using a magnetic anomaly locator magnetometer or by inspection, in accordance with the guidance provided in CIRIA C681 (CIRIA, 2009). The results of the risk mitigation survey carried out for the ground investigation are given in Appendix D.

The UXO surveys on site were carried out by MACC International.

A MAGNEX 120 LW device was used, which serves for locating ferromagnetic objects which are buried underground or underwater. A further important field of use of the Magnex 120 LW lies in the probing of boreholes where magnetic anomalies have been encountered at relatively great depths or in detections fields with a lot of surface bound interference.

A total of two borehole locations were terminated before reaching their scheduled depth due to high magnetometer readings. At these locations scanned depths were increased but readings remained high. The MACC UXO specialist on site advised that the exploratory holes should be terminated immediately following continuous high readings. A summary of the locations terminated due to high magnetometer readings are provided in the Table 1.

**Table 1 - UXO Borehole Termination Summary**

Location	Date	Termination Depth (m BGL)	Note
MBH1	11/06/2018	4.00	Location moved 4.0m away from original location
MBH5	20/06/2018	0.00	Location moved 3.0m away from original location

#### 3.3 CONTAMINATED SITE PROCEDURES

The site was designated to be in the Institution of Civil Engineers Site Investigation Steering Group Yellow Category and appropriate protection measures were undertaken (Site Investigation Steering Group, 1993).

Hand held sampling tools were cleaned after each sample to prevent cross contamination between samples. Samples for chemical contamination testing were taken as appropriate for the intended analyses, as shown on the exploratory hole records.

Each borehole was cased, which was progressively reduced in diameter with depth. Environmental seals of bentonite pellets, adequately hydrated were installed with every change in casing diameter, in order to prevent downward migration of any contaminants within shallow Alluvial deposits at the river bed.

## 4 FACTUAL INFORMATION

### 4.1 CABLE PERCUSSION BORING

No information from land locations are included in this factual report. The land based ground investigation is presented in the 2018 Factual Report (REF:GYTRC-WSP-VGT-XX-RP-GE-0001).

### 4.2 MARINE CABLE PERCUSSION BORING

Ten cable percussion boreholes using three diameter casings 305mm, 250mm, 200mm and 150mm were sunk to depths below the riverbed level (bgl) between 1.00m and 41.70m using light cable tool percussion boring techniques. The borehole records are included in Appendix C.

The cable percussive boreholes are summarised in the table below:

**Table 2 - Borehole Summary**

Borehole ID	Date Completed	Depth (mbgl)	Location	Easting	Northing	Ground Level
MB01	12/06/2018	4.0	West Side of River Yare	652421	306010	-6.59
MB01A	19/06/2018	25.33	West Side of River Yare	652421	306014	-7.88
MB02	14/06/2018	40.60	West Side of River Yare	652432	305996	-7.87
MB03	18/06/2018	25.45	West Side of River Yare	652422	305978	-7.67
MB04	15/06/2018	1.00	West Side of River Yare	652434	305964	-8.10
MB04A	17/06/2018	41.70	West Side of River Yare	652435	305962	-7.99
MB05	21/06/2018	25.45	West Side of River Yare	652426	305946	-5.77
MB06	25/06/2018	25.60	East Side of River Yare	652494	306024	-6.56
MB07	27/06/2018	40.29	East Side of River Yare	652485	306003	-6.85
MB08	22/06/2018	25.44	East Side of River Yare	652499	305988	-6.70
MB09	04/07/2018	40.45	East Side of River Yare	652490	305973	-6.13
MB010	23/06/2018	25.44	East Side of River Yare	652502	305958	-5.87

A total of two locations, MB01 and MB04, were terminated before the scheduled depth due to an obstruction detected during drilling. Details of the termination are included on the log that are presented in Appendix C. A single borehole (BM05) was relocated before drilling was started due to high Magnetometer readings, as detailed in Section 3.2.

Disturbed samples were taken from the seabed sediment and after that at each change in soil type and at regular vertical intervals during boring in order to identify and give a record of the strata encountered. Environmental disturbed samples were also taken at varying depths within the boreholes which reduced in frequency at deeper depths.

In cohesive soils nominal 100mm diameter general purpose thin-wall driven open tube (U100) samples were taken and subsequently sealed to preserve their natural moisture content.

Standard penetration tests (SPT) using a split spoon (S) or a solid 60° cone (C) were carried out in granular deposits and alternating with U100 sampling in the cohesive materials. The results are shown on the borehole logs in Appendix C.

Where blowing sand were encountered during drilling, preventative measures were undertaken to reduce the negative effects of the blowing. This was achieved by altering the drilling method to reduce the build-up of negative pressures, as well as adding Drilling fluid, i.e. water or a 'Dandopol' polymer/water mix to aid drilling.

### **4.3 DYNAMIC WINDOW SAMPLING BOREHOLES**

No dynamic window samples were undertaken as part of this ground investigation.

### **4.4 TRIAL PITTING**

No Trial pits were undertaken as part of this ground investigation.

### **4.5 INSTRUMENTATION AND MONITORING**

No installations for monitoring purposes were undertaken as part of this overwater ground investigation.

### **4.6 SITE SURVEY**

A topographic survey was completed at locations along the west and east quay walls to aid in locating each off-shore borehole location and in manoeuvring the Jack up rig, prior to the start of the ground investigation. Each borehole was located during the manoeuvring of the jack up with the use of satellite locating equipment and the final surveyed location is derived from these individual surveys.

## 5 FIELD TESTING

### 5.1 STANDARD PENETRATION TESTING

Standard Penetration Tests (SPT's) were carried out using the split spoon (S) sampler or solid cone (C) attachment within the boreholes. The tests were carried out in accordance with BS EN ISO 22476-3:2005+A1:2011 (British Standard, 2006). The results are included on the appended borehole logs presented in Appendix C. The calibration / efficiency information for the relevant drilling rigs are summarised in the table below:

**Table 3 - SPT Efficiency Ratings**

SPT I.D	SPT Rod Type	Calibration Date	SPT Energy Ratio	Boreholes
D4000	Cable Percussive rig	17/11/2017	71.68	All Cable Percussive Boreholes

### 5.2 PRESSUREMETER TESTING

A total of 4 No. Pressuremeter Test locations were undertaken by Cambridge Insitu Limited, as set out by WSP on site. At each location testing was attempted at depths where suitably cohesive material was encountered. Details of the test results and interpretations are presented in Appendix E.

Tests had to be abandoned at many locations due to the borehole stability problems.

The locations of the pressuremeter testing completed is summarised in the table below.

**Table 4 – Pressuremeter Testing Summary**

Test ID	Date Completed	Depth (mbgl)	Remark	Easting	Northing	Riverbed Level
MBH 2	12/06/2018	13.5	Testing not completed - Arm 2 hits limit after one u/r cycle.	652432	305996	-7.87
MBH 2	13/06/2018	20.4	Test completed	652432	305996	-7.87
MBH 9	03/07/2018	23.0	Test completed	652490	305973	-6.13
MBH 9	04/7/2018	39.5	Test completed	652490	305973	-6.13

The scope of works included for 12 No. pressuremeter tests to be undertaken at 6 no. depths in boreholes MBH02 and MBH09. During drilling most of the scheduled test locations encountered ground conditions that were recorded as being too dense or not suitable for undertaking the test. Some locations where testing was attempted comprised low cohesive material and silty sands, which during the setting up of the tests blew around the equipment, resulting in the abandoning of the test. The methods for managing blowing sands during drilling could not be implemented during the setting up of the test equipment. Maintaining a head of water within the casing, with the use of a pump, could not be maintained during the assembly of the hydraulics and jacking system causing sand to blow within the casing around the testing apparatus before the test could be started.

The first test attempted in MBH2 at a depth of 13.50m was terminated after one reload cycle due to a sensor reaching the scale limit.

## 6 LABORATORY TESTING

### 6.1 GEOTECHNICAL LABORATORY TESTING

The laboratory testing schedules for geotechnical tests were prepared by WSP in coordination with the Norfolk Partnership Laboratory.

The information included in this report is taken from the results of tests undertaken by the NPL UKAS accredited testing laboratory No. 0920 and Terra Tek, UKAS accredited testing laboratory No. 0126. The results of the laboratory test certificates attached to this report may not include some of the data required by the test procedure. However, a full set of data is available from the NPL.

The following accredited test procedures were carried out:

- Natural Moisture Content
- Plasticity Index
- Liquid Limit
- Plastic limit
- Particle Size Distribution (PSD)
- Sedimentation
- Triaxial Testing (Quick Undrained Single Stage)

Testing was also scheduled and undertaken envirolab for sulphate suite in accordance with BRE Special Digest 1 (BRE, 2005), for which 57 No. tests were completed. Details of the testing included are listed below:

- Sulphate (total water soluble)
- Sulphate (acid soluble)
- Sulphur (Total)
- pH
- Ammonium (Water Sol 2:1)
- Chloride (Water Sol 2:1)
- Nitrate (Water Sol 2:1)
- Magnesium (Water Sol 2:1)

A summary of the completed testing is shown in the table below:

**Table 5 - Geotechnical Laboratory Testing Summary**

Test	Number	Standard
Natural Moisture Content	217	BS 1377: Part 2 :1990, Section 3
Liquid Limit/ Plasticity Index	31	BS1377-2:1990 CI 4.3 BS1377-2:1990 CI 5
Particle Size Distribution	200	BS 1377: Part 2 :1990, Section 9.1 & 9.4
Determination of Undrained Shear Strength - Definitive	33	BS1377: Part 7: 1990, Clause 8, Single Specimen

Geotechnical laboratory tests were carried out in the period between the June 2018 to August 2018. This report includes all completed geotechnical testing received up to 14<sup>th</sup> September 2018.

The geotechnical laboratory testing has been carried out in accordance with BS 1377: 1990 (British Standard, 1990) using calibrated equipment specified within the British Standard.

The geotechnical laboratory test results are included in this report as Appendix F.

## 6.2 CHEMICAL LABORATORY TESTING

Soil samples selected by WSP were tested against a geo-environmental testing suite as scheduled by WSP. The MCERTS accredited testing was undertaken by EnviroLab (UKAS Laboratory No. 1247).

The following accredited chemical testing test procedures were carried out on soil, water and for leachates:

**Table 6 – Chemical Laboratory Testing Summary**

Determinands	Soil	Soil Leachate
Metals (Arsenic, Boron, Cadmium, Chromium (total and hexavalent), Copper, Lead, Mercury, Nickel, Selenium and Zinc)	✓	✓
pH	✓	✓
TPH CWG (GC-MS aliphatic/aromatic split) inc BTEX and MTBC	✓	✓
VOCs by GCMS (including vinyl chloride)	✓	
SVOCs by GCMS excluding PAHs	✓	✓
speciated PAH (USEPA 16)	✓	✓
Ammonia as N	✓	✓
Phenol	✓	✓
Soil Organic Matter	Selected samples	
Cyanide - total	✓	✓
Cyanide - free	✓	✓
PCB's EC7 Congeners	Selected samples	
PCB's WHO 12 Congeners	Selected samples	
Sulphate - total	✓	
Sulphate - water soluble, 2:1 extract	✓	✓
Asbestos (screen only)	Selected samples	
Total WAC Suite	Selected samples	

Determinands	Soil	Soil Leachate
Leachate prep		✓

In addition to the laboratory testing outlined above selected samples were tested against the Waste Acceptance Criteria (WAC) suite of contaminants for classification for potential offsite disposal. The WAC testing was undertaken between June 2017 to July 2018 by EnviroLab.

Details of the standards used and the test results are presented in the Laboratory Test Results included in Appendix G. All chemical testing will be submitted in AGS format with the electronic version of the report.

## Executive Summary

**The Site:** The study area, centred on the approximate OS National Grid Reference: TG 52451 05820, is located in Great Yarmouth, approximately 10m north of Southtown Common Recreation Ground. The site is bound to the north by residential properties fronting Waveney Road, to the east by the Petersons Distribution Centre, to the south by residential properties fronting Alpha Road and to the west by the A12 Dual Carriageway

The study area is complex / varied, comprising industrial / commercial properties in the east and residential areas mixed with commercial units in the west, with the River Yare passing north to south through the site. The study area encompasses a number of highways; the A1243, Cromwell Road, Cromwell Crescent, Southtown Road, Queen Anne's Road, William Adams Way, Suffolk Road, Beccles Road and the A12. In the west, there is a variety of soft open ground including allotment gardens, residential gardens, areas of dense vegetation, mature woodland and the periphery of Southtown Common Recreation Ground.

**Proposed Works:** The proposed Site Investigation which shall include both onshore and offshore boreholes to a maximum depth of 50m bgl, CPT boreholes to a maximum depth of 30m bgl, trial pits to 3m bgl, observation trenches to 6m bgl and window samples to 6m bgl.

**Risk Assessment Methodology:** In accordance with CIRIA guidelines this assessment has carried out research, analysed the evidence and considered the risks that the site has been contaminated with unexploded ordnance; that such items remained on site; that they could be encountered during any intrusive works and the consequences that could result. Appropriate risk mitigation measures have been proposed.

**Explosive Ordnance Risk Assessment:** Taking into consideration the findings of this study, Dynasafe BACTEC considers the risk across the route to be heterogeneous and can therefore be divided into **Low**, **Medium** and **High** Risk Zones.

### **German UXO:**

- The site was located within central Great Yarmouth within an area of very high bombing density during WWII, with up to 8 x HE bombs likely to have landed on or adjacent to the site boundary. At least 12 further HE bombs are recorded within a 300m radius of the site. In addition, the site is likely to have been affected by 1kg incendiary bombing.
- The eastern extent of the site, comprising busy commercial / industrial areas would have been accessed on a daily basis thereby decreasing the risk of any UXB strike evidence going unnoticed. In addition, these areas may have been subject to post-raid checks for UXB entry holes.
- The western half of the site was occupied by large areas of ambiguous open ground and allotment gardens which are unlikely to have been accessed as regularly or frequently. Access to the allotments would have varied depending on the season and therefore, a UXB could conceivably have fallen here unobserved.
- Moreover, there are multiple areas of clearance and a ruin apparent on site, suggesting that these areas sustained serious bomb damage. As a result, the affected buildings will have been abandoned for a time, increasing the likelihood of subsequent UXO falling on site unnoticed. Therefore, it can be assumed that, for a time, significant quantities of rubble occupied this area and debris may have been strewn across the site, increasing the likelihood of a UXB remaining on site. However, had a UXB landed within the allotments, open ground soft, rubble, or area of open air storage on site it could have gone undetected. Note, that the entry hole of an SC50 (the most commonly deployed German HE bomb) could be as little as 20cm in diameter and therefore, easily obscured in dense vegetation.
- A UXB landing in the river during a night time raid will have been immediately obscured from view, beneath the waterline. Consequently, it is unlikely to have been observed, reported and mapped.
- A UXB entry hole within the river bank mud on site (revealed at low tide) is unlikely to have persisted; the next high tide filling in the hole with water and sediment. Even if evidence of a UXB was observed here and reported, it is highly unlikely to have been recovered by the local bomb disposal unit due to its insignificant location and the impracticalities of deep buried UXB removal in this environment.

### **British/Allied UXO:**

- Due to its coastal location in south-eastern England, Great Yarmouth was considered vulnerable to German invasion and consequently, was well defended by Army and HG units, with River Yare and beaches fortified with static defences, minefields and gun positions.
- A group of WWII anti-invasion defences, including four pillboxes, a road block and a Spigot Mortar emplacement were present within the northern section of the site on the junction of Queen Anne's Road and

Southtown Road. The central element of the site was a substantial road block, designed to check the progress of tanks rather than act as a check point. Further defences were located within the site boundary, located at the westernmost end of Cromwell Road a Spigot Mortar position and associated Type 24 Pillbox were located.

- Although these defence installations were located on site, it is considered highly likely that the risk of shallow buried UXO has been mitigated on site due to post war development.
- Note, that four HAA batteries were situated within a 5km radius of the site during WWII. For the same reasons as given above, it is quite possible that an unexploded AA shell or rocket could have landed in the river on site and remained there.

**The Risk that Unexploded Ordnance Remains on site: Land** - Within the footprint of post-war ground works, the risk of small, shallow buried UXO (LSA, SAA, AA shells and German 1kg incendiaries) remaining will have been partly mitigated since any such items could have been encountered and removed during soil stripping / levelling, foundations etc.

Only within the volume of any post-war basement level bulk excavations and at the precise locations of any post-war pile foundations / boreholes, will the risk from deeper buried German HE UXBs have been completely mitigated. Therefore, it is conceivable that such a weapon could reside within virgin / untouched geology, beneath and amongst any such post-WWII ground works, down to the maximum bomb penetration depth. The risk from UXO contamination within the eastern extent of the site and pre-war buildings has been assessed as minimal and therefore the risk from UXO remaining is minimal.

**River** - It has been assessed that a HE UXB falling in the river will likely have achieved full burial within the overburden sediment and may also have penetrated the Crag Group bedrock. Consequently, such a UXB will have remained in situ up to the present day, largely unaffected by environmental conditions. Also, any large partially buried UXBs on site are less likely to be affected by environmental conditions as a result of their significant mass.

Tidal riverbed environments are mobile in nature and therefore as a result of water currents, any small items of UXO (British AA shells and German 1kg IBs) residing on or near the riverbed surface could experience migration. This is evidenced by the large quantity of munitions that are washed up on beaches around the UK, every year. The wider River Yare environment will have been subject to the same UXO contamination conditions as the site during WWII and therefore although riverbed UXO could have migrated out of the site since WWII, equally, additional UXO could have migrated into the site.

**Bomb Penetration Assessment:** It has been assessed that a 500kg bomb would have had an approximate maximum bomb penetration depth of between **8-10m** below WWII ground level. Penetration depth could potentially have been greater if the UXB was larger (though only 4% of German bombs used in WWII over Britain were of that size). Note that UXBs may be found at any depth between just below the WWII ground level and the maximum penetration depth.

**Recommended Risk Mitigation Measures:** Dynasafe BACTEC believes the following risk mitigation measures should be deployed to support the proposed works at the Southtown, Great Yarmouth site:

- Site Specific Explosive Ordnance Safety and Awareness Briefings to all personnel conducting intrusive works.
- The Provision of Unexploded Ordnance Site Safety Instructions.
- Explosive Ordnance Disposal (EOD) Engineer presence on site to support shallow intrusive works.
- Handheld Intrusive Magnetometer Survey of all borehole locations down to the maximum bomb penetration depth.
- Non-Intrusive Magnetometer and Side Scan UXO Survey.
- Intrusive Magnetometer Survey - Down-hole Vallon Probing ahead of Marine Boreholes.

**Further Recommended Measures should the Scope of Works Change:**

- Intrusive Magnetometer Survey of all pile / boreholes locations down to the maximum bomb penetration depth.
- Pre-Piling Intrusive Magnetometer Survey: TFG Clearance ahead of Piling.
- Intrusive Magnetometer Survey: Down-hole Vallon Probing ahead of Piling.

# Explosive Ordnance Threat Assessment

In Respect of

## Southtown, Great Yarmouth

### 1 Introduction

#### 1.1 Background

WSP UK Limited has commissioned Dynasafe BACTEC Limited to conduct an Explosive Ordnance Threat Assessment for the Southtown, Great Yarmouth site.

Unexploded Ordnance (UXO) presents a significant threat to construction projects in parts of the UK as a result of enemy actions during the two 20<sup>th</sup> Century World Wars and historic British and Allied military activity.

It is estimated that over 20% of the UK landmass has been used for military training at some point and between 2006 and 2009, over 15,000 items of mainly British / Allied ordnance (excluding small arms ammunition) were found on UK construction sites.

In addition, one of the legacies of the two World Wars is buried unexploded air-dropped bombs or anti-aircraft projectiles resulting from the failure of a proportion of such weapons to function as designed. It is commonly accepted that the failure rate of these munitions was approximately 10% and, depending on their shape, weight, velocity and ground conditions many penetrated the ground and came to rest at depth.

Intensive efforts were made during and after the war to locate and render safe all UXO but, unsurprisingly, not all were found and dealt with. This is evidenced by the regular, on-going discoveries of UXO during construction-related intrusive ground works.

As a result of a generally increased risk awareness amongst professionals involved in ground engineering works and proactive health and safety measures, the threat to life and limb from UXO has been minimised. However even the simple discovery of a suspected device during on-going works can cause considerable disruption to production and cause unwanted delays and expense.

Such risks can be more fully addressed by a better understanding of the site-specific threat and the implementation of appropriate risk mitigation measures.

### 2 Construction Industry Duties and Responsibilities

#### 2.1 The UK Regulatory Environment

There is no specific legislation covering the management and control of the UXO risk in the UK construction industry but issues regarding health and safety are addressed under a number of regulatory instruments, as outlined below.

In practice, the regulations impose a responsibility on the construction industry to ensure that they discharge their obligations to protect those engaged in ground-intrusive operations (such as archaeology, site investigation, drilling, piling or excavations) from any reasonably foreseeable UXO risk.

## 2.2 The Health and Safety at Work Act, 1974

The Act places a duty of care on an employer to put in place safe systems of work to address, as far as is reasonably practicable, all risks (to employees and the general public) that are reasonably foreseeable.

## 2.3 Construction (Design and Management) Regulations 2015

CDM 2015 ensures that health and safety within the construction industry is continually improved:

- Works are sensibly planned and managed.
- Competent staff are engaged in the works.
- Risks are identified and managed.
- All parties cooperate and coordinate activities.
- Communication flows to those who require it.
- Workers are consulted and engaged about risks and how they are being managed.

In line with CDM 2015 legislation, Dynasafe BACTEC Limited are able to assist parties in their discharge of CDM duties as follows:

- Assist Principal Designers with pre-construction information and risk assessments
- Assist the Designer with the Designer's Risk Assessment.
- Issue UXO risks as have been identified, and manage risks accordingly.
- Assist the Principal Contractor with the construction phase information, in particular risk assessments and mitigation strategies.
- Plan, manage and monitor survey and clearance works under Dynasafe BACTEC Limited's control.

## 2.4 Other Legislation

Other relevant legislation includes the "Management of Health and Safety at Work Regulations 1999" and "The Corporate Manslaughter and Corporate Homicide Act 2007".

# 3 The Role of the Authorities and Commercial Contractors

## 3.1 The Authorities

The Police have the responsibilities for co-ordinating the emergency services in the case of an ordnance-related incident on a construction site. They will make an initial assessment (i.e. is there a risk that the find is ordnance or not?) and if they judge necessary impose a safety cordon and/or evacuation and call the military authorities (JSEODOC - Joint Services Explosive Ordnance Disposal Operations Centre) to arrange for investigation and/or disposal. In the absence of an EOD specialist on site many Police Officers will use the precautionary principle, impose cordon(s)/evacuation and await advice from the JSEODOC.

The priority given to the request by JSEODOC will depend on their judgement of the nature of the threat (ordnance, location, people and assets at risk) and the availability of resources. They will respond immediately or as resources are freed up. Depending on the on-site risk

assessment the item of ordnance may be removed or demolished (by controlled explosion) in situ. In the latter case additional cordons and/or evacuations may be necessary.

Note that the military authorities will only carry out further investigations or clearances in very high profile or high-risk situations. If there are regular ordnance finds on a site, the JSEODOC may not treat each occurrence as an emergency and will encourage the construction company to put in place alternative procedures (i.e. the appointment of a commercial contractor) to manage the situation and relieve pressure from the JSEOD disposal teams.

### 3.2 Commercial Contractors

In addition to pre-construction site surveys and follow-on clearance work, a commercial contractor is able to provide a reactive service on construction sites. The presence of a qualified EOD Engineer with ordnance recognition skills will avoid unnecessary call-outs to the authorities and the Contractor will be able to arrange for the removal and disposal of low risk ordnance. If high risk ordnance is discovered actions will be co-ordinated with the authorities with the objective of causing the minimum possible disruption to site operations whilst putting immediate, safe and appropriate measures in place.

## 4 This Report

### 4.1 Aims and Objectives

The aim of this report is to examine the possibility of encountering any explosive ordnance during any intrusive works at the Southtown, Great Yarmouth site. Risk mitigation measures will be recommended, if deemed necessary, to eliminate or reduce the threat from explosive ordnance during the envisaged works. The report follows the CIRIA Guidelines.

The following issues will be addressed in the report:

- The risk that the site was contaminated with unexploded ordnance.
- The risk that UXO remains on site.
- The risk that ordnance may be encountered during any intrusive works.
- The risk that ordnance may be initiated.
- The consequences of initiating or encountering ordnance.

Risk mitigation measures, appropriate to the assessed level of risk and site conditions, will be recommended if required.

### 4.2 Approach

In preparing this Explosive Ordnance Threat Assessment Report, Dynasafe BACTEC has considered general and, as far as possible, site specific factors including:

- Evidence of German bombing and delivery of UXBs.
- Site history, occupancy and conditions during WWII.
- The legacy of Allied military activity.
- Details of any known EOD clearance activity.
- The extent of any post war redevelopment.
- Scope of the current proposed works.

### 4.3 Sources of Information

Dynasafe BACTEC has carried out detailed historical research for this Explosive Ordnance Threat Assessment including accessing military records and archived material held in the public domain and in the MoD.

Material from the following sources has been consulted:

- The National Archives.
- Norfolk Record Office.
- Norfolk County Council.
- Landmark Maps.
- Peel Ports Great Yarmouth.
- Council for British Archaeology.
- Available material from 33 Engineer Regiment (EOD) Archive.
- Relevant information supplied by WSP UK Limited.
- Dynasafe BACTEC's extensive archives built up over many years of research and hands-on Explosive Ordnance Disposal activities in the UK.
- Open sources such as published books, local historical records and the internet.

### 4.4 General Considerations

This report is based upon research of historical evidence. Whilst every effort has been made to locate all relevant material Dynasafe BACTEC cannot be held responsible for any changes to the assessed level of risk or risk mitigation measures based on documentation or other information that may come to light at a later date.

The accuracy and comprehensiveness of wartime records is frequently difficult or impossible to verify. As a result, conclusions as to the exact location, quantity and nature of the ordnance threat can never be definitive but must be based on the accumulation and careful analysis of all accessible evidence. Dynasafe BACTEC cannot be held responsible for inaccuracies or gaps in the available historical information.

### 4.5 Bombing Records

During WWII, considerable efforts were expended in recording enemy air raids. Air Raid Precautions (ARP) wardens were responsible for making records of bomb strikes either through direct observation or by post-raid surveys. However, their immediate priority was to deal with casualties and limit damage, so it is to be expected that records are often incomplete and sometimes contradictory. Record keeping in the early days of bombing was not comprehensive and details of bombing in the early part of the war were sometimes destroyed in subsequent attacks. Some reports may cover a single attack, others a period of months or the entire war.

Records of raids that took place on sparsely or uninhabited areas were often based upon third party or hearsay information and are not always reliable; records of attacks on military or strategic targets were often maintained separately from the general records and have not always survived.

## 5 The Site

### 5.1 Site Location

The study area is located in Great Yarmouth, approximately 10m north of Southtown Common Recreation Ground. The site is bound to the north by residential properties fronting Waveney Road, to the east by the Petersons Distribution Centre, to the south by residential properties fronting Alpha Road and to the west by the A12 Dual Carriageway.

The site, centred on the approximate OS National Grid Reference: TG 52451 05820.

Site Location Maps are presented in **Annex A**.

### 5.2 Site Description

The study area is complex / varied, comprising industrial / commercial properties in the east and residential areas mixed with commercial units in the west, with the River Yare passing north to south through the site.

The study area encompasses a number of highways; the A1243, Cromwell Road, Cromwell Crescent, Southtown Road, Queen Anne's Road, William Adams Way, Suffolk Road, Beccles Road and the A12.

In the west, there is a variety of soft open ground including allotment gardens, residential gardens, areas of dense vegetation, mature woodland and the periphery of Southtown Common Recreation Ground.

A Recent Aerial Photograph of the site is presented in **Annex B**.

## 6 Scope of the Proposed Works

The proposed Site Investigation which shall include both onshore and offshore boreholes to a maximum depth of 50m bgl, CPT boreholes to a maximum depth of 30m bgl, trial pits to 3m bgl, observation trenches to 6m bgl and window samples to 6m bgl.

A Site Plan showing the proposed future development of the site is presented in **Annex C**.

## 7 Ground Conditions

Published British Geological Survey (BGS) scale mapping indicates that the western extent of the site is underlain by superficial Breydon Formation (Peat), whilst the River Yare and the eastern extent of the site is underlain with Tidal River or Creek Deposits (Clay and Silt). Whereas the entirety of the site is underlain by Crag Group bedrock.

Data supplied by the WSP UK Limited, for a borehole sunk on land in 2007, records the following shallow geology on site:

- 1m of Made Ground.
- 3m of Sand (Tidal and River Creek Deposits).
- >10m of Sand (dense brown fine medium and coarse Sand – North Denes Formation).

A (marine) log (dated 2007) for a borehole sunk on site records the following shallow geology:

- 1.39m of Sand (shelly Sand with occasional silt/clay).

- >8.21m of Sand (Sand with layers of gravel).

## 8 Site History

Latest available pre-WWII and earliest available post-WWII OS maps were obtained from Landmark Maps. These are presented in **Annex D** and described below:

### 8.1 Pre-WWII

The 1927 (1:2,500 scale) map shows the site split into two halves by the River Yare. The eastern half is occupied by multiple industrial buildings, areas of open ground, unlabelled roadways and part of *Fish Wharf*. A rail siding supplying the Wharf is present in three locations within the eastern half of the site.

The western half of the site is predominantly occupied by residential properties, open ground and *Allotment Gardens*. The western half of the site is crossed by *Southtown Road*, *Queen Anne's Road*, *Cromwell Road* and smaller unlabelled roadways. The southern section of the site occupied the peripheries of *Southtown Common Recreation Ground*.

Note, that a 1927 (1: 2,500 scale) map was reviewed (not annexed) which shows the westernmost section of the site to be occupied by open ground.

### 8.2 Post-WWII

The 1949 (1:2,500 scale) map shows the eastern half of the site to have undergone two small areas of clearance, whilst the south-easternmost section of the site encroaches upon an area of redevelopment. No further major changes have occurred on this part of the site.

The western half of the site has sustained five areas of clearance across the site, whilst a single *Ruin* is located to the centre of the site. Note, the westernmost section of the site remains open ground.

Within the immediate surrounding area, a number of examples of clearance, redevelopment and ruins are noted. Such observations are often indicative of serious bomb damage on early post-WWII OS maps.

## 9 The Threat from German Aerial Bombing and Artillery Shelling

### 9.1 Conflict History of Great Yarmouth

#### 9.1.1 First World War

##### 9.1.1.1 Air Raids

A WWI bomb census map, shows that the town was subject to aerial bombardment. Note however that the map does not allow an accurate assessment of the bomb strike locations in relation to the study area due to the small scale and lack of detail.

Great Yarmouth suffered the first aerial bombardment in the UK, inflicted by Zeppelin L3 on 19<sup>th</sup> January 1915. Humberside is thought to have been the intended target, however, due to navigational difficulties, Great Yarmouth was attacked.

The Zeppelin reportedly dropped 10 bombs across the town; one of which landed outside the First and Last Tavern in Southgate Road by Fish Wharf. No casualties were sustained, the damage was confined to broken windows and a hole in the road. A second bomb landed adjacent to a riverside restaurant at Fish Wharf causing extensive damage, inflicted one

casualty from shattering glass. Therefore, as Fish Wharf occupies the eastern extent of the site it is likely that these bombs landed on site. However, no UXBs were noted.

#### **9.1.1.2 Naval Bombardment**

On the 25<sup>th</sup> April 1916 Lowestoft was attacked by the German Navy. Four large German battle cruisers (SMS Lützow, Derfflinger, Moltke and Von der Tann) supported by U-Boats bombarded the town with 6", 11" and 12" projectiles from a distance of approximately 6.5km. The attack commenced at 04:10 and lasted for 10 minutes.

The secondary target for this raid was to be Great Yarmouth however, the Royal Navy were made aware of the Germans actions and the British fleet engaged the German ships. This, coupled with heavy fog meant that only a few shells were fired at Great Yarmouth before the German warships pulled back.

#### **9.1.1.3 Deductions**

Although this study recognises the threat posed by WWI bombs and shells, it cannot be quantified to the same degree as the WWII threat due to the lack of complete and accurate incident records.

WWI bombs were generally smaller than those used in WWII and were dropped from a lower altitude, resulting in limited UXB penetration depths. Aerial bombing was often such a novelty at the time that it attracted public interest and even spectators to watch the raids in progress.

As only a few shells landed in Great Yarmouth it is unlikely that any failed to explode. Therefore, the risk of a German WWI unexploded bomb or shell landing on site unobserved, and subsequently going unreported, is considered minimal and therefore the risk from German WWI UXO is considered low and will not be further addressed in this report.

### **9.1.2 Second World War**

The Luftwaffe reportedly carried out more bombing raids on Great Yarmouth than any other coastal town, due in part to the presence of an important port with a large fishing fleet and associated industries.

Moreover, due to the town's position on the east coast, where it was difficult to detect an incoming attack en route to the Midlands, it would have been vulnerable to 'tip and run' incidents, whereby an enemy aircraft under heavy AA fire or fighter interception would prematurely jettison its bomb load in order to evade the defences or indiscriminately deposit unused ordnance whilst returning to bases in northern Europe.

Consequently, the town was frequently attacked by German bombers. In a total of 237 properties were destroyed, 1,598 were severely damaged and subsequently demolished, 1,816 were seriously damaged but repairable and 19,818 were slightly damaged.

The available records of bombing incidents for Great Yarmouth are presented in the following sections.

## **9.2 Second World War Bombing Records**

### **9.2.1 Bombing Statistics**

The following table summarises the quantity of German bombs (excluding 1kg incendiaries and anti-personnel bombs) falling on the Municipal Borough of Great Yarmouth (within which the site was historically located) between 1940 and 1945: (source: National Archives)

<b>Record of German Ordnance Dropped on the Municipal Borough of Great Yarmouth</b>	
Area Acreage	3,598
High Explosive Bombs (all types)	910
Parachute Mines	9
Oil Bombs	1
Phosphorus Bombs	8
Fire Pot	10
V1 Flying Bomb	0
V2 Long Range Rocket	0
Total	938
<b>Items Per 1,000 Acres</b>	<b>260.7</b>

Evidence from a secondary source shows the statistics regarding the quantity of UXO dropped on Great Yarmouth<sup>1</sup>:

<b>Record of German UXO Dropped on the Municipal Borough of Great Yarmouth</b>	
High Explosive (all types)	221 (12)
Parachute Mines	7 (2)
Phosphorus Bombs	7 (1)
Fire Pot	10
Oil Bomb	1
V1 Flying Bomb	0
Unclassified HE Bombs	653 (60)

*N.B. Number denoted in brackets are Unexploded Bombs*

Detailed records of the quantity and locations of the 1kg incendiary and anti-personnel bombs were not routinely maintained by the authorities as they were frequently too numerous to record. However, an estimated 1,590 of these IBs were recorded in the Municipal Borough of Great Yarmouth.

Although the incendiaries are not particularly significant in the threat they pose, they nevertheless are items of ordnance that were designed to cause damage and inflict injury and should not be overlooked in assessing the general risk to personnel and equipment. The anti-personnel bombs were used in much smaller quantities and are rarely found today but are potentially more dangerous. This table does not include UXO found during or after WWII.

---

<sup>1</sup> Bowyer, M. *Air Raid the Emergency air offensive against East Anglia 1939-1945* (1986)

### 9.2.2 Great Yarmouth Bomb Plot Map

This Great Yarmouth Bomb Plot Map (presented in **Annex E**) only records 28 raids between 11/10/1941 and 31/05/1944, taken from the National Archives. It records the closest HE bomb strike to be approximately 115m south-west of the site. Note, this map only depicts a small quantity of the ordnance dropped on the town as Luftwaffe activity was greater between the summers of 1940 and 1941.

### 9.2.3 Great Yarmouth Bomb Census Map

A bomb census map for the wider area included within a publication (*J. P. Foynes 1994*) was reviewed. A section of this small-scale map (presented in **Annex F**) depicts the locations of bombs and mines dropped on Great Yarmouth throughout the duration of WWII.

It records approximately 8 x HE bomb strikes on or within the site boundary and multiple 1kg IBs to have fallen on site.

However, this map has very few geographical indicators and is of poor quality, therefore should not be considered an accurate representation of the distribution of bomb strikes in and around Great Yarmouth. Note, however it is possible to apply some accuracy when plotting the site due to the gas works location immediately to the east of the site.

### 9.2.4 WWII-era RAF Aerial Photography

Historical RAF aerial photography of the site was supplied by Norfolk County Council. A post-WWII image is presented in **Annex F**.

This photography, was taken in 1946, and shows the site in its entirety, much as it appears in the OS Mapping. Although of small scale and low resolution it shows the western half of the site to be occupied by large areas of unused open ground, allotment gardens, hard-surfaced roadways and residential properties.

The eastern half of the site is occupied by a number of industrial buildings and hard-surfaced roadways, which appear to have survived the war intact. Note, that there are two smaller areas set back from the quayside which appear to be occupied by open soft ground which may have been used for the storage of materials during the war. An area of clearance is apparent within the western section of the site as is consistent to post-war OS Mapping, and is likely a result of bomb damage.

Note, no HE bomb craters are visible within the open soft ground, however, such features on worked ground (allotments) are likely to have been infilled during the war. Therefore, a UXB entry hole could have gone unnoticed on site.

### 9.2.5 Abandoned Bombs

A post-air raid survey of buildings, facilities and installations would have included a search for evidence of bomb entry holes. If evidence were encountered, Bomb Disposal Officer teams would normally have been requested to attempt to locate, render safe and dispose of the bomb. Occasionally evidence of UXBs was discovered but due to a relatively benign position, access problems or a shortage of resources the UXB could not be exposed and rendered safe. Such an incident may have been recorded and noted as an Abandoned Bomb.

Given the inaccuracy of WWII records and the fact that these bombs were 'abandoned', their locations cannot be considered definitive, nor the lists exhaustive. The MoD states that 'action to make the devices safe would be taken only if it was thought they were unstable'. It should be noted that other than the 'officially' abandoned bombs, there will inevitably be UXBs that

were never recorded. Dynasafe BACTEC holds no records of officially registered abandoned bombs at or near the site.

### 9.3 Likelihood of Post-raid UXO Detection

Utilising the available historical bombing records as reviewed in *Section 9.2*, it is possible to make an assessment of the likelihood that evidence of UXO would have been noted on a site during the war and the incident dealt with or recorded at the time. Factors such as bombing density, frequency of access, ground cover, damage and failure rate have been taken into consideration.

#### 9.3.1 Density of WWII Bombing

Bombing density is an important consideration for assessing the possibility that UXO remains in an area. A very high density can for example result in increased levels of damage sustained to structures, greater likelihood of errors in record keeping and a higher risk that UXBs fell over the area.

The site was located within an area of very high bombing density during WWII, with up to 8 x HE bombs likely to have landed on or adjacent to the site boundary. At least 12 further HE bombs are recorded within a 300m radius of the site. In addition, the site is likely to have been affected by 1kg incendiary bombing.

#### 9.3.2 Damage

If structures on a site have been subject to significant bomb or fire damage, rubble and debris are likely to have been present; similarly, a HE bomb strike on open ground is likely to have resulted in a degree of soil disturbance. Under such conditions there is a greater risk of the entry holes of UXBs dropped during subsequent raids being obscured and going unnoticed.

A review of the historical resources suggests that many of the buildings on site survived the war largely intact. Note however, the available aerial photograph does not allow for an accurate assessment of bomb damage to all buildings.

Note, there are multiple areas of clearance apparent within the western section of the site, and a single ruin, suggesting that these areas sustained serious bomb damage. As a result, the affected buildings will have been abandoned for a time, increasing the likelihood of subsequent UXO falling on site unnoticed. Therefore, it can be assumed that, for a time, significant quantities of rubble occupied this area and debris may have been strewn across the site.

#### 9.3.3 Frequency of Access

UXO at sites where human access was infrequent would have a higher chance of being overlooked than at those sites which were subject to greater occupancy. The importance of a site or facility to the war effort is also an important consideration as such sites are likely to have been both frequently accessed and are also likely to have been subject to post-raid checks for evidence of UXO.

The eastern extent of the site was occupied by Fish Wharf, comprising quayside areas and associated buildings / structures during the war. Note, however there is an area of open ground that may have possibly been occupied by dense vegetation/bare earth or used for open air storage during the war. Therefore, decreasing the likelihood of regular / frequent access.

These busy commercial / industrial areas would have been accessed on a daily basis thereby decreasing the risk of any UXB strike evidence going unnoticed. In addition, these areas may have been subject to post-raid checks for UXB entry holes.

The western half of the site was occupied by large areas of ambiguous open ground and allotment gardens. These areas are unlikely to have been accessed as regularly or frequently as the developed portion of the site. Access to the allotments would have varied depending on the season and therefore a UXB could conceivably have fallen here unobserved. This is especially pertinent since many of the German air raids over Great Yarmouth took place at night. Furthermore, the undeveloped parts of the site would not have been subject to specific post-raid searches for UXO.

#### 9.3.4 Ground Cover

The degree and type of groundcover present during WWII would have a significant effect on the visual evidence at ground level which may have indicated the presence of buried UXO.

Evidence of German UXO will have been obvious within the developed, undamaged parts of the study area, as a UXB strike to buildings and hard-standing will still have caused significant damage or an obvious, persistent entry hole, even without detonating. Following any such incident, the UXB would have been reported and subsequently exhumed / removed.

However, had a UXB landed within the allotments, open ground soft, rubble, or area of open air storage on site it could have gone undetected. Note, that the entry hole of an SC50 (the most commonly deployed German HE bomb) could be as little as 20cm in diameter and therefore, easily obscured in dense vegetation.

A UXB entry hole within the river bank mud on site (revealed at low tide) is unlikely to have persisted; the next high tide filling in the hole with water and sediment. Even if evidence of a UXB was observed, it is unlikely to have been reported due to its insignificant position.

A UXB striking the water on site will have been immediately obscured from view and therefore, is unlikely to have been observed, reported and mapped.

Also noteworthy is that during WWII German 1kg incendiary bombs were observed to penetrate to a significant depth when dropped into soft ground. The photograph presented in **Annex H** shows how such a sub-munition (known to have been deployed locally), could have remained undetected in the post-war period.

#### 9.3.5 Bomb Failure Rate

There is no evidence to suggest that the bomb failure rate in the vicinity of the site would have been different from the “approximately 10%” figure normally used.

### 9.4 Generic Types of WWII German Air-delivered Ordnance

The nature and characteristics of the ordnance used by the Luftwaffe allows an informed assessment of the hazards posed by any unexploded items that may remain today. Detailed illustrations of German air delivered ordnance are presented at **Annex I**.

- **HE Bombs:** In terms of weight of ordnance dropped, HE bombs were the most frequent weapon deployed. Most bombs were 50kg, 250kg or 500kg (overall weight, about half of which was the high explosive) though large bombs of up to 2,000kg were also used. HE bombs had the weight, velocity and shape to easily penetrate the ground intact if they failed to explode. Post-raid surveys would not always have spotted the entry hole or other indications that a bomb penetrated the ground and failed to explode and contemporary ARP documents describe the danger of assuming that damage, actually caused by a large UXB, was due to an exploded 50kg bomb. Unexploded HE bombs therefore present the greatest risk to present-day intrusive works.

- Blast Bombs/Parachute Mines: Blast bombs generally had a slow rate of descent and were extremely unlikely to have penetrated the ground. Non-retarded mines would have shattered on most ground types, if they had failed to explode. There have been extreme cases when these items have been found unexploded, but this was where the ground was either very soft or where standing water had reduced the impact. BACTEC does not consider there to be a significant threat from this type of munition on land.
- Large incendiary bombs: This type of bomb ranged in size from 36kg to 255kg and had a number of inflammable fill materials (including oil and white phosphorus), and a small explosive charge. They were designed to explode and burn close to the surface but their shape and weight meant that they did have penetration capability. If they penetrated the ground complete combustion did not always occur and in such cases, they remain a risk to intrusive works.
- 1kg Incendiary Bombs (IB): These bombs, which were jettisoned from air-dropped containers, were unlikely to penetrate the ground and in urban areas would usually have been located in post-raid surveys. However, if bombs did not initiate and fell in water or dense vegetation, or became mixed with rubble in bomb damaged areas they could have been overlooked. Some variants had explosive heads and these present a risk of detonation during intrusive works.
- Anti-personnel (AP) Bomblets: AP bombs had little ground penetration ability and should have been located by the post-raid survey unless they fell into water, dense vegetation or bomb rubble.
- Specialist Bombs (smoke, flare, etc): These types do not contain high explosive and therefore a detonation consequence is unlikely. They were not designed to penetrate the ground.

## 9.5 German Air-delivered Ordnance Failure Rate

Based on empirical evidence, it is generally accepted that 10% of the German HE bombs dropped during WWII failed to explode as designed. This estimate is probably based on the statistics of wartime recovered UXBs and therefore will not have taken account of the unknown numbers of UXBs that were not recorded at the time, and is probably an underestimate.

The reasons for failures include:

- Fuze or gain malfunction due to manufacturing fault, sabotage (by forced labour) or faulty installation.
- Clockwork mechanism failure in delayed action bombs.
- Failure of the bomber aircraft to arm the bombs (charge the electrical condensers which supplied the energy to initiate the detonation sequence) due to human error or equipment defect.
- Jettison of the bomb before it was armed or from a very low altitude. Most likely if the bomber was under attack or crashing.

War Office Statistics document that a daily average of 84 bombs which failed to function were dropped on civilian targets in Great Britain between 21<sup>st</sup> September 1940 and 5<sup>th</sup> July 1941. 1 in 12 of these (probably mostly fitted with time delay fuzes) exploded sometime after they fell - the remainder were unintentional failures.

There is no evidence to suggest that the bomb failure rate in the vicinity of the study area would have been different from the “approximately 10%” figure normally used.

From 1940 to 1945 bomb disposal teams dealt with a total of 50,000 explosive items of 50kg and over (i.e. German bombs), 7,000 AAA shells and 300,000 beach mines. These operations resulted in the deaths of 394 officers and men.

Media articles relating to recent German UXB finds on land and underwater are presented in **Annex J**.

## 9.6 Initiation of Unexploded Bombs

Unexploded bombs do not spontaneously explode. All high explosive requires significant energy to create the conditions for detonation to occur. In the case of unexploded German bombs discovered within the construction site environment, there are a number of potential initiation mechanisms:

- Direct impact onto the main body of the bomb: Unless the fuze or fuze pocket is struck, there needs to be a significant impact (e.g. from piling or large and violent mechanical excavation) to initiate a buried iron bomb. Such violent action can cause the bomb to detonate.
- Re-starting the clock timer in the fuze: Only a small proportion of German WWII bombs employed clockwork fuzes. It is probable that significant corrosion has taken place within the fuze mechanism over the last 60 years that would prevent clockwork mechanisms from functioning, nevertheless it was reported that the fuze in a UXB dealt with by 33 EOD Regiment in Surrey in 2002 did re-commence.
- Induction of a static charge, causing a current in an electric fuze: The majority of German WWII bombs employed electric fuzes. It is probable that significant corrosion has taken place within the fuze mechanism over the last 60 years such that the fuze circuit could not be activated.
- Friction impact initiating the (shock-sensitive) fuze explosive: This is the most likely scenario resulting in the bomb detonating.

**Annex K** details UXB incidents where intrusive works have caused UXBs to detonate, resulting in death or injury and damage to plant.

## 10 Unexploded Bomb Penetration

### 10.1 General Considerations

The actual penetration depth of aerial delivered bombs into the ground will have been determined by the mass and shape of the bomb, the velocity and angle of the bomb on impact (dependent on the height of release) and the nature of the ground and ground cover; the softer the ground, the greater the potential penetration. Peat, alluvium and soft clays are easier to penetrate than gravel and sand. Bombs are brought to rest or are commonly deflected by bedrock or large boulders.

### 10.2 The “j” Curve Effect

An air-dropped bomb falling from normal bombing altitude (say 5,000m) into homogeneous ground will continue its line of flight but turn in an upwards curve towards the surface as it comes to rest. This offset from vertical is generally thought to be about one third of the penetration depth, but can be up to 15m depending on ground conditions or the bomb’s angle of impact.

### 10.3 Second World War UXB Land Penetration Studies

During WWII, the Ministry of Home Security undertook a major study on actual bomb penetration depths, carrying out statistical analysis on the measured depths of 1,328 bombs as reported by Bomb Disposal, mostly in the London area. They then came to conclusions as to the likely average and maximum depths of penetration of different sized bombs in different geological strata.

The median penetration of 430 x 50kg German bombs in London Clay was 4.6m and the maximum penetration observed for the SC50 bomb was 9m.

They concluded that the largest common German bomb, 500kg, had a likely penetration depth of 6m in sand or gravel but 8.7m in clay. The maximum observed depth for a 500kg bomb was 10.2m and for a 1,000kg bomb 12.7m. Theoretical calculations suggested that significantly greater penetration depths were probable.

### 10.4 Maximum Bomb Penetration Depth - Land

To assess the maximum bomb penetration depth at the eastern and western (land) extents of the site, the following parameters have been used:

- WWII Geology - 1m of Made Ground, >13m of Sand.
- Impact Angle and Velocity - 80-90° from horizontal and 267 metres per second.
- Bomb Mass and Configuration - The 500kg SC (General Purpose) HE bomb, without retarder units or armour piercing nose. This was the largest of the common bombs used against Britain.

Taking into account the above-mentioned factors it has been assessed that a 500kg bomb would have had an approximate maximum bomb penetration depth of **8-10m** below WWII land level. Penetration depth could potentially have been greater if the UXB was larger (though only 4% of German bombs used in WWII over Britain were of that size). Note that UXBs may be found at any depth between just below the WWII ground level and the maximum penetration depth.

### 10.5 UXB Penetration through Water

UXB penetration of riverbed (through water) provides a more challenging scenario to model. The key considerations are:

- Bombs hit the water at the terminal velocity of air: 267 metres per second.
- Ignoring surface tension there will be an immediate loss of inertia due to rapid energy losses; sound, wave, splash, bubble formation and cavitation.
- The drag force rapidly decelerates the bomb. If there is sufficient water depth then acceleration will become 0m/s<sup>2</sup> and terminal velocity through water will be achieved: 11m/s.
- Once the terminal velocity in water is reached the bomb impacts the riverbed as a free-fall penetrator, not necessarily in a nose down orientation.

Analysis of the air-water-soil regime is complex. The current model assumes that 5m of water is required in order to achieve the terminal velocity in water of a 500kg UXB. Impacts at this speed will cause a penetration of 2.3m assuming a riverbed bearing capacity of 75kPa (*Department of The US Army, TM 5-855-1*). However, the bearing capacity of the riverbed sediment within the site boundary is not known.

In order to assess the bomb penetration depth within the river environment, the extreme water depth scenario must be considered; that is, the deepest point of the river at low tide. A current Admiralty Chart for the site was reviewed. This confirms the deepest Chart Datum water depth within the site boundary to be 4.3m.

As the depth is <5m, it can be assumed that a 500kg German UXB landing at any location within the river, at any time of day will strike the river bed with a force sufficient to impact the river bed in a vertical / nose down orientation. As opposed to the “tumbling” nature of items falling through the water column once the terminal velocity has been achieved.

However, the nature of the river sediment within the site boundary is not known both in terms of its precise composition and thickness. This, coupled with the lack of an accurate mathematical model for bomb behaviour through the water column, makes calculation of a maximum penetration depth value within the river environment impossible.

However, the significant decelerating effect caused by the water column on site indicates that even a large German UXB would not be able to penetrate a substantial distance into the Crag Group bedrock underlying the overburden sediment.

## **11 The Threat from British / Allied Military Ordnance**

### **11.1 General**

The following historical and modern facilities / activities / incidents have been considered:

- Army, Navy and RAF Bases / Installations
- Military Training Areas / Weapons Ranges
- Ordnance / Explosives Factories and Storage Depots
- Sites requisitioned for military use
- Military Fortifications and Coastal Defences
- Locations of Army Explosive Ordnance Clearance Tasks
- WWII Anti-Aircraft Batteries
- WWII Pipe Mined Locations and Beach Minefields

The most likely source of British / Allied ordnance is anti-aircraft fire/Home Guard activity, as discussed below.

### **11.2 Potential Sources of Explosive Ordnance**

#### **11.2.1 Anti-Aircraft Artillery**

At the start of the war two types of AAA guns were deployed: Heavy Anti-Aircraft Artillery (HAA), using large calibre weapons such as the 3.7” QF (Quick Firing) gun and Light Anti-Aircraft Artillery (LAA) using smaller calibre weapons such as 40mm Bofors gun.

During the early war period, there was a severe shortage of AAA available and older WWI 3” and modified naval 4.5” guns were deployed alongside those available 3.7” weapons. The maximum ceiling height of fire at that time was around 11,000m (for the 3.7” gun and less for other weapons). As the war progressed improved variants of the 3.7” gun was introduced and, from 1942, large 5.25-inch weapons began to be brought into service. These had significantly improved ceiling heights of fire reaching over 18,000m.

The LAA batteries were intended to engage fast low flying aircraft and were typically deployed around airfields or strategic installations. These batteries were mobile and could be moved to new positions with relative ease when required. The most numerous of these was the 40mm Bofors gun which could fire up to 120 x 40mm HE shells per minute to over 1,800m.

The HAA projectiles were high explosive shells, usually fitted with a time delay or barometric pressure fuze to make them explode at a pre-determined height. Before the war all the clockwork fuses used by the Royal Artillery had come from Switzerland. When that source of supply was cut off, Britain had been forced to make its own. After four years of war, the country still lacked the engineering skills to produce a reliable fuse.

This resulted in a considerable number of AA projectiles either exploding prematurely, killing the gunners or failing to explode at all; falling to the ground as UXBs. In January 1944 more people in London were killed by HAA shells than by German bombs. Details of the most commonly deployed WWII AAA projectiles are shown below:

Gun type	Calibre	Shell Dimensions	Shell Weight	HE Fill Weight
3.7 Inch	94mm	94mm x 438mm	12.7kg	1.1kg
4.5 Inch	114mm	114mm x 578mm	24.7kg	1.7kg
40mm	40mm	40mm x 311mm	0.84kg	70g

Although the larger unexploded projectiles could enter the ground they did not have great penetration ability and are therefore likely to be found close to WWII ground level. These shells are frequently mistakenly identified as small German air-delivered bombs, but are differentiated by the copper driving band found in front of the base. With a high explosive fill and fragmentation hazard these items of UXO present a significant risk if encountered. The smaller 40mm projectiles are similar in appearance and effect to small arms ammunition and, although still dangerous, present a lower risk.

Four static HAA batteries were operational within 5km of the site during WWII. With four guns per battery, firing up to ten rounds a minute, HAA batteries could expend numerous shells during even short air raids and therefore as the town was frequently attacked by the Luftwaffe, the risk of unexploded HAA shell contamination within study area is elevated.

Numerous unexploded AA shells were recovered during and following WWII, and are still occasionally encountered on sites today. Illustrations of Anti-Aircraft projectiles and rockets are presented in **Annex L**. Any unexploded AA shell landing in the river would have remained there for a time could have become subsequently buried in sediment.

## 11.2.2 Home Guard Activity

The Home Guard (HG) was a defence organisation of the British Army, operational between 1940 and 1944. It comprised 1.5 million local volunteers, otherwise ineligible for military service, and acted as a secondary defence force, in case of enemy invasion which was expected during 1940 and 1941. The HG guarded the coastal areas of Britain and other important facilities such as RAF airfields, weapons factories, explosives stores, radar sites, etc.

Due to its coastal location in south-eastern England, Great Yarmouth was considered vulnerable to German invasion and consequently was well defended by Army and HG units, with River Yare and beaches fortified with static defences, minefields and gun positions.

A group of WWII anti-invasion defences, including four pillboxes, a road block and a Spigot Mortar emplacement were present within the northern section of the site on the junction of

Queen Anne's Road and Southtown Road. The central element of the site was a substantial road block, designed to check the progress of tanks rather than act as a check point.

To the south, the road block was flanked by two pillboxes, a Type 22 on the easternmost extent of site boundary, and a Type 24 or variant pillbox on the north side of Queen Anne's Road. The defences were removed and the road resurfaced in August 1945.

Located at the westernmost end of Cromwell Road a Spigot Mortar position and associated Type 24 Pillbox were located. It can be assumed that the installation was sited to guard trackways and bridges across the drains that lay to the north of Queen Anne's Road.

Today, items of WWII ordnance related to the HG are occasionally encountered by members of the public and the construction industry. Experience has shown that the 'housekeeping' of WWII soldiers was often poor with items of faulty, surplus or expended ammunition often burnt, buried, misplaced or otherwise discarded on civilian land (see *Section 12.2*).

Furthermore, HG personnel are known to have purposefully buried caches of ammunition and weapons in tactical positions, to be exhumed and used in case of invasion. This is substantiated by several recent HG UXO finds (see *Annex M*).

Details of the most commonly encountered WWII-era British ammunition (Land Service Ammunition and Small Arms Ammunition) are presented in *Annex N* and *Annex O* respectively.

## 12 Ordnance Clearance and Post-WWII Ground Works

### 12.1 General

The extent to which any ordnance clearance activities have taken place on site or extensive ground works have occurred is relevant since on the one hand they may indicate previous ordnance contamination but also may have reduced the risk that ordnance remains undiscovered.

### 12.2 EOD Bomb Disposal and Clearance Tasks

Dynasafe BACTEC holds a number of official records of explosive ordnance disposal operations during and following WWII, obtained from the Explosive Ordnance Disposal (EOD) Archive Information Office at 33 Engineer Regiment (EOD), British Army. However, no records could be found to indicate that any Army EOD tasks have taken place on site.

No evidence of Royal Navy EOD divers carrying out any UXO disposal tasks in the River Yare (in close proximity to the site) was found.

Note, however that two gardeners discovered a live grenade at Dicken Court (approximately 330m north-east of the site) during garden maintenance operations. This would have likely been buried by the HG as part of a cache that of weapons in case of invasion, and often occurred within vulnerable coastal areas.

### 12.3 Post War Redevelopment

The eastern half of the site has undergone two phases of post war redevelopment, the first in the 1970's and the second during the 1980's when the site took its current form. Whilst the western half of the site appears to have remained largely untouched since the war, apart from the A12 roundabout and A147 installation during the 1980's and larger commercial properties to the north and east of the site.

Note, that minor dredging works are reported to have occurred on the River Yare in the post-war period. However, the extents of which are unknown at the time of writing this report.

## 13 The Overall Explosive Ordnance Threat Assessment

### 13.1 General Considerations

Taking into account the quality of the historical evidence, the assessment of the overall threat to any intrusive works from UXO must evaluate the following risks:

- That the site was contaminated with unexploded ordnance
- That UXO remains on site
- That such items could be encountered during any intrusive works
- That ordnance may be activated by the works operations
- The consequences of encountering or initiating ordnance

### 13.2 The Risk that the Site was Contaminated with Unexploded Ordnance

For the reasons discussed in *Sections 9 and 11* Dynasafe BACTEC believes that there is a risk that UXO contaminated the study area. This is based on the following:

#### **German UXO:**

- The site was located within central Great Yarmouth within an area of very high bombing density during WWII, with up to 8 x HE bombs likely to have landed on or adjacent to the site boundary. At least 12 further HE bombs are recorded within a 300m radius of the site. In addition, the site is likely to have been affected by 1kg incendiary bombing.
- The eastern extent of the site, comprising busy commercial / industrial areas would have been accessed on a daily basis thereby decreasing the risk of any UXB strike evidence going unnoticed. In addition, these areas may have been subject to post-raid checks for UXB entry holes.
- The western half of the site was occupied by large areas of ambiguous open ground and allotment gardens which are unlikely to have been accessed as regularly or frequently. Access to the allotments would have varied depending on the season and therefore, a UXB could conceivably have fallen here unobserved.
- Moreover, there are multiple areas of clearance and a ruin apparent on site, suggesting that these areas sustained serious bomb damage. As a result, the affected buildings will have been abandoned for a time, increasing the likelihood of subsequent UXO falling on site unnoticed. Therefore, it can be assumed that, for a time, significant quantities of rubble occupied this area and debris may have been strewn across the site, increasing the likelihood of a UXB remaining on site. However, had a UXB landed within the allotments, open ground soft, rubble, or area of open air storage on site it could have gone undetected. Note, that the entry hole of an SC50 (the most commonly deployed German HE bomb) could be as little as 20cm in diameter and therefore, easily obscured in dense vegetation.
- A UXB landing in the river during a night time raid will have been immediately obscured from view, beneath the waterline. Consequently, it is unlikely to have been observed, reported and mapped.
- A UXB entry hole within the river bank mud on site (revealed at low tide) is unlikely to have persisted; the next high tide filling in the hole with water and sediment. Even if evidence of

a UXB was observed here and reported, it is highly unlikely to have been recovered by the local bomb disposal unit due to its insignificant location and the impracticalities of deep buried UXB removal in this environment.

**British/Allied UXO:**

- Due to its coastal location in south-eastern England, Great Yarmouth was considered vulnerable to German invasion and consequently, was well defended by Army and HG units, with River Yare and beaches fortified with static defences, minefields and gun positions.
- A group of WWII anti-invasion defences, including four pillboxes, a road block and a Spigot Mortar emplacement were present within the northern section of the site on the junction of Queen Anne's Road and Southtown Road. The central element of the site was a substantial road block, designed to check the progress of tanks rather than act as a check point. Further defences were located within the site boundary, located at the westernmost end of Cromwell Road a Spigot Mortar position and associated Type 24 Pillbox were located.
- Although these defence installations were located on site, it is considered highly likely that the risk of shallow buried UXO has been mitigated on site due to post war development.
- Note, that four HAA batteries were situated within a 5km radius of the site during WWII. For the same reasons as given above, it is quite possible that an unexploded AA shell or rocket could have landed in the river on site and remained there.

### 13.3 The Risk that Unexploded Ordnance Remains on Site

**Land** - Within the footprint of post-war ground works, the risk of small, shallow buried UXO (LSA, SAA, AA shells and German 1kg incendiaries) remaining will have been partly mitigated since any such items could have been encountered and removed during soil stripping / levelling, foundations etc.

Only within the volume of any post-war basement level bulk excavations and at the precise locations of any post-war pile foundations / boreholes, will the risk from deeper buried German HE UXBs have been completely mitigated. Therefore, it is conceivable that such a weapon could reside within virgin / untouched geology, beneath and amongst any such post-WWII ground works, down to the maximum bomb penetration depth.

The risk from UXO contamination within the eastern extent of the site and pre-war buildings has been assessed as minimal and therefore the risk from UXO remaining is minimal.

**River** - It has been assessed that a HE UXB falling in the river will likely have achieved full burial within the overburden sediment and may also have penetrated the Crag Group bedrock. Consequently, such a UXB will have remained in situ up to the present day, largely unaffected by environmental conditions. Also, any large partially buried UXBs on site are less likely to be affected by environmental conditions as a result of their significant mass.

Tidal riverbed environments are mobile in nature and therefore as a result of water currents, any small items of UXO (British AA shells and German 1kg IBs) residing on or near the riverbed surface could experience migration. This is evidenced by the large quantity of munitions that are washed up on beaches around the UK, every year. The wider River Yare environment will have been subject to the same UXO contamination conditions as the site during WWII and therefore although riverbed UXO could have migrated out of the site since WWII, equally, additional UXO could have migrated into the site.

### 13.4 The Risk that Ordnance may be Encountered during the Works

**Land** - The most likely scenarios under which a UXO could be encountered during construction works is during piling, drilling operations or bulk excavations for basement levels. The overall risk will depend on the extent of the works, such as the numbers of boreholes/piles (if required) and the volume of the excavations.

Since an air-dropped bomb may come to rest at any depth between just below ground level and its approximate penetration depth there is also a chance that such an item could be encountered during shallow excavations (for services or site investigations) into the original WWII ground level.

If the proposed works are due to be undertaken within post war fill material / made ground, the risk of encountering WWII UXBs is low. However, if works are to be undertaken below WWII ground level this risk is significantly higher.

The risk of UXO remaining within the eastern extent of the site and pre-war buildings has been assessed as minimal, therefore the risk from UXO being encountered during the proposed works is minimal.

**River** – Minor dredging works on the River Yare have been identified to have taken place, however it is not known to what extent these would have occurred within the site boundary. Therefore, these activities could have partly mitigated the risk from UXO within the river environment, however it is conceivable that UXO could have subsequently been washed into the site boundary. Therefore, the risk of encountering UXO during the proposed works remains partially unmitigated. The proposed investigatory works will be to a depth beyond the maximum bomb penetration depth, therefore if UXO is situated at the location of the borehole, it will be encountered.

### 13.5 The Risk that Ordnance may be Initiated

The risk that UXO could be initiated if encountered will depend on its condition, how it is found and the energy with which it is struck. The most violent activity on most construction sites is percussive piling. As a result, items that are shallow buried present a slightly lower risk than those that are deep buried, since the force of impact is usually lower and they are more likely to be observed – when immediate mitigating actions can be taken.

### 13.6 The Consequences of Encountering or Initiating Ordnance

Clearly the consequences of an inadvertent detonation of UXO during construction operations would be catastrophic with a serious risk to life, damage to plant and a total site shutdown during follow-up investigations.

Since the risk of initiating ordnance is significantly reduced if appropriate mitigation measures are undertaken, the most important consequence of the discovery of ordnance will be economic. This would be particularly so in the case of high profile locations and could involve the evacuation of the public.

The unexpected discovery of ordnance may require the closing of the site for any time between a few hours and a week with a potentially significant cost in lost time. Note also that the suspected find of ordnance, if handled solely through the authorities, may also involve loss of production since the first action of the Police in most cases will be to isolate the locale whilst awaiting military assistance, even if this turns out to have been unnecessary.

### 13.7 Dynasafe BACTEC's Assessment

Taking into consideration the findings of this study, Dynasafe BACTEC considers the risk on the site to be heterogeneous and can therefore be divided into **Low**, **Medium** and **High** Risk Zones. These are described below and illustrated on a Risk Map, presented in **Annex P**.

#### Low Risk Zone:

- Buildings and hard standing that survived the war intact.

Type of Ordnance	Level of Risk			
	Negligible	Low	Medium	High
German WWII High Explosive Bombs		✓		
German WWII 1kg Incendiary Bombs		✓		
British Anti-Aircraft Shells		✓		
British Small Arms and Land Service Ammunition		✓		

#### Medium Risk Zone:

- Open soft ground that would not have been accessed regularly nor frequently.
- Areas of substantial bomb damage.
- Buffer Area to incorporate the "J-Curve" Buffer Zone.

Type of Ordnance	Level of Risk			
	Negligible	Low	Medium	High
German WWII High Explosive Bombs			✓	
German WWII 1kg Incendiary Bombs			✓	
British Anti-Aircraft Shells			✓	
British Small Arms and Land Service Ammunition			✓	

#### High Risk Zone:

- Occupied by the River Yare.

Type of Ordnance	Level of Risk			
	Negligible	Low	Medium	High
German WWII High Explosive Bombs				✓
German WWII 1kg Incendiary Bombs			✓	
British Anti-Aircraft Shells			✓	
British Small Arms and Land Service Ammunition		✓		

## 14 Proposed Risk Mitigation Strategy

### 14.1 General

Dynasafe BACTEC believes the following risk mitigation measures should be deployed to support the proposed works at the Southtown, Great Yarmouth site.

### 14.2 Scope Specific Risk Mitigation Measures

*All Risk Zones:*

- **Site Specific Explosive Ordnance Safety and Awareness Briefings to all personnel conducting intrusive works:** A specialised briefing is always advisable when there is a possibility of explosive ordnance contamination. It is an essential component of the Health & Safety Plan for the site and conforms to requirements of CDM Regulations 2015. All personnel working on the site should be instructed on the identification of UXB, actions to be taken to alert site management and to keep people and equipment away from the hazard. Posters and information of a general nature on the UXB threat should be held in the site office for reference and as a reminder.
- **The Provision of Unexploded Ordnance Site Safety Instructions:** These written instructions contain information detailing actions to be taken in the event that unexploded ordnance is discovered. They are to be retained on site and will both assist in making a preliminary assessment of a suspect object and provide guidance on the immediate steps to be taken in the event that ordnance is believed to have been found.

*Medium Risk Zones:*

- **Explosive Ordnance Disposal (EOD) Engineer presence on site to support shallow intrusive works:** When on site the role of the EOD Engineer would include; monitoring works using visual recognition and instrumentation and immediate response to reports of suspicious objects or suspected items of ordnance that have been recovered by the ground workers on site; providing Explosive Ordnance Safety and Awareness briefings to any staff that have not received them earlier and advise staff of the need to modify working practices to take account of the ordnance threat, and finally to aid Incident Management which would involve liaison with the local authorities and Police should ordnance be identified and present an explosive hazard.
- **Handheld Intrusive Magnetometer Survey of all borehole locations down to the maximum bomb penetration depth:** As part of the EOD Engineer presence on site, Dynasafe BACTEC can deploy intrusive magnetometry techniques to provide staged clearance ahead of all the borehole locations.

*High Risk Zone:*

- **Non-Intrusive Magnetometer and Side Scan UXO Survey:** A Magnetometer and high-resolution Side Scan Survey should be conducted over the proposed works area to identify any ferrous anomalies (potential UXO) on or near to the riverbed surface. This will provide clear areas for the placement of barge legs or anchors. It also allows for the identification of non-ferrous near surface obstructions which may hamper the proposed works.
- **Intrusive Magnetometer Survey - Down-hole Vallon Probing ahead of Marine Boreholes:** A down-hole Vallon magnetometer is lowered to the estuary bed first to scan a radius for ferrous anomalies. Provided the river bed is clear, boreholing is conducted to 1m. Nonferrous sleeving must be used with the Vallon lowered down the sleeve to clear the next metre ahead of the borehole. This sequence is repeated until bomb penetration depth is reached, then boreholing can continue unrestricted. Sleeving would be expected to extend from the JU Barge deck to river bed to ensure drill bit relocates the borehole each time it is withdrawn.

**14.3 Further Recommended Measures should the Scope of Works Change:**

- **Intrusive Magnetometer Survey of all pile / boreholes locations down to the maximum bomb penetration depth:** Dynasafe BACTEC can deploy a range of intrusive magnetometry techniques to clear ahead of all the pile locations. The appropriate technique is governed by a number of factors, but most importantly the site's ground conditions. The appropriate survey methodology would be confirmed once the enabling works have been completed. A site meeting would be required between BACTEC and the client to determine the methodology suitable for this site. Target investigation or avoidance will be recommended as appropriate.
- **Pre-Piling Intrusive Magnetometer Survey: TFG Clearance ahead of Piling:** A TFG magnetometer survey probe will scan 1m at a time for ferrous anomalies ahead of a rotary drill. This process is repeated down to the max bomb penetration depth. If a ferrous mass is located the TFG survey would have to relocate however, this would clear the way prior to the borehole survey. Having cleared the location, piling can then be conducted on that position unrestricted.
- **Intrusive Magnetometer Survey: Down-hole Vallon Probing ahead of Piling:** A down-hole Vallon magnetometer is lowered to the estuary bed first to scan a radius for ferrous anomalies. Provided the river bed is clear, piling is conducted to 1m. Nonferrous sleeving must be used with the Vallon lowered down the sleeve to clear the next metre ahead of the borehole. This sequence is repeated until bomb penetration depth is reached, then piling can continue unrestricted.

**Most Commonly Deployed German Bombs**

**SC 50**

**Bomb Weight:** 40-54kg (110-119lb)  
**Explosive Weight:** c25kg (55lb)  
**Fuze Type:** Impact fuze/electro-mechanical time delay fuze  
**Bomb Dimensions:** 1,090 x 280mm (42.9 x 11.0in)  
**Body Diameter:** 200mm (7.87in)  
**Use:** Against lightly damageable materials, hangars, railway rolling stock, ammunition depots, light bridges and buildings up to three stories.  
**Remarks:** The smallest and most common conventional German bomb. Nearly 70% of bombs dropped on the UK were 50kg.

50kg bomb, London Docklands

**SC 250**

**Bomb weight:** 245-256kg (540-564lb)  
**Explosive weight:** 125-130kg (276-287lb)  
**Fuze type:** Electrical impact/mechanical time delay fuze.  
**Bomb dimensions:** 1640 x 512mm (64.57 x 20.16in)  
**Body diameter:** 368mm (14.5in)  
**Use:** Against railway installations, embankments, flyovers, underpasses, large buildings and below-ground installations.

250kg bomb, Hawkinge

**1kg Incendiary Bomb**

**Bomb weight:** 1.0 and 1.3kg (2.2 and 2.87lb)  
**Filling:** 680gm (1.3lb) Thermite  
**Fuze type:** Impact fuze  
**Bomb dimensions:** 350 x 50mm (13.8 x 1.97in)  
**Body diameter:** 50mm (1.97in)  
**Use:** As incendiary – dropped in clusters against towns and industrial complexes  
**Remarks:** Jettisoned from air-dropped containers. Magnesium alloy case. Sometimes fitted with high explosive charge

1. Scaffold pipe
2. Incendiary 1kg bomb
3. Incendiary bomb recently found on site in UK

Unexploded bomb 'started to tick'

An unexploded World War II bomb started to tick and ooze liquid as experts tried to defuse it, police have said.

The large bomb was found in a river at Sugar House Lane, near Bromley-by-Bow Tube station in east London, on Monday.

Rush-hour travel was disrupted as overnight work to make the bomb safe continued into Thursday morning.

"It measures approximately the size and length of a man, and weighs around 1,000kg (2,200lb).

## WW2 bomb found in Portsmouth harbour

22 February 2017 | Hampshire &amp; Isle of Wight

Share

**A World War Two bomb containing 290lb (131kg) of "high explosives" has been found in Portsmouth harbour.**

The ordnance was discovered by a dredger in the water at about 03:00 GMT, the Royal Navy said.

Specialist divers at the scene said the bomb posed a "very serious threat". It was towed out to sea and detonated.

All ferries were stopped and trains between Portsmouth and Southsea station and Portsmouth Harbour were suspended, but have since started running again.

There were also extensive road closures in the area, affecting access to Gunwharf Quays.

The Royal Navy said the device, believed to be a German SC250 that weighs 500lb (227kg), was removed from the harbour before being "safely" blown up in the sea off the Isle of Wight.

Lt Mike St Pierre, the officer leading the bomb disposal team, had said: "Despite being old, these devices can pose a very serious threat."

## Portsmouth harbour is sealed off with hundreds of people evacuated and ferries halted after a 500lb unexploded WWII bomb was found on the sea bed

The Royal Navy today destroyed an unexploded 500lb German World War Two bomb which closed Portsmouth harbour for six hours when dredging workers discovered it on the sea bed.

Contractors completing works ready for the arrival of the Royal Navy's new 65,000 tonne state-of-the-art ship HMS Queen Elizabeth discovered the German UXB torpedo while dredging Portsmouth Harbour, Hampshire, this morning.

Bomb disposal experts rushed to the scene after it was brought to the surface while work was carried out west of Victory Jetty.

The bomb was towed from Portsmouth Harbour, Hants, out to open waters 1.5 miles east of the Isle of Wight.

## World War Two bomb removed from River Thames and exploded

© 20 January 2017 | London

Share

**An unexploded 50kg World War Two bomb found in the River Thames has been removed and exploded.**

The operation by the Royal Navy and Metropolitan Police forced Waterloo Bridge, Westminster Bridge and Victoria Embankment in central London to shut.

A Ministry of Defence spokesman said the WW2 device had been towed along the river to Tilbury, Essex, where it was safely detonated.

Police had been called to the river at 17:15 GMT on Thursday.

The device has been identified as a German SD 50kg bomb, a small armour-piercing ordnance dropped from an aircraft.

The Port of London Authority said the suspected bomb measured 2ft by 1ft (60cm x 30cm).

1994

RESCUE workers search for survivors after a Second World War bomb exploded at a building site in Berlin, killing three people and injuring at least eight others. A fire brigade spokesman said he feared the final death toll could be higher. One worker was still missing, believed to be trapped under a machine. "We've

### Blown up by history

found human remains 100 metres away but we can't tell if they belong to the dead already found," the spokesman said. The blast, set off by drilling work on Frankfurter Allee, one of east Berlin's busiest avenues, trapped

workers under building machinery and sent huge chunks of concrete tumbling through the air. A large office block was being built on the site of the explosion which sent shoppers scrambling for shelter and paralysed

dense afternoon traffic. One eyewitness said: "There was a bang, then silence, and then it started raining stones and dirt." Dozens of cars within a 250-metre radius were wrecked and the top two floors of a nearby apartment block caved in. Radio reports claimed that the total number of injured stood at 14.

2006

### World War II bomb kills three in Germany

Three people have been killed and six injured trying to defuse a World War II bomb in central Germany.

Workers building a sports stadium had earlier unearthed the bomb in the town of Goettingen.

It was not immediately clear why the bomb, reportedly weighing 500kg (1,100lb), had detonated.

Unexploded WWII bombs dropped by Allied planes are frequently found in Germany, though it is unusual for them to explode unexpectedly.

2010

2014

The bomb went off as the machine lifted up earth and debris

A World War Two bomb has exploded at a construction site near a west German town, killing a man and injuring eight others, police say.

The explosion occurred after a digger accidentally struck the device during excavation work in Euskirchen in the state of North Rhine-Westphalia.

The machine's operator died on the spot. Two of those hurt were critically wounded, the dpa news agency reports.

## Covert British troops 'could have buried' WWII devices

**World War II incendiary devices found on a building site in Gloucestershire could have been left by covert British troops, according to researchers.**

More than 20 phosphorus bombs were unearthed in Birdlip after a digger hit one, causing it to burst into flames.

A former worker at the site said he saw a Home Guard officer burying objects there 65 years ago.

The Coleshill Auxiliary Research Team said auxiliary officers often used Home Guard uniforms as cover.

The bombs were put into vats of water to make them safe

## Army bomb disposal team called to Blacksole Bridge in Herne Bay

by Aidan Barlow [abarlow@thekmgroupp.co.uk](mailto:abarlow@thekmgroupp.co.uk) 08 July 2015

It was like a scene from Dad's Army when Army bomb disposal experts found wartime explosives made by the Home Guard in makeshift bottles.

A team was called to the Blacksole Bridge in Herne Bay after the wartime bombs were found.

The team from the Royal Logistics Corps set up a 30 metre exclusion zone for pedestrians around the railway embankment after the suspected homemade phosphorous bombs were found.

## Treasure hunter stumbles on deadly Dad's Army bomb cache

By MAIL ONLINE REPORTER  
Last updated at 4:06 PM on 9th July 2010

Comments (0) Add to My Stories

A treasure hunter escaped serious injury when he unearthed a cache of bombs that were buried by the Home Guard during the darkest days of World War 2.

The weapons - primed to go off when they made contact with the air - were secreted on a beach by a Captain Mainwaring of the day.

Loaded with dangerous benzene and phosphorus, the Dad's Army-style team would have used them in battle against Nazi troops in the event of invasion.

'Are you sure that's wise?': The Home Guard's stash of bombs finally goes off, 70 years later

## VIDEO: Explosion after 80 grenades detonated in Eastbourne

16:31 Monday 13 April 2015

Marked 'AW Bomb 1940' the grenades were thought to have been phosphorus incendiary grenades created as improvised anti-tank weapons when Britain was facing invasion following the army's evacuation from Dunkirk in 1940.

He said, "I remember the grenades being buried. It was part of the Home Guard stash, it was put there in case we were invaded. It had to be in 1943. There were a lot of them [stashes], they were all over the place."

Report Reference: 7307TA	Client: WSP UK Limited
	Project: Southtown, Great Yarmouth

**No. 36 'Mills' Grenade**

Weight: 0.7kg filled (1lb 6oz)  
 Type: Hand or discharger, fragmentation  
 Dimensions: 95 x 61mm (3.7 x 2.4in)  
 Filling: Alumatol, Amatol 2 or TNT  
 Remarks: 4 second hand-throwing fuse with approximate 30m range. First introduced May 1918.

Grenade, .303 inch rifle, No. 36M, Mark I.

**No. 69 Grenade**

Weight: 0.38kg filled (0.8lb)  
 Type: Percussion/Blast  
 Date Introduced: December 1940  
 Remarks: Black Bakelite body. Blast rather than fragmentation type. After unscrewing the safety cap, a tape is held when throwing the grenade releasing the safety bolt in the throwing motion. Detection is problematic due to its very low metal content.

**Typical Smoke Grenade**

Dimensions: Approx. 65 x 115mm (2.5 x 4.5in)  
 Type: Smoke  
 Date Introduced: Current MoD issue  
 Remarks: Smoke grenades are used as ground-to-ground or ground-to-air signalling devices, target or landing zone marking devices, and screening devices for unit movement.

Report Reference:  
7307TA

Client: WSP UK Limited  
 Project: Southtown, Great Yarmouth

### Typical 2 inch High Explosive Mortar

- Bomb Weight: 1.02kg (2.25lb)
- Type: High Explosive
- Dimensions: 51 x 290mm (2in x 11.4in)
- Filling: 200g RDX/TNT
- Maximum Range: 457m (500yds)
- Remarks: Fitted with an impact fuze which detonates the fuze booster charge (exploder) and, in turn, the high explosive charge. The main charge shatters the mortar bomb body, producing near optimum fragmentation and blast effect at the target.

### Typical 3 inch Smoke Mortar

- Type: Smoke
- Dimensions: c490 x 76mm (19.3in x 3in)
- Filling: Typically white phosphorous
- Maximum Range: 2515m (2,750yds)
- Remarks: On impact, the fuze functions and initiates the bursting charge. The bursting charge ruptures the mortar bomb body and disperses the white phosphorous filler. The white phosphorous produces smoke upon exposure to the air.

### Typical 2 inch Illuminating Mortar

- Type: Illum.
- Dimensions: 51 x 290mm
- Filling: Various
- Remarks: The expulsion charge ignites and ejects the candle assembly. A spring ejects the parachute from the tail cone. The parachute opens, slowing the descent of the burning candle which illuminates the target.

Report Reference:  
7307TA

Client:  
WSP UK Limited

Project:  
Southtown, Great Yarmouth

### Self Igniting Phosphorous (SIP) Grenades

**Filling:** White Phosphorous and Benzene  
**Remarks:** The grenade comprised a glass bottle with a total volume of approximately one pint. It was filled with White Phosphorus, benzene, a piece of rubber and water. Over time the rubber dissolved to create a sticky fluid which would self ignite when the bottle broke. Fired by hand or Northover Projector. Sometimes called the "A & W" (Albright & Wilson) grenade.

### No 74 Grenade (Sticky Bomb)

**Remarks:** Designed as an anti-tank grenade and used by the Home Guard. The grenade consisted of a glass ball on the end of a Bakelite (plastic) handle. Inside the glass ball was an explosive filling whilst on the outside was a very sticky adhesive covering. Until used, this adhesive covering was encased in a metal outer casing.

### Flame Fougasse Bomb

**Remarks:** A Flame Fougasse was a weapon in which the projectile was a flammable liquid, typically a mixture of petrol and oil. It was usually constructed from a 40-gallon drum dug into the roadside and camouflaged. Ammonal provided the propellant charge which, when triggered, caused the weapon to shoot a flame 3m (10ft) wide and 27m (30 yards) long. Initially a mixture of 40% petrol and 60% gas oil was used, this was later replaced by an adhesive gel of tar, lime and petrol known as 5B.

WSP UK Limited  
Project:  
Southtown, Great Yarmouth

### 20mm Hispano HEI Ammunition

Type: Live canon round  
 Markings: Upper half of projectile painted 'buff' colour, lower half is red.  
 Cartridge Weight: 256 grams  
 Dimensions: Total cartridge / projectile length - 182mm  
 Fuzed: Contact fuze – No.253, No.254 or No.917  
 Filling: 108 grains of contact explosive + 68 grains of SR.379 incendiary composition.  
 Threat: Explosives within unspent cartridge as well as the projectile.  
 Deployment: Royal Navy, RAF and British Army Light Anti-Aircraft guns. Also RAF aircraft canons.  
 Remarks: Cartridges are belted or supplied lose in cartons.

COLOUR IDENTIFICATION		
BRITISH		
NATURE OF SHELL	H.E. FILLING	COLOUR
H.E. TRACER	T.N.T.	Blue
H.E.	T.N.T.	Orange
PROJ. PRACTICE		Purple
PROJ. TRACER		Green
H.E. INCENDIARY	T.N.T.	Red
H.E. INCENDIARY TRACER	T.N.T.	Green

### .303" Ammunition

Type: Rifle / machine gun round  
 Markings: Regular round - none. Tracer round – red Primer  
 Bullet Weight: 150 - 180 grams  
 Dimensions: Total cartridge /projectile length - 78mm  
 Filling: Regular round – none. Tracer round - small incendiary fill  
 Threat: Explosive cordite within unspent cartridge  
 Deployment: Royal Navy, RAF and British Army Light Anti-Aircraft guns, machine guns and rifles. Standard British and Commonwealth military cartridge from 1889 until the 1950s.  
 Remarks: Cartridges are belted or supplied lose in cartons.

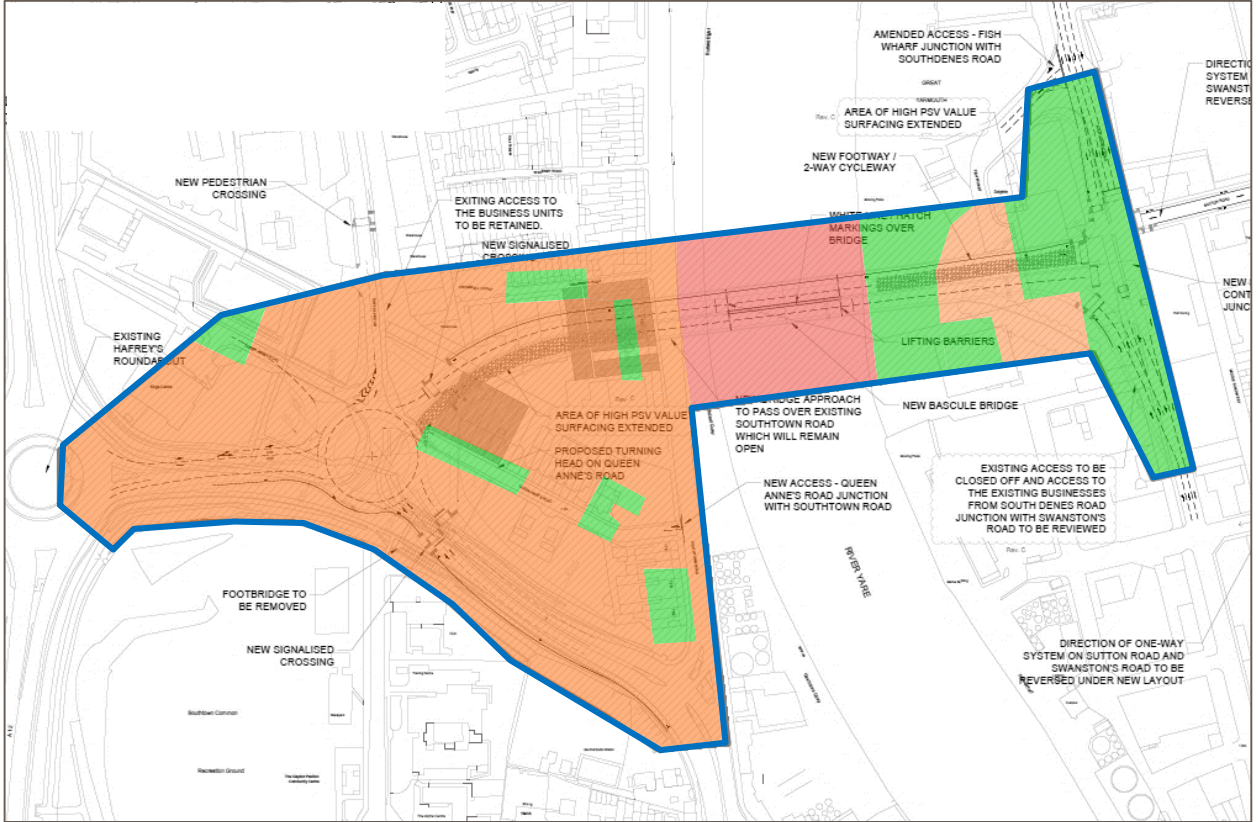

TYPES OF SMALL ARMS AMMUNITION  
 Fig. 1. Four types of ammunition used by modern infantry. 1 and 2 are ball cartridges, 3 is an armour-piercing bullet, and 4 a tracer bullet which burns and makes its flight visible.

 <p><b>Low Risk Zone</b></p> <p>Buildings and hard standing that survived the war intact.</p>	 <p><b>Medium Risk Zone</b></p> <ul style="list-style-type: none"> <li>• Open Soft Ground that would not have been accessed regularly nor frequently.</li> <li>• Areas of substantial bomb damage.</li> <li>• Buffer area to account for the “J-Curve” Effect.</li> </ul>	 <p><b>High Risk Zone</b></p> <p>The River Yare</p>
--	--	--

**Scope Specific Risk Mitigation Measures:**

*All Risk Zone:*

- Site Specific Explosive Ordnance Safety and Awareness Briefings to all personnel conducting intrusive works.
- The Provision of Unexploded Ordnance Site Safety Instructions.

*Medium Risk Zone:*

- Explosive Ordnance Disposal (EOD) Engineer presence on site to support shallow intrusive works.
- Handheld Intrusive Magnetometer Survey of all borehole locations down to the maximum bomb penetration depth

*High Risk Zone:*

- Non-Intrusive Magnetometer and Side Scan UXO Survey.
- Intrusive Magnetometer Survey - Down-hole Vallon Probing ahead of Marine Borehole.

## **PRESSUREMETER TESTING**

# Great Yarmouth Third River Crossing

Borehole: BH02

Date: 15<sup>th</sup> June 2018

Revision No: 1

Pressuremeter tests

Preliminary analysis

Report reference: CIR1420/18

Cambridge Insitu Limited

[DETAILS OF TEST]

Project :  
Site : Gt Yarmouth 3RC  
Borehole : BH02  
Test name : BH02 Test 1  
Test date : 13 Jun 18  
Test depth : 13.50 mBML  
Water table : Nothing entered  
Ambient PWP : Nothing entered  
Material : Silty sand  
Probe : Digital 3 arm weak rock self boring pressuremeter  
Diameter : 88.1 mm  
Data analysed using average arm displacement curve  
A non-linear analysis of the rebound cycles has been carried out

Analysed by SDB on 15 Jun 18

Remarks: Deck to mud = 11m. Water depth = 8.4m above mudline. Flush coming up casing for most of drilling causing a cavity on one side. Arm 2 hits limit after one u/r cycle.

[RESULTS FOR CAVITY REFERENCE PRESSURE]

Po from Lift off (kPa) : "Arm ave=206.5"

[LINEAR INTERPRETATION OF SHEAR MODULUS G]

Initial slope shear modulus (MPa) : "Arm ave=1.6"

Axis	Loop	Value	Mean Strain	Mean Pc	dE	dPc
	No	(MPa)	(%)	(kPa)	(%)	(kPa)
Arm ave	1	14.9		368	0.649	97

[UNDRAINED NON LINEAR INTERPRETATION OF SECANT SHEAR MODULUS]

Axis	Loop	Intercept	Alpha	Gradient
	No	(MPa)	(MPa)	
Arm ave	1	8.307	7.285	0.877

[DETAILS OF TEST]

Project :  
Site : Gt Yarmouth 3RC  
Borehole : BH02  
Test name : BH02 Test 2  
Test date : 13 Jun 18  
Test depth : 20.40 Metres  
Water table : Nothing entered  
Ambient PWP : Nothing entered  
Material : Sandy clay  
Probe : Digital 3 arm weak rock self boring pressuremeter  
Diameter : 88.1 mm  
Data analysed using average arm displacement curve  
A non-linear analysis of the rebound cycles has been carried out  
The file includes results from a curve fitting analysis

Analysed by SDB on 15 Jun 18

Remarks:

[RESULTS FOR CAVITY REFERENCE PRESSURE]

Strain Origin (mm) : "Arm ave=0.87"  
Po from Marsland & Randolph (kPa) : "Arm ave=554.5"  
Po from Lift off (kPa) : "Arm ave=275.6"

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT

**Envirolab Job Number:** 18/05528  
**Issue Number:** 1  
**Date:** 20 July, 2018

**Client:** Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk  
NR1 2SG

**Project Manager:** Scott Viner/Sharon Woods; Simon Holden  
**Project Name:** Gt Yarmouth 3rd River Crossing  
**Project Ref:** PZ1522D1  
**Order No:** 598805  
**Date Samples Received:** 25/06/18  
**Date Instructions Received:** 11/07/18  
**Date Analysis Completed:** 20/07/18

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT

**Envirolab Job Number:** 18/04935  
**Issue Number:** 1  
**Date:** 02 July, 2018

**Client:** Norfolk Partnership Laboratory  
Environment, Transport and Development Department

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT

**Envirolab Job Number:** 18/05419  
**Issue Number:** 1  
**Date:** 16 July, 2018

**Client:** Norfolk Partnership Laboratory  
Environment, Transport and Development Department  
Norfolk County Council  
County Hall  
Norwich  
Norfolk  
NR1 2SG

**Project Manager:** Sharon Woods; Simon Holden

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## **REPORT NOTES**

### **General:**

This report shall not be reproduced, except in full, without written approval from Envirolab.

All samples contained within this report, and any received with the same delivery, will be disposed of one month after the date of this report.

Analytical results reflect the quality of the sample at the time of analysis only.

Opinions and interpretations expressed are outside the scope of our accreditation.

If results are in italic font they are associated with an AQC failure and there is insufficient sample to repeat the analysis. These are not accredited and are unreliable.

A deviating samples report is appended and will indicate if samples or tests have been found to be deviating. Any test results affected may not be an accurate record of the concentration at the time of sampling and, as a result, may be invalid.

### **Soil chemical analysis:**

All results are reported as dry weight (<40°C).

For samples with Matrix Codes 1 - 6 natural stones, brick and concrete fragments >10mm and any extraneous material (visible glass, metal or twigs) are removed and excluded from the sample prior to analysis and reported results corrected to a whole sample basis. This is reported as '% stones >10mm'.

For samples with Matrix Code 7 the whole sample is dried and crushed prior to analysis and this supersedes any "A" subscripts

All analysis is performed on the sample as received for soil samples which are positive for asbestos or the client has informed asbestos may be present and/or if they are from outside the European Union and this supersedes any "D" subscripts.

### **TPH analysis of water by method A-T-007:**

Free and visible oils are excluded from the sample used for analysis so that the reported result represents the dissolved phase only.

### **Electrical Conductivity of water by Method A-T-037:**

Results greater than 12900µS/cm @ 25°C / 11550µS/cm @ 20°C fall outside the calibration range and as such are unaccredited.

### **Asbestos:**

Asbestos in soil analysis is performed on a dried aliquot of the submitted sample and cannot guarantee to identify asbestos if only present in small numbers as discrete fibres/fragments in the original sample.

Stones etc. are not removed from the sample prior to analysis.

Quantification of asbestos is a 3 stage process including visual identification, hand picking and weighing and fibre counting by sedimentation/phase contrast optical microscopy if required. If asbestos is identified as being present but is not in a form that is suitable for analysis by hand picking and weighing (normally if the asbestos is present as free fibres) quantification by sedimentation is performed. Where ACMs are found a percentage asbestos is assigned to each with reference to 'HSG264, Asbestos: The survey guide' and the calculated asbestos content is expressed as a percentage of the dried soil sample aliquot used.

### **Predominant Matrix Codes:**

1 = SAND, 2 = LOAM, 3 = CLAY, 4 = LOAM/SAND, 5 = SAND/CLAY, 6 = CLAY/LOAM, 7 = OTHER, 8 = Asbestos bulk ID sample.

Samples with Matrix Code 7 & 8 are not predominantly a SAND/LOAM/CLAY mix and are not covered by our BSEN 17025 or MCERTS accreditations, with the exception of bulk asbestos which are BSEN 17025 accredited.

### **Secondary Matrix Codes:**

A = contains stones, B = contains construction rubble, C = contains visible hydrocarbons, D = contains glass/metal,

E = contains roots/twigs.

### **Key:**

IS indicates Insufficient Sample for analysis.

US indicates Unsuitable Sample for analysis.

NDP indicates No Determination Possible.

NAD indicates No Asbestos Detected.

N/A indicates Not Applicable.

Superscript # indicates method accredited to ISO 17025.

Superscript "M" indicates method accredited to MCERTS.

Subscript "A" indicates analysis performed on the sample as received.

Subscript "D" indicates analysis performed on the dried sample, crushed to pass a 2mm sieve

Please contact us if you need any further information.

## FINAL ANALYTICAL TEST REPORT

## Annex D: Human Health Risk Assessment Background Information

# METHODOLOGY FOR THE DERIVATION OF GENERIC QUANTITATIVE ASSESSMENT CRITERIA TO EVALUATE RISKS TO HUMAN HEALTH FROM SOIL & GROUNDWATER CONTAMINATION

## UK APPROACH

In the UK, the potential risks to human health from contamination in the ground are usually evaluated through a generic quantitative risk assessment (GQRA) approach. This allows generic and conservative exposure assumptions to be readily applied to risk assessments and can be a useful tool for rapidly screening data and to identify those contaminants or scenarios that could benefit from further investigation and/or site-specific detailed quantitative risk assessment (DQRA). Current industry good practice is to use the approach presented in the Environment Agency (EA) publications SR2<sup>1</sup> and SR3<sup>2</sup>. This approach allows the derivation of Generic Assessment Criteria (GACs), primarily for chronic exposure.

In April 2012, the Department of Environment, Food and Rural Affairs (Defra) published updated statutory guidance<sup>3</sup> which introduced a four category approach to determining whether land in England and Wales is contaminated or not on the grounds of significant possibility of significant harm (SPOSH). **Figure 1** presents a graphical representation of the categories.

**Figure 1: Four Categories for Determining if Land Represent a SPOSH**

Cases classified as Category 1 are considered to be SPOSH based on actual evidence or an unacceptably high probability of harm existing. Category 4 cases are those where there is no risk, or a low risk of SPOSH.

<sup>1</sup> Environment Agency 'Human Health Toxicological Assessment of Contaminants in Soil', Report SC050021/SR2. January 2009.

<sup>2</sup> Environment Agency 'Updated Technical Background to the CLEA Model,' Report SC050021/SR3. January 2009.

<sup>3</sup> Defra 'Environmental Protection Act 1990: Part 2A Contaminated Land Statutory Guidance'. April 2012.

GACs represent a minimal risk level, well within Category 4. A 2014 publication by Contaminated Land: Applications in Real Environments (CL:AIRE), SP1010<sup>4</sup> and endorsed by Defra<sup>5</sup> provided an approach to determine Category 4 Screening Levels (C4SLs) which are higher than the GACs whilst being “more pragmatic but still strongly precautionary”. It also provided C4SLs for six contaminants of concern. Although the C4SLs were designed to support Part 2A assessments to determine ‘contaminated land’ they are specifically mentioned, along with reference to the Part 2A statutory guidance, by the Department for Communities and Local Government (DCLG) for use in a planning context<sup>6</sup>.

An updated version the Contaminated Land Exposure Assessment (CLEA) Workbook (v1.071) was released by the EA in September 2015 to take into account the publication of SP1010. The updates comprised: additional toxicity data for the six chemicals for which C4SLs were derived; two new public open space land use scenarios; updated exposure parameters; options to run the model using C4SL exposure assumptions; and increased functionality. There were no changes to algorithms, so it is still possible to replicate the withdrawn SGVs using the input parameters held within v1.071.

It should be noted that the four category approach has not been adopted in Scotland under Part 2A or the planning regime. The Part 2A statutory guidance applicable in Scotland (Paper SE/2006/44 dated May 2006) does not reflect the changes introduced by Defra in April 2012 which allow for the use of C4SLs within Part 2A risk assessments. Additionally, it is considered that the principal of ‘minimal risk’ should still apply under planning in Scotland, based on current guidance.

## WSP APPROACH

Following the withdrawal of the SGVs, and in the absence of an industry-wide, accepted set of GACs it is down to individual practitioners to derive their own soil assessment criteria. WSP has used the approach provided within SR2, SR3, SP1010, CLEA Workbook v1.071 and SR4<sup>7</sup> to produce a set of minimal risk GACs. The chemical-specific data within two key publications were considered during their production: CL:AIRE 2010<sup>8</sup> and LQM 2015<sup>9</sup>. Both documents provide comprehensive sets of GACs for different contaminants of concern.

The LQM Suitable For Use Levels (S4ULs) have selected exposure parameters somewhere between those of the SR3 land uses and the C4SL exposure scenarios. This approach was rejected by WSP as not representing minimal risk, however, the LQM S4UL document was critically reviewed and the approach and chemical input parameters were utilised where considered to be appropriate.

An industry-led C4SL Working Group is in the process of deriving a larger set of C4SLs in the near future, for approximately 20 contaminants. This will include a critical review of the chemical input data for all selected substances, and may therefore lead to further amendments to the chemical input data used in the WSP in-house screening values. It is considered likely that the contaminant list will

<sup>7</sup> Environment Agency ‘CLEA Software (Version 1.05) Handbook (and Software)’, Report SC050021/SR4. September 2009.

<sup>8</sup> CL:AIRE ‘The EIC/AGS/CL:AIRE Soil Generic Assessment Criteria for Human Health Risk Assessment’. ISBN 978-1-05046-20-1. January 2010.

<sup>9</sup> Nathanail et al ‘The LQM/CIEH S4ULs for Human Health Risk Assessment’, Land Quality Press, ISBN 978-0-9931084-0-2. 2015.

crossover with the current CL:AIRE GACs. As such, this document was not critically reviewed by WSP.

WSP's current approach to the assessment of risks to human health is to continue to evaluate minimal risk through the use of in-house derived GACs, and to use the published C4SLs as a secondary tier of assessment until such time as additional C4SLs are published and/or in-house values are derived.

## EXPOSURE MODELS

### LAND USES

WSP has largely adopted the exposure assumptions of the generic land use scenarios included within SR3, with two additional public open space scenarios included from within SP1010:

- à Residential with homegrown produce consumption;
- à Residential without homegrown produce consumption;
- à Allotments;
- à Commercial;
- à Public open space near residential housing (POS<sub>resi</sub>); and
- à Public park (POS<sub>park</sub>).

Exceptions are described in the following Sections.

### SOIL PROPERTIES

SR3 assumes a sandy loam soil with a pH of 7 and a Soil Organic Matter (SOM) content of 6% for its generic land uses, based on the geographical spread of topsoils in the UK. WSP has adopted these default values. In addition, GACs based on an SOM of 1% and 2.5% have been derived, based on common experience of the nature of Made Ground and lack of topsoil on many brownfield sites.

### RECEPTOR CHARACTERISTICS AND BEHAVIOURS

SP1010 provides some updated exposure parameters for long-term inhalation rates<sup>10</sup> and the consumption rates for homegrown produce<sup>11</sup> compared to those provided in SR3. This data was used to derive WSP's GACs.

The changes in inhalation rates do not apply to the allotment generic land use scenario, as these are based on the breathing rates for short-term exposure of light to moderate intensity activity which were derived from a study that was not updated in USEPA 2011, so the SR3 rates were retained.

<sup>11</sup> National Diet and Nutrition Survey 2008/2009 to 2010/2011.

## CHEMICAL DATA

### PHYSICO-CHEMICAL PARAMETERS

Physico-chemical properties for the contaminants for which GACs have been derived have been obtained following critical review of the following hierarchy of data sources:

1. Environment Agency/Defra SGV reports where available.
2. Environment Agency 'Compilation of Data for Priority Organic Pollutants for Derivation of Soil Guideline Values', Report SC050021/SR7, November 2008.
3. Published fate and transport reviews within Nathanail et. al 2015 and CL:AIRE 2010.

Where appropriate, and where sufficient data is available, values were adjusted to reflect a UK soil temperature of 10°C (e.g.  $K_{aw}$ ).

### TOXICOLOGICAL DATA

Toxicological data for the derivation of minimal risk Health Criteria Values (HCV) for each contaminant was selected with due regard to the approach presented in SR2. Where appropriate, the following hierarchy of data sources was used:

1. UK toxicity reviews published by authoritative bodies including:
  - < EA;
  - < Public Health England (PHE);
  - < Committee on Toxicity of Chemicals in Food, Consumer Products and the Environment (COT); and
  - < Committee on Carcinogenicity of Chemicals in Food, Consumer Products and the Environment (COC).
2. Authoritative European sources such as European Food Standards Agency (EFSA)
3. International organisations including:
  - < World Health Organisation (WHO); and
  - < Joint FAO/WHO Expert Committee on Food Additives (JECFA).
4. Authoritative country-specific sources including:
  - < United States Environmental Protection Agency (USEPA);
  - < US Agency for Toxic Substances and Disease Registry (ATSDR);
  - < US Integrated Risk Information System (IRIS); and
  - < Netherlands National Institute for Public Health and the Environment (RIVM).

Factors such as the applicability of the data to human health (e.g. epidemiological vs. animal studies), the quality of the data, the level of uncertainty in the results and the age of the data were also taken into account in the final selection. Details for specific substances are available on request.

## MEAN DAILY INTAKES

Estimations of background exposure for each threshold substance have been updated. In line with the SR2 approach, the exposure from non-threshold substances in the soil does not take into account exposure from other sources, and as such GACs were derived without consideration of the Mean Daily Intake (MDI) for those substances.

The data published by the EA in its series of TOX reports between 2002 and 2009 was evaluated to determine whether the values were considered to remain valid today. Values from these current UK published sources were not amended unless they were considered to be significantly different so that the GACs remained as comparable as possible with the revoked SGVs.

## ORAL MEAN DAILY INTAKES

Oral MDI were generally estimated as the sum of exposure via the ingestion of food and drinking water using the default adult physiological parameters presented in Table 3.3 of SR2.

Data on the exposure of substances from food ingestion was generally obtained from UK Total Diet Studies (TDS) published by the Food Standards Agency (FSA) and its predecessor the Ministry of Agriculture, Fisheries and Food (MAFF) and from studies commissioned by COT. Where no UK-specific data was available, MDI were derived from the European Food Safety Authority (EFSA), Health Canada and US sources. This was a rare occurrence, and in these instances, the data was evaluated to determine its applicability to the UK.

Data on the concentrations of substances in tap water was obtained from a variety of sources. UK data was used where available, with preference given to Drinking Water Inspectorate (DWI) 2014 data from water company tap water testing (LOD, 1<sup>st</sup> and 99<sup>th</sup> percentile data is available). Where the substance was not included in tap water testing, other UK sources of information were considered including:

- à DWI data from water company tap water testing from previous years;
- à COT; and
- à FSA.

Where UK data was not available, a number of other data sources were considered, largely WHO International Programme on Chemical Safety (IPCS) Concise International Chemical Assessment Documents (CICADs) and background documents for the development of Guidelines for Drinking Water Quality, using professional judgement on the relevance of the data to the UK. The final decision on the MDI from drinking water was made using professional judgement on the balance of relevance and probability, taking into account the detection limit where not detected, Koc and solubility, reduction in use of the substance, banned substances, tight controls (e.g. on explosives) and with due consideration to the SR2 instruction that “if no data or information in background exposure are available, background exposure should be assumed to be negligible and the MDI set to zero....”.

Data from other countries was generally not used because it was considered that the hydrogeology of these countries along with industrial practices were unlikely to be reflective of the UK.

## INHALATION MEAN DAILY INTAKES

Inhalation MDIs were based on estimates of average daily exposure by the inhalation pathway and calculated using the default adult physiological parameters presented in Table 3.3 of SR2.

The inhalation MDIs were generally estimated using background exposure data from the UK, derived from Defra's UK-AIR: Air Information Resource<sup>12</sup>, which provides ambient air quality data from a number of sites forming a UK-wide monitoring network. The MDIs for heavy metals were based on rolling annual average metal mass concentration data from Defra's UK Heavy Metals Monitoring Network from the period October 2009 to September 2010<sup>13</sup>.

Information for some substances was obtained from UK sources including Environment Agency TOX reports and data from the UK Expert Panel on Air Quality Standards (EPAQS). Where recent UK data was not available, data was sourced from the International Programme on Chemical Safety (IPCS), the World Health Organisation (WHO), the Agency for Toxic Substances and Diseases Registry (ATSDR), Health Canada, and various other peer-reviewed sources summarised by LQM/CIEH<sup>14</sup>.

For other substances, where no data or information on background exposure was available, background exposure was assumed to be negligible and the MDI set at 0.5\*TDI in accordance with guidance in SR2.

## PLANT UPTAKE

Soil to plant concentration factors are available in CLEA v1.071 for arsenic, cadmium, hexavalent chromium, lead, mercury, nickel and selenium. For all remaining inorganic chemicals, concentration factors were obtained using the PRISM model. Substance-specific correction factors have been selected in accordance with the guidance established within SR3. This is consistent to the approach utilised in the derivation of the LQM S4UL values and the EIC/AGS/CL:AIRE GAC.

Where there is a lack of appropriate data to enable the derivation of specific soil to plant concentrations factors for organic chemicals, plant uptake was modelled within CLEA v1.071 using the generic equations recommended within SR3, as follows:

- à Green Vegetables – Ryan et al. (1988);
- à Root Vegetables – Trapp (2002);
- à Tuber Vegetables – Trapp et al. (2007); and
- à Tree Fruit – Trapp et al. (2003).

There are no suitable models available for modelling uptake for herbaceous fruit or shrub fruit. Exposure is considered negligible.

## SOIL SATURATION LIMITS

GACs are not limited to their theoretical soil saturation within CLEA, although where either the aqueous or the vapour-based saturation is exceeded, this is highlighted within the Workbook (compared with the lower of the two values). This affects pathways which depend on partitioning calculations so in reality this only affects the vapour pathways and is relevant to organic substances and other substances, such as elemental mercury, that have a significant volatile component. However, the Workbook highlights saturation for direct contact pathways to indicate to the user where further qualitative consideration of free phase contamination at surface may be required.

Where the lower of the two saturation limits is exceeded and the vapour pathway is the only exposure route being considered, the chronic risks to human health are likely to be negligible. Further evaluation could be undertaken using an alternative model suitable for evaluating non-aqueous phase liquids (NAPLs), such as the Johnson & Ettinger (J&E) approach described in USEPA 2003. However, WSP considers that if NAPLs are suspected, given the known limitations and over-simplifications of J&E, soil vapour monitoring is a more accurate way of assessing potential risks.

Where the lower saturation limit is exceeded for the vapour pathway and a number of exposure routes are being considered, then the contribution from the NAPL via vapour inhalation to the overall exposure can be evaluated using the procedure provided in SR4. WSP would evaluate this as part of a DQRA process or through soil vapour monitoring on-site to determine site-specific soil vapour concentrations.

## CHEMICAL SPECIFIC ASSUMPTIONS

### CYANIDES

Cyanide has high acute toxicity, and short term exposure is an important consideration when assessing the risks from soils contaminated with cyanide. The primary risk to human receptors from free cyanide in soils is an acute risk.

There is no current UK guidance available for calculating acute risks from free cyanide. Consequently, GAC for acute exposure were derived using the algorithms presented in MADEP 1992<sup>15</sup> and assuming a one-off ingestion of 10g of soil (this conservative value has been taken as an upper bound estimate for a one-off soil ingestion rate amongst children). Receptor body weights have been selected according to the critical receptor for each exposure scenario. The lowest of the chronic and acute GAC for each land use scenario were adopted by WSP. Brinckerhoff.

### LEAD

The SGV for lead was withdrawn by the EA in 2009, and in 2011 the EA withdrew their published TOX report in light of new scientific evidence. The C4SL for lead was derived using the latest scientific evidence from a large human dataset. As such, no chemical-specific margin was applied in the derivation of the C4SL for lead. It may be possible for WSP to derive a GAC for lead using the same dataset and applying a chemical-specific margin, but the value is likely to be lower than UK natural background concentrations. Therefore, WSP has adopted the toxicological data used to derive the C4SLs in deriving the GAC for lead until such time as alternative GACs are published by an authoritative body. The relative bioavailability was set at 100% in line with the approach taken for other GACs, whereas the C4SL assumes 60% for soil and 64% for airborne dust. Thus, the WSP GAC are lower than the C4SLs.

<sup>15</sup> MADEP 'Background Documentation for the Development of an "Available Cyanide" Benchmark Concentration' 1992. [http://www.mass.gov/dep/toxics/cn\\_soil.htm](http://www.mass.gov/dep/toxics/cn_soil.htm)

## POLYCYCLIC AROMATIC HYDROCARBONS

WSP's approach to the assessment of polycyclic aromatic hydrocarbons (PAHs) uses the surrogate marker approach. BaP was used as a surrogate marker for all genotoxic PAHs in line with the Health Protection Agency 2010<sup>16</sup> recommendations and SP1010. This assumes that the PAH profile of the data is similar to that of the coal tars used in the Culp *et al* oral carcinogenicity study from which the toxicity data for BaP was produced. In reality, this profile has been shown by HPA to be applicable on the majority of contaminated sites based on assessment of sites across the country.

The alternative is the Toxic Equivalency Factor (TEF) approach which uses a reference compound and assigns TEFs for other compounds based on estimates of potency. Key uncertainties with this approach include the assumption that all compounds have the same toxic mechanism of action within the body and that no compounds with a greater potency than the reference compound are present. It is considered by the HPA that the TEF approach is likely to under predict the true carcinogenicity of PAHs and therefore favours the surrogate marker approach.

For these reasons, WSP considers that the adoption of BaP as a surrogate marker for genotoxic PAHs as opposed to the TEF approach is reasonable, even in cases where the PAH profile may differ from that of the Culp *et al* study. In addition, WSP has derived a GAC for naphthalene, which is commonly a risk driver due to its high volatility, relative to other PAH compounds, as an indicator compound for threshold PAHs.

## TRIMETHYLBENZENES

The GAC for trimethylbenzenes can be used for the assessment of any individual isomer (1,2,3-trimethylbenzene, 1,2,4-trimethylbenzene or 1,3,5-trimethylbenzene), or a mixture of the three isomers.

## CHEMICAL GROUPS

For a number of chemical groups, the available toxicity data is for combinations of chemicals. Given that the physico-chemical parameters may differ between the chemicals, the GACs for the chemicals within the groups have been calculated and then the lowest GAC selected to represent the entire group. This was the approach taken by the EA for m-, o- and p-xylenes, and has also been adopted by WSP for:

- à 2-chlorophenol, 2,4-dichlorophenol, 2,4,6-trichlorophenol and 2,3,4,6-tetrachlorophenol;
- à 2-, 3- and 4-methylphenol (total cresols);
- à aldrin and dieldrin; and
- à  $\alpha$ - and  $\beta$ -endosulphan.

## EXPOSURE TO VAPOURS

### INHALATION OF MEASURED VAPOURS

WSP has derived a set of soil vapour GACs ( $GAC_{sv}$ ) that allow for the assessment of measured site soil vapour concentrations, using J&E, in order to establish potential risks via indoor inhalation of vapours. This methodology enables a more robust assessment of exposure via the inhalation of soil vapours indoors than using CLEA-derived soil GAC, as it is based upon measured soil vapour concentrations beneath the site. It also allows for the assessment of vapours from all source terms (i.e. groundwater, soil or NAPL). Outdoor inhalation was not included. WSP considers that the indoor inhalation pathway is the significantly dominant risk-driver.

The generic land use scenarios within CLEA (residential and commercial) that were used to derive the soil GAC were used to define the receptor and building characteristics for the soil vapour GAC. Only residential and commercial generic land use scenarios include the indoor inhalation of vapours pathway.

The  $GAC_{sv}$  were derived for three different soil types; sand, sandy loam and clay, reflecting the importance of this parameter within the J&E model. A depth to contamination of 0.85 m below the base of the building foundation was assumed (i.e. 1 m below ground level). This differs from the depth assumed for the soil GAC (0.5 m bgl), but was selected by WSP as a reasonable worst case scenario.

It is acknowledged that the J&E commonly over-predicts indoor vapour concentrations. In particular, it will significantly over-predict vapour concentrations for suspended floor slabs, which many new builds are constructed with, it does not take into account lateral migration and assumes an infinite source of contamination at steady state conditions. In addition, it is common for soil gas/vapour wells to be installed with at least 1 m of plain riser at the surface and this equates to a total depth of 0.85 m below the building foundation plus a 0.15 m thick foundation, and so is more representative of the depth that samples will be taken from.

The TDSIs and IDs for each substance were converted from  $\mu\text{gkg}^{-1}\text{bwday}^{-1}$  to  $\mu\text{gm}^{-3}$  using the standard conversions quoted in Table 3.3 of SR2, thereby replacing the need to model  $C_{air}$  in the equation:

$$C_{air} = \alpha \cdot C_{vap} \cdot 1,000,000 \text{cm}^3 \text{m}^{-3}$$

Where:

$C_{air}$  is the concentration of vapours within the building,  $\text{mg}^{-3}$

$\alpha$  is the steady state attenuation coefficient between soil and indoor air, dimensionless

$C_{vap}$  is the soil vapour concentration,  $\text{mgcm}^{-3}$

The target concentrations within indoor air for each substance ( $C_{air}$ ) are a function of receptor inhalation rates and occupancy periods, as defined by the site conceptual exposure model (assuming standard CLEA occupancy periods and receptors).

The attenuation factor was calculated using J&E (Equation 10.4 in SR3) and the resulting  $C_{vap}$  is equivalent to the  $GAC_{sv}$  for the modelled exposure scenario.

Where the calculated  $GAC_{sv}$  for a substance exceeds the vapour saturation limit, no  $GAC_{sv}$  has been proposed.

## INHALATION OF GROUNDWATER-DERIVED VAPOURS

The CLEA model does not have the capacity to derive GACs to assess vapours derived from dissolved phase contamination. WSP has derived a set of groundwater GACs ( $GAC_{gw}$ ) to evaluate the potential risks through the indoor inhalation of groundwater-derived vapours by first applying the approach described above for the derivation of the WSP  $GAC_{sv}$  to determine the acceptable concentration in soil vapour directly above the water table.

The depth to groundwater was assumed to be 1 m bgl (i.e. 0.85 m below the base of the building foundation). This depth was considered to be more representative of commonly encountered groundwater conditions than the 0.5 m below the base of the building foundation (i.e. 0.65 m bgl) that is used by CLEA for an unsaturated source present in the overlying soil.

The  $GAC_{gw}$  was then back-calculated from the  $GAC_{sv}$  using the air-water partition coefficient ( $K_{aw}$ ) for each substance.

Where the calculated  $GAC_{gw}$  for a substance exceeds the solubility limit, no  $GAC_{gw}$  has been proposed.

# 1 Introduction

## 1.1 Authorisation

---

- 1.1.1 This PWRA has been produced to support the design and Development Consent Order (DCO) process for the construction of a third river crossing over the River Yare at Great Yarmouth (“the Scheme”).

## 1.2 Site Information

---

- 1.2.1 The Scheme involves the construction, operation and maintenance of a new crossing of the River Yare in Great Yarmouth. The Scheme consists of a new dual carriageway road, including a road bridge across the river, linking the A47 at Harfrey's Roundabout on the western side of the river to the A1243 South Denes Road on the eastern side. The Scheme would feature an opening span double leaf bascule (lifting) bridge across the river, involving the construction of two new 'knuckles' extending the quay wall into the river to support the bridge. The Scheme would include a bridge span over the existing Southtown Road on the western side of the river, and a bridge span on the eastern side of the river to provide an underpass for existing businesses, enabling the new dual carriageway road to rise westwards towards the crest of the new crossing.

- 1.2.2 If constructed, the Scheme would comprise the following principal elements:

- a new dual carriageway road, crossing the River Yare in an east-west orientation, comprising of:
  - A new double-leaf bascule bridge providing an opening span to facilitate vessel movement within the river. This would include structures to support and accommodate the operational requirements of the bridge-opening mechanism, including counterweights below the level of the bridge deck. The bridge would be supported on driven piles;
  - New substructures, supported by driven piles, to support the double leaf bascule bridge within the existing quays either side of the river and within the river itself, requiring new permanent "knuckle" walls, creating cofferdams in the waterway to accommodate their construction;
  - A new five-arm roundabout connecting the new dual carriageway road with Suffolk Road, William Adams Way and the western end of Queen Anne's Road. Sections of the new five arm roundabout

---

---

would be supported on driven piles where deep soft ground is encountered;

- A single-span bridge over Southtown Road, with reinforced earth embankments joining that bridge to the new roundabout at William Adams Way. Southtown Road bridge and the reinforced earth embankments would be supported on driven piles;
  - A single-span bridge to provide an underpass on the eastern side of the river, with reinforced earth embankments joining that single span bridge to South Denes Road. The underpass and reinforced earth embankments would be supported on driven piles; and
  - A new signalised junction connecting the new road with A1243 South Denes Road.
- The closure of Queen Anne's Road, at its junction with Suffolk Road, and the opening of a new junction onto Southtown Road providing vehicular and pedestrian access to residential properties and the MIND Centre and Grounds at the eastern end of Queen Anne's Road;
  - Revised access arrangements for existing businesses onto the local highway network;
  - Dedicated provision for cyclists and pedestrians which ties into existing networks;
  - Implementation of part of a flood defence scheme along Bollard Quay that is proposed to be promoted by the Environment Agency, and works to integrate with the remainder of the flood defence scheme;
  - A control tower structure located immediately south of the crossing on the western side of the river. The control tower would facilitate the 24/7 operation of the opening span of the new double-leaf bascule bridge;
  - A plant room located on the eastern side of the river for the operation of the opening span of the new double-leaf bascule bridge;
  - The demolition of an existing footbridge on William Adams Way;
  - Associated changes, modifications and/or improvements to the existing local highway network;
  - Additional signage, including Variable Message Signs (VMS) at discrete locations, to assist the movement of traffic in response to network conditions and the openings / closings of the double-leaf bascule bridge;
  - The relocation of existing allotments to compensate for an area to be lost as a result of the Scheme and other works, including those at the MIND Centre and Grounds; and
  - New public realm, landscape, ecology and sustainable drainage measures.

---

**1.2.3** The Scheme also includes works to facilitate the construction, operation and maintenance of the above elements including:

- Creation of temporary construction sites and accesses from the public highway;
- Provision of new utilities and services and the diversion of existing utilities;
- Provision of drainage infrastructure, lighting and landscaping;
- Demolition of a number of existing residential and commercial / business properties; and
- Provision of vessel waiting facilities to the north and south of the new crossing, either as floating pontoons or additional fendering to the existing berths, including any dredging and quay strengthening works that may be required.

### **1.3 Objectives**

---

**1.3.1** The objective of this PWRA is to assess the potential risks to human health and controlled waters associated with piling through the Made Ground into the underlying natural strata and Principal Aquifer. This report also provides a brief summary of the ground and groundwater conditions encountered during the recent ground investigation works, as reported in:

- WSP Interpretative Environmental Ground Investigation Report, Great Yarmouth Third River Crossing prepared by WSP UK Ltd dated March 2019 (Appendix 16C of the Environmental Statement).

### **1.4 Previous Reports**

---

**1.4.1** The Principal Application Site has been the subject of a ground investigation (GI) undertaken between September 2017 and July 2018 by Norfolk Partnership Laboratory (NPL) who are the Applicant's appointed Sub-Contractor. Piling will only be occurring within the Principal Application Site. No piling is to be carried out within the Satellite Application Sites.

**1.4.2** The following reports have been produced by WSP UK Ltd in relation to the contaminated land aspects of the Scheme:

- 
- Interpretative Environmental Desk Study Report, ref. 70046035-EGS-0001 dated March 2019 (Appendix 16B of the Environmental Statement)
  - Interpretative Environmental Ground Investigation Report, ref. 70046035-EGS-0002 dated March 2019 (Appendix 16C of the Environmental Statement)

1.4.3 Information provided in Sections 2 and 3 of this report has been reproduced from the above reports.

## 1.5 Assessment

---

1.5.1 The Applicants Construction Contractor has tendered a design that has identified that the following piling techniques will be adopted for the Scheme:

- Combi piles comprising driven open toe steel tube and interconnecting driven steel sheet piles to form the bridge abutment cofferdam. These will transfer the bridge load through the made ground and superficial deposits into the underlying Crag Formation.
- Pre-cast concrete driven piles for the highway embankment approaches to the bascule bridge. These will transfer the embankment load through the made ground into the underlying superficial deposits.

1.5.2 The PWRA has been carried out with consideration to the guidance and information provided in the following documents:

- Piling in layered ground: risks to groundwater and archaeology. Environment Agency (October 2006) (Ref 16D.1);
- Piling into contaminated sites. Environment Agency National Groundwater and Contaminated Land Centres (February 2002) (Ref 16D.2); and
- Piling and penetrative ground improvement methods on land affected by contamination: guidance on pollution prevention. Environment Agency (May 2001) (Ref 16D.3).

---

---

## 2 Site Setting

### 2.1 Site History

---

2.1.1 Piling is only occurring within the Principal Application Site. For the purposes of this piling report to enhance clarity when discussing the ground conditions and historical uses, the Principal Application Site has been split in two, bisected by the River Yare – referred to as the eastern area and western area.

### 2.2 Eastern Area

---

2.2.1 The earliest map provided by GroundSure dated 1883 indicates the eastern area of the Principal Application Site to be densely developed predominantly with commercial / industrial properties including a gasworks, boat building yard and an icehouse. Some residential properties were present but generally the area is dominated by industry. This eastern area of the Principal Application Site has generally remained a commercial / industrial area up to the present day. Various industries have been present including fish canning, oilskin production, chemical factory and unspecified depots, warehouses and factories.

### 2.3 Western Area

---

2.3.1 The earliest map provided by GroundSure dated 1883 indicates the western area of the Principal Application Site to be less developed than the eastern area. The majority of the development was present adjacent to the River Yare and comprised a mix of residential properties and commercial / industrial sites such as an iron works, rope walk, gas works and malhouses. Beyond, towards the western boundary of the study area was agricultural land.

2.3.2 By 1906, a railway line running north south was constructed towards the western boundary and by 1926 / 1927, formal gardens and allotments are present towards the centre of the Principal Application Site. A shoe factory is marked adjacent to Queen Anne's Road in 1949 and by 1966 is relabelled as a printing works.

2.3.3 By 1978 the railway line had been dismantled and commercial / industrial units had started to be developed in the far west of the Principal Application Site and beyond. By 1988 the former rail route had started to be redeveloped as a dual carriageway and by 2002 the current major highway routes had been established.

---

## 2.4 Surrounding Land Uses

---

2.4.1 Immediate neighbouring land uses were as follows at the time of the Environmental Desk Study Report dated March 2019 (Appendix 16B of the Environmental Statement):

- North – Predominantly commercial / industrial with some residential properties on the west side of the river and predominantly residential with a few commercial / industrial properties on the east side of the river.
- East – Predominantly residential properties with occasional commercial properties and a community centre.
- South – Commercial / industrial properties on the east side of the river and residential properties, commercial / industrial properties and a recreation ground on the west side of the river.
- West – Commercial / industrial properties.

## 2.5 Environmental Setting

---

### Published Geology

2.5.1 The regional BGS 1:50,000 geological map and information available on the BGS on-line Geology of Britain Viewer ([www.bgs.ac.uk](http://www.bgs.ac.uk)) indicates the Superficial Geology immediately underlying the Principal Application Site within the Order Limits varies as follows:

- South west of the River Yare - peat of the Breydon Formation,
- North west of the River Yare – clay and silt of the Breydon Formation,
- East of the River Yare – sand and gravel of the North Denes Formation.
- Within the River Yare - Clay and silt Tidal River or Creek Deposits.

2.5.2 Bedrock geology is indicated to be the Crag Group (sand and gravel) across the Principal Application Site.

### Hydrogeology

2.5.3 The North Denes Formation superficial deposits underlying the red-line boundary to the east of the River are classified as a Secondary (A) Aquifer with permeable layers. These are defined by the Environment Agency as permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers.

- 
- 2.5.4 The peat and clay / silt superficial deposits underlying the Principal Application Site to the west of the River Yare are classified as unproductive.
  - 2.5.5 The underlying bedrock is classified as a Principal Aquifer. These are defined by the Environment Agency as layers of rock or drift deposits that have high intergranular and/or fracture permeability - meaning they usually provide a high level of water storage. They may support water supply and/or river base flow on a strategic scale.
  - 2.5.6 The nearest active groundwater abstraction is approximately 71m to the north west of the red-line boundary and is for laundry use.
  - 2.5.7 The Principal Application Site is not within a Source Protection Zone.

### Hydrology

- 2.5.8 The River Yare splits the red-line boundary in two and is recorded as a Primary River. At this point it is estuarine and is not separated from the sea by any locks. No other surface water features are present.
- 2.5.9 No surface water or potable water abstractions are present within 2km of the Order Limits.

## 2.6 Ground Investigation

---

- 2.6.1 The ground investigation undertaken in 2017/2018 by Norfolk Partnership Laboratory (NPL) generally confirmed the anticipated geological sequence above and is summarised below. Full details of the ground investigation works undertaken and the ground conditions encountered are presented in the WSP Interpretative Environmental Ground Investigation Report (Appendix 16C of the Environmental Statement).
- 2.6.2 Exploratory hole locations are indicated on the drawing entitled Exploratory Hole Locations Figure 16.1 reference GYTRC-WSP-EGN-XX-DR-EN-0047 presented in Volume 3 of the Environmental Statement.

### Made Ground Eastern Area

- 2.6.3 Made ground was recorded at almost all exploratory hole locations (absent from BH15) and varied in thickness from 0.55m to 4.8m. The thickness of made ground varied across the Principal Application Site with the thicker made ground generally recorded close to the quay wall.
- 2.6.4 The made ground was generally granular and heterogeneous in nature and included detritus comprising brick, wood, concrete, porcelain, asphalt, ceramics and metal. However, BH12A and BH13A both recorded brick / concrete within natural strata at depth (5.9m and 3.5m respectively)

indicating this material may be reworked rather than being in-situ natural strata.

### **Made Ground Western Area**

- 2.6.5 Made ground was recorded at almost all exploratory hole locations (absent from WS8) and varied in thickness from 0.4m to at least 4.2m, although the base of the made ground was not encountered in WS2 at 2m depth and therefore may be deeper.
- 2.6.6 The thickness of made ground varied across the western area and although thick made ground was recorded close to the quay wall, the thickest made ground was not recorded in this area.
- 2.6.7 The made ground was generally granular and heterogeneous in nature and included detritus comprising; concrete, asphalt, tile, brick, ceramic, pottery, wood, ash, leather, metal, glass, plastic, mortar and slag. BH5A at 2.0m recorded brick gravel within the Breydon Formation indicating this layer is likely to be made ground rather than in-situ natural strata.
- 2.6.8 WS4 at 2.3m and WS5 at 1.85m recorded a geogrid structure.

### **Concrete and Underground Structures**

- 2.6.9 Solid concrete was recorded at most locations in the eastern area and was recorded up to 0.65m thick. However, only a few locations in the western area recorded concrete up to 0.5m thick.
- 2.6.10 Tarmac up to 0.2m thick was recorded at a few locations in the western area but was absent from the eastern area.
- 2.6.11 No pipes or underground structures were recorded on the Engineer's logs.

### **Natural Strata**

#### Tidal River or Creek Deposits

- 2.6.12 Tidal River or Creek deposits were generally indistinguishable from the underlying Breydon Formation. The Tidal River or Creek Deposits encountered that can be differentiated are located in the eastern area overlying the sand deposits of the North Denes formation. Here, they generally comprised a dark grey to black, silty, variably organic Clay, and a sandy, clayey Silt interbedded with light brown to black, fine to coarse Sand with occasional flint gravel and pockets of organic material.
- 2.6.13 The deposit was generally encountered underlying Made Ground, to the maximum depth of 5.6m in BH14. The thickness of this deposit varied from 0.5m in BH13 to 3.80m in borehole BH14.

---

---

### North Denes Formation

- 2.6.14 The North Denes Formation was only encountered in the eastern area where it was found underlying made ground. The Formation was typically described as a very loose to dense yellowish brown fine to coarse Sand with some rare gravels and some rare thin silt and clay bands.
- 2.6.15 The Formation was recorded at a maximum depth of 5.6m below ground level (bgl) in BH14 and was not recorded in the four boreholes undertaken along the edge of the eastern quay wall (BH12, BH12A, BH13, BH13A), where Tidal River or Creek Deposits and the Breydon Formation were encountered within the depth range that the sands of the North Denes Formation were found towards the east.

### Breydon Formation

- 2.6.16 The Breydon Formation was encountered in most boreholes in both the western and eastern areas of the Principal Application Site. In the west the Formation was encountered as either granular, cohesive or peat material. The Breydon Peat was encountered predominantly towards the west, but was also found in thinner layers close to the river. The cohesive and granular materials were encountered as interbedded layers of varying thicknesses across the Principal Application Site.
- 2.6.17 The Breydon Formation can be recognised as separate interbedded substrata and these are described below.

### Breydon Peat

- 2.6.18 The Breydon Peat was encountered solely in the western area as soft, dark brown and black, variably fibrous, sometimes clayey amorphous Peat. Occasional wood and reed fragments were observed.
- 2.6.19 The Peat was found to a maximum depth of 11.9m bgl in BH2, with thickness ranging between 0.25m to 3.66m.
- 2.6.20 Towards the west the Peat was encountered in thicker layers often underlying made ground and overlaying the granular and cohesive Breydon Formation strata.

### Breydon Clay and Silt

- 2.6.21 The clay component of the Breydon Formation was generally encountered as very soft to soft, dark grey to brown and variably silty, sandy and organic Clay, containing occasional shell fragments, gravel, pockets of peat and rootlets. The silt component contains occasional traces of gravel, organic debris, rootlets and shell fragments. The thickness of the cohesive bands

---

---

vary from 0.1m to 1.0m in the eastern area and from 0.1m to a maximum of 5.1m in the western area.

- 2.6.22 The silts and clays were encountered between 0.3m and 4.0m bgl in the western area, and between 2.60m and 4.50m bgl in the eastern area.

#### Breydon Sand and Gravel

- 2.6.23 The granular component of the Breydon Formation comprises predominantly loose to very loose, with some locally dense areas, grey and brown-grey silty clayey fine to medium sand, with some angular to rounded gravels of flint and occasional quartz.
- 2.6.24 The thickness of the sand and gravel varies from 0.15m to 2.0m in the eastern area, with the top being encountered between 4m bgl and 4.95m bgl and to a maximum depth of 6.50m bgl
- 2.6.25 The granular material in the western area was encountered in layers ranging between 0.10m and 4.00m thick, the top of which was found at depths of 0.85m bgl to 11.40m bgl. The base of the strata was found up to a maximum depth of 13.00m bgl

#### Breydon Formation (Stratum A)

- 2.6.26 A stratum within the Breydon Formation was encountered as quartz and quartzite gravels within a granular matrix. This material was encountered across both the eastern and western areas and was typically described as a loose to medium dense, grey, slightly silty and gravel, where the gravels are fine to medium, angular to rounded flint and quartz with some rare limestone gravels and shells.
- 2.6.27 It was encountered across both the western and eastern areas at thicknesses ranging between 1.6m to 9.4m. The thickness decreases towards the west away from the river but remains relatively consistent in the eastern area. The top of the strata in the western area was encountered at depths of between 3.00m bgl to 6.00m bgl and in the eastern area at depths of between 3.20m bgl to 11.70m bgl
- 2.6.28 To differentiate it from the other strata within the Breydon Formation, the WSP Geotechnical assessment has labelled this material as Breydon Formation (Stratum A).

#### Happisburgh Glacigenic Formation

- 2.6.29 The Happisburgh Glacigenic Formation was encountered below the Breydon Formation Stratum A in the east. In the western site area, it is partly replaced by the granular and cohesive layers of the Breydon Formation.

- 
- 2.6.30** The Happisburgh Glaciogenic Formation was typically described as a loose to medium dense, light brown to orange-brown, fine to coarse though predominantly medium, variably silty sand with rare fine gravels. The sand contains variable amounts of angular to rounded, fine to coarse flint gravel. Some cohesive deposits were encountered within the strata as firm to stiff orange-brown laminated sandy silt and clay, with olive grey clay banding.
- 2.6.31** The formation was encountered in the western area at depths ranging between 5.00m bgl to 13.00m bgl and ranged in thickness between 4.30m to 14.70m. On the eastern area the formation was encountered deeper than in the west at depths ranging from 10.00m bgl to 18.00m bgl ranging in thickness between 3.00m and 12.00m.

#### Crag Group

- 2.6.32** The Crag Group was encountered across the entire Principal Application Site underlying the Happisburgh Glacigenic Formation as dense to very dense, grey to dark grey, fine to medium grained silty Sand with frequent white shell fragments, with some fine gravel and occasional soft to firm silty clay layers.
- 2.6.33** This stratum was encountered at depths ranging between 15.85m bgl and 22.80m bgl and with thicknesses ranging from 22.30m to 25.65m. Generally, the top of the strata indicated a relatively uniform horizon in both the west and east of the Principal Application Site.

#### London Clay

- 2.6.34** London Clay was encountered at depth underlying the Crag Formation as a stiff to very stiff, brown grey, sometimes laminated silty clay. Some rare flint gravels and gypsum crystals were encountered.
- 2.6.35** The London Clay was encountered at depths ranging between 44.00m bgl to 46.50m bgl and the base was not confirmed in any boreholes.

#### **Visual and Olfactory Evidence of Contamination**

- 2.6.36** Other than the man-made detritus recorded within the made ground, visual and olfactory evidence of contamination was recorded by NPL at the following locations. Further detail is provided on the Engineer's logs presented in Annex B of the Interpretative Ground Investigation Report (Appendix 16C of the Environmental Statement).

*Table 2.1: Summary of Visual and Olfactory Evidence of Contamination*

	Exploratory Hole reference	Comment	Strata Type (identified on Engineer's logs)	Impacted Strata Depth (m bgl)
<b>Eastern Area</b>	WS21	Hydrocarbon odour	Alluvium	1.4m – 2.0m
	WS21	Hydrocarbon odour	Alluvium	2.5m – 2.95m
	BH14	Diesel odour	Alluvium	2.6m
	BH14	Slight diesel odour	North Denes Formation	7.6m – 8.0m
<b>Western Area</b>	BH6	Slight hydrocarbon odour	Made ground	0.4m – 1.2m
	BH4BU	Hydrogen sulphide odour	Breydon Formation	2.65m – 2.85m

### Marine Sediments

**2.6.37** The Engineer's logs for the marine boreholes presented in Annex C of the Interpretative Environmental Ground Investigation Report (Appendix 16C of the Environmental Statement) indicate that the shallow sediments within the River Yare comprise gravel, sand, silt and clay and are classified as Tidal River or Creek Deposits. These vary in thickness from 0.8m up to 5.3m. Underlying these sediments are the Happisburg Glacigenic Formation and the Crag Formation, both predominantly comprising sand but layers of silt and clay are also present. London Clay was encountered at depth beneath the Crag Formation at a few locations.

## 3 Contamination Assessment

3.1.1 This Section summarises the findings of human health, controlled waters and ground gas risk assessments. Full details are presented in the WSP Interpretative Environmental Ground Investigation Report (ref. 70046035-EGS-0002) dated March 2019 (Appendix 16C of the Environmental Statement).

### 3.2 Human Health Risk Assessment

3.2.1 The chemical test results were screened against both a public open space and a commercial / industrial end use. Whilst both are considered to be conservative these are the two closest standard scenarios for the type of site ie highway with landscaping areas accessible by the general public.

#### Assessment of Results – Public Open Space End Use Scenario

3.2.2 Evidence of hydrocarbons (diesel) was identified at three locations during the ground investigation as detailed in Table 2.1 above. Two of these three locations were targeted for chemical testing and none of the results exceeded the Generic Assessment Criteria (GAC) derived for hydrocarbons using a Public Open Space (POS) scenario. It should be noted that the diesel odour in BH14 was not scheduled for chemical testing by NPL but the area was targeted subsequently at the request of WSP with the three additional window samples WS20, WS21 and WS22. None of the additional samples tested recorded results in excess of the hydrocarbon GAC's.

#### Natural Ground (Eastern Area)

3.2.3 The following Contaminants of Concern (CoC) have been identified from the screening of natural ground in the eastern area:

- Alkaline pH at two locations – BH13A and WS20 – 9.78 and 10.31 respectively compared to a screening value of 9.5.

#### Natural Ground (Western Area)

3.2.4 The following CoC have been identified from the screening of natural ground in the western area:

- Acid pH at one location – TP01 – 5.4 compared to a screening value of 5.5.

#### Made Ground (Eastern Area)

3.2.5 The following CoC have been identified from the screening of made ground in the eastern area:

- Alkaline pH at five locations – BH12A (9.62), BH17 (12.49), BH16 (11.41), BH14 (10.15) and WS21 (11.01) exceeded the GAC of 9.5.

#### Made Ground (Western Area)

3.2.6 The following CoC have been identified from the screening of made ground in the western area:

- Asbestos was recorded by the chemical testing laboratory in four samples:
  - BH6 at 0.5m as chrysotile loose fibres,
  - BH6 at 1.0m as chrysotile loose fibres,
  - CPT3 at 0.5m as chrysotile loose fibres,
  - CPT3 at 1.0m as chrysotile loose fibres,
- Lead at one location – BH5A at 0.5m depth (878mg/kg) compared to a GAC of 808mg/kg.
- Alkaline pH at two locations – BH11A (9.84) and BH10A (11.62) values exceeded the GAC of 9.5.
- Benzo(a)pyrene at two locations – BH7 at 0.8m depth (510mg/kg) and BH4 at 2.0m depth (13.9mg/kg) compared to a GAC of 11mg/kg.

#### **Assessment of Results – Commercial / Industrial End Use Scenario**

3.2.7 Evidence of hydrocarbons (diesel) was identified at three locations during the ground investigation as detailed in Table 2.1 above. Two of these three locations were targeted for chemical testing and none of the results exceeded the GAC derived for hydrocarbons using a Commercial / Industrial end use scenario. It should be noted that the diesel odour in BH14 was not scheduled for chemical testing by NPL but the area was targeted subsequently at the request of WSP with the three additional window samples WS20, WS21 and WS22. None of the additional samples tested recorded results in excess of the hydrocarbon GAC's.

#### Natural Ground (Eastern Area)

3.2.8 The following CoC have been identified from the screening of natural ground in the eastern area:

- Alkaline pH at two locations – BH13A and WS20 – 9.78 and 10.31 respectively compared to a screening value of 9.5.

#### Natural Ground (Western Area)

3.2.9 The following CoC have been identified from the screening of natural ground in the western area:

- Acid pH at one location – WS TP01 – 5.4 compared to a screening value of 5.5.

#### Made Ground (Eastern Area)

3.2.10 The following CoC have been identified from the screening of made ground in the eastern area:

- Alkaline pH at five locations – BH12A (9.62), BH17 (12.49), BH16 (11.41), BH14 (10.15) and WS21 (11.01) exceeded the GAC of 9.5.

#### Made Ground (Western Area)

3.2.11 The following CoC have been identified from the screening of made ground in the western area:

- Asbestos was recorded by the chemical testing laboratory in four samples:
  - BH6 at 0.5m as chrysotile loose fibres,
  - BH6 at 1.0m as chrysotile loose fibres,
  - CPT3 at 0.5m as chrysotile loose fibres,
  - CPT3 at 1.0m as chrysotile loose fibres,
- Alkaline pH at two locations – BH11A (9.84) and BH10A (11.62) values exceeded the GAC of 9.5.
- Benzo(a)pyrene at one location – BH7 (510mg/kg) compared to a GAC of 38mg/kg.

### **Discussion**

3.2.12 Asbestos has been identified at four shallow locations and is therefore likely to be encountered during the earthworks. Most of the other exceedances will be mitigated from a human health perspective through the presence of hard standing or landscaping inert cover. However, the benzo(a)pyrene exceedance of 510mg/kg in BH7 may need further assessment if this material is likely to be disturbed during construction.

## **3.3 Controlled Waters Risk Assessment**

---

### **Risks to Aquifer**

#### Soil Leachability Testing

3.3.1 Generic screening of 31 soil leachate test results from the ground investigation was undertaken against Water Quality Standards (WQS). The exceedances are summarised in the table below.

Table 3.1: Summary of Potential Leachate Risks to the Aquifer

Determinand	WQS	Number of Exceedences	Range of Values Recorded
<b>Alkaline pH</b>	>10	1	11.18
<b>Acid pH</b>	<6.5	1	6.22
<b>Ammoniacal Nitrogen</b>	0.389mg/l	11	0.39mg/l to 5.08mg/l
<b>Total Cyanide</b>	0.005mg/l	6	0.006mg/l to 0.021mg/l
<b>Arsenic</b>	10µg/l	6	13µg/l to 37µg/l
<b>Lead</b>	10µg/l	12	14µg/l to 145µg/l
<b>Nickel</b>	20µg/l	1	61µg/
<b>Selenium</b>	10µg/l	1	20µg/l
<b>Benzo(a)pyrene</b>	0.01µg/l	3	0.03µg/l to 0.13µg/l
<b>Sum of four polyaromatic hydrocarbons</b>	0.1µg/l	2	0.23µg/l to 0.34µg/l

3.3.2 It should be noted that the limits of detection for benzo(a)pyrene, bis(2-ethylhexyl) phthalate and hexachlorobutadiene are in excess of the screening values.

#### Groundwater Sampling

3.3.3 Generic screening of groundwater test results from the fourteen monitoring visits identified WQS exceedences for the following determinands but not from every sample on every monitoring visit.

- pH
- Ammoniacal nitrogen
- Sulphate
- Free cyanide
- Total cyanide
- Arsenic
- Boron
- Benzo(a)pyrene

- Sum of four speciated Polyaromatic Hydrocarbons
- Aromatic C10-C12
- Aromatic C12-C16
- Aromatic C16-C21

3.3.4 It should be noted that the limits of detection for bis(2-ethylhexyl) phthalate, vinyl chloride, 1,2-dibromoethane, 1,2-dibromo-3-chloropropane, hexachlorobutadiene are in excess of the screening values.

3.3.5 Most of the exceedances are marginal (less than one order of magnitude) and are unlikely to pose an unacceptable risk to drinking water. However, there are a few exceedances that are one or more orders of magnitude higher than the screening values and these are highlighted below:

- Ammoniacal nitrogen exceeds the WQS in most samples by one order of magnitude although occasional samples from BH13, WS20, WS21 and WS22 recorded concentrations two orders of magnitude higher.
- Sulphate exceeds the WQS by one order of magnitude in a few samples; BH7, BH4D (deep), BH11, BH13 and BH4.
- Arsenic exceedances are no more than one order of magnitude higher than the WQS and are generally recorded in BH7, BH4D (shallow), BH15, but also in BH4D (deep), BH13, BH11, WS20, WS21 and WS22 on occasions.
- Exceedances of benzo(a)pyrene were recorded in BH4D, BH4, WS20, WS21, WS22 and are generally less than one order of magnitude higher than the screening value. However, a maximum concentration of 1.87µg/l was recorded in WS22 during visit eight on 4th October 2018.
- Total PAH exceeded the WQS on only nine occasions and were generally less than one order of magnitude higher than the WQS. However, two samples recorded concentrations greater than one order of magnitude – WS22 – 5.46µg/l on 4th October and WS20 – 1.54µg/l on 29th November.
- Petroleum hydrocarbons are generally below the screening values apart from WS21 and BH13 in the last two monitoring visits where aromatic C12-C16 hydrocarbons were recorded up to 163µg/l. Test results above

the limit of detection were also recorded for aromatic C10-C35 hydrocarbons indicating the possible presence of diesel.

### Risks to River Yare Surface Water

#### Soil Leachability Testing

- 3.3.6 Generic screening of 31 soil leachate test results from the ground investigation was undertaken against Water Quality Standards (WQS). The table below summarises the exceedences.

Table 3.2: Summary of Potential Leachate Risks to Surface Waters

Determinand	WQS	Number of Exceedences	Range of Values Recorded
Cyanide	0.001mg/l	6	0.006mg/l to 0.021mg/l
Arsenic	25µg/l	1	37µg/l
Copper	3.76µg/l	18	4µg/l to 80µg/l
Nickel	8.6µg/l	1	11µg/l
Mercury	0.07µg/l	1	0.1µg/l
Lead	1.3µg/l	23	2µg/l to 145µg/l
Zinc	6.8µg/l	21	7µg/l to 644µg/l
Anthracene	0.1µg/l	1	0.13µg/l
Benzo(a)pyrene	0.00017µg/l	3	0.03µg/l to 0.13µg/l
Fluoranthene	0.0063µg/l	21	0.02µg/l to 0.2µg/l
Naphthalene	2µg/l	1	3.75µg/l
Bis(2-ethylhexyl)phthalate	1.3µg/l	1	4µg/l
Phenol	7.7µg/l	1	11µg/l
Aromatic hydrocarbons C <sub>8</sub> -C <sub>10</sub>	20µg/l	1	21µg/l
Aromatic hydrocarbons C <sub>12</sub> -C <sub>16</sub>	2µg/l	1	11µg/l

- 3.3.7 It should be noted that the limits of detection for cyanide, phenols, cadmium, hexavalent chromium, mercury, benzo(a)pyrene, fluoranthene, 1,2,4-trichlorobenzene, 2,4-dichlorophenol, bis(2-ethylhexyl) phthalate, butylbenzyl phthalate, phenol and aromatic C5-C7, C10-C12, C12-C16, C16-C21 and C21-C35 hydrocarbons are in excess of the screening values.

#### Groundwater Sampling

- 3.3.8 Generic screening of groundwater test results from the 14 monitoring visits identified WQS exceedances for the following determinands but not from every sample on every monitoring visit.

- Free cyanide
- Total cyanide
- Arsenic
- Copper
- Mercury
- Zinc
- Anthracene
- Benzo(a)pyrene
- Fluoranthene
- Phenol
- Trichloroethene
- Aromatic C9-C10
- Aromatic C10-C12
- Aromatic C12-C16
- Aromatic C21-C35

- 3.3.9 Most of the exceedances are marginal (less than one order of magnitude) and are unlikely to pose an unacceptable risk to surface waters. However, there are a few possible patterns that may indicate an impact has previously occurred, as detailed below:

- Trichloroethene and 1,2-dichloroethene are recorded above the limit of detection in BH4 (shallow and deep wells) in most of the monitoring visits. Trichloroethene is recorded above the screening value of 10µg/l in BH4D (deep) during each of the first five monitoring visits. The concentrations recorded range from 14µg/l to 20µg/l. 1,2-dichloroethene concentrations only vary from 1µg/l to 12µg/l (compared to a WQS of 50µg/l). This would suggest an impact has occurred in the past but in the absence of

significantly elevated concentrations of any other VOC's a significant risk is not considered to exist. This location is on the western side of the river.

- Hydrocarbons were not recorded above the limit of detection during the first six visits. However, aromatic hydrocarbons were recorded above the limit of detection in wells on the eastern side of the river from visit seven (30th August 2018), particularly BH13, WS20, WS21 and WS22 until the final two monitoring visits; the concentrations did not exceed 53µg/l. However, the last two monitoring visits recorded an increase in the number of locations recording concentrations above the limit of detection, particularly for aromatic C16 to C21 (up to 97µg/l). WS21 recorded aromatic hydrocarbons up to 163µg/l (C12 to C16).
- Aliphatic hydrocarbons were generally less than the limit of detection except for a few occasions when BH4D, BH10, WS21 and WS22 recorded speciations above the limit of detection up to 80µg/l.
- Hydrocarbon odours were recorded in BH14 and WS21 on the eastern side of the river during the drilling works. Elevated hydrocarbon concentrations within the groundwater have also been recorded in a similar area but only during the final two sampling visits. The elevated concentrations are for the aromatic C9 to C35 fractions and have a maximum concentration of 163µg/l and exceed the WQS for these fractions. An impact appears to have occurred but it is unclear why the last two sampling visits recorded exceedances and the previous visits generally did not.
- Elevated arsenic was recorded in BH15 only up to a maximum concentration of 75µg/l and elevated cyanide was commonly recorded in BH15 and BH4D up to 0.227µg/l.
- Fluoranthene was recorded in most samples during most visits and the results are generally in the range of 0.01µg/l to 0.05µg/l. However, occasional results for WS20, WS21, WS22, BH12B and BH4D (shallow) are recorded an order of magnitude higher, up to 0.48µg/l. WS22 also recorded a maximum concentration of 2.33µg/l. This same sample from WS22 (4th October 2018) also recorded elevated benzo(a)pyrene (1.87µg/l), the highest recorded during the monitoring as well as the only phenol exceedance and one of two anthracene exceedances (the other being WS20).

### Discussion

- 3.3.10 The ground investigation recorded some olfactory evidence of hydrocarbons in WS21, BH14 and BH6.
- 3.3.11 Sampling of groundwater from monitoring well installations (adopting best practice of purging) identified some exceedances of the conservative generic groundwater screening values for metals, inorganics and hydrocarbons.

---

Most of these exceedances are less than one order of magnitude greater than the screening values and are therefore not considered to be indicative of significant contamination.

- 3.3.12** However, there is some evidence of organic contamination (polyaromatic hydrocarbons, volatile organic compounds and petroleum hydrocarbons) and to a lesser extent metals and non-metals in the groundwater across the Principal Application Site indicating the groundwater has been impacted previously and has the potential to impact the surface water of the River Yare.
- 3.3.13** The soil leachate WQS exceedances are generally less than one order of magnitude above the screening values and indicate that there is a theoretical potential for an impact to occur. However, the Principal Application Site will be generally hard standing, thus limiting the degree of rainfall percolation through the made ground and hence the concentrations recorded suggest the made ground would not pose a significant risk to Controlled Waters.
- 3.3.14** In view of the above, it is considered that the absence of test results that consistently exceed the screening values at each monitoring visit indicates that there is unlikely to be an unacceptable risk to the identified receptors and hence specific remediation to target existing groundwater exceedances is not considered necessary.
- 3.3.15** The groundwater monitoring test data has also been assessed on a strata by strata basis. This has not identified any significant difference in the exceedances between the different strata or from one side of the river to the other. This would suggest there is hydraulic continuity between the different strata.

## **3.4 Groundwater Levels**

---

- 3.4.1** Monitoring of groundwater levels in relation to Ordnance Datum was undertaken on eight occasions following the completion of the intrusive ground investigation works and the data is summarised in Tables 3.3 and 3.4 below.
- 3.4.2** The tables do not include the data for BH4A, BH10 or BH12B; the response zones in these wells cross the made ground / natural ground boundary and therefore the exact source of the ground water cannot be confirmed.

**Table 3.3: Summary of Ground Water Level Monitoring in the Eastern Study Area**

Stratum	Minimum (mOD)	Maximum (mOD)	Observations
<b>Made Ground</b>	-	-	No standalone monitoring wells within the made ground
<b>Natural Ground</b>	-0.18	0.77	-

**Table 3.4: Summary of Ground Water Level Monitoring in the Western Study Area**

Stratum	Minimum (mOD)	Maximum (mOD)	Observations
<b>Made Ground</b>	-1.66	0.09	-
<b>Natural Ground</b>	-0.33	0.19	-

### Hydraulic Gradient

- 3.4.3 The groundwater monitoring data obtained to date appears to indicate the hydraulic gradient is towards the River Yare from both the western area and the eastern area as would be expected. However, it should be noted that the groundwater monitoring data may be subject to tidal fluctuations which could affect the recorded levels.

### Hydraulic Continuity

- 3.4.4 The superficial deposits are likely to be in hydraulic continuity with the Crag Group due to the absence of any continuous low permeable strata separating these aquifers.
- 3.4.5 Similar groundwater quality characteristics across the Principal Application Site and the proximity to the tidally influenced River Yare also indicate that the mixing of groundwater between the superficial deposits and the Crag Group is likely to be occurring.
- 3.4.6 The regional Chalk Group aquifer is essentially protected by the overlying London Clay Formation, which is considered to significantly reduce the potential risks of any groundwater pollution present migrating to the chalk within the study area.

### Assessment of Saline Intrusion

- 3.4.7 The two most recent sets (14th November and 29th November 2018) of groundwater testing included results for electrical conductivity in order to make an assessment of saline intrusion. The results indicate that there is some influence from seawater across the Principal Application Site in both shallow and deep groundwater monitoring wells. It is noted that pile materials should take into account the potential presence of saline water.

### 3.5 Ground Gas Risk Assessment

3.5.1 To date, nine rounds of ground gas monitoring have been undertaken by NPL on the following dates:

- 17th August 2018 – excludes BH7 and window sample locations WS20-WS22,
- 30th August 2018 - excludes BH7 and window sample locations WS20-WS22,
- 4th October 2018 – excludes BH7,
- 18th October 2018 - excludes BH7,
- 1st November 2018 - excludes BH7,
- 14th November 2018 - excludes BH7,
- 29th November 2018 - excludes BH7,
- 11th December 2018 - excludes BH7,
- 20th December 2018 – only BH7 was monitored on this occasion.

3.5.2 A control building and a plant room will be constructed as part of the bridge and therefore this gas assessment will inform the design of those buildings.

3.5.3 Atmospheric pressure varied as summarised in Table 3.5 below during the monitoring period:

*Table 3.5: Summary of Atmospheric Pressure Recorded during Gas Monitoring Visits*

Date	Atmospheric Pressure	Trend
17/8/18	1010	Steady
30/8/18	1020	Steady
4/10/18	1022	Steady
18/10/18	1024	Steady
1/11/18	1001	Steady
14/11/18	1022-1021	Falling
29/11/18	1002	Steady
11/12/18	1026	Steady
20/12/18	1003	Steady

3.5.4 The results of the gas monitoring are presented in Annex B.1 of the Interpretative Environmental Ground Investigation Report (Appendix 16C of the Environmental Statement). The table below presents Gas Screening

Values (GSV) which have been calculated in accordance with C665 for each gas monitoring well.

*Table 3.6: Summary of Ground Gas Monitoring Results*

Exploratory Hole	Max Flow Rate (l/hr)	Max Methane (% v/v)	Max Carbon Dioxide (% v/v)	Methane GSV	Carbon Dioxide GSV	Characteristic Situation
<b>BH4</b>	0.1	0	4.8	0	0.000048	1
<b>BH4A</b>	0	0	5.1	0	0	1
<b>BH4D Shallow</b>	1.1	0	10.6	0	0.1166	2
<b>BH4D Deep</b>	1.0	0	10.1	0	0.101	2
<b>BH6</b>	0.1	0	0.9	0	0.0009	1
<b>BH7</b>	0	0	4.7	0	0	1
<b>BH10</b>	0.1	0	1.5	0	0.0015	1
<b>BH11</b>	1.1	1.1	6.1	0.0121	0.0671	1
<b>BH12B</b>	0.1	0	3.6	0	0.0036	1
<b>BH13</b>	0.1	0.8	0.3	0.0008	0.0003	1
<b>BH15</b>	0	0	0.5	0	0	1
<b>WS20</b>	0	0	0.1	0	0	1
<b>WS21</b>	0	0	0.1	0	0	1
<b>WS22</b>	0	0	0.2	0	0	1

**3.5.5** The above GSV's range between zero and 0.1166 and indicate most monitoring wells are classified as Characteristic Situation 1, with two locations (BH4D deep and BH4D shallow) being Characteristic Situation 2. However, BH4A, BH11 and possibly also BH4, BH7 and BH13 exhibit gas concentrations that could classify these as Characteristic Situation 2 should gas flow increase at these locations.

**3.5.6** No gas protection measures above and beyond standard construction are required for the areas classified as Characteristic Situation 1 whereas areas classified as Characteristic Situation 2 are likely to require gas protection measures. However, the only buildings to be constructed on the Principal Application Site (control room and the plant room) are both located on the bridge abutments above ground level, cantilevered from the sides of the abutments. It is therefore considered that no pathway exists for ground gas to migrate into either of these proposed buildings and hence no gas protection measures are required for the design.

## 4 Conceptual Site Model

### 4.1 Introduction

4.1.1 This Section summarises the Conceptual Site Model (CSM) from the WSP Interpretative Environmental Ground Investigation Report (Appendix 16C of the Environmental Statement). Plausible source-pathway-receptor contaminant linkages have been refined in line with industry good practice (principally CLR11 (Ref 16D.4)).

4.1.2 Table 4.1 provides the potential contaminant linkages that are considered to be plausible for the future use of the Principal Application Site. Where mitigation measures are proposed in the table below, these are detailed in the outline CoCP (document reference 6.16) and secured via a requirement in the DCO.

*Table 4.1: Summary of Plausible Contaminant Linkages*

Potential Contaminants	Potential Pathways	Potential Receptors	Comments
<b>Free asbestos fibres in made ground soil</b>	Inhalation of asbestos fibres.	Future site users Future maintenance workers	Extensive hard standing will restrict exposure following construction but exposure during construction and during maintenance works cannot be discounted. The presence of asbestos elsewhere within the made ground cannot be discounted therefore if made ground materials are placed in landscaping areas, a capping layer will also need to be considered to minimise the risk to site users and adjacent site users

Potential Contaminants	Potential Pathways	Potential Receptors	Comments
			from inhalation of fibres.
<b>Contaminants in soil</b>	Dermal contact, ingestion and inhalation of contaminated made ground, soil particles and fugitive dust.	Future site users Future maintenance workers	Detected potential contaminants limited to benzo-a-pyrene (2 locations), pH (ten locations) and lead (one location).  Extensive hard standing will restrict exposure at most locations except where landscaping is proposed where an inert capping will be required.
<b>Leachable contaminants and contaminants in groundwater</b>	Vertical leaching from impacted soil and lateral migration of impacted groundwater derived from on-site sources.	Superficial Secondary (A) aquifers and bedrock Principal Aquifer.  River Yare surface water	Groundwater appears to have been impacted slightly by inorganic determinands and at a few locations (principally WS22) by hydrocarbons.  There is a theoretical risk to surface waters from leachable contaminants in soil including minor hydrocarbon exceedances.  Extensive hard standing will limit rainfall percolation and leachate potential and the identified exceedances of the

Potential Contaminants	Potential Pathways	Potential Receptors	Comments
			<p>WQS criteria are generally not significantly elevated.</p> <p>Whilst a potential contaminant linkage has been identified, an unacceptable risk to controlled waters is considered unlikely to occur due to the limited contamination identified.</p>

## 5 Piling Risk Assessment

### 5.1 Pile Type and Method

- 5.1.1 Due to the inherently variable nature of the Made Ground, the soft compressible nature of the Superficial deposits including Breydon Peat and Tidal River and Creek Deposits and the high loads required to support the structures, piled foundations are considered the most appropriate technique for the Scheme.
- 5.1.2 The Applicant's construction Contractor's tender design has identified that the following techniques will be adopted at the Scheme:
- Combi piles comprising driven open toe steel tube and interconnecting driven steel sheet piles to form the bridge abutment cofferdam. These will transfer the bridge load through the made ground and superficial deposits into the underlying Crag Formation.
  - Pre-cast concrete driven piles for the highway embankment approaches to the bascule bridge. These will transfer the embankment load through the made ground into the underlying superficial deposits.
- 5.1.3 Driven piles provide the most effective solution for the ground conditions present on the Applicant Site (ie. predominantly granular soils). Bored piles would not be as suited to the ground conditions present due to the risk of 'blowing sands' and disturbance of the sands at the pile toe which could compromise the integrity of the bridge foundations. Driven piles also avoid the need for disposal of pile arisings and the use of drillings fluids such as bentonite hence eliminating the risk of pile arisings and spillages entering the River Yare. Noise and vibration from driven piles present a nuisance risk due to the proximity of residential properties and businesses and will need to be adequately mitigated by selection of appropriate driving heads and vibratory plant.
- 5.1.4 Driven piles can introduce preferential migration pathways due to the smooth surface of the piles (in the case of the proposed precast concrete and steel tubes). However, due to the limited contamination (i.e no significant plumes of hydrocarbons, solvents or other mobile / leachable contaminants) identified at the proposed piling locations (highway embankments and bridge abutments), it is considered that an unacceptable risk to groundwater is unlikely to occur. It is also noted that vertical hydraulic continuity is likely to exist between the superficial deposits and the underlying Crag Group and hence piling will not introduce any new migration pathways.
- 5.1.5 Driven piles can also allow potentially contaminated soils to be dragged along the shaft of the pile or be pushed ahead of the pile toe while driving.

---

However, this is not considered to represent an unacceptable risk due to the limited contamination identified at the piling locations.

### Design Responsibility

- 5.1.6 Specific pile design is the responsibility of the specialist contractor who will complete the detailed design of the Scheme based on the available ground information, the loads to be carried, the preferred construction sequence and their own proprietary techniques.
- 5.1.7 As detailed in the outline CoCP (document reference 6.16) and secured via CoCP Requirements, the detailed piling design will follow regulatory guidance and take full cognisance of any contaminated soils and groundwater identified on the Principal Application Site. Appropriate site management and pile installation quality control measures will be in place during pile installation.

## 5.2 Pollution Scenarios and Mitigation Measures

---

- 5.2.1 Environment Agency guidance document 'Piling and Penetrative Ground Improvement Methods on Land Affected by Contamination: Guidance on Pollution Prevention' (2001) (Ref 16D.3) presents guidance on the potential environmental and human health risks associated with different piling techniques. Six possible pollution scenarios are identified and described, representing situations where there is concern that piling or penetrative ground improvement operations have potential to cause a risk to receptors:

**Scenario 1** - Creation of preferential pathways, through a low permeability layer (an aquitard), to allow potential contamination of an underlying aquifer;

**Scenario 2** - Creation of preferential pathways, through a low permeability surface layer, to allow upward migration of landfill gas, soil gas, or contaminant vapours to the surface;

**Scenario 3** - Direct contact of site workers and others with contaminated soil arisings which have been brought to the surface;

**Scenario 4** - Direct contact of the piles or engineered structures with contaminated soil or leachate causing degradation of pile materials (where the secondary effects are to increase the potential for contaminant migration);

**Scenario 5** - The driving of solid contaminants down into an aquifer during pile driving; and

**Scenario 6** - Contamination of groundwater and, subsequently, surface water by concrete, cement paste, or grout.

**5.2.2** Where potential contaminant linkages have been identified, mitigation measures have been outlined and these are detailed in the outline CoCP (document reference 6.16) which is secured by a requirement in the DCO. A summary of each pollution scenario is shown in Table 5.1 below. The identification of potential “contaminant linkages” is a key aspect of the evaluation of potentially contaminated land. An approach based on the UK CIRIA report C552 (Ref 16D.5) has been adopted within this table and the matrices used to generate the risk level are presented in Annex A.

**5.2.3** In view of the controlled waters contamination assessment and the absence of any significant soil based contamination summarised in Section 3 above, the potential for contamination of groundwater from the proposed piling activities is considered to be LOW.

#### **Pollution Scenario 1 – Creation of Preferential Pathways through an Aquitard, to Allow Potential Contamination of an Underlying Aquifer**

**5.2.4** It is assumed that piles would penetrate through made ground and be founded in either the superficial deposits (Secondary A aquifer) in the case of the precast driven piles supporting the embankment approaches or in the Crag Group in the case of the combi piles for the bridge support foundations. The soils encountered on site are predominantly granular with no continuous low permeability surface layers being identified and hence are likely to be in hydraulic continuity. Therefore, the proposed piling technique (ie. driven) is not considered to create new preferential pathways for any contamination present. It is also noted that only limited contamination has been identified at the proposed piling locations. Scenario 1 is considered to represent a low risk.

#### **Pollution Scenario 2 – Creation of Preferential Pathways through a Low Permeability Surface Layer, to Allow Upward Migration of Soil, Gas or Contaminant Vapours to the Surface**

**5.2.5** Piles have the potential to create a pathway for any soil gas or contaminant vapours to migrate to the surface. Gas monitoring undertaken and reported in the Interpretative Environmental Ground Investigation report (Appendix 16C of the Environmental Statement) identified that concentrations of methane and carbon dioxide are generally below threshold values (1.0% v/v and 5.0% v/v, respectively) with associated low flow rates once steady state has been reached. Based on the monitoring data, most monitoring locations are classified as Characteristic Situation 1 (Very low risk) with two locations being Characteristic Situation 2 (Low risk). Scenario 2 is considered to represent a low risk for the Principal Application Site due to the proposed end-use (bridge structure/ highway/ landscaping) and the absence of any significant concentrations of ground gas. The only proposed buildings (control room and plant room) are to be founded above ground level and

cantilevered off the side of the bridge abutments and therefore no gas pathway exists.

### **Pollution Scenario 3 – Direct Contact of Site Workers and others with Contaminated Soil Arisings that have been brought to the Surface**

- 5.2.6 WSP's Interpretative Environmental Ground Investigation report (Appendix 16C of the Environmental Statement) has identified only limited contamination present, mainly in the made ground deposits. All made ground was tested for the presence of asbestos and chrysotile fibres were identified in four soil samples (from BH6 and CPT3) located to the west of any proposed bridge supports. It is possible that asbestos fibres could be present in made ground in other areas of the Principal Application Site and hence shallow soils could pose a potential risk to construction workers and third parties.
- 5.2.7 On the basis that appropriate health and safety training, planning and monitoring will be in place for the works the risks are anticipated to be low and contractors will be made aware of the potential issues associated with coming into contact with potentially contaminated material. There will be no pile arisings due to the piling technique adopted by the Contractor.
- 5.2.8 The Contractor should ensure that all construction workers wear appropriate PPE/RPE and the application of mitigation measures such as the dust suppression are implemented in any areas where excavations are undertaken. It is considered that employing appropriate measures, wearing suitable PPE/RPE and the fact that site workers will have limited exposure to excavated soils will prevent Scenario 3 from being a significant concern and the risk is considered to be very low.

### **Pollution Scenario 4 – Direct Contact of the Piles or Engineered Structures with Contaminated Soil or Leachate Causing Degradation of Pile Materials (where the Secondary Effects are to Increase the Potential for Contaminant Migration)**

- 5.2.9 With regard to the potential for contaminated soil or leachate causing degradation of pile materials, appropriate chemical resistant concrete / steel should be employed for the piles in accordance with guidance provided in 'BRE Special Digest 1 Concrete in Aggressive Ground' (Ref 16.D.6) for all strata encountered. This is considered not to be a significant issue and should not pose lasting impact to the Principal Application Site or the wider environment. The pile type adopted by the Contractor (ie. driven steel tubes and precast concrete piles) will be fabricated off-site and result in improved quality control compared with cast in-situ concrete piles.
- 5.2.10 No Non-Aqueous Phase Liquid (NAPL) has been identified and as such the opportunity for degradation of piles is limited. However, consideration of pile material should be given during design and an appropriate material selected

---

---

for use. The potential for degradation of materials under Scenario 4 is therefore considered to be low.

### **Pollution Scenario 5 – The Driving of Solid Contaminants down into an Aquifer during Pile Driving**

- 5.2.11 There is a risk that potentially contaminated soils could be dragged along the shaft of the pile or be pushed ahead of the pile toe during pile driving due to the piling techniques adopted by the Contractor. However, Scenario 5 is considered to represent a low risk due to the limited contamination present.

### **Pollution Scenario 6 – Contamination of Groundwater and Subsequently, Surface Waters by Concrete, Cement, Paste or Grout**

- 5.2.12 The driven piles selected by the Contractor (precast concrete and steel tubes) are fabricated off site and hence the risk of pollution by spillages of concrete or arisings during pile installation does not require further consideration. Good site practices should be employed to prevent escape of concrete, cement paste and grout, particularly with regard to spillages of such materials into the River Yare if any in-situ concreting is undertaken. Scenario 6 is therefore considered to represent a low risk assuming good site management practices.

## **5.3 Existing Infrastructure**

---

- 5.3.1 Consideration will be given to the safeguarding of existing buried services, pursuant to the relevant draft protective provisions contained within the DCO (document reference 3.1).

## **5.4 Risk Matrix and Pollution Scenarios**

---

- 5.4.1 Table 5.1 presents the risk matrix and pollution scenarios. Reference should be made to Annex A for a description of the methodology and risk descriptors.

*Table 5.1: Piling Works Risk Matrix with Pollution Scenarios*

<b>Risk Scenario</b>	<b>Severity of Risk</b>	<b>Probability of Risk Occurring</b>	<b>Comments</b>	<b>Does the Pile Design Sufficiently Mitigate Risk?</b>	<b>Risk Level CIRIA 552</b>
<b>1. Creation of preferential pathways through an aquitard.</b>	<b>Medium -</b> Pollution of sensitive controlled waters (surface waters or aquifers).	<b>Unlikely</b> – Proposed piles will likely be founded in the Crag Group but new preferential pathways are unlikely to be created as no continuous low permeable strata exist above the Crag Group. Also, it is noted that only limited contamination has been identified at the piling locations.	The shallow groundwater is already likely to be in hydraulic continuity with the Crag Deposits and hence the piles will not create an additional pathway	Yes	<b>Low Risk</b>
<b>2. Creation of preferential pathways through a low permeability surface layer allowing migration of soil gas or</b>	<b>Medium -</b> Chronic (long-term) risk to human health.	<b>Unlikely</b> - Gas monitoring undertaken identified that all levels of methane and carbon dioxide are generally below threshold values (1.0% v/v and 5.0% v/v, respectively) with associated negligible	Limited ground gas identified. No pathway exists as the only buildings proposed are not founded on the ground.	Yes	<b>Low Risk</b>

Risk Scenario	Severity of Risk	Probability of Risk Occurring	Comments	Does the Pile Design Sufficiently Mitigate Risk?	Risk Level CIRIA 552
contaminant vapours to the surface		flow rates once steady state has been reached.			
<b>3. Direct contact of site workers and others with contaminated soil arisings</b>	<b>Minor</b> - Requirement for protective equipment during site works to mitigate health effect.	<b>Unlikely</b> – Limited contamination of near surface soils identified; asbestos identified at 4 locations. There will be no soil arisings from the piling techniques adopted by the Contractor (ie. driven). Based on control measures, any contact with potential contaminated soils will be mitigated.	Appropriate control measures and correct selection of PPE/ RPE and training for staff will mitigate any risks from any contaminated soil encountered including asbestos.	Yes	Very Low Risk
<b>4. Direct contact of the piles or engineered structures with contaminated soil</b>	<b>Medium</b> – degradation of piles and structures.	<b>Unlikely</b> – No NAPL was identified. Appropriate chemical resistant concrete / steel will need to be employed for the piles in	Appropriate pile material selection required. The driven piles adopted by the Contractor will be	Yes	Low Risk

## 6 Conclusions and Requirements

### 6.1 Conclusions

- 6.1.1** Due to the inherently variable nature of the Made Ground and the soft, compressible, near surface soils, piles founded in the superficial deposits or Crag Group are considered the most appropriate solution for the proposed bascule bridge and the approach embankments. The Contractor has adopted driven piles; combi piles comprising steel tubes with interconnecting sheet piles for the bascule bridge foundations and precast concrete piles for the embankments. Limited contamination has been identified from analysis of soils, leachate and groundwater results (mainly in the near surface soils) but it is noted that the near surface soils are likely to be in hydraulic continuity with the Principal Aquifer (Crag Group) at depth so the use of piles will not create additional pathways for migration of any contamination present.
- 6.1.2** A detailed review of the groundwater levels and also the chemical composition of groundwater (including electrical conductivity) within the Superficial Deposits (Tidal River or Creek Deposits, North Denes Formation, Breydon Formation and Happisburgh Glacigenic Formation) and underlying Principal Aquifer (Crag Formation) identifies that the strata are in hydraulic continuity and that there is saline intrusion in both shallow and deep groundwater samples retrieved from borehole installations. This is as expected due to the lack of any continuous low permeable strata separating the Superficial Deposits and the Crag Formation. It is also considered that the groundwater will be in hydraulic continuity with the River Yare although it is noted that the river is subject to tidal influence at this location.
- 6.1.3** The proposed driven pile solution provides the most effective solution for the ground conditions present on the Site (ie. predominantly granular soils). Driven piles also avoid the need for disposal of pile arisings and the use of drillings fluids such as bentonite hence eliminating the risk of pile arisings and spillages entering the River Yare. Driven piles can introduce preferential migration pathways due to the smooth surface of the piles (in the case of the proposed precast concrete and steel tubes). However, due to the limited contamination identified at the proposed piling locations, it is considered that an unacceptable risk to groundwater is unlikely to occur and no additional pathways will be created as a result of using driven piles as the Superficial Deposits and underlying Crag Deposits are already in hydraulic continuity.
- 6.1.4** Mitigation measures will be required if construction workers come into contact with excavated soils, including (but not limited to) dust suppression and the wearing of appropriate PPE/RPE. This will be the responsibility of the piling contractor and managed accordingly. Details are given in the outline CoCP (document reference 6.16).

- 
- 6.1.5 The driven piles should be constructed of suitable materials taking into consideration the chemical composition of the soil encountered on the Principal Application Site including the potential presence of saline water.
- 6.1.6 On review of the ground investigation data, the proposed piling works are not considered to represent a significant risk to local controlled waters or human health receptors. A risk assessment adopting the approach in UK CIRIA Report C552 (Ref 16D.5) assesses the risk to be LOW.
- 6.1.7 Specific pile design will remain the responsibility of a specialist contractor who will complete the detailed design of the Scheme based on the available ground information, the loads to be carried, the preferred construction sequence and their own proprietary techniques.
- 6.1.8 The detailed piling design will follow regulatory guidance and take full cognisance of any contaminated soils and groundwater identified on the Principal Application Site. Appropriate site management and pile installation quality control measures will be in place during pile installation.

## 6.2 Requirements

---

- 6.2.1 On the basis of this assessment, the following will be detailed in the outline CoCP (document reference 6.16) and secured via full CoCP Requirements.
- Use of appropriate pile materials to be resistant to the chemical composition of soil encountered on the Application Site including the potential presence of saline water.
  - Due to limited soil contamination (predominantly in the near surface soils and groundwater), appropriate dust suppression measures should be undertaken and site workers should wear suitable PPE/ RPE.
  - Quality Assurance and Quality Control (QA/QC) measures should be identified and adopted prior to piling works being undertaken. These are primarily for construction quality and structural performance. However, they are also equally relevant to mitigate environmental risk, for example spillages of oil/hydrocarbons during the construction process (re-fuelling). The relevant measures should ensure that the foundation pile solution techniques are carried out correctly and in an appropriate manner so that the risk assessment and conclusions remain valid. Such QA/QC procedures will normally be agreed between the contractor, client, and relevant regulators.

## Annex A: Risk Descriptors

**A.1.1.1** The identification of potential “pollutant linkages” is a key aspect of the evaluation of potentially contaminated land. An approach based on the UK CIRIA report C552 (Contaminated Land Risk Assessment: A Guide to Good Practice, 2001) has been adopted within this report. For each of the pollutant linkages, an estimate is made of:

- The potential severity of the risk; and
- The likelihood of the risk occurring.

**A1.1.2** Table A-1 presents the classification of the severity of the risk:

**Table A-1: Severity of Risk**

Severe	Acute risks to human health; Major pollution of controlled waters (watercourses or groundwater)
Medium	Chronic (long-term) risk to human health; Pollution of sensitive controlled waters (surface waters or aquifers)
Mild	Pollution of non-sensitive water resources.
Minor	Requirement for protective equipment during site works to mitigate health effects; Damage to non-sensitive ecosystems or species

**A1.1.3** The probability of the risk occurring is classified by criteria given in Table A-2.

**Table A-2: Probability of Risk Occurring**

High Likelihood	Pollutant linkage may be present, and risk is almost certain to occur in the long term, or there is evidence of harm to the receptor.
Likely	Pollutant linkage may be present, and it is probable that the risk will occur over the long term.
Low Likelihood	Pollutant linkage may be present and there is a possibility of the risk occurring, although there is no certainty that it will do so.
Unlikely	Pollutant linkage may be present but the circumstances under which harm would occur are improbable.

**A1.1.4** An overall evaluation of the level of risk is gained from a comparison of the severity and probability as presented in Table A-3.

**Table A-3: Comparison of Severity and Probability**

		Severity			
		Severe	Medium	Mild	Minor
Probability	High Likelihood	Very high risk	High risk	Moderate risk	Moderate / low risk
	Likely	High risk	Moderate risk	Moderate/low risk	Low risk
	Low Likelihood	Moderate risk	Moderate/low risk	Low risk	Very low risk
	Unlikely	Moderate / low risk	Low risk	Very low risk	Very low risk

A1.1.5 Table A-4 then provides a description of the typical consequences and potential actions required following each risk definition.

**Table A-4: Qualitative Risk Assessment - Classification of Consequence**

Classification	Definition
Very High Risk	Severe harm to a receptor may already be occurring, or a high likelihood severe harm will arise to a receptor, unless immediate remedial works / mitigation measures are undertaken.
High Risk	Harm is likely to arise to a receptor, and is likely to be severe, unless appropriate remedial actions / mitigation measures are undertaken. Remedial works may be required in the short-term, but likely to be required over the long-term.
Moderate Risk	Possible that harm could arise to a receptor, but low likelihood that such harm would be severe. Harm is likely to be mild. Some remedial works may be required in the long-term.
Moderate / Low Risk	Possible that harm could arise to a receptor, but where a combination of likelihood and consequence results in a risk that is above low, but is not of sufficient concern to be classified as mild.  Limited further investigation may be required to clarify the risk. If necessary, remediation works are likely to be limited in extent.
Low Risk	Possible that harm could arise to a receptor. Such harm, at worst, would normally be mild.

---

---

Very Low Risk

Low likelihood that harm could arise to a receptor. Such harm is unlikely to be any worse than mild.

---

---
